HONEYWELL PROPRIETARY

Non-Disclosure Statement

This proposal or qualification data includes data that shall not be disclosed outside the **Montclair Board of Education (Montclair BOE or the District)** and shall not be duplicated, used or disclosed – in whole or part – for any purposed other than to evaluate this proposal or quotation. If, however, a contract is awarded to this Offeror as a result of -- or in connection with -- the submission of this data, the **Montclair Board of Education** shall have the right to duplicate, use, or disclose the data to the extent provided in the resulting contract. This restriction does not limit the **Montclair Board of Education's** right to use information contained in this data if it is obtained from another source without restriction. The data subject to this restriction are contained in all sheets.

Budgetary Proposal

This budgetary proposal is provided for information and planning purposes only, to be used for feasibility decisions, planning, and budget development only, and is non-binding and does not constitute an offer for sale. Honeywell will be pleased to provide a firm price proposal upon request which will include all technical and commercial considerations

Honeywell reserves the right, in its discretion, to increase the price(s) set forth in this Proposal in the event that tariffs (or similar governmental charges) imposed by the United States or other countries result in any increase in the costs that Honeywell used to determine such price(s).

General Disclaimer about Pre-Contract Information

HONEYWELL MAKES NO REPRESENTATION OR WARRANTY REGARDING ANY FINANCIAL PROJECTIONS, DATA OR INFORMATION PROVIDED, EXCEPT AS MAY BE EXPRESSLY SET FORTH IN A DEFINITIVE AGREEMENT.

Municipal Advisor Disclaimer

HONEYWELL BUILDING SOLUTIONS, A STRATEGIC BUSINESS UNIT OF HONEYWELL INTERNATIONAL INC. (“HONEYWELL”), IS NOT A MUNICIPAL ADVISOR AND CANNOT GIVE ADVICE WITH RESPECT TO MUNICIPAL SECURITIES OR MUNICIPAL FINANCIAL PRODUCTS TO YOU ABSENT YOUR BEING REPRESENTED BY, AND RELYING UPON THE ADVICE OF, AN INDEPENDENT REGISTERED MUNICIPAL ADVISOR. HONEYWELL IS NOT SUBJECT TO A FIDUCIARY DUTY WITH REGARD TO YOU OR THE PROVISION OF INFORMATION TO YOU. INFORMATION ABOUT MUNICIPAL SECURITIES AND/OR MUNICIPAL FINANCIAL PRODUCTS, IF ANY, IS PROVIDED FOR EDUCATIONAL PURPOSES ABOUT POSSIBLE FINANCING OPTIONS AND IS NOT THE PROVISION OF ADVICE OR A RECOMMENDATION TO PURSUE ANY PARTICULAR FINANCING OPTION. CONSULT WITH YOUR INDEPENDENT REGISTERED MUNICIPAL ADVISOR ABOUT THE FINANCING OPTION APPROPRIATE FOR YOUR SITUATION.

To ensure compliance with requirements imposed by the IRS under Circular 230, we inform you that any U.S. federal tax advice contained in this communication (including any attachments), unless otherwise specifically stated, was not intended or written to be used, and cannot be used, for the purpose of (1) avoiding penalties under the Internal Revenue Code or (2) promoting, marketing or recommending to another party any matters addressed herein. The information contained herein is general in nature and based on authorities that are subject to change. Honeywell Building Solutions, a strategic business unit of Honeywell International Inc., recommends that you consult your tax adviser to understand its applicability to specific situations.

SECTION A EXECUTIVE SUMMARY

Honeywell is pleased to submit this Energy Savings Plan for the Montclair Board of Education (Montclair BOE). During the development of the Energy Savings Plan, Honeywell has completed a thorough investment grade energy audit of the Montclair BOE's buildings and grounds. Based on the audit findings and Honeywell's extensive experience in working with school districts, we can confidently state that we can deliver a financially viable, comprehensive solution to address Montclair BOE's facility concerns and goals. Our Energy Savings Plan includes projects that achieve energy and operational efficiencies, create a more comfortable and productive environment and are actionable via the New Jersey Energy Savings Improvement Program (NJ ESIP) in accordance with NJ PL2012, c.55.

The Energy Savings Plan is the core of the NJ ESIP process. It describes the energy conservation measures that are planned and the cost calculations that support how the plan will pay for itself through the resulting energy savings. Under the law, the Energy Savings Plan must address the following elements:

- The results of the energy audit;
- A description of the energy conservation measures (ECMs) that will comprise the program;
- An estimate of greenhouse gas reductions resulting from those energy savings;
- Identification of all design and compliance issues and identification of who will provide these services;
- An assessment of risks involved in the successful implementation of the plan;
- Identify the eligibility for, and costs and revenues associated with, the PJM Independent System Operator for demand response and curtail-able service activities;
- Schedules showing calculations of all costs of implementing the proposed energy conservation measures and the projected energy savings;
- Maintenance requirements necessary to ensure continued energy savings, and describe how they will be provided; and
- If developed by an ESCO, a description of, and cost estimates of a proposed energy savings guarantee.

The purpose of this document is to provide all the information required for the Montclair BOE to determine the best path forward in the implementation of a District-Wide NJ ESIP Project. It is important to note that the Energy Savings Plan provides a comprehensive evaluation of ALL potential ECMs within the Montclair BOE. This is not meant to infer that all the ECMs identified can be implemented. However, if the ECM is part of this plan, it may be implemented later as additional funding becomes available or technology changes to provide for an improved financial return.

Our Energy Savings Plan is structured to clearly demonstrate compliance with the NJ ESIP law, while also presenting the information in an organized manner which allows for informed decisions to be made. The information is divided into the following sections:

A. Executive Summary (This Section)

B. Preliminary Utility Analysis – The Preliminary Utility Analysis (PUA) defines the utility baseline for the Montclair BOE buildings included in the Energy Savings Plan. It provides an overview of the current usage and a cost per square foot by building of utility expenses. The report also compares the Montclair BOE's utility consumption to that of other districts in the same region on a per square foot basis.

C. Energy Conservation Measures – This section includes a detailed description of the ECMs we have selected and identified for your School District. It is specific to your facilities in scope, savings methodology and environmental impact. It is intended to provide a basis of design for each measure in narrative form. It is not intended to be a detailed specification for construction. ALL potential ECMs for the Montclair BOE are identified for the purposes of potential inclusion in the program. Final selected ECMs are to be determined by the Montclair BOE in conjunction with Honeywell during the project development phase of the NJ ESIP process.

D. Technical and Financial Summary – This section includes an accounting of all technical and financial outcomes associated with the ECMs as presented on the New Jersey Board of Public Utilities Forms II through IV. Information detailed on the forms includes projected implementation hard costs, projected energy savings, projected operational savings and projected environmental impact. Form VI: Annual Cash Flow Analysis provides a “rolled-up” view of the overall project financials, inclusive of financing costs, on an annual basis as well as over the entire 15 or 20-year term of the agreement.

E. Measurement & Verification and Maintenance Plan – This section identifies the intended methods of verification and measurement for calculating energy savings. These methods are compliant with the International Measurement and Verification Protocols (IMVP), as well as other protocols previously approved by the Board of Public Utilities (BPU) in New Jersey. This section also includes the recommended maintenance requirements for each type of equipment. Consistent maintenance is essential to achieving the energy savings projected in this plan.

F. Design Approach – This section includes a summary of Honeywell’s best practices for the successful implementation of a NJ ESIP project. It includes a project specific Safety Management Plan and provides an overview of our project management procedure, construction management and a sample schedule for the overall completion of the project. Within the schedule, we clearly define the tasks directed towards compliance with architectural, engineering and bidding procedures in accordance with New Jersey Public Contracts Law.

G. Independent Energy Audit – This section includes, for reference, the independent energy audits as previously received by the Montclair BOE through the Local Government Energy Audit (LGEA) program. The audits provided by TRC have been included on a USB drive as Appendix 1. A comparison can be made between the ECMs outlined in this Independent Energy Audit and the additional ECMs described in the overall Energy Savings Plan.

H. Energy Calculations and Greenhouse Gas Reduction Summary – This section titled Appendix 2: ECM Calculations includes all the energy calculations required to ensure compliance with the law and to confirm the energy savings can, and will, be achieved. These calculations are subject to an independent 3rd party engineering firm review for verification.

I. **Equipment Cut-sheets –** This section titled Appendix 3: Equipment Cut-sheets includes specification data for the equipment which shall be utilized as the basis of design for plans and specifications during the subsequent project development and NJ public bid phase.

J. **Safety Management Plan –** This section titled Appendix 4: Safety Management Plan establishes a plan for the implementation of Honeywell's Safe Operations Management (SOM) program. The document includes procedures and requirements specific to the Montclair BOE necessary to support a safe workplace for all stake holders. The Safety Management Plan is a living document, which will be updated and modified to maintain its relevance throughout the project as site conditions and circumstances change.

Benefits

The measures investigated in this Energy Savings Plan could result in an annual utility savings of 2,052,491 kWh of electricity and save 291,481 therms of natural gas. Additionally, these energy savings will result in a net reduction of greenhouse gases and will reduce the school district's carbon footprint by 2627 MTE of CO_2 annually. This is equivalent to removing 554 cars from the road annually and /or 2488 forested acres per year. All these savings are achieved while improving the classroom environment and renewing many items that have been in service beyond useful life expectancy.

In accordance with the NJ ESIP process, the next step in the project development phase is for Honeywell to provide our recommendations and for the Montclair BOE to select the desired content of the project based upon the Montclair BOE's unique goals and objectives. The selections will consider the projected costs, projected energy and operational savings, available financing options at the time of the agreement, interest rates, length of term and Montclair BOE priorities, which will all play a part in the final selection and cash flow of ECMs. The definitive requirement under NJ PL2012, c.55 is that the project is self-funding within the 15 or 20-year term as outlined in the legislation.

Overall, it is evident that the Montclair BOE is well positioned to implement a program that will upgrade your facilities, while funding itself within the requirements of the law and with zero impact on your taxpayer base. We welcome this opportunity to partner with the Montclair BOE to improve the comfort and efficiency of your facilities through the successful implementation of this Energy Savings Plan.

Sincerely,

Joseph Coscia
Sr. Business Consultant

SECTION B PRELIMINARY UTILITY ANALYSIS

This Page Intentionally Left Blank

Honeywell

Preliminary Utility Analysis

Montclair Township Board of Education
Montclair, NJ

Helping customers manage energy resources to improve financial performance

Executive Summary

Honeywell would like to thank you for the opportunity of providing you with this Preliminary Utility Analysis. A one year detailed billing analysis was completed for all utility data provided by your staff. The facility's electric and gas consumption were compared to a benchmark of typical facilities of similar use and location. It should be noted however, that some of Buildings which make up the benchmarking standards are not equipped with mechanical cooling (air conditioning). Therefore, these buildings may unjustly appear to be less efficient in comparison.

Through our Energy Services offerings, Honeywell's goal is to form a long term partnership for the purpose of meeting your current infrastructure needs by focusing to:

- Improve Operational Cost Structures
- Ensure Satisfaction
- Upgrade Infrastructure While Reducing Costs
- Meet Strategic Initiatives
- Leverage Teamwork
- Pursue Mutual Interests
- Provide Financing Options

How does it work?

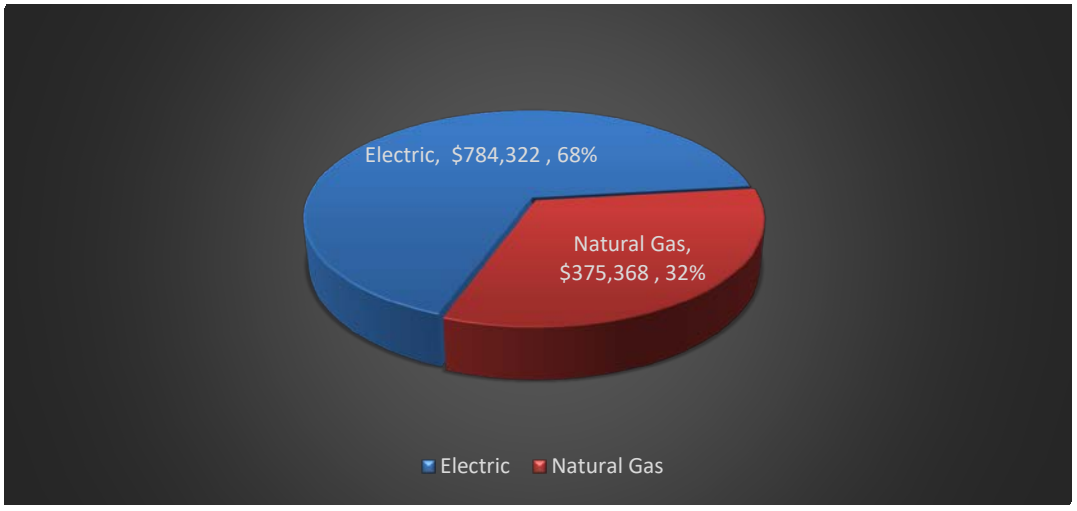
Under an energy retrofit solution, Honeywell installs new, energy efficient equipment and optimizes your facility, as part of a multi-year service contract. Most of these improvements are cost-justified by energy and operational savings. Some of the energy conservation measures provide for a quick payback, and as such, would help offset other capital intensive energy conservation measures such as, boilers, package rooftop units, domestic hot water heaters, etc. The objective is to provide you with reduced operating costs, increased equipment reliability, optimized equipment use, and improved occupant comfort.

After review of the utility analysis, you can authorize Honeywell to proceed with the development of a detailed engineering report. The report development phase allows Honeywell to prepare an acceptable list of proposed energy conservation measures, which are specific to the selected facility. Some examples of typical Energy Conservation Measures include:

- Lighting
- Control Systems
- Boilers
- AC Units/Condensers
- Building Enevelope
- Package Rooftop Units
- Domestic Hot Water Heaters
- Plug Load Management

Why Honeywell?

- Honeywell is one of the world leaders in providing infrastructure improvements
- With Honeywell as your building partner, you gain the advantage of more than 115 years of leadership in building services
- Honeywell has the infrastructure and manpower in place to manage and successfully implement your project
- Honeywell has over 30 years experience in the energy retrofit marketplace with over $5 Billion in customer energy savings
- Honeywell provides you with "Single Source Responsibility" - from Engineering to Implementation, Servicing and Financing (if desired)



Historical Summary

Utility Analysis Period:
March 2019 through February 2020

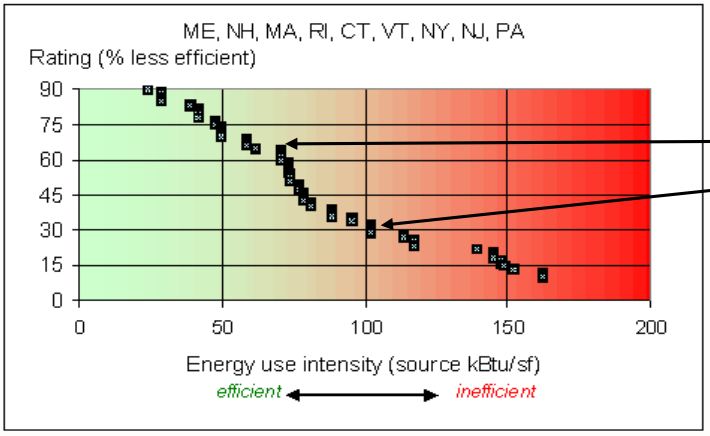
	Electric	Natural Gas
Utility Costs*	$784,322	$375,368
Utility Usage (kWh, Therms)	5,536,584	477,378
$ Cost/Unit (kWh, Therms)	$0.14166	$0.786
Annual Electric Demand (kW)	22,045	

* Costs include energy and demand components, as well as taxes, surcharges, etc.

Actual Cost by Utility
March 2019 through February 2020

Total Cost
$1,159,690

Energy Benchmarking



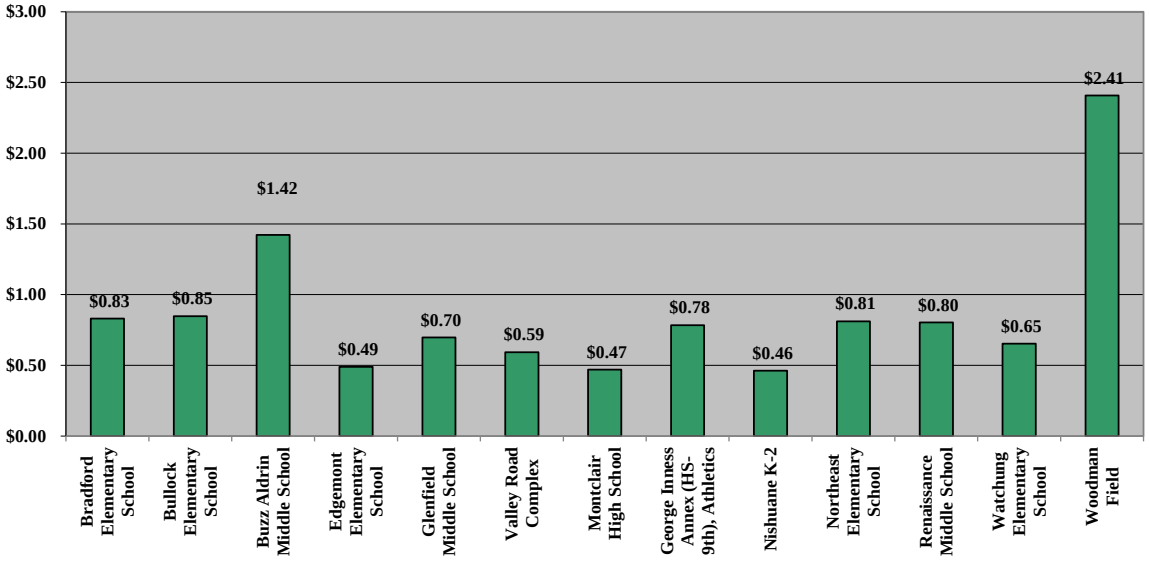
The calculation of EUI (Energy Use Intensity) is shown below. EUI, expressed in kBtu/sf, is normalized for floor area, the most dominant influence on energy use in most buildings. Its use usually provides a good approximation of how your building's energy performance compares to others. Site EUI indicates the rate at which energy is used at your building (the point of use). Source EUI indicates the rate at which energy is used at the generation sources serving your building (the point of source) and indicates the societal energy penalty due to your building The lower the EUI, the higher the rating, indicating that the building is more efficient than other buildings. The greater the EUI, the lower the rating, indicating that there is an opportunity for higher potential benefits from operational improvements.

The Source EUI below has been applied to a Department of Energy statistical model from the Oak Ridge National Laboratory web site, http://eber.ed.ornl.gov/benchmark. The Department of Energy has estimated energy use and cost reductions for building source EUI ratings (percentiles) in the table below. Please see the DOE Regional Source EUI Comparison graph below to rate your building in relation to the regional distribution of similar type buildings. (Note: The Source EUI includes the inefficiencies of electrical generation and transmission. A reduction in 'electrical' source EUI includes a benefit in terms of reduction of air pollution emissions and green house gases, and is thus an indicator of societal benefit.)

Source EUI Rating for your Building	Energy use and cost reduction potential (%)	Walk-thru energy assessment recommended?
above 60%	below 25%	No
40 to 60%	20 to 35%	Maybe
20 to 40%	35 to 50%	Yes
Below 20%	above 50%	Definitely

Site EUI Rank		Annual Total Electrical Use (kWh)	Annual Total Non-Electrical Fuel Use (Therms)	Building Gross Floor Area (sq-ft)	Site EUI Rating	Source EUI: Annual Total Source Energy Use per Sq-Ft (kBtu/sf)	Rating (Regional Source EUI Comparison)
1	Bradford Elementary School	316,377	25,827	58,129	**63**	**101**	**50%**
2	Bullock Elementary School	478,514	0	84,017	**19**	**59**	**29%**
3	Buzz Aldrin Middle School	620,172	59,576	58,128	**139**	**213**	**100%**
4	Edgemont Elementary School	94,680	25,462	34,638	**83**	**102**	**51%**
5	Glenfield Middle School	787,484	41,873	125,281	**55**	**98**	**49%**
6	Valley Road Complex	657,410	73,682	172,102	**56**	**82**	**41%**
7	Montclair High School	948,990	75,388	262,855	**41**	**66**	**33%**
8	George Inness Annex (HS-9th), Athletics	552,617	44,390	89,261	**71**	**114**	**57%**
9	Nishuane K-2	221,790	39,290	87,440	**54**	**71**	**36%**
10	Northeast Elementary School	267,450	22,259	56,549	**55**	**88**	**44%**
11	Renaissance Middle School	154,890	19,369	37,167	**66**	**95**	**48%**
12	Watchung Elementary School	219,090	28,783	52,109	**70**	**99**	**49%**
13	Woodman Field	217,120	21,480	13,184	**219**	**333**	**100%**

School Facilities



*Note that the Valley Road Complex represents the Board of Education Offices, Community Pre-K, Central Heating Plant, and Hillside Elementary School, due to their shared/district steam heating system.

Source EUI	Est Regional Rating	Building
101	50%	Bradford Elementary School
59	29%	Bullock Elementary School
213	100%	Buzz Aldrin Middle School
102	51%	Edgemont Elementary School
98	49%	Glenfield Middle School

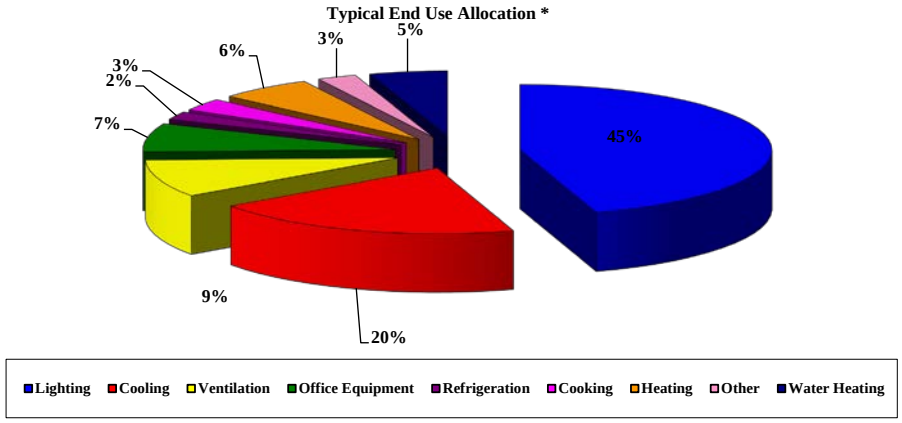
Utility Analysis
Electric

Square Footage Analysis

Cost per Sq. Ft.

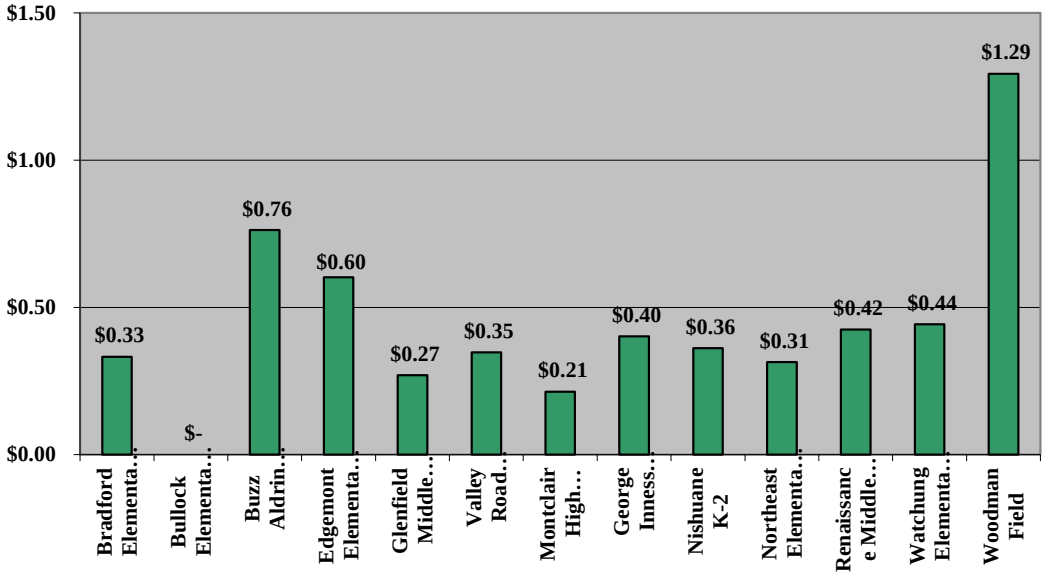


Usage (kWh per Sq. Ft.)

Utility Analysis

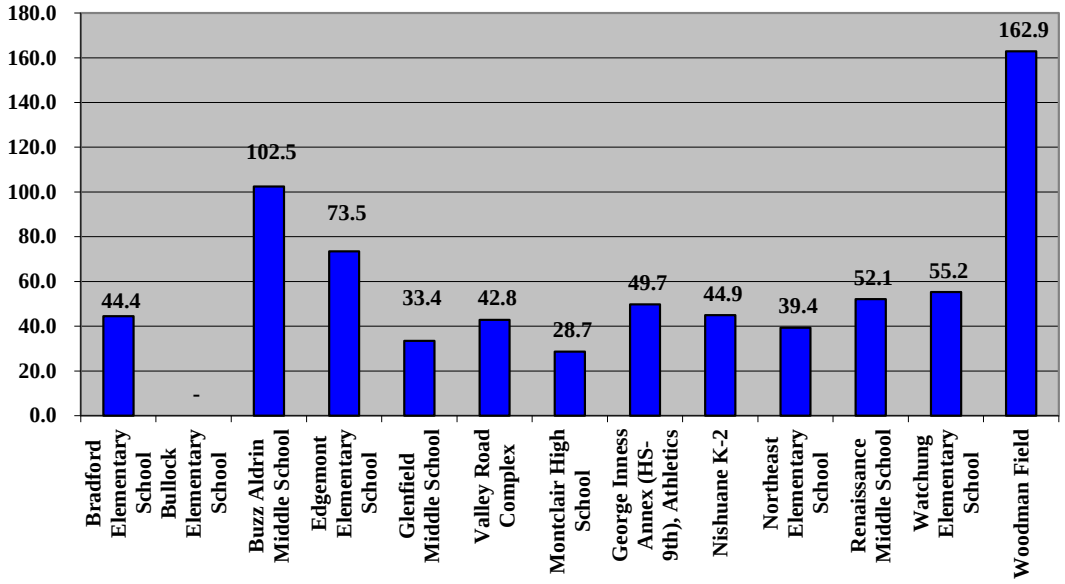
Sources of Electric Consumption

**This allocation is generic and is not a representation of the actual end use in your buildings included in this report.



Typical Allocation Applied to Your Electric Cost**

	Lighting	$352,945
	Cooling	$156,864
	Ventilation	$72,158
	Office Equipment	$54,903
	Refrigeration	$15,686
	Cooking	$23,530
	Heating	$47,059
	Other	$19,608
	Water Heating	$39,216
Your Total Cost	**March 2019 through February 2020**	**$784,322**

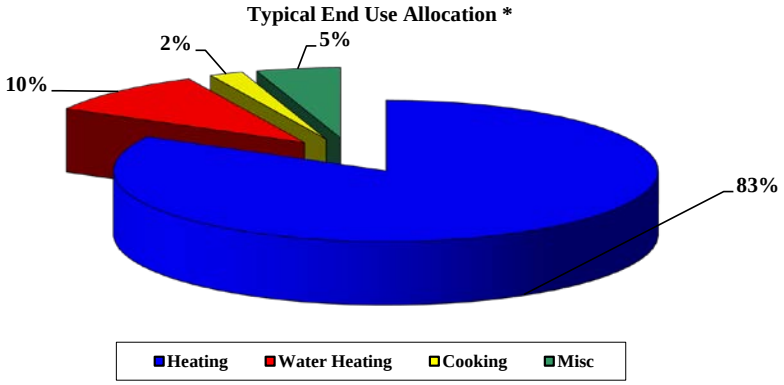


Utility Analysis

Natural Gas

Square Footage Analysis
Cost per Sq. Ft.

Usage (kBtu per Sq. Ft.)



There is a fairly direct correlation between your gas usage and heating degree days, indicating that the vast majority of your natural gas usage is for space heating.

Utility Analysis

Natural Gas

Sources of Usage
Natural Gas

**This allocation is generic and is not a representation of the actual end use in your buildings included in this report.

Typical Allocation Applied to Your Cost**
Natural Gas

	Heating	$311,556
	Water Heating	$37,537
	Cooking	$7,507
	Misc	$18,768
Your Total Cost	**March 2019 through February 2**	**$375,368**

Annual Emissions & Environmental Impact

Montclair Township Board of Education

Calendar Year March 2019 through February 2020

The following energy usage, cost and pollution have been quantified:

Total Annual Electric usage	5,536,584	kWh
Annual Natural Gas usage	477,378	Therms

Annual Greenhouse Gas Emissions

CO2	13,381,400	pounds
SO2	25,524	pounds
NOx	17,440	pounds

This is equivalent to one of the following:

300	No. of passenger vehicles - annual greenhouse gas emissions
176,715	Gallons of gasoline consumed - CO_2 emissions
3,653	Barrels of oil consumed - CO_2 emissions
134	No. of homes energy use for one year - CO_2 emissions
40,282	No. of tree seedlings grown for 10 years - carbon sequestered
335	No. of acres of pine or fir forests - carbon sequestered annually
65,458	No. of propane cylinders used for home barbeques - CO_2 emissions
8	No. of railcars' worth of coal burned - CO_2 emissions

Based on the US Environmental Protection Agency -
Clean Energy Power Profiler

Potential Retrofits

Retrofit Description	Utility/Fuel Type	Symptomatic Issues	Common Recommendations for Action
Lighting Retrofit and Motion Sensors	Electric/Natural Gas	Elevated EUI	Lighting and Controls UpGrade
De-Stratification Fans	Electric/Natural Gas	Elevated EUI	Redistribution of Conditioned Air
DHW Boiler Replacements	Electric/Natural Gas	Elevated EUI	Higher Efficiency Units
Classroom Unit Replacments	Electric	Elevated EUI	Higher Efficiency Units
RTU Replacements	Electric/Natural Gas	Elevated EUI	Higher Efficiency Units
Boiler Replacements	Natural Gas	Elevated EUI	Higher Efficiency Units
Burner Replacements	Natural Gas	Elevated EUI	Decrease Thermal Losses
Building Envelope Improvements	Electric/Natural Gas	Elevated EUI	Reduce Building In leakage
Roof Top Unit Replacements	Electric	Elevated EUI	Lower Energy Consumption
Computer Controllers	Electric	Elevated EUI	Lower Energy Consumption
Install Premium Efficient Motors	Electric	Elevated EUI	Lower Energy Consumption
CHP	Electric/Natural Gas	Elevated EUI	Lower Energy Consumption
Load Reduction	Electric	Elevated EUI	Lower Energy Supply Side Consumption

SECTION C ENERGY CONSERVATION MEASURES

INTRODUCTION

The information used to develop this Section was obtained through the independent energy audit building surveys to collect equipment information, interviews with operators and end users, and an understanding of the components to the systems at the sites. The information obtained includes nameplate data, equipment age, condition, the system's design and actual load, operational practices and schedules, and operations and maintenance history.

Honeywell has done a review of the ECMs which would provide energy and cost savings to the Montclair Township BOE. This report aims to be an assessment of the feasibility and cost effectiveness of such measures, and an indication of the potential for their implementation. The ECMs listed below have been reviewed throughout your facilities for consideration within a complete Energy Savings Plan. What follows is a general description of the energy auditing process and the detailed descriptions of the available ECMs for your facilities.

ENERGY CONSERVATION MEASURES

ECMs Included in Recommended Project ●
ECMs Analyzed for Alternate Projects ●

OVERVIEW

Honeywell has closely evaluated and audited the District to develop the optimum mix of energy saving measures. These site-specific measures have been selected and developed using the following process:

- Review Site Audits
- Engineering Team Site Visits
- Develop Measures
- Review Measures with Team

Reject and Accept Measures Based On

- Alignment with Critical Success Factors (CSF)
- Value to the School
- Economic Financial Payback
- Equipment Service Life
- Effect on Current Space Conditions

In developing the proposed measures, the following considerations were critical:

- Reduction of space heating and cooling loads by performing systems review, with complete consideration of current indoor environmental quality standards.
- Review and redesign lighting systems noting reductions in the internal heat gain in the affected spaces.
- Load reduction measures always precede optimization measures.

Bin weather data was used from a 15-year average reported from Newark, NJ. Ventilation rates, taken from ASHRAE published standard, were predicted by using the building's population multiplied by cfm/person during occupied hours.

Reasonable infiltration rates were assumed based on the building's fenestration conditions and expected values for typical buildings. A reduced infiltration rate was assumed for the unoccupied hours. Envelope heat loss calculations assumed a reasonable heat transmission rate (U value) based on the construction of the buildings. Wall area and glass area were estimated by supplied drawings and field photographs.

Current efficiencies were derived from assumed and later to be measured boiler efficiencies, and assumed system losses due to thermal losses, distribution losses and loose operational control. The current assumed boiler system efficiencies were then applied to the calculated load and calibrated to last year's actual fuel consumption.

Demand Sensitive Operation

Review existing and proposed thermal loads. For example, the review process will facilitate the application of:

1. Optimized flow rates (steam, water, and air).
2. Optimized operation of equipment, matching current occupancy use profiles, and considering both outside and indoor space temperatures.

Benefits of Mechanical Improvements

Listed below are some of the benefits that the District would reap from the mechanical portion of the measures:

1. Avoid costly repairs and replace equipment that would have to be replaced in the next five years.
2. Improved compliance with ASHRAE Ventilation Standards.
3. Ability to trend ventilation rates; thus, insuring compliance through documentation.
4. Operating a more weather sensitive facility.
5. Allowing for a greater capability of central monitoring and troubleshooting via remote.
6. Greater operating flexibility to reduce costs and optimize staff efficiency.

Indoor Air Quality

Implementation of new energy-related standards and practices has contributed to a degradation of indoor air quality. In fact, the quality of indoor air has been found to exceed the Environmental Protection Agency (EPA) standards for outdoor air in many homes, businesses, and factories.

The American Council of Governmental Industrial Hygienists (ACGIH) in their booklet “Threshold Limit Values,” has published air quality standards for the industrial environment. No such standards currently exist for the residential, commercial, and institutional environments, although the ACGIH standards are typically and perhaps inappropriately used. The EPA has been working to develop residential and commercial standards for quite some time.

Recent studies indicate that for even the healthiest students, indoor air pollution can reduce the ability to learn. As an example, if you were to place several students in a room where it is hot, there is little, or no air circulation and other children are coughing and sneezing, exposing the student body to airborne related illnesses such as the cold or flu. Honeywell has addressed this issue by focusing on the proper operation and replacement of the unit ventilators and air handler equipment which will assure IAQ standards are met.

ECM 1A LED LIGHTING

The key benefits of this ECM include:

- **Energy Savings** from reducing total energy consumption with more efficient, state of the art technology. Today's most efficient way of illumination and lighting has an estimated energy efficiency of 80%-90% when compared to traditional lighting and conventional light bulbs.
- **Improved teacher and student performance** from enhanced lighting quality that translates to an enhanced working and learning environment.
- **Improved equipment longevity** by reducing amount of light usage and extending the useful life of your lighting system. LED bulbs and diodes have an outstanding operational life time expectation of up to 100,000 hours. This is 11 years of continuous operation, or 22 years of 50% operation. Operational savings in terms of bulb and ballast replacement are significant based on this technology.
- **Reduced maintenance and operational costs** by modernizing your lighting system and providing for longer lasting and technologically advanced lights, without the need to address deficient or bad ballasts.
- **Ecologically Friendly** - LED lights are free of toxic chemicals. Most conventional fluorescent lighting bulbs contain a multitude of materials like mercury that are dangerous for the environment. LED lights contain no toxic materials and are 100% recyclable and will help to reduce carbon footprint by up to a third. The long operational life time span mentioned above means also that one LED light bulb can save material and production of 25 incandescent light bulbs. A big step towards a greener future!

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
1A LED Lighting	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●

Existing Conditions

Indoor lighting predominantly consists of T-12s and T-8s, some CFLs, and some incandescent bulbs. In general, lighting is operated on switches.

Scope of Work

The proposed lighting system is based on the recent investment grade lighting system audit where existing lighting systems were analyzed and inventoried. Honeywell proposes to retrofit all existing T-8 and T-12 fixtures with high efficiency Light Emitting Diode (LED) lamps.

The District will receive many benefits from the lighting system upgrade.

Existing Lighting at High School

Existing Lighting at Pre-K/DLC

LED Parking Lot Lighting Upgrades

Existing Conditions

The District parking lots consist of various types of HID light fixtures, which are not as efficient as modern LED types. Parking lot exterior lights consist of pole mounted shoe-box type and wall pack HID fixtures.

Scope of Work

Outdoor Lighting

The exterior wall-packs and pole-mounted shoebox fixtures are currently high wattage HID lamps. These will be replaced with lower wattage LED fixtures. The LED technologies offer significant advantages such as extended lamp life, minimal lumen depreciation, “instant on,” and very high energy conversion efficiency. These fixtures will provide substantial maintenance savings via the new 100,000-hour LED lamp life versus the 20,000 hours of the existing metal halide lamps.

To retrofit these lights with energy efficient LEDs, the existing ballasts that are in the space behind the light will be removed. Once removed, we will replace them with LED drivers which will use approximately 24V and will not need the existing ballast. The existing lamps will be removed, and new energy efficient LED lamps are installed in their place. Replacements or maintenance is not required on these type fixtures for up to 100,000 hours or 15-20 years depending on usage time.

Changes in Infrastructure

New LED lamps will be installed as part of this ECM. Existing poles and shoe box fixtures will be utilized.

Customer Support and Coordination with Utilities

Coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced electric energy usage. A slight increase in heating energy is resultant from the reduced heat output of more efficient lamps.
Waste Production	All lamps and ballasts that are removed will be properly disposed.
Environmental Regulations	No environmental impact is expected.

ECM 1B LIGHTING CONTROLS

The key benefits of this ECM include:

- **Energy savings** from reducing total energy consumption with more efficient, state of the art technology. Lighting controls keep lighting off when no occupancy is detected, reducing electrical energy consumption.
- **Reduced maintenance and operational costs** by reducing the runtime of lighting system and components.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
1B Lighting Controls		●					●			●						

Existing Conditions

Educational institutions, such as K-12 districts, are focused on providing classrooms and campuses for their teachers and students that are safe, healthy, energy-efficient, and provide the best environment for learning, and they are also chartered with reducing the costs of building operations.

Solution

Honeywell proposes the installation of occupancy-based lighting controls for interior spaces where none are currently installed. These controls will automatically control lighting systems based on occupancy.

Bullock gym to receive controls

Hillside gym to receive controls

Example of interior lighting sensor

Scope of Work

Lighting controls lower cost by adjusting light levels by occupancy, turning lights off when not needed.

Changes in Infrastructure

New lighting control devices will be installed as part of this ECM.

Customer Support and Coordination with Utilities

Coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced electric energy usage. A slight increase in heating energy is resultant from the reduced heat output lighting that is turned off.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

ECM 1C VENDING MISERS

The key benefits of this ECM include:

- **Energy savings** by better managing the power consumption of electrical equipment.
- **Longer equipment life** thanks to reduced usage.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
1C Vending Misers		●			●					●						

Multiple vending machines were observed in various buildings. As such, Honeywell has investigated the use of vending machine misers for these areas.

Existing Conditions

Vending machines are located throughout multiple buildings offering soft drinks to the occupants. A typical cold drink machine consumes over 5,000 kWh annually.

Vending Machines to be retrofitted with controls

Montclair High School	Cold Beverage	Faculty Lounge	2
Montclair High School	Snack	Faculty Lounge	2
Total			**13**

Proposed Vending Machines for Vending Miser Controls

Proposed Solution

During the site visit, Honeywell noted vending machines providing an opportunity for energy savings by shutting off non-critical loads during the non-occupied periods.

The VMOC also monitors electrical current used by the vending machine. This ensures that the unit will never power down a vending machine while the compressor is running, so a high head pressure start never occurs. In addition, the current sensor ensures that every time the vending machine is powered up, the cooling cycle is run to completion before again powering down the vending machine. The Coca Cola Company and Pepsi Corporation approve the proposed controller for use on their machines.

Interface with Existing Equipment

All the VMOC devices are easily installed. The vending machine controllers are installed separately from the machine, and implementation will occur during working hours. A period of three (3) weeks will be required to verify proper calibration of the sensors.

With respect to the vending machines in the various buildings, Honeywell has estimated the number and types of vending machines based on our site tour. During the implementation phase, Honeywell will check with the vendor about the type and specification of the vending machines as it relates to any internal time clocks which may exist inside the machine. Should this be the case, the savings and cost will be adjusted accordingly.

Changes in Infrastructure

New vending machine controls will be installed as part of this ECM.

Customer Support and Coordination with Utilities

Minor coordination efforts will be needed to reduce or limit impact to building occupants.

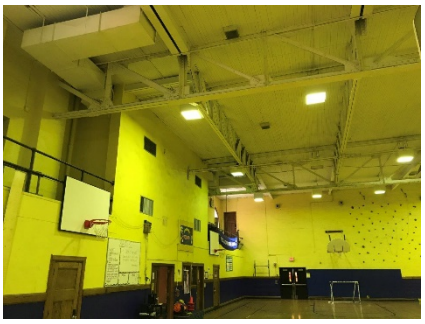
Environmental Issues

Resource Use	Energy savings will result from reduced electric energy usage.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

ECM 1D DE-STRATIFICATION FANS

The key benefits of this ECM include:

- **Improved efficiency and energy savings** through more equal distribution of conditioned air space.
- **Equipment longevity** due to lower utilization of equipment to condition air.
- **Increased comfort** of students and teachers.



ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
1D De-stratification Fans	●		●	●	●		●			●	●	●	●	●	●	

Existing Conditions

Warm air stratifies close to the ceiling in high ceiling areas such as in a gymnasium or auditorium. Elevated levels of heat transfer through the high walls and roof causes elevated heat loss.

Gym at Hillside

Gym at Buzz Aldrin

Examples of Spaces for Destratification Fans

Proposed Solution

In areas with 20+ foot ceiling heights, there is approximately a 15°F+ temperature difference between the floor and the ceiling. With higher ceilings, it is even greater. That means to generate the heat necessary to maintain a comfortable 70°F temperature at the floor level, where student activities occur, the ceiling could be 85°F or higher.

De-stratification fans even out the air temperature to a zero to 3°F differential from floor to ceiling and wall to wall. This will allow HVAC systems to run for a shorter duration because of the absence of extreme temperatures to heat or cool, thus allowing the local thermostats to be satisfied for longer periods of time.

Systems Evaluation and Selection

An energy-efficient motor drives a near-silent fan that forces a column of hotter air from the ceiling to the cooler floor below. As this column of warm air nears the floor, it begins to flare out in a circular pattern and rise again creating a torus. While doing so, it warms the cooler air and mixes with air near the floor, increasing the temperature and comfort of occupants. Through a natural law of physics, this torus will continue to re-circulate air, mixing warmer air from the ceiling with cooler air near the floor until the ceiling and air temperatures are nearly equal. As this happens, it will require less and less energy to comfortably heat the work area, allowing thermostats to be lowered and energy savings to be realized. Once started, the entire process of "thermal equalization" will take on average less than 24 hours.

Based on preliminary site investigation conducted by our staff, we propose to install the following as indicated in the table below:

School	Location	Qty	Type
Valley Road Complex	Hillside Gym	4	Air Pear S-25
Bradford Elementary School	Gym	2	Air Pear S-25
Bradford Elementary School	Stage	4	Air Pear S-25
Northeast Elementary School	Gym	2	Air Pear S-25
Northeast Elementary School	Stage	4	Air Pear S-25

George Inness Annex (HS-9th), Athletics	Gym 1	4	Air Pear A-25
George Inness Annex (HS-9th), Athletics	Gym 2	4	Air Pear A-25
Glenfield Middle School	Main Gym	6	Air Pear A-25
Glenfield Middle School	Small Gym	2	Air Pear A-25
Montclair High School	Main Gym	9	Air Pear A-25
Montclair High School	Small Gym	6	Air Pear A-25
Nishuane K-2	Gym	4	Air Pear A-25
Renaissance Middle School	Gym	2	Air Pear S-25
Watchung Elementary School	Gym	4	Air Pear S-25
Total		**71**	

Proposed De-Stratification Fans

Scope of Work

Per De-Stratification Fan:

- Shut off the main electric power to the area in which the unit(s) will be installed.
- Install new de-stratification fan and wiring.
- Re-energize.
- Inspect unit operation by performing electrical and harmonics testing.

Changes in Infrastructure

New de-stratification fans will be installed as part of this ECM.

Customer Support and Coordination with Utilities

Coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced thermal energy usage. A slight increase in electrical energy is resultant from the increase run time of the fan motors.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

ECM 1E PLUG LOAD MANAGEMENT VIA WIFI

The key benefits of this ECM include:

- **Energy Savings** by better managing the power consumption of electrical equipment.
- **Longer equipment life** thanks to reduced usage.

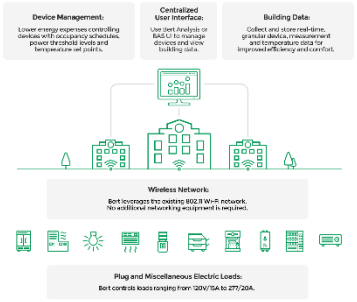
ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
1E Plug Load Management via Wi-Fi	●	●	●	●	●	●	●		●	●	●	●	●	●	●	●

Existing Conditions

The School District is equipped with a host of equipment and devices. A byproduct of the electronic devices such as printers, projectors, televisions, and window air conditioning units are their phantom load. Phantom load refers to energy that is used when a device is off. This includes energy used by TV's and copiers when they're in standby mode (i.e. when they can be turned on with a remote), and energy used by chargers or a laptop's AC adapter. Studies estimate that phantom load now accounts for 6% of all energy use. This measure will address energy waste due to phantom loads in your buildings.

Typical electrical draws for when devices are off are as follows:

Plug Load Management Applications



Device	Wattage
Projectors	21
Charging Cart	35
Printer/Copier	30
Smart Boards	20
Window ACs	100

Electrical Draw per Typical Device

Proposed Solution

Honeywell proposes to install plug load management devices to provide a comprehensive solution to the device control dilemma, by using an existing Wi-Fi network. This computer-based system is designed to allow you to program or control your devices with a customizable schedule. These plugs are a switch that stops all electrical power to the device, turning off equipment and eliminating phantom loads, and are a proven technology with a high degree of reliability and security.

The Plug Load Controller enables energy savings by controlling plug loads through occupancy or schedule-based on/off control of receptacles on a circuit. The device is paired with a sensor or a group of sensors in the network to enable occupancy-based control. The controller features two sets of wires to separately power controlled and uncontrolled outlets, so that energy consumption on both uncontrolled and controlled circuits are separately measured.

Energy Savings Methodology and Results

Installation of the devices will reduce the operating hours of the connected peripheral devices reducing electrical consumption.

Changes in Infrastructure

None.

Customer Support and Coordination

None.

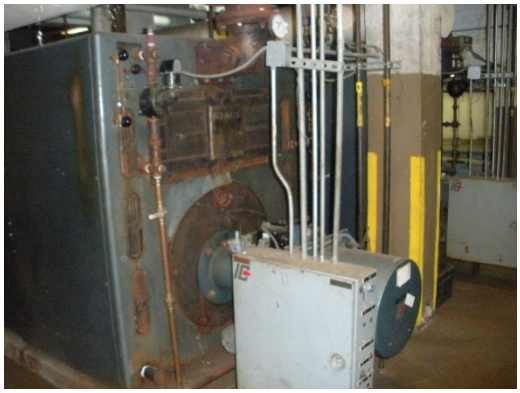
Environmental Issues

Resource Use	Annual savings for student computers is based wattage difference between the two monitor types.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

ECM 2A BOILER UPGRADE

The key benefits of this ECM include:

- **Reduced energy usage** from improved boiler efficiency thanks to replacement of older equipment.
- **Lower operational costs** through less frequent maintenance and operational issues.



ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2A Boiler Upgrade		●	●							●	●			●	●	

Existing Conditions

Some boilers in the District are near or past the end of their useful life and are not as efficient as new boilers. Some can be replaced with high-efficiency, condensing boilers.

Boilers at Buzz Aldrin

Boilers at George Inness Annex

Existing Boilers to be Replaced

Building	Location	Manufacturer	Model	Qty	Input (MBH)	Fuel
Bullock Elementary School	Boiler Room	Lochinvar	CHN2071	2	1,739	Natural Gas
Buzz Aldrin Middle School	Boiler Room	Weil McLain	2294	2	6,100	Natural Gas
George Inness Annex (HS-9th), Athletics	Boiler Room	Weil McLain	H1994-WS	2	5,230	Natural Gas
Montclair High School	Boiler Room	Cleaver-Brooks	CB800-100	1	3,347	Natural Gas
Montclair High School	Boiler Room	Cleaver-Brooks	CB800-200	1	6,695	Natural Gas
Montclair High School	Boiler Room	Weil McLain	H-988-WS	1	2,176	Natural Gas
Renaissance Middle School	Boiler Room	HB Smith	28-14	1	3,370	Natural Gas

Building	Location	Manufacturer	Model	Qty	Input (MBH)	Fuel
Watchung Elementary School	Boiler Room	Weil McLain	H-1188-WS	1	2,724	Natural Gas

Existing Boilers to be Replaced

Proposed Solution

It is recommended that the boilers listed in the table above be replaced with boilers operating at higher efficiency listed in table below. New condensing hot water boilers have thermal efficiencies that range from 88% – 95% depending on the return hot water temperature from the heating loop. With proper design, it is typical to see thermal efficiencies of around 92%. Thermal efficiency is only one part of the equation that makes up the seasonal efficiency of a boiler. Compared to the existing boilers in these schools, the new boilers will provide an increase in boiler efficiency of anywhere between 10% to 15%. Boilers which cannot be converted from steam will be replaced with new steam boilers, which will still operate at to 10% more efficient than the existing boilers.

New boiler sizes and quantities will be based on the heat load of the building with redundancy, take into account the existing system sizing and level of redundancy.

Building	Location	Manufacturer	Model	Qty	Input (MBH)	Fuel
Bullock Elementary School	Boiler Room	AERCO	BMK 1500	3	1,500	Natural Gas
Buzz Aldrin Middle School	Boiler Room	Weil McLain	2094	2	5,520	Natural Gas
George Inness Annex (HS-9th), Athletics	Boiler Room	Weil McLain	1894	2	4,940	Natural Gas
Montclair High School	Boiler Room	Smith	28HE-S-13	1	3,304	Natural Gas
Montclair High School	Boiler Room	Weil McLain	2494	1	6,680	Natural Gas
Montclair High School	Boiler Room	Smith	28HE-S-9	1	2,249	Natural Gas
Renaissance Middle School	Boiler Room	Smith	28HE-S-14	1	3,567	Natural Gas
Watchung Elementary School	Boiler Room	Smith	28HE-S-11	1	2,776	Natural Gas

Proposed Boiler Equipment

Scope of Work

The following outlines the boiler replacement:

- Disconnect gas back to shutoff valve and electric back to source panel-board.
- Remove existing boilers.
- Install new boilers.
- Connect gas and heating hot water appurtenances to new boilers.
- Terminate and power new boiler electric circuiting.
- Start up, commissioning, and operator training.

Energy Savings Methodology and Results

In general, Honeywell uses the following approach to determine savings for this specific measure:

Existing Boiler Efficiency	= Existing Heat Production/ Existing Fuel Input
Proposed Boiler Efficiency	= Proposed Heat Production/ Proposed Fuel Input
Energy Savings $	= Heating Production (Proposed Efficiency – Existing Efficiency)

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available. Honeywell and the customer will determine final selections.
Equipment Identification	As part of the ECM design and approval process, specific product selection will be provided for your review and approval.

Changes in Infrastructure

New boilers will be installed in itemized locations; in addition, training for maintenance personnel will be required, as well as on-going, annual preventive maintenance. New gas piping will need to be run from the new gas service/meter to the equipment.

O&M Impact

The new boilers will decrease the O&M cost for maintaining the boilers.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods. Continuity of service must be maintained for the customer.

Environmental Issues

Resource Use	Energy savings will result from greater combustion efficiency, reduced maintenance costs control and setback.
Waste Production	Existing boilers scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected; all regulations will be adhered to in accordance with EPA and local code requirements.

ECM 2A.1 VACUUM TANK REPLACEMENTS

The key benefits of this ECM include:

- **Reduced energy usage** from improved steam system efficiency thanks to replacement of older equipment.
- **Lower operational costs** through less frequent maintenance and operational issues.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2A.1 Vacuum Tank Replacements	●		●	●				●		●	●	●		●	●	

Existing Conditions

Some condensate vacuum tanks in the District are near or past the end of their useful life and lead to wasted energy due to heat loss from the steam condensate system. These older vacuum tanks will be replaced with new systems.

Existing Vacuum, Tanks to be Replaced

Building	Location	Qty
Bradford Elementary School	Boiler Room	1
Buzz Aldrin Middle School	Boiler Room	1
Edgemont Elementary School	Boiler Room	1
Central Heating Plant	Boiler Room	1
Montclair High School	Boiler Room	1
George Inness Annex (HS-9th), Athletics	Boiler Room	1
Nishuane K-2	Boiler Room	1

Building	Location	Qty
Renaissance Middle School	Boiler Room	1
Watchung Elementary School	Boiler Room	1

Existing Vacuum, Tanks to be Replaced

Proposed Solution

It is recommended that the vacuum tanks listed in the table above be replaced with new equipment. New vacuum tanks will reduce loss from the steam system and allow for lower operating steam pressures.

Scope of Work

The following outlines the vacuum tank replacement:

- Disconnect electrical and piping from existing vacuum tanks.
- Remove existing vacuum tanks.
- Install new vacuum tanks.
- Reconnect electrical and piping back to new vacuum tanks.
- Terminate and power new vacuum tank electric circuiting.
- Start up, commissioning, and operator training.

Energy Savings Methodology and Results

In general, Honeywell uses the following approach to determine savings for this specific measure:

Existing Heat Loss	= Annual Steam Production (lbm) * Existing Steam Enthalpy (Btu/lbm)
Proposed Heat Loss	= Annual Steam Production (lbm) * Proposed Steam Enthalpy (Btu/lbm)
Energy Savings $	= Existing Heat Loss – Proposed Heat Loss

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available. Honeywell and the customer will determine final selections.
Equipment Identification	As part of the ECM design and approval process, specific product selection will be provided for your review and approval.

Changes in Infrastructure

New vacuum tanks will be installed in itemized locations; in addition, training for maintenance personnel will be required, as well as on-going, annual preventive maintenance.

O&M Impact

The new vacuum tanks will decrease the O&M cost for maintaining the vacuum tanks.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods. Continuity of service must be maintained for the customer.

Environmental Issues

Resource Use	Energy savings will result from reduced steam system heat loss, and reduced maintenance costs control.
Waste Production	Existing vacuum tanks scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected; all regulations will be adhered to in accordance with EPA and local code requirements.

ECM 2B BOILER BURNER REPLACEMENT & CONTROLS

The key benefits of this ECM include:

- **Reduced energy usage** from improved boiler efficiency thanks to replacement of older burner controls.
- **Lower operational costs** through less frequent maintenance and operational issues.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2B Boiler Burner Replacement & Controls	●			●				●				●	●	●	●	

Existing Conditions

Honeywell observed that the existing boiler burners have limited fuel / air ratio controls in place, which reduces your ability to optimize combustion efficiency and system reliability. The below table indicates which systems Honeywell recommends installation of new advanced combustion controls to decrease costs and increase efficiency. In cases where burners cannot be retrofit with controls, new burners will be installed.

Building	Manufacturer	Model	Output (MBH Each)	Type	Qty	Fuel	Replace Burner
Bradford Elementary School	Weil McLain	988	2,274	Steam	2	Natural Gas	Y
Edgemont Elementary School	Smith	28A-13	2,867	Steam	2	Natural Gas	Y
Nishuane K-2	HB Smith	M450L-20	4,720	Steam	2	Natural Gas	N
Northeast Elementary School	HB Smith	28-14	3,194	Steam	2	Natural Gas	Y

Watchung Elementary School	Weil McLain	H-1188-WS	2,724	Steam	1	Natural Gas	Y

Existing Boilers for Burner Controls & Replacements

Existing Burners without Advanced Combustion Controls

Proposed Solution

Typically, boilers are sized to accommodate the coldest days (approximately 5% of the year). During these periods of maximum demand, the burner is constantly on and operating at maximum capacity. The burner cycles on and off, maintaining temperature or pressure in the boiler. It is during these periods of lesser demand, that the controller will monitor the boiler make up rate, and efficiently manage the firing of the boiler.

The length of the burner's off-cycle is the best measure of total heating demand or load. In other words, the load is directly related to the time it takes for water (or steam) in the boiler to drop from its high-limit temperature (or pressure) to its low-limit or "call" setting. When demand is high, these off-cycles are short, and the on-cycles are longer. When demand is lower, off-cycles are longer, and on-cycles are reduced.

The device, which is a microprocessor-based computer, constantly monitors the demand on the boiler by assimilating all factors affecting a building's heating requirements, including occupancy, climate, wind chill, solar gain, type of building, and many others.

Proposed Systems and Scope of Work

Honeywell will replace the burners on the boilers listed above with new, natural gas-fired burners, utilizing advanced controls.

Honeywell SLATE™

Honeywell SLATE™ will integrate to the existing Burner Management Flame Safe Guard Controller (FSG) to monitor and control the burner fuel and air ratios to maintain proper combustion. The single actuator will be replaced with separate Direct Coupled Actuators (DCA) for air and fuel(s) and will be connected to the existing burner control.

This upgrade will provide a combustion curve and light-off points including minimum/maximum firing rate points resulting in a precise firing rate control over the

entire firing rate of the burner. Combustion efficiency will be maximized throughout the combustion curve and will provide a fuel curve to achieve maximum efficiency.

Modulating Burner Control

The Modulating Burners integrates flame safeguard control, fuel-air ratio control, O_2 Trim, VFD control, and proportional integral derivative (pID) control into a single, integrated, user-friendly system.
The features integrated into the burner provide energy savings, reduced emissions, reduced installation costs and enhanced safety.

Fuel Metering

- Reduced fuel use.
- Increased burner efficiency.
- Greenhouse gas emissions reduction.

Easy Access Panels

- Totla access to components.
- Easy Maintenance.

Graphic Burner Management System

- Graphic annunciation of critical burner functions.

Scope of Work

The following outlines the boiler burner controls and replacements:

- Install new burner controls on existing burner (where applicable)
- Remove existing boiler burners (where applicable).
- Install new boiler burners (where applicable)
- Start up, commissioning and operator training.

Energy Savings Methodology and Results

In general, Honeywell uses the following approach to determine savings for this specific measure:

Existing Boiler Efficiency	= Existing Heat Production/ Existing Fuel Input
Proposed Boiler Efficiency	= Proposed Heat Production/ Proposed Fuel Input
Energy Savings $	= Heating Production (Proposed Efficiency – Existing Efficiency)

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available. Honeywell and the customer will determine final selections.
Equipment Identification	As part of the ECM design and approval process, specific product selection will be provided for your review and approval.

Changes in Infrastructure

New combustion controls (and new burners, where applicable) will be installed and programmed in the locations listed above; in addition, training for maintenance personnel will be required as well as on-going, annual preventive maintenance.

O&M Impact

The new boiler controls will decrease the O&M cost for maintaining the boilers.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods. Continuity of service must be maintained for the customer.

Environmental Issues

Resource Use	Energy savings will result from greater boiler load control, reduced maintenance costs control and setback.
Waste Production	Existing boiler burners scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected; all regulations will be adhered to in accordance with EPA and local code requirements.

ECM 2C DOMESTIC HOT WATER HEATER REPLACEMENT

The key benefits of this ECM include:

- **Reduced energy usage** from improved efficiency thanks to replacement of older equipment.
- **Lower operational costs** through less frequent maintenance and operational issues.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2C DHW Heater Replacement		●		●			●				●	●	●			

Existing Conditions

The existing domestic hot water heaters are generally in good condition but are not high-efficiency units.

Water Heater at Bullock

Water Heater at Edgemont

Hillside Elementary School	1	AO Smith	BTR 199 118	199	81	Natural Gas

Existing Domestic Hot Water Heater Equipment

Proposed Solution

Honeywell proposes replacing the existing DHW heaters at the above locations with highly efficient condensing DHW heaters. New condensing DHW heaters have efficiencies between 97% - 98%. They provide better control with capabilities as night setback, temperature adjustments and demand control hot water.

Building	Qty	Manufacturer	Model	Capacity MBH	Storage (Gal)	Fuel
Bullock Elementary School	2	AO Smith	BTH-199(A)	199	100	Natural Gas

Hillside Elementary School	1	AO Smith	BTH-199(A)	199	100	Natural Gas

Proposed Domestic Hot Water Heater Equipment

Scope of Work

The following outlines the domestic hot water heater replacement:

- Demolish and remove old water heaters.
- Furnish and install condensing gas fired domestic hot water heaters as specified in the table above.
- Install all required piping, controls, and breeching as needed.
- Install mixing valve.
- Install circulators where needed for building use and kitchen supply.
- Test and commission.

Energy Savings Methodology and Results

The savings are calculated from the domestic hot water heater efficiency differences.

Existing Equipment Efficiency	= Existing Boiler Efficiency + Existing Heat Exchanger Efficiency
Proposed Equipment Efficiency	= Efficiency of the New Domestic Hot Water Heater
Energy Savings	= DHW Load x (Existing Equipment Efficiency – New Equipment Efficiency)

Changes in Infrastructure

A new controller for each DHW heater will be installed and programmed. In addition to the controllers, training for maintenance personnel will be required.

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available.
Equipment Identification	As part of the measure design and approval process, specific product selection will be provided for your review and approval.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from improved thermal efficiency.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

Utility Interruptions

Proper phasing procedures will minimize gas interruptions.

ECM 2D ROOFTOP UNIT REPLACEMENT (DI)

The key benefits of this ECM include:

- **Reduced energy usage** from improved efficiency thanks to replacement of older equipment.
- **Lower operational costs** through less frequent maintenance and operational issues.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2D RTU Replacement (DI)	●									●	●		●			●

Existing Conditions

Some Rooftop Units (RTUs) serving the locations marked below are inefficient or past their useful lives. Replacing these units with new, high efficiency units will save energy costs over the long term while reducing repair costs that would otherwise have been necessary to keep the old RTUs in operation.

Existing Rooftop Units to be Replaced

Building	Make	Model	Location Served	Tons	Qty.
Bradford Elementary School	AAON	RK-40	New Wing	40.3	1
Bradford Elementary School	AAON	RM-13	New Wing Library	13.2	1

Northeast Elementary School	Carrier	48HJF008	Hallway	7.5	1
Woodman Field	Carrier	48PGDC24	Fieldhouse	20.0	1

Existing Rooftop Units to be Replaced

Proposed Solution

Honeywell proposes replacing the existing rooftop units in the above Table. The new units will be installed in the same location as the existing units. Existing electrical power supply will be reconnected to the new motors. The new units will be equipped with factory-installed microprocessor controls that improve unit efficiency. The units will also communicate with the building management system.

Building	Make	Model	Location Served	Tons	Qty.
Bradford Elementary School	TRANE	OANG040A	New Wing	40.0	1
Bradford Elementary School	York	ZJ150C00B4 *1EAA1A	New Wing Library	12.5	1
George Inness Annex (HS-9th), Athletics	York	ZJ180N40B4 A1EAA1A	600B & 602	15	2
Montclair High School	TRANE	4YCY50241	Science Office	1.5	1
Northeast Elementary School	Carrier	48HCED14B 1A5-0*0G0	Media Center	12.5	1

Northeast Elementary School	Carrier	48HCED09B 1A5-0*0G	Hallway	8.5	1
Northeast Elementary School	Carrier	48HCED08B 1A5-0*0G	Hallway	7.5	1
Woodman Field	Carrier	48HCDD24B 1A5-0*0G0	Fieldhouse	20.0	1

Proposed Rooftop Units

Scope of Work

The following outlines the scope of work to install the rooftop units stated in the above table:

- Disconnect existing RTU electric connections.
- Disconnect piping and air ducts from the unit.
- Remove unit from the base.
- Modify base for new unit if necessary.
- Rig and set new unit at the base.
- Inspect piping and air ducts before reconnecting them to the unit.
- Reconnect piping and air ducts.
- Repair duct and piping insulation.
- Connect electric power.
- Start up and commissioning of new unit.
- Maintenance operator(s) training.

Energy Savings Methodology and Results

The savings approach is based on the energy efficiency between the existing and new units. The savings are generally calculated as:

Electric Energy savings	Existing unit energy consumption (kWh) – replacement unit energy consumption (kWh)

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available. Honeywell and the customer will determine final selections.
Equipment Identification	Product cut sheets and specifications are available upon request. As part of the measure, design, and approval process, specific product selection will be provided for your review and approval.

Customer Support and Coordination with Utilities

Coordination of the electrical tie-in will be required.

Environmental Issues

Resource Use	Energy savings will result from higher efficiency units.
Waste Production	Existing unit scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 2E KITCHEN HOOD CONTROLS

The key benefits of this ECM include:

- **Reduced energy usage** from improved equipment control and reduced exhaust of conditioned air.
- **Lower operational costs** through less frequent maintenance and operational issues.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2E Kitchen Hood Controls	●	●		●	●		●			●	●	●	●			●

Existing Conditions

Honeywell observed that the kitchens utilizes a constant volume kitchen exhaust hood system. This system operates at full load, even when there is no activity in the kitchen. It also requires operating the exhaust fan at full load. This wastes both fan energy and heating energy. When the hood is not utilized, an opportunity exists to reduce airflow and conserve energy.

Kitchen Hood at High School

Kitchen Hood at Bullock

Proposed Solution

Honeywell recommends installing a microprocessor-based controls system whose sensors automatically regulate fan speed based on cooking load, time of day and hood temperature while minimizing energy usage. The system includes a temperature sensor installed in the hood exhaust collar, IP sensors on the ends of the hood that detect the presence of smoke or cooking effluent and VFD that control the speed of the fans. This will result in energy and cost savings, noise reduction, longer equipment life and reduction in cleaning costs.

Building	Kitchen Hood Area (sq. ft.)
Hillside Elementary School	60
Bradford Elementary School	16
Bullock Elementary School	96
Edgemont Elementary School	16
George Inness Annex (HS-9th), Athletics	32
Glenfield Middle School	25
Montclair High School	160
Nishuane K-2	16
Northeast Elementary School	16
Woodman Field	16

Existing Kitchen Hoods to receive Controls

Scope of Work

- Install a temperature sensor in the hood to monitor temperature of the exhaust gas
- Install a set of two photo sensors on the sides to monitor smoke density across the hood
- Install a control panel with a small point controller and a set of relays in the kitchen close to the hood
- Provide electric wiring from the new panel to the sensors, exhaust fan motor as well as to the closest electric panel for power supply
- Provide connection to the BMS system for remote monitoring, control, and alarming. This system could also be stand-alone to save on cost.
- Commission control components and sequences and calibrate control loops.

Sequence of operation will enable the exhaust fans when either temperature or smoke density in the range hoods is above a pre-set value. Time delays between start and stop will be programmed to prevent motor short cycling. Schedule programming could be implemented as well.

Energy Savings Methodology and Results

The savings approach is based upon reducing the amount of conditioned air that is being exhausted when there is no cooking taking place.

Changes in Infrastructure

There will be improvements in HVAC equipment and controls for not operating fans continuously.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from reduced energy.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 2F WALK-IN COMPRESSOR CONTROLS

The key benefits of this ECM include:

- **Energy savings** from reducing equipment runtime.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.
- **Operational savings** from less frequent need to repair or replace equipment thanks to less frequent equipment use.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2F Walk-In Compressor Controls		●								●	●					

Existing Conditions

In many refrigeration, walk-in freezers and coolers, the compressor is oversized and cycles on/off frequently. This compressor cycling results in higher energy consumption and may reduce the life of the compressor.

Walk-In at Bullock

Walk-In at High School

Building	Location	Walk-In Refrigerators	Walk-In Freezers
Bullock Elementary School	Kitchen	1	-
Bullock Elementary School	Kitchen	-	1
George Inness Annex	Kitchen	1	-
George Inness Annex	Kitchen	-	1
Montclair High School	Kitchen	1	-

Building	Location	Walk-In Refrigerators	Walk-In Freezers
Montclair High School	Kitchen	-	1

Existing Walk-In Refrigerator/Freezers to receive Controls

Proposed Solution

Honeywell will install a controller manufactured by Intellidyne at the above-mentioned buildings to reduce the compressor cycles of the kitchen walk-in coolers and freezers. The installation of this ECM will have no negative impact on system operation or freezing of food products. By reducing the cycling, the sensor will improve operating efficiency and reduce the electric consumption by 10% to 20%.

This control enhancement will save energy through the reduced compressor cycling in the kitchen walk-in coolers and freezers and will extend the operating life of the compressor. Consequently, the compressor will not have to be replaced as often.

Intellidyne Sensor Features

- Automatic restart on power failure.
- Surge protection incorporated into circuitry.
- Fully compatible with all energy management systems.
- UL listed.
- Maintenance free.

Intellidyne Sensor Benefits

- Patented process reduces air conditioning electric consumption typically 10% to 20%.
- Increased savings without replacing or upgrading costly system components.
- “State-of-the-art” microcomputer controller – LED indicators show operating modes.
- Protects compressor against momentary power outages and short cycling.
- Simple 15-minute installation by qualified installer.
- No programming or follow-up visits required.
- Maximum year-round efficiency.
- Reduces maintenance and extends compressor life.
- Fail-safe operation.
- Guaranteed to save energy.
- UL listed, “Energy Management Equipment”.

Intellidyne’s patented process determines the cooling demand and thermal characteristics of the entire air conditioning system by analyzing the compressor’s cycle pattern, and dynamically modifies that cycle pattern to provide the required amount of cooling in the most efficient manner. This is accomplished in real-time by delaying the start of the next compressor “on” cycle, by an amount determined by the cooling demand analysis. These new patterns also result in less frequent and more efficient compressor cycles.

Energy Savings Methodology and Results

The energy savings for this ECM is realized by the reduction in run time of the compressors and fan motors in the freezers/refrigerators.

Changes in Infrastructure

None.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from the reduced electrical consumption of the compressor.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 2G PREMIUM EFFICIENCY MOTORS AND VFDS

The key benefits of this ECM include:

- **Energy savings** from reduced run hours and reduced motor speeds.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization and reduced startup wear.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2G Premium Efficiency Motors and VFDs								●		●	●					

ECM Overview

Variable Frequency Drives (VFDs) allow motors to run at specified speeds rather than just on or off while allowing systems to more accurately move heat. Honeywell recommends this ECM due to the significant savings potential given the relationship between energy consumption and motor speed.

Examples of existing motors

Existing Conditions

Honeywell has identified standard efficiency electric motors on several pumps. Energy savings can be obtained by replacing the standard efficiency motors with premium efficiency motors as well as by installing VFDs on systems that have two-way control valves.

The motors that were identified in the buildings are listed as follows:

Building	Equipment Description	Qty	Motor HP	Replace Motor Y/N	Add VFD Y/N
George Inness Annex (HS-9th), Athletics	Chilled Water Pump	2	5.0	Y	Y
George Inness Annex (HS-9th), Athletics	Chilled Water Pump	2	10.0	Y	Y
Montclair High School	Heating Hot Water Pump	3	5.0	Y	Y
Montclair High School	Boiler Feed Water Pump	2	1.5	Y	Y
Montclair High School	Heating Hot Water Pump	1	3.0	Y	Y
Central Heating Plant	Combustion Fan	2	7.5	Y	Y
Montclair High School	Combustion Fan	1	10.0	Y	Y

Existing Motors

Proposed Solution

Honeywell observed that several motors and pumps that are sized to meet peak heating or cooling conditions. However, we've learned that most operating hours occur during conditions that require less than peak loads.

Honeywell proposes replacement of all above-mentioned single speed standard efficiency motors (that do not have VFDs) with new premium efficiency motors, installing new couplings where applicable. In addition, Honeywell recommends installing VFDs on these pumps. Energy used by the motor can be reduced by varying the flow in response to varying loads in the space. Motor speed may be controlled either based on the pressure in the distribution system or based on time of day.

Honeywell recommends fitting unit ventilators with two-way valves (provided that unit ventilators located at end of piping branches are fitted with three-way valves to keep hot water moving through the distribution piping at all times).

Honeywell also recommends installing VFDs on the heating hot water pumps and chilled water pumps to better match pumping output to system requirements and reduce energy waste. Each motor will be equipped with new selector relays that will allow one drive to operate per pump with the VFD drive. Honeywell also recommends installation of new differential pressure sensors and tying them to the control system to allow you to regulate the speed of the pump per load requirements. Lastly, we recommend installation of VFDs on the cooling system pump motors that have higher horsepower. VFDs will maintain temperatures in the unit by adjusting the speed of both the motor and the pump and can be connected to your BMS.

Energy Savings Methodology and Results

The energy consumed by electric motors varies inversely with the cube of the motor speed. Variable frequency drives reduce motor speed (in response to load) thus reducing energy consumption exponentially.

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available.
Equipment Identification	Product cut sheets and specifications for generally used are available upon request. As part of the measure, design, and approval process, specific product selection will be provided for your review and approval.

Changes in Infrastructure

New motors will be installed in place of the old motors. No expansion of the facilities will be necessary.

Customer Support and Coordination with Utilities

Coordination of the electrical tie-in will also be required.

Environmental Issues

Resource Use	Energy savings will result from reducing electrical usage by operating higher efficiency motors for the same horsepower output. The equipment uses no other resources.
Waste Production	This measure will produce waste byproducts. Old motors shall be disposed of in accordance with all federal, state, and local codes.
Environmental Regulations	No environmental impact is expected.

ECM 2H PIPING INSULATION

The key benefits of this ECM include:

- **Energy savings** from reducing heat losses from uninsulated pipes.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2H Piping Insulation	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●

Existing Conditions

Heat losses result from uninsulated hot piping giving off heat to the space around it. This measure will insulate these surfaces, resulting in energy savings and improved comfort of those areas in or near occupied spaces.

During the site visits, it was noted that some hot water piping and valves were not insulated. The un-insulated piping and valves waste energy and also pose a danger of getting injured with exposed hot piping. In addition, the boiler has to work harder to make up for the wasted energy.

Examples of Uninsulated Piping

Proposed Solution

Honeywell proposes insulating these pipes and valves with appropriately sized fiberglass insulation. The following table lists the recommended insulation thickness.

Building	Pipe Size (in.)													
	12+	10	8	6	5	4	3	2.5	2	1.5	1	0.75	0.5	Traps/Fittings/Etc.
Bradford Elementary School						35.0	50.0		75.0	-	180.0			
Bullock Elementary School						-	-	-	-	-	-	-		-
Buzz Aldrin Middle School						27.0	26.0		218.0	-	80.5	75.0		
Edgemont Elementary School						48.0		133.0		80.0	298.0	249.0	-	
Glenfield Middle School						6.0			35.0	64.0	4.0			51
Valley Road Complex			1.0		145.0	96.0	498.5	152.5	149.5	1,343.0	739.0	181.5	37.0	1,056
Montclair High School	2.0	10.0	2.0	5.0		11.0	149.5	56.5	64.0	673.5	81.5	64.0	1.0	592
George Inness Annex (HS-9th), Athletics									168.0	80.0	113.5	102.0		
Nishuane K-2						3.0	42.0		83.0		65.0	27.0		
Northeast Elementary School						13.0		52.0	64.0		77.0	29.0		
Renaissance Middle School						26.0			76.0	45.0	134.0	2.0		
Watchung Elementary School						12.0	9.0			69.0	158.0	55.0		
Woodman Field								15.5		116.0	5.0	14.5		

Uninsulated Pipe Sizes

Energy Savings Methodology and Results

Energy savings results from significantly reducing the heat lost to the atmosphere from the piping and valve surfaces. In general, Honeywell uses the following approach to determine savings for this specific measure:

Energy Savings $	= ((Heat Loss Rate per foot of Uninsulated Pipe – Heat Loss Rate per foot of Insulated Pipe) x (Length of Pipe x Hours of Operation) x Cost/btu)/(Boiler Efficiency))

Reference is made to the ASHRAE 1989 Fundamentals text page 22.19, Table 9A “Heat Loss from Bare Steel Pipe to Still Air at 80 degrees F, Btu/hr-ft” for losses from un-insulated lines, and Table 11 “Recommended Thickness for Pipe and Equipment Insulation”.

Changes in Infrastructure

The insulation of hot piping can happen anytime without impact on building operation. In areas were asbestos is present; precautions will be required. Areas that are dangerously hot may require coordination with a normally occurring shutdown of that portion of the system.

Customer Support and Coordination with Utilities

The service to the specific lines may require interruption to allow for the repair or replacement. Coordination with site personnel will be required to minimize interruption to the buildings affected.

Environmental Issues

Resource Use	Energy savings will result from higher efficiency units.
Waste Production	Any waste generated will be properly disposed of.
Environmental Regulations	No environmental impact is expected.

ECM 2I SPLIT SYSTEM REPLACEMENTS

The key benefits of this ECM include:

- **Energy Savings** from increased equipment efficiency.
- **Equipment Longevity** due to more efficient and less wasteful equipment utilization.
- **Operational Savings** from less frequent need to repair or replace key HVAC equipment thanks to less frequent equipment use.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2I Split System Replacements					●		●			●	●		●			

Existing Conditions

Honeywell identified some condensing units as being inefficient and having exceeded their useful service life. Replacing these units with new, high efficiency units will save energy costs over the long term, while reducing repair costs that would otherwise have been necessary to keep the old units in operation.

Split System Condensing Units

Building	Make	Model	Qty.	Tons

Existing Split System Units to be Replaced

Proposed Solution

Honeywell proposes replacing the existing condensing units in the table above. The new units will be installed in the same location as the existing units. Existing electrical power supply will be reconnected to the new motors. The new units will be equipped with factory-installed microprocessor controls that improve unit efficiency. The units will also communicate with the existing or enhanced building management system.

Building	Make	Model	Qty.	Tons
George Inness Annex	Mitsubishi	PUZ-A12NKA7	1	1.0

Northeast Elementary School	TRANE	4TTR7024	4	2.0
Northeast Elementary School	TRANE	4TTA7036	2	3.0
Hillside Elementary School	TRANE	4TTR6018	1	1.5

Proposed Split Systems

Scope of Work

The following outlines the scope of work to install the condensing units listed in the Proposed System table above.

- Disconnect existing electric connections.
- Disconnect piping from the unit.
- Remove unit from the base.
- Modify base for new unit if necessary.
- Rig and set new unit at the base.
- Inspect piping and air ducts before reconnecting them to the unit.
- Reconnect piping and air ducts.
- Repair duct and piping insulation.

- Connect electric power.
- Start up and commissioning of new unit.
- Maintenance operator(s) training.

Energy Savings Methodology and Results

The savings approach is based on the energy efficiency between the existing and new units. The savings are generally calculated as:

Electric Energy savings	Existing unit energy consumption (kWh) – replacement unit energy consumption (kWh)

Equipment Information

Manufacturer and Type	Several quality and cost-effective manufacturers are available. Honeywell and the customer will determine final selections.
Equipment Identification	Product cut sheets and specifications are available upon request. As part of the measure, design, and approval process, specific product selection will be provided for your review and approval.

Customer Support and Coordination with Utilities

Coordination of the electrical tie-in will be required.

Environmental Issues

Resource Use	Energy savings will result from higher efficiency units.
Waste Production	Existing rooftop unit scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 2J STEAM TRAP RETROFITS

The key benefits of this ECM include:

- **Energy Savings** from reducing heating losses caused by old, inefficient steam traps that will be retrofitted
- **Equipment Longevity** due to more efficient and less wasteful equipment utilization.
- **Operational Savings** from less frequent need to repair or replace key heating equipment thanks to less frequent equipment use.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2J Steam Trap Retrofits	●		●	●		●	●	●	●	●	●	●	●	●	●	●

Existing Conditions

When steam heats the building and transfers heat throughout the building, it condenses back to water. The condensate must be trapped and sent back to the boiler. When steam traps fail, the steam does not condense, which reduces the heat transfer, causing unnecessary heat losses. The repair or replacement of the steam traps will reduce unnecessary losses.

Traps are designed to drain only the condensate, and prevent live steam from entering the condensate return piping.As the distribution system ages, the moving parts in the trap tend to get sluggish or fail altogether. This failure results in live steam entering the condensate return piping. The cumulative effect of this is to return the condensate above the flash point, resulting in steam and hence valuable heating energy loss at the boiler. This loss of energy can be minimized by a thorough survey to identify leaking traps by use of infrared temperature sensing instruments.

Existing Steam Traps

Proposed Solution

Honeywell recommends retrofitting the traps per the following scope of work. The steam trap retrofit includes surveying all the existing steam traps and engineering appropriate replacements. During construction, Honeywell will provide all materials, fittings, labor and supervision for the timely completion of the project. All existing strainers, isolation valves, check valves, and fittings in good repair will be reused.

Energy Savings Methodology and Results

All mechanical steam traps lose some live steam, either through normal cycling, leaking through a closed trap, or failing in the open position. Various sources have stated that the loss through a properly operational trap may exceed ten lbs./hour, while the failed steam trap population ranges between 20-50% at any given time.

We have estimated the steam losses based on a conservative figure of 20% leaking. Failure rates are based on sample testing of the steam trap population. In determining steam losses, the trap orifices and steam pressures have been grouped and averaged to create a simpler statistical basis

Equipment Information

Material and Type	Steam Trap selection will be determined in conjunction with District
Material Identification	Specific material selection will be provided for your review and approval.

Customer Support and Coordination with Utilities

Coordination of the trap installation.

Environmental Issues

Resource Use	Energy savings will result the reduction of steam loss from malfunctioning traps resulting in lower fuel consumption. The equipment uses no other resources.
Waste Production	Existing steam traps scheduled for removal will be disposed of properly.
Environmental Regulations	Asbestos abatement may be required

ECM 2K AIR HANDLING UNIT REFURBISHMENTS

The key benefits of this ECM include:

- **Improved efficiency and energy savings** from better heat transfer and reduced fan operation.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.
- **Operational savings** from less frequent equipment repairs and replacements.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
2K Air Handling Unit Refurbishments					●											

Existing Conditions

Some of the existing AHUs observed are aging and no longer operating efficiently. Even with regular maintenance and repairs, the motors, fans, and coils within the units run less efficiently than when they were new, leading to higher energy usage and increased frequency of maintenance issues.

Typical Air Handling Units

Proposed Solution

Honeywell proposes to refurbish the units in the table below by replacing their internal components, namely the fans, motors, and coils. Existing electrical power supply will be reconnected to the new motors. Where possible, the units will incorporate variable speed drives (VFDs) on the motors to allow them to operate in a Variable Air Volume mode, instead Constant Volume. This will lead to reduced heating and cooling energy expended. The units will also communicate with the existing or enhanced building management system.

Building	Quantity	Area Serving
Glenfield Middle School	2	Halls
Glenfield Middle School	1	Gym

Proposed Air Handling Units to be refurbished

Scope of Work

The following outlines the scope of work to refurbish the air handling units stated in the above table:

- Disconnect existing electric connections.
- Disconnect piping from the unit.
- Replace fans, motors, and coilers, where applicable
- Inspect piping and air ducts before reconnecting them to the unit.
- Reconnect piping and air ducts.
- Repair duct and piping insulation.
- Connect electric power.
- Start up and commissioning of refurbished unit.
- Maintenance operator(s) training.

Energy Savings Methodology and Results

The savings approach is based on the energy efficiency between the existing and new units. The savings are generally calculated as:

Electric and Thermal Energy Savings	Existing unit energy consumption (kWh) and (therms) – refurbished unit energy consumption (kWh) and (therms).

Equipment Information

Manufacturer and Type	Honeywell and the Customer will determine final selections.
Equipment Identification	Product cut sheets and specifications are available upon request. As part of the measure, design, and approval process, specific product selection will be provided for your review and approval.

Customer Support and Coordination with Utilities

Coordination of the installation and electrical tie-in will be required.

Environmental Issues

Resource Use	Energy savings will result from higher efficiency operation.
Waste Production	Existing fans, motors, and coils scheduled for removal will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 3A BUILDING MANAGEMENT CONTROL SYSTEMS

The key benefits of this ECM include:

- **Operational efficiency** thanks to better control and system wide visibility.
- **Energy savings** from reducing total energy consumption with more efficient, state of the art technology.
- **Occupancy comfort and productivity** by way of enhanced temperature and humidity control throughout your buildings.

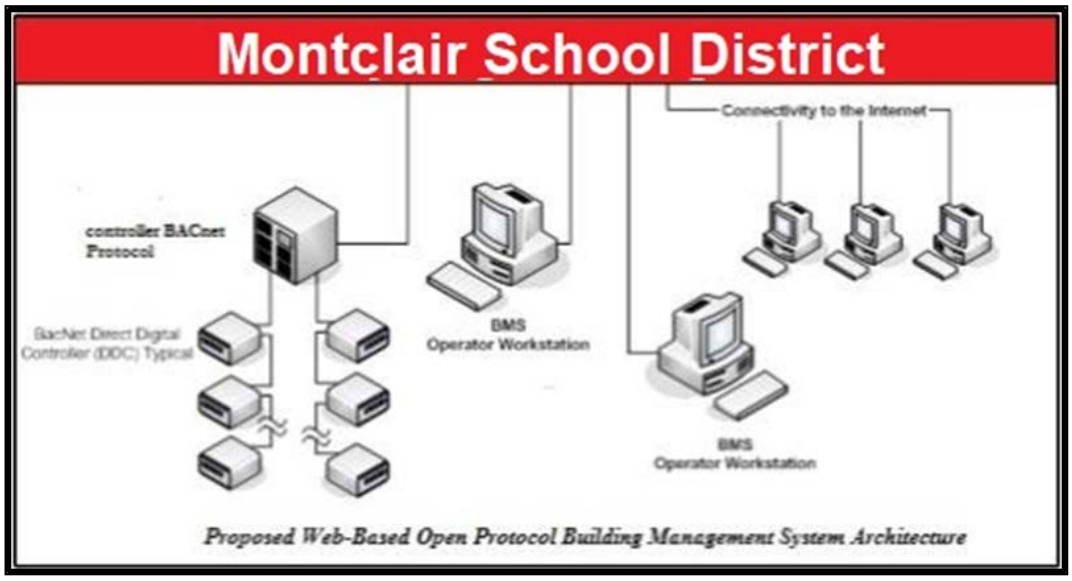
3A Building Management Control Systems	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●

Existing Condition

Honeywell assessed the existing building management systems (BMS) of Montclair School District. Upon inspection, it was noted that some of the buildings have either Automated Logic BMS, Allerton controls, Honeywell Niagara Tridium controls or no controls. The buildings without any controls use time-clock or manual breakers to turn on and turn off their equipment. Many the building's field devices such as damper actuators or valve actuators are pneumatically operated.



Existing Controls Components

The schools are currently equipped with approximately 40% of DDC controls. These DDC controls are remotely monitored and operated by Energy for America (EFA). The district has a steam plant that provide steam to the BOE building, Hillside school, and the Pre-K DLC building. George Inness building is the only building that uses a chilled water system. Most of the buildings have steam boilers and others

have hot water boilers. Each building has a combination of RTUs, AHUs, and split AC, Fan Coils, and exhaust fans.

Proposed Conditions

Honeywell proposes to establish a web-enabled BMS for Montclair School District that will utilize the latest technology in building automation. The BMS shall communicate over the School District local area network (LAN) via the industry standard BACnet open protocol. Existing vintage DDC and electronic HVAC controls shall be upgraded to the latest Honeywell BACnet direct digital controllers. Honeywell proposes to replace the pneumatic field devices with electro-mechanicals devices to maximize the energy savings. In addition, three dimensional (3-D) graphical representations of all connected heating, ventilating and air conditioning equipment shall be provided to allow for intuitive control, monitoring, and scheduling of all systems. Operators shall be capable of system control and/or monitoring from any local computer or smart devices via a standard internet connection. Honeywell BMS control suite provides and delivers smarter buildings and enterprise systems through the integration of things. The Result? Improved business efficiency, greater control, and faster decision making.

Typical Local BMS network Topology

Operational and Maintenance Impact

Upgrading and consolidating all HVAC controls under one system will result in the following benefits to Montclair School District.

1. Minimize time for the maintenance department to troubleshoot problems by allowing operators to investigate and resolve facility issues at any computer connected either locally or remotely (from home) to the IT network.
2. Ensure a comfortable and productive learning environment for patrons and staff by improving the HVAC controls through technology enhancements and repairs.
3. Minimize unexpected disruptions to the buildings by notifying operators of problematic and/or inefficient system operation prior to irrevocable equipment failures.

4. Eliminate unnecessary energy consumption by individually scheduling equipment operation based on real-time space occupancy status, holiday and summer schedules.
5. Reduce building heating, ventilating and air conditioning repair costs by providing operators with direct access to information used in the troubleshooting process.
6. Identify opportunities for improvement and prioritize repairs based on energy benchmarking data available through advanced reporting and trending capabilities.
7. Mobile access to approve personnel on and off campus to the systems.
8. The elimination of Operating Costs Associated with outside monitoring services required to operating the buildings.

Potential Application and Control Programs with BMS Upgrades

Outcome Based Analytics

Outcome Based Analytics is Honeywell's smart big data solution, helping you to save money through better decision making and improve the quality of life for those who learn and work inside the building. With the power to digitize the way mechanical services are carried out, Outcome Based Analytics provides facilities managers and other key stakeholders with a better view of their building health and reduces total cost of ownership through significant savings on capital expenditure and operating expenses. Outcome Based Analytics is an option that is available for the district as part of an overall BMS strategy and platform.

Night Setback & Setup

Design and implementation of a more aggressive setback and setup schedule will help to further eliminate energy waste in each of your buildings by utilizing an optimal start/stop schedule.

Set Point Optimization

Honeywell will help deliver temperature uniformity by calibrating thermostats to the same set point, thereby achieving optimum comfort for your occupants by reducing the occurrence of hot and cold spots. We will also help you to reduce energy waste caused when adjacent areas cause your systems to overcompensate due to running in different operating modes.

Heating/Cooling Mode Selection

A modern, state of the art building management system can make real time decisions about the heating and cooling needs of any of your buildings. Honeywell will help you establish optimal system configurations to ensure that your buildings are always in optimal settings to deliver a more comfortable space and reduce energy waste.

Optimal Start/Stop

Honeywell understands that equipment start times are typically set to run earlier than normal to ensure optimal comfort is maintained during hot and cold weather seasons. We will work with staff to ensure that optimal start and stop features are fully utilized to optimize occupancy comfort and eliminate energy waste.

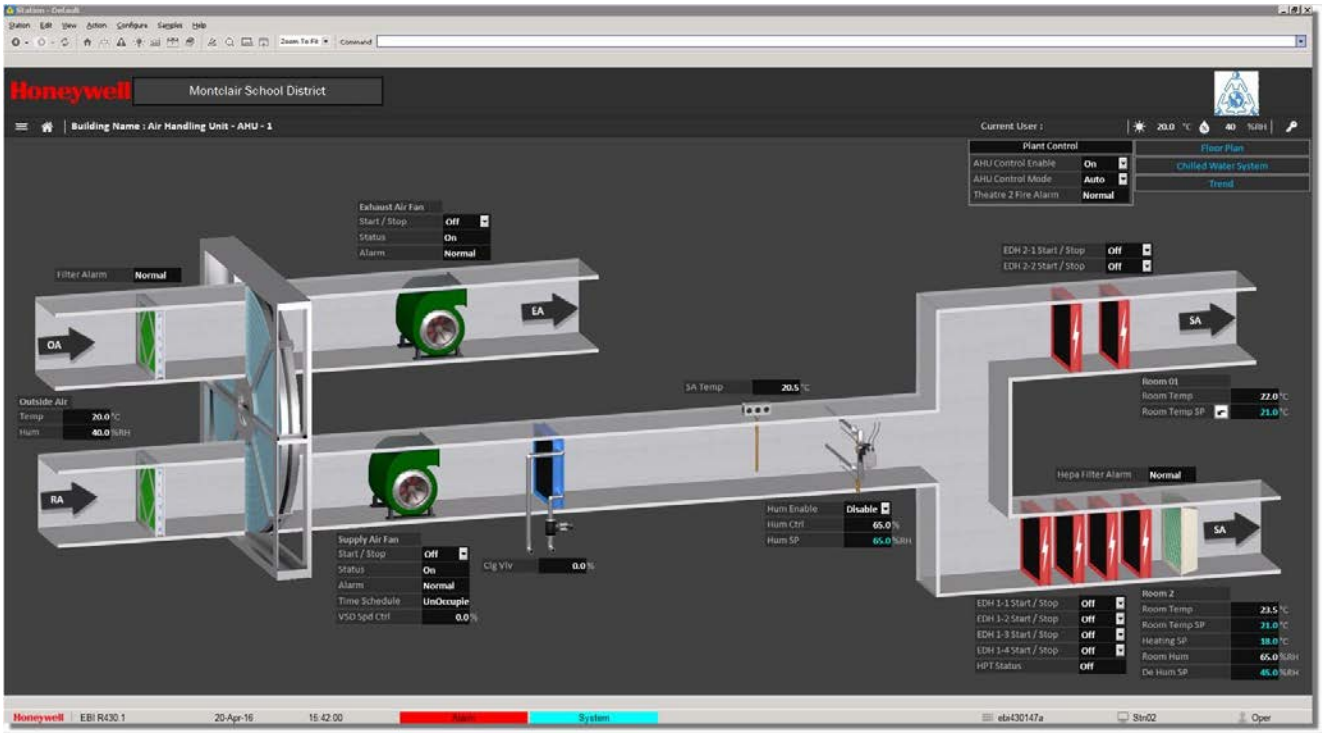
Remote Access

Facility managers will be able to login in to their BMS system from anywhere via their smartphone or iPad/Tablet or other internet enable devices. This added granular view will allow them to verify existing

conditions and effectively manage their alarms and critical conditions and take steps to remediate the situation

Scope of Work:

1. Montclair School District Building Management System



1.1 BMS

Existing State:

a. Existing Automated Logic Controls, Allerton, and Niagara Tridium.
b. Combination of vintage controllers and pneumatic systems.

Proposed State:

a. Honeywell propose to leverage Montclair School District IT infrastructure to establish a new BMS based on a BACnet open-protocol platforms. BMS operators shall be capable of real-time control and monitoring of any mechanical systems in the two buildings.
b. Remote access via computers, laptops, and mobile devices.
c. Integrate standalone equipment into the new Honeywell EBI system.
d. Establish a common communication platform throughout the entire school district.
e. Integrate existing non-defective controllers into the new systems.
f. Replace older equipment to maximize the energy savings.
g. Generate 3-dimensional graphical representation of all connected heating, cooling, ventilating, and air conditioning equipment to allow for intuitive control and monitoring of all systems.

Sample BMS Graphic

2. Montclair BOE

2.1 Heating Systems (Typical of 1).

Existing State:

a. Steam is provided from the Central plant.
b. Condensate systems pumps condensate back to Central Plant.
c. Steam radiators are used to heat the building.
d. Cooling is provided by window AC units.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the steam supply.
b. Monitor condensate pumps start/stop and status.
c. Generate 3-D graphical representation of the system to monitor and control the unit.
d. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

2.2 Steam Radiators (Typical of 25).

Existing State:

a. Steam radiators are used to heat the building.

Proposed State:

a. Install new Thermostatic Radiator Valves on the steam radiators
b. Install Sylk sensors to monitor common spaces, 1 per floor.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

2.3 Air Handling Unit (Typical of 1)

Existing State:

a. RTUs are controlled by local thermostats.

Proposed State:

a. Install new BACnet controllers to control the RTUs.
b. Establish connectivity between the BACnet thermostat and the network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3. Bradford Elementary

3.1 Air Handler Unit (Typical of 1)

Existing State:

a. AHU units are standalone and controlled by pneumatic system.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace existing pneumatic damper actuators with electronic actuators.
c. Replace existing pneumatic valves and valves actuators.
d. Install VFDs are required for demand-controlled ventilation.
e. Install Duct CO_2 sensor.
f. Replace temperature sensors with Honeywell duct temperature sensors.
g. Establish connectivity between the AHU controllers and the CPO-6A network controller.
h. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
i. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.

d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.2 Roof Top Unit (Typical of 4)

Existing State:

a. RTUs are controlled by local thermostats.

Proposed State:

a. Install new BACnet controllers to control the RTUs.
b. Establish connectivity between the RTU controllers and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.3 Classroom Fan Coils (Typical of 10).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.

c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.4 Heating Systems (Typical of 2).

Existing State:
a. Steam Boilers are controlled via JCI DX-9100 controllers.

Proposed State:
a. Install new Honeywell BACnet controller to control and monitor the two boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:
a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.5 Exhaust Fans (Typical of 10).

Existing State:
a. Exhaust fans are manually controlled via breakers.

Propose State:
a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.6 VAV Boxes (Typical of 23)

Existing State:
a. Controlled by JCI unitary controllers.

Proposed State:
a. Install new BACnet VAV-2A controller.
b. Daisy Chain BACnet Bus to and from each controller.
c. Establish connectivity between the VAV Box controllers and the CPO-6A network controller.
d. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
e. Establish an equipment run schedule based on the actual building usage.

Benefits:
a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

3.7 Radiators (Typical of 60)

Existing State:
a. Radiators are standalone.

Proposed State:
a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:
a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.

4. Bullock Elementary

4.1 Integration of Existing Controls.

Existing State:

a. The school is currently controlled by Allerton DDC system.

Proposed State:

a. Integrate the existing systems with Honeywell Front-end.
b. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
c. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

5. Buzz Aldrin

5.1 Package AC (Typical of 11)

Existing State:

a. AC units are standalone and controlled by local thermostats.

Proposed State:

a. Install new Honeywell BACnet controllers or Honeywell BACnet Controller to control the AHU.
b. Establish connectivity between the units and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

5.2 Roof Top Unit (Typical of 1)

Existing State:

a. RTU is controlled by a local thermostat.

Proposed State:

a. Install new Honeywell BACnet thermostat to control the RTU.
b. Establish connectivity between the AHU controllers and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

5.3 Classroom Fan Coils (Typical of 65).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.

d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

5.4 Exhaust Fans (Typical of 4).

Existing State:

a. Exhaust fans are manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

5.5 Radiators (Typical of 45)

Existing State:

a. Radiators are standalone.

Proposed State:

a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.

5.6 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are controlled locally.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the two boilers.
b. Control and monitor system start/stop and status of all the boilers.

c. Control and monitor the feed water pumps.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

6. Central Heating

6.1 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are controlled locally.

Proposed State:

a. Install new Honeywell BACnet controller to control the boiler and the pumps.
b. Integrate the new boiler to the new district BMS.
c. Control and monitor system start/stop and status of the boiler.
d. Install space sensor to monitor the central plant environment.
e. Open the fresh air damper whenever the boilers are in operation.
f. Generate 3-D graphical representation of the system to monitor and control the unit.
g. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
b. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

7. Edgemont Elementary

7.1 Air Handler Unit (Typical of 2)

Existing State:

a. AHU units are locally controlled by a thermostat.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace temperature sensors with Honeywell duct temperature sensors.
c. Establish connectivity between the AHU controllers and the CPO-6A network controller.
d. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
e. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

7.2 Classroom Fan Coils (Typical of 20).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

7.3 Radiators (Typical of 28)

Existing State:

a. Radiators are standalone.

Proposed State:

a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.

7.4 Heating Systems (Typical of 3).

Existing State:

a. Steam boilers are controlled by a Honeywell Tridium Jace.

Proposed State:

a. Integrate the existing Niagara Tridium controller into Montclair School District BMS.

Benefits:

c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

8. Furlong Fieldhouse

8.1 Package AC and Unit heaters in garage. (Typical of 10)

Existing State:

a. AC units are standalone and controlled by local thermostats.
b. Units are in the fieldhouse and the two garages.

Proposed State:

a. Install new Honeywell BACnet controllers or Honeywell BACnet Controller to control the AHU.
b. Establish connectivity between the units and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.

c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

8.2 Radiators (Typical of 28)

Existing State:
a. Radiators are standalone.

Proposed State:
a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:
a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.

8.3 Exhaust Fans (Typical of 2).

Existing State:
a. Exhaust fans are manually controlled via breakers.

Propose State:
a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:
a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

8.4 Heating Systems (Typical of 1).

Existing State:
a. Steam boilers are controlled by a time clock.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the two boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Generate 3-D graphical representation of the system to monitor and control the unit.
d. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

9. George Inness

9.1 Roof Top Unit (Typical of 4)

Existing State:

a. RTUs are standalone and controlled by local standalone thermostats.

Proposed State:

a. Install new Honeywell BACnet controllers or Honeywell BACnet Controller to control the RTU.
b. Establish connectivity between the AHU controller and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

9.2 Classroom Fan Coils (Typical of 52).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

9.3 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are locally controlled.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the two boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the feed water pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

9.4 Chilled Water Systems (Typical of 2).

Existing State:

a. Chillers are locally controlled.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the two chillers.
b. Control and monitor system start/stop and status of chillers.
c. Control and monitor the 2 pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

10. Glenfield Middle

10.1 Air Handler Unit (Typical of 3)

Existing State:

a. AHU units are standalone and controlled by pneumatic system.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace existing pneumatic damper actuators with electronic actuators.
c. Replace existing pneumatic valves and valves actuators.
d. Replace temperature sensors with Honeywell duct temperature sensors.
e. Establish connectivity between the AHU controllers and the CPO-6A network controller.
f. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
g. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.

c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

10.2 Split AC (Typical of 6)

Existing State:
a. Split AC units are standalone and controlled by local thermostats.

Proposed State:
a. Install new Honeywell BACnet controllers or Honeywell BACnet Controller to control the Split ACs.
b. Establish connectivity between the units and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AC units.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:
a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

10.3 Classroom Fan Coils (Typical of 53).

Existing State:
a. Fan Coils are controlled by a pneumatic system.

Proposed State:
a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

10.4 Radiators (Typical of 30)

Existing State:
a. Radiators are standalone.

Proposed State:
a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:
a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is satisfied.

10.5 Exhaust Fans (Typical of 10).

Existing State:
a. Exhaust fans are manually controlled via breakers.

Propose State:
a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:
a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

10.6 Heating Systems (Typical of 3).

Existing State:

a. Hot Water boilers are controlled locally.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the three boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the 2 pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

11. Hillside Elementary

11.1 Heating Systems

Existing State:

a. Steam is provided by the Central plant.
b. The radiators and controlled by Alerton DDC.

Proposed State:

a. Install new Niagara Tridium Jace at Hillside Elementary.
b. Integrate existing Alerton DDC to the District Wide BMS.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

12. Montclair High School

12.1 Roof Top Unit (Typical of 3)

Existing State:

a. RTUs are standalone and controlled by local standalone thermostats.

Proposed State:

a. Install new Honeywell BACnet controllers or Honeywell BACnet Controller to control the RTU.
b. Establish connectivity between the RTU controller and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the RTU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

12.2 Split AC (Typical of 7)

Existing State:

a. Split ACs (cooling only) are controlled by a local thermostat.

Proposed State:

a. Install new BACnet thermostat to control the units.
b. Establish connectivity between the Split AC controllers and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the ACs.
d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

12.3 Classroom Fan Coils (Typical of 69).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

12.4 Radiators (Typical of 37)

Existing State:

a. Radiators are standalone.

Proposed State:

a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is satisfied.

12.5 Exhaust Fans (Typical of 20).

Existing State:

a. Exhaust fans are manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.

c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

12.6 Heating Systems (Typical of 3).

Existing State:

a. Steam boilers are locally controlled via timeclock.
b. Of the 3 boilers, 2 are steam and 1 is hot water.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the 3 boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

13. Nishuane

13.1 Air Handler Unit (Typical of 1)

Existing State:

a. AHU units are standalone and controlled by pneumatic system.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace existing pneumatic damper actuators with electronic actuators.
c. Replace existing pneumatic valves and valves actuators.
d. Replace temperature sensors with Honeywell duct temperature sensors.
e. Establish connectivity between the AHU controllers and the CPO-6A network controller.
f. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
g. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

13.2 Roof Top Unit (Typical of 1)

Existing State:

a. RTU is standalone and controlled by local thermostats.

Proposed State:

a. Install new Honeywell BACnet controllers to control the RTU.
b. Establish connectivity between the units and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the RTU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

13.3 Classroom Fan Coils (Typical of 55).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

13.4 Radiators (Typical of 25)

Existing State:

a. Radiators are standalone.

Proposed State:

a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is satisfied.

13.5 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are locally controlled by Alerton DDC.

Proposed State:

a. Integrate the Alerton DDC system into the District Wide BMS.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

14. Northeast Elementary

14.1 Split AC (Typical of 10) and Roof Top Units (Typical of 4)

Existing State:

a. Split AC and RTU units are standalone and controlled by local thermostats.

Proposed State:

a. Install new Honeywell BACnet thermostats to control the Split ACs and the RTUs.
b. Establish connectivity between the new BACnet controller and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the ACs and the RTUs.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

14.2 Air Handler Unit (Typical of 1)

Existing State:

a. AHU units are standalone and controlled by pneumatic system.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace existing pneumatic damper actuators with electronic actuators.
c. Replace existing pneumatic valves and valves actuators.
d. Replace temperature sensors with Honeywell duct temperature sensors.
e. Establish connectivity between the AHU controllers and the CPO-6A network controller.

f. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
g. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

14.3 Classroom Fan Coils (Typical of 52).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

14.4 Exhaust Fans (Typical of 5).

Existing State:

a. Exhaust fans are manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system

14.5 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are locally controlled via timeclock.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the 3 boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

15. Pre-K DLC

15.1 Air Handler Unit (Typical of 5)

Existing State:

a. AHU units are standalone and controlled by a local thermostat.

b. The unit control the steam from the Central Plant by controlling the steam valve actuator.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace temperature sensors with Honeywell duct temperature sensors.
c. Monitor the condensate pumps.
d. Establish connectivity between the AHU controllers and the CPO-6A network controller.
e. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
f. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

15.2 Roof Top Unit (Typical of 3)

Existing State:

a. RTUs are controlled by local thermostats.

Proposed State:

a. Install new BACnet controllers to control the RTUs.
b. Establish connectivity between the RTU controllers and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

15.3 Radiators (Typical of 33)

Existing State:

a. Radiators are standalone.

Proposed State:

a. Install new thermostatic valves to control the steam output of the radiators.

Benefits:

a. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is satisfied.

15.4 Exhaust Fans (Typical of 3

Existing State:

a. Exhaust fans are manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the district-wide building automation system.
b. **Electrical Impact:** Reduce electrical consumption by de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

16. Renaissance Middle

16.1 Split AC (Typical of 1)

Existing State:

a. Split ACs is controlled by a local thermostat.

Proposed State:

a. Install new BACnet thermostat to control the ACs.
b. Establish connectivity between the unit and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the ACs.

d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

16.2 Air Handler Unit (Typical of 3)

Existing State:

a. AHU units are standalone and controlled by pneumatic system.

Proposed State:

a. Install new Honeywell BACnet controllers to control the AHU.
b. Replace existing pneumatic damper actuators with electronic actuators.
c. Replace existing pneumatic valves and valves actuators.
d. Replace temperature sensors with Honeywell duct temperature sensors.
e. Establish connectivity between the AHU controllers and the CPO-6A network controller.
f. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the AHU.
g. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

16.3 Classroom Fan Coils (Typical of 29).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.

d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

16.4 Ventilation Fans (Typical of 1).

Existing State:

a. Ventilation Fan is manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.
b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system

16.5 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are locally controlled via timeclock.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the 3 boilers.
b. Control and monitor system start/stop and status of all the boilers.

c. Control and monitor the pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

17. Watchung School

17.1 Split AC (Typical of 8)

Existing State:

a. Split ACs is controlled by a local thermostat.

Proposed State:

a. Install new BACnet thermostat to control the ACs.
b. Establish connectivity between the unit and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the ACs.
d. Establish an equipment run schedule based on the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

17.2 Roof Top Units (Typical of 2)

Existing State:

a. RTUs are standalone and controlled by local thermostats.

Proposed State:

a. Install new Honeywell BACnet thermostat to control the RTUs.

b. Establish connectivity between the RTU controllers and the CPO-6A network controller.
c. Generate a 3-dimensional graphical representation of the equipment allowing building operators to monitor and adjust operating parameters of the RTU.
d. Establish an equipment run schedule based upon the actual building usage.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

17.3 Classroom Fan Coils (Typical of 38).

Existing State:

a. Fan Coils are controlled by a pneumatic system.

Proposed State:

a. Replace existing pneumatic thermostat with a new wireless BACnet temperature sensor.
b. Install the new wireless BACnet controller at the Fan Coil unit.
c. Install new relays and CTs to control the fan.
d. Install new valves and valve actuators to control the heating valves.
e. Establish wireless BACnet communication with Network Controller gateway.
f. Create 3-D representation of the new systems to allow for intuitive control and monitoring.
g. Establish equipment runtime

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature set point and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature set point when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

17.4 Exhaust Fans (Typical of 5).

Existing State:

a. Ventilation Fan is manually controlled via breakers.

Propose State:

a. Install a new Honeywell BACnet controller to control the units.

b. Incorporate exhaust fan command start/stop and status into the BMS.
c. Integrate the exhaust fan control with the new CPO-6A network controller.
d. Generate 3-D graphical representation of the exhaust fan allowing building operators to schedule operating hours.
e. Schedule unit to operate only when the school is opened for business.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system

17.5 Heating Systems (Typical of 2).

Existing State:

a. Steam boilers are locally controlled via timeclock.

Proposed State:

a. Install new Honeywell BACnet controller to control and monitor the 3 boilers.
b. Control and monitor system start/stop and status of all the boilers.
c. Control and monitor the pumps and program for lead/lag operation.
d. Install new outdoor air temperature sensor.
e. Generate 3-D graphical representation of the system to monitor and control the unit.
f. Create equipment schedule based on the building's hours of operation.

Benefits:

a. **Occupancy Impact:** Improved space temperature and ventilation control ensuring a comfortable occupancy environment.
b. **Electrical Impact:** Reduce electrical consumption by increasing cooling space temperature setpoint and de-energizing the fan when the space served is unoccupied.
c. **Natural Gas Impact:** Reduce natural gas consumption by reducing heating space temperature setpoint when the space served is unoccupied.
d. **Operational Impact:** Improve maintenance response times by automatically notifying building operators of system deficiencies on a real-time basis via the Network-wide building management system.

Energy Savings Methodology and Results

The savings approach is based upon reducing the amount of energy that needs to pre-heat or cool the outside air. The savings are generally calculated as:

Existing Heating BTU & Cost per BTU	= Metered data from existing meter readings

Cost of Existing Heating	= Average site data $/CCF or $/Gallon
Reduction in Heating/Cooling BTU	= Reduction in outside air CFM x 1.08 x Delta T x Operating Hours
	= Reduced BTU x Cost per BTU
Cost of Proposed Heating/Cooling	= Existing Costs – Proposed Costs
Energy Savings $	

The baseline adjustment calculations are included with the energy calculations.

Changes in Infrastructure

None.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from reduced energy.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 3B DEMAND CONTROL VENTILATION (IN BMS SCOPE)

The key benefits of this ECM include:

- **Operational efficiency** thanks to better control and reduced outside air.
- **Energy Savings** from reducing total energy consumption with more efficient, state of the art technology.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.
- **Occupancy comfort and productivity** by way of enhanced temperature and humidity control throughout your buildings.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
3B Demand Control Ventilation (in BMS scope)					●		●						●	●		

Existing Conditions

HVAC equipment serving large one-zone spaces such as gyms, auditoriums and multi-purpose rooms are often designed for peak occupancy conditions to supply outside air to the space with return air from space being exhausted. Most of the time these spaces are not fully occupied, which increase energy demand for heating and cooling of excessive amount of outside air.

Typical Units for Demand Control Ventilation

Proposed Solution

Honeywell will install CO_2 sensors at the below locations. The CO_2 sensors will provide the control signal for the HVAC equipment to optimize the quantity of fresh air required. The installation of CO_2 sensors will

read the levels of CO_2 in the space and ensure that only the required outside air is supplied and heated to meet the minimum outdoor air requirements. This control strategy will reduce the amount of outside air intake and thus reduce the heating energy used by the HVAC units and electric energy used by the motors. Based on this fact, there are reduced requirements for outside air to the spaces.

Building	Area Served	Number of Units	CFM Total (each unit) (est.)
Glenfield Middle School	Gym	1	9,912
Northeast Elementary School	Cafetorium	1	9,000
Renaissance Middle School	Gym	2	3,304
Hillside Elementary School	Gym Supply	1	5,000
Hillside Elementary School	Auditorium Supply	1	3,000

Existing Units to be installed with CO_2 sensors

Energy Savings Methodology and Results

The savings approach is based upon reducing the amount of energy that needs to pre-heat or cool the outside air. The savings are generally calculated as:

Existing Heating BTU & Cost per BTU	= Metered data from existing meter readings
Cost of Existing Heating	= Average site data $/CCF or $/Gallon
Reduction in Heating/Cooling BTU	= Reduction in outside air CFM x 1.08 x Delta T x Operating Hours
	= Reduced BTU x Cost per BTU
Cost of Proposed Heating/Cooling	= Existing Costs – Proposed Costs
Energy Savings $	

The baseline adjustment calculations are included with the energy calculations.

Changes in Infrastructure

None.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from reduced energy.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 3C EXHAUST FAN CONTROLS (IN BMS SCOPE)

The key benefits of this ECM include:

- **Energy Savings** from reducing total runtime of energy consuming exhaust fans.
- **Equipment longevity** due to fewer equipment run hours per year.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
3C Exhaust Fan Controls (in BMS scope)	●	●	●		●	●				●			●		●	●

Existing Conditions

Currently, exhaust fans are manually controlled via breakers and/or timeclocks. This can lead to fans which run continuously or at least more often than is required.

Typical Exhaust Fans

Proposed Solution

Honeywell will install new BACnet controllers to control the exhaust fans, incorporate exhaust fan command start/stop and status into the BMS, and schedule the fans to operate only when the buildings are opened.

Building	Number of Fans
Bradford Elementary School	10
Bullock Elementary School	18
Buzz Aldrin Middle School	4
Glenfield Middle School	10
Hillside Elementary School	1
Montclair High School	4
Northeast Elementary School	5
Watchung Elementary School	5
Woodman Field	2

Buildings where exhaust fans will be controlled

Energy Savings Methodology and Results

The savings approach is based upon reducing the amount of energy consumed by the fans by reducing the number of hours over which they operate.

Changes in Infrastructure

Exhaust fans will be connected to BMS system as part of this measure.

Customer Support and Coordination with Utilities

Coordination of the electrical tie-in will be required.

Environmental Issues

Resource Use	Energy savings will result from reduced fan run hours.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 4A BUILDING ENVELOPE IMPROVEMENTS

The key benefits of this ECM include:

- **Energy savings** from reducing unwanted outside air infiltration.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.
- **Occupancy comfort and productivity** by way of enhanced temperature and humidity control throughout your buildings.
- **Improved building envelope** from addressing building gaps that allow unconditioned air penetration.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
4A Building Envelope Improvements	●	●	●	●	●	●	●		●	●	●	●	●	●	●	●

Existing Conditions

Heat loss due to infiltration is a common problem, particularly in places with long and cold winter seasons such as New Jersey. This problem has been shown to represent the single largest source of heat loss or gain through the building envelopes of nearly all types of buildings. Our work has found 30% to 50% of heat loss attributable to air leaks in buildings.

Honeywell uncovered several leaks that allow for heat loss to occur during the winter season and unwanted heat gains during the summer season. These problems include door gaps, exhaust fans in poor condition, open windows or windows in poor condition, lack of air sealing and insulation.

Honeywell has helped customers such as you to address these problems with a comprehensive and thorough building envelope solution that seals up your buildings to improve occupancy comfort and help eliminate unwanted energy waste. We propose to conduct a comprehensive weatherization job to weatherproof doors and windows, caulk and seal leaks, and install spray foam and rigid foam boards to stop unwanted air movement and provide a thermal barrier between spaces. Part of this process may include decoupling floor-to-floor and compartmentalizing of components of the building to equalize pressure differences.

Building Envelope Opportunities

Proposed Solution

AC Unit Weatherization

Make upper sash stationary using fasteners, caulk upper sash in place for air tight seal. Install flexible foam between raised lower sash and upper sash of double hung window system. Install mastic to seal insulation strips in place and adhere to window frame. Paint to match aesthetics as necessary of each treated window.

Attic Air Barrier Retrofit

Re-locate the existing fiberglass batt insulation to create open access to attic floor framing (save for re-use). Install Dow Thermax rigid insulation fastened to the existing framing using screws and screw plates; use sheathing tape to cover all fastener penetrations in rigid insulation material; install polyurethane foam sealant or sheathing tape at perimeter and seams of all rigid insulation boards for an air tight seal. At the attic floor intersection with gable walls and the intersection of the underside of the roof assembly create an air-tight seal between Dow Thermax rigid insulation and the adjoining wall or roof surface using polyurethane sealants. In areas of high traffic install 5/8" CDX plywood to support future workers; install polyurethane foam sealant or sheathing tape at perimeter and seams of all plywood for an air tight seal. Use caution tape or other clear markings to partition off areas of ceiling structure that will not support future workers in the attic. Re-install the fiberglass batt insulation on the attic-side of the retrofit Thermax and plywood air barrier materials; re-install fiberglass batt for 100% coverage of attic surface with fiberglass batt material.

Attic Bypass Air Sealing

Seal the attic air barrier retrofit material/ surface to the original ceiling surface/ air barrier. Install Dow Thermax Sheathing as blocking/ backer and install polyurethane sealants at the perimeter and seams of the Thermax Sheathing for an air-tight seal. Pull-Down stair is to be covered with Therma-Dome Product or similar to provide complete thermal cover as well as treatment with weather stripping. Carpentry may be necessary to provide an air tight seal with framing around the pull-down stair setup.

Insulation Baffles

Install insulation baffles at the eaves; install in an air-tight fashion at the exterior top plate using sealants. The baffles should create a space for air to properly flow to the ridge of the attic between the underside of the roof deck and the cellulose insulation.

Attic Insulation

After all Attic Bypass Air Sealing and Attic Insulation Baffles work is complete; install additional cellulose insulation to desired depth. Cellulose insulation is assumed to settle to a depth of 80% of its original installed depth. In an empty attic if desired settled depth is 12 inches of cellulose the installed depth of cellulose when first blown in should be 15 inches. The desired R value of all attics treated with cellulose insulation is a minimum of R40.

Buck Frame Air Sealing

Remove existing loose paints and other debris between the window frame and wall assembly at the window header joint above the drop ceiling. Install new polyurethane sealant between the window header and window frame for an air-tight transition from the top of the aluminum window frame, to the header, and to the wall assembly above. For smaller gaps, install spray polyurethane foam sealant to seal the gap. For mid-size or large gaps, install Dow Thermax Sheathing as blocking/ backer, install fasteners with washers as necessary to fasten the Thermax Sheathing in place, install polyurethane sealants at the perimeter and seams of the Thermax Sheathing for an air-tight seal.

Caulking

Caulk the non-operational components of the window jamb, casing or trim that have been identified as pathways for air leakage using siliconized acrylic caulk; install backer rod and elastomeric caulking if necessary. Install caulking with colors to match the interior aesthetics as closely as possible. A majority of windows throughout the district were replaced with similar style window assemblies. The linear footage reported to be sealed mostly comes from installing 3 lines of caulk per window; 2 at the snap trim intersections and one at the wood casing to wall intersection. All windows and doors are to be fully caulked as required; there will be instances where more or less than 3 lines of caulk are required in order to complete the caulking task at select locations.

Door Weather Stripping

Ensure the door operates and closes appropriately. Notify prime contractor and/or owner when doors are damaged. Install heavy duty weather stripping with aluminum carrier and Q-lon insert gasket at door sides and top jamb. Install for 40% - 60% weather strip compression. Caulk behind weather strip carrier for air-tight seal. Cut aluminum carrier weather strip at locks, swing arms or any other hardware where necessary. Install door bottom sweep with aluminum carrier and sweep insert. For double doors install an astragal weather strip material at both sides of the center meeting.

Hopper Window Weatherization

Clean debris from the mounting surface on the aluminum sash. Apply weather stripping around the perimeter of the sash to create an air tight compression seal when the windows are closed. Cut and remove any excess material from the corners of the window sash to ensure it operates properly. Broken and inoperable windows are to be caulked/sealed shut; no less than 2 windows per classroom are to be caulked/sealed shut in to allow ample egress in case of emergency.

Overhead Door Weather Stripping

Remove existing weather-stripping materials and fasteners; install heavy-duty aluminum carrier with oversized vinyl insert gasket at the sides and top of the overhead door; install heavy-duty aluminum carrier with an oversized bottom U-style gasket at bottom.

Roof-Wall Intersection Air Sealing

Install air barrier materials and sealants to create an air-tight transition at the roof-to-wall intersection. For smaller gaps, install spray polyurethane foam sealant to seal the gap. For mid-size or large gaps, install Dow Thermax Sheathing as blocking/ backer, install fasteners with washers as necessary to fasten the Thermax Sheathing in place, install polyurethane sealants at the perimeter and seams of the Thermax Sheathing for an air-tight seal. Install all materials to create an air-tight seal in accordance with the manufacturer's specifications.

Wall Air Sealing

Install air barrier materials and sealants to create an air-tight transition at the incomplete areas of wall air barrier and insulation materials. For smaller gaps, install spray polyurethane foam sealant to seal the gap. For mid-size or large gaps, install Dow Thermax Sheathing as blocking/ the primary air barrier material, install fasteners with washers as necessary to fasten the Thermax Sheathing in place, install polyurethane sealants at the perimeter and seams of the Thermax Sheathing for an air-tight seal. Install all materials to create an air-tight seal in accordance with the manufacturer's specifications.

Benefits

This work will allow for more efficient operation of your buildings by reducing heating and cooling losses throughout the year. In addition, the draftiness of the buildings and hot and cold spots will be significantly reduced. A reduction in air infiltration will also minimize potential concerns for dirt infiltration or indoor air quality concerns including allergies.

Energy Savings Methodology and Results

The energy savings for this ECM are realized at the buildings' HVAC equipment. The improved building envelope will limit conditioned air infiltration through openings in the building air barrier. Less infiltration means less heating required by the heating system.

Changes in Infrastructure

Building envelope will be improved with little or no noticeable changes.

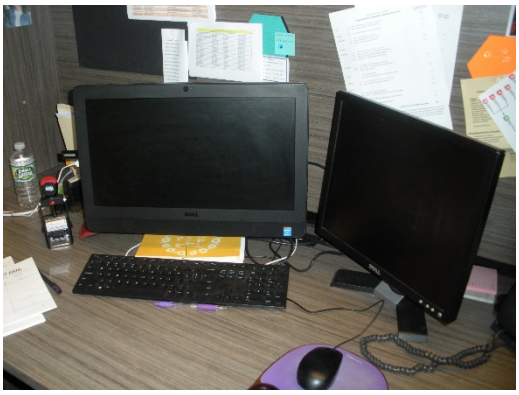
Customer Support and Coordination with Utilities

Minimal coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced HVAC energy usage and better occupant comfort.
Waste Production	Some existing caulking and weather-stripping will be removed and disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 5A COMPUTER POWER MANAGEMENT



The key benefits of this ECM include:

- **Guaranteed energy savings** by better managing the power consumption of computer equipment.
- **Longer equipment life** thanks to reduced usage.
- **Security protection** because external access can't occur when the computer system is shut down after hours.
- **Virus protection** from the ability to shot down the computers before viruses reach the network.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
5A Computer Power Management	●	●	●	●	●	●	●		●	●	●	●	●	●	●	●

Existing Conditions

Information Technology (IT) is a major consumer of energy in school buildings and campuses. At more than 25 percent of total energy consumption energy efficient IT becomes less of a nice-to-have and more of a necessity. This ECM implements a power management system for all of your LAN based computers, printers and copiers throughout the building. The software system will automatically shut down your IT equipment at scheduled times to prevent unnecessary energy consumption during unoccupied hours.

Computer Power Management Opportunities

Honeywell proposes computer power management software *Surveyor* by Verdiem to manage PC consumption from phantom power, providing a detailed breakdown of usage by IT device type to allow energy managers to better plan, manage and optimize an organization's overall power consumption. This ECM will also provide for enhanced staff productivity. Energy consumption of distributed IT devices can

be reduced by up to 60%. Verdiem helps IT departments to accurately measure IT device energy consumption, enforce policies for greater energy efficiency, and optimize savings.

Proposed Equipment for Computer Power Management

Energy Savings Methodology and Results

Annual savings for administrative and student computers is based on previous logging results for computers with similar usage types.

Changes in Infrastructure

Server will be integrated into current IT network.

Customer Support and Coordination with Software

Support will be required for software deployment by IT department.

Environmental Issues

Resource Use	Annual savings for administrative and student computers is based on previous logging results for computers with similar usage types.
Waste Production	None.
Environmental Regulations	No environmental impact is expected.

ECM 6A PERMANENT LOAD REDUCTION PROGRAM

The key benefits of this ECM include:

- **Energy Savings** from reducing energy loads during peak hours.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.
- **Revenue generation** from participation in the PJM permanent load reduction program.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
6A Permanent Load Reduction	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●	●

Proposed Solution

Honeywell proposed to facilitate the District's participation in the PJM Energy Efficiency Program. This program is offered through the PJM Regional Transmission Organization (RTO), and Independent System Operator (ISO). The energy efficiency program pays PJM customers for implementing ECMs that result in permanent load reductions during defined hours.

PJM Permanent Electrical Load Reduction

PJM Permanent Load Reduction

PJM offers incentives to customers who install energy-efficient equipment that permanently reduces the use of electricity during peak times. Documentation of the type of new energy-efficient equipment installed, when it was installed, and how it is being used is required. PJM also requires a measurement of electricity usage during the peak summer periods to verify if a building is actually using less energy. Also, as a cooperative, PJM relies on its members to combine projects together to make sure the volume is

significant enough to impact their system. The table below outlines the anticipated kW reduction that will be incentivized by PJM.

Building	Permanent Load Reduction (KW)
Bradford Elementary School	24.1
Bullock Elementary School	74.2
Buzz Aldrin Middle School	61.6
Edgemont Elementary School	18.7
Glenfield Middle School	58.4
Valley Road Complex	134.7
Montclair High School	109.4
George Inness Annex (HS-9th), Athletics	23.7
Nishuane K-2	33.8
Northeast Elementary School	24.8
Renaissance Middle School	24.6
Watchung Elementary School	15.8
Woodman Field	6.5

Proposed Permanent Load Reduction

Energy Savings Methodology and Results

Revenue is generated through participation in the PJM program.

Changes in Infrastructure

None.

Customer Support and Coordination with Utilities

Initiation of demand response curtailment will be required.

Environmental Issues

Resource Use	None.
Waste Production	This measure will produce no waste by-products.
Environmental Regulations	None.

ECM 7A TRANSFORMER REPLACEMENTS

The key benefits of this ECM include:

- **Guaranteed energy savings** from reducing total energy consumption with more efficient, state of the art technology.
- **Equipment longevity** due to more efficient and less wasteful equipment utilization.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
7A Transformer Replacements	●										●					

Existing Conditions

The transformers in locations within the electrical distribution systems in the District consist of 480 Volts. Distribution transformers are installed in the boiler rooms and in various electrical and utility closets to step down the voltage to 120-208 Volts. Typically, an electrical distribution system has some losses associated with the electrical system and a considerable portion of these losses are associated with distribution transformers.

Typical Transformers

Systems Evaluation and Selection

Typical transformers are not designed to handle harmonic loads of today's modern facilities, and suffer significant losses, even if the transformer is relatively new. Typically, conventional transformer losses, which are non-linear, increase by 2.7 times when feeding computer loads. The nonlinear load loss multiplier reflects this increase in heat loss, which decreases the net transformer efficiency. Also, unlike

most substation transformers that are vented to the exterior, building transformers are ventilated within the building they are located, and their heat losses therefore add to the cooling load.

Based on site investigation conducted by our staff, we identified the following transformers that we propose to replace with energy efficient replacements at a size matching the existing loads as indicated in the table below:

Building	kVA	Qty	Location
Bradford Elementary School	112.5	1	Electric Rm 3
Bradford Elementary School	150.0	1	Boiler Rm
Bradford Elementary School	15.0	1	Boiler Rm
George Inness Annex (HS-9th), Athletics	300.0	1	Main Electric
George Inness Annex (HS-9th), Athletics	225.0	1	Electric Rm 2

Existing Transformers to be Replaced

Proposed Solution

The proposed transformers will be Power Smiths High Efficiency K-Star Harmonic Mitigating units. They are Energy-Star rated and meet the new TP1 Law requiring replacement of transformers of 600 volts or under.

Scope of Work

Remove and install new E-saver transformers

Per Transformer Unit:

- Shut off the main electric power to the transformer to be replaced
- Disconnect the existing transformer and install replacement unit
- Turn power back on
- Inspect unit operation by performing electrical and harmonics testing
- Dispose of old transformers properly

Energy Savings Methodology and Results

The energy savings for this ECM is realized by reduction in electric energy lost in the existing transformers as a result of the higher efficiency of the new transformers.

Changes in Infrastructure

New transformers where indicated.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of services for the affected areas.

Environmental Issues

Resource Use	Energy savings will result from increased voltage conversion efficiency.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 8A COMBINED HEAT & POWER (COGENERATION)

The key benefits of this ECM include:

- **Energy Savings** from utilizing a combined heat and power system to supplement the existing heating system.
- **Operational savings** thanks to improved operational efficiencies unique to CHP technology.
- **Resiliency** unique to CHP technology that can allow you to operate the building during emergency situations and grid disruptions.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
8A Combined Heat and Power					●											

Existing Conditions

The Glenfield Middle School is a candidate for a small CHP system based on its seasonal profile of natural gas usage.

Proposed Solution

Honeywell recommends the installation of one 35 kW CHP generating unit that will generate electric power and produce thermal energy that can supplement heating loads. This system will be appropriate to this site given the year-round operational needs of this facility and leverage healthy state rebates to help pay for it. Since the unit is a synchronous generator it does not require any excitation energy to produce electricity and therefore may be used for emergency back-up power.

Yanmar Unit

Yanmar CP35 Low Emissions CHP Module takes the many benefits of modular cogeneration. Modules come fully pre-packaged from the factory, including engine, generator, oil/ jacket/ exhaust heat recovery, controls, electrical switchgear, emissions controls, and modem for remote monitoring and data-logging. This allows for standardization and minimizes installation cost and complexity in the field. Also, the comprehensive third-party (ETL/IEEE/NYSIR/UL) certifications provide streamlined interconnection permitting with the local electric utility and are NJDEP Air Permit Exempt.

Scope of Work

Building	Qty	Make	Model
Glenfield Middle School	1	Yanmar	CP35

Recommended Cogeneration Unit

Equipment Information

Manufacturer and Type	Yanmar CP35, Electrical Output 35 kW, Thermal Output 407,000 Btu/hr, or approved equal
Equipment Identification	Product cut sheets and specifications for generally used are available upon request. As part of the measure design and approval process, specific product selection will be provided for your review and approval.

Energy Savings Methodology and Results

Savings are based on energy conversion of natural gas to thermal and electrical energy.

Changes in Infrastructure

The proposed micro-generator would reside in or near the boiler room.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods. The customer and Honeywell will decide the exact location of the cogeneration installation at the central utility plant.

Environmental Issues

Resource Use	Renewable energy will be generated to supplement energy purchased from the electrical utility.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	Aside from the environmental benefits from on-site energy generation, no other environmental impact is expected.

ECM 9A ROOF RE-SEALING

The key benefits of this ECM include:

- **Equipment longevity** due to newly installed materials and updated warranty term.
- **Occupancy comfort and productivity** thanks to a tighter and more efficient building envelope.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
9A Roof Re-sealing	●		●	●	●	●	●		●	●	●	●	●	●	●	●

Existing Conditions

Due to the age of the existing roofs across the district, and the fact that many of them are near or past their warranty expiration, Honeywell investigated the implementation of a Silicone Coating to existing roofs for the purpose of extending the warranty periods, allowing for the installation of rooftop solar photovoltaic systems, through a power purchase agreement (PPA), without the risk of roof warranties expiring before the end of the PPA term. This coating will re-seal the roof surfaces, increasing water-tightness and decreasing unwanted air infiltration.

Building	Square Footage
Bradford Elementary School	10,687
Buzz Aldrin Middle School	7,210
Edgemont Elementary School	8,720
Glenfield Middle School	32,053
Valley Road Complex	35,350
Montclair High School	80,251
George Inness Annex (HS-9th), Athletics	6,293
Nishuane K-2	33,505
Northeast Elementary School	6,156
Renaissance Middle School	15,162
Watchung Elementary School	23,100
Woodman Field	3,615

Roof Replacement Opportunities

Proposed Solution

Honeywell proposes the installation of a new Silicone Roof Coating over the existing roofing materials. This solution will decrease unwanted air infiltration while also providing a new warranty period to the district for the roofing surface.

Energy Savings Methodology

Following approach is used to determine savings for this specific measure:

Existing Roof Efficiency	= Existing U + Existing Infiltration Rate
Proposed Roof Efficiency	= Proposed U + Proposed Infiltration Rate
Energy Savings (Btu)	= UAdTproposed – UAdTexisting
Winter Savings (Therms)	= Energy Savings/Boiler Eff./100,000
Summer Savings (Tons Cooling)	= Energy Savings/12,000 Btu/Ton

Interface with Building

The new roof coating will be installed over existing roofing materials.

Energy Savings Methodology

The energy savings for this ECM are realized at the buildings' HVAC equipment. The improved roof will limit conditioned air infiltration through openings in the building air barrier. Less infiltration means less heating and cooling required by HVAC systems.

Changes in Infrastructure

A Silicone roof coating will be implemented on portions of the roofs identified.

Support and Coordination with Utilities

Coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced HVAC energy usage and better occupant comfort.
Waste Production	Any materials removed will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 10A KITCHEN EQUIPMENT CONVERSION

The key benefits of this ECM include:

- **Lower operational costs** through less expensive utility rates for heating fuel.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
10A Kitchen Equipment Conversion	●		●	●	●		●					●	●			

Existing Conditions

The existing kitchen cooking equipment utilizes electricity to generate heat. Electrical heating is a much more expensive way to power heating/cleaning equipment than natural gas.

Typical Kitchen Equipment

Proposed Solution

Honeywell recommends replacing existing kitchen cooking and cleaning equipment with natural gas-fired units. This new equipment will last much longer than the old electrical equipment would have and reduce operating costs due to the price difference between electricity and natural gas.

Building	Equipment Type	Quantity
Bradford Elementary School	Electric Double Convection Oven	1
Buzz Aldrin Middle School	Electric Double Convection Oven	1
Hillside Elementary School	Electric Double Convection Oven	1

Building	Equipment Type	Quantity
Edgemont Elementary School	Electric Double Convection Oven	1
Glenfield Middle School	Electric Double Convection Oven	1
Nishuane K-2	Electric Double Convection Oven	1
Northeast Elementary School	Electric Single Convection Oven	1

Existing Kitchen Equipment to be Replaced

Scope of Work

- Disconnect and remove select existing electrically-heated kitchen equipment.
- Run new gas line from new natural gas service/meter location to the kitchen.
- Install and connect new gas-fired kitchen equipment.
- Start-up and test new units.

Energy Savings Methodology and Results

The savings approach is based upon the difference in energy use and cost between the existing and new kitchen equipment.

Changes in Infrastructure

New gas piping will need to be run from the new gas service/meter to the kitchen.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Energy savings will result from reduced energy.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

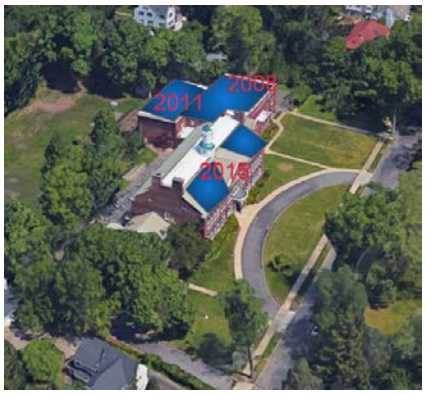
ECM 11A SOLAR POWER PURCHASE AGREEMENT

The key benefits of this ECM include:

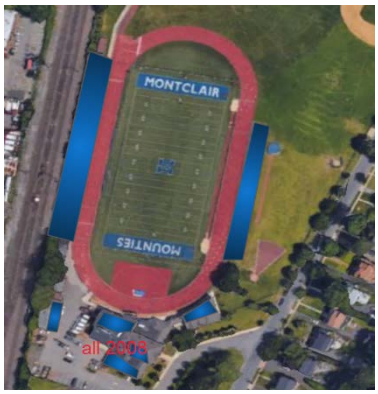
- **Reduced utility costs** due to lower electricity rates than grid-supplied power.
- **Guaranteed utility rates for 15 years** to provide a valuable hedge against future price volatility and deliver greater budgetary certainty utilizing clean electricity.
- **Additional savings** from solar can provide the District with more potential ESIP funding to expand the overall project scope and include additional projects.
- **Educational asset** to provide additional tools for teachers to engage students on sustainability and the environment.
- **Low risk** given that maintenance is provided by the 3rd party system owner.
- **No upfront costs**.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
11A Solar Power Purchase Agreement	●		●	●	●	●	●		●	●	●	●	●	●	●	●

ECM Overview



Honeywell recommends that the District further assess the feasibility of a solar photovoltaic system on District owned roofs to generate on-site renewable electricity. This could be provided at no upfront cost via a power purchase agreement (PPA). A PPA is a public-private partnership financial arrangement in which a third-party solar company owns, operates, and maintains your photovoltaic system, while the host customer agrees to provide the site for the system on its property. The solar system's power production is purchased by you for a predetermined price ($/kWh) and for a predetermined period. This stable price for electricity will be lower than the utilities and third-party suppliers, thereby allowing you to benefit from cheaper electricity prices, on-site renewable energy generation, a reduction in greenhouse gas emissions and a powerful educational tool for your teachers and students. Meanwhile, the system will not add any additional maintenance costs since it is owned by the third-party solar company. One of the more significant benefits of this potential ECM is that it will provide for a rate change, helping to deliver greater savings within your ESIP project to help fund other measures.



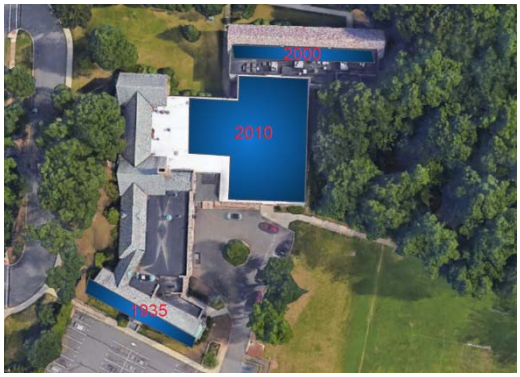
Bradford Elementary School

Buzz Aldrin Middle School

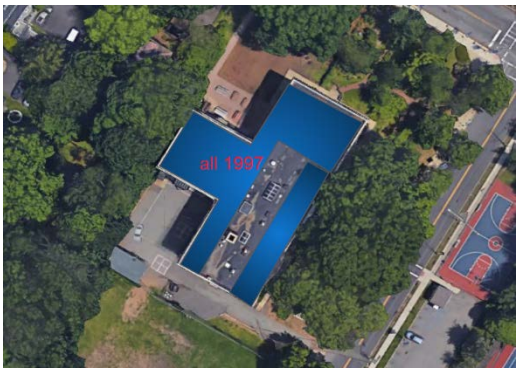
Edgemont Elementary School

Woodman Field

George Innes Annex



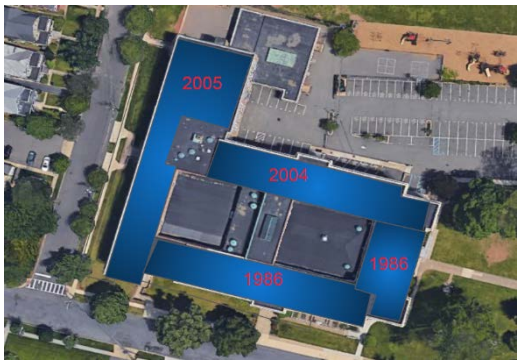
Glenfield Middle School



Montclair High School

Nishuane School

Northeast Elementary School



Renaissance Middle School

Admin & Community Pre-K

Watchung Elementary School

Hillside Elementary School

Honeywell will oversee the design and construction and help with the operations and maintenance of the system. We will first help conduct a feasibility study in conjunction with your technical consultant and legal team, to provide RFP development, solicitation, and oversight of the installation of a solar photovoltaic system.

Proposed Solution

Honeywell proposes to install the solar PPA system at the buildings listed in the chart below.

Location	Rating kW-DC
Bradford Elementary School	177.1
Buzz Aldrin Middle School	156.4
Edgemont Elementary School	373.9
Glenfield Middle School	361.2
Hillside Elementary School	47.9
Community Pre-K	254.2
Montclair High School	843.7
George Inness Annex	161.1
Nishuane K-2	319.3
Northeast Elementary School	182.1
Renaissance Middle School	52.7
Watchung Elementary School	250.7
Woodman Field	409.8

Proposed Solar Arrays

Energy Savings Methodology and Results

Savings are based on the difference in kWh price between the PPA and the current electrical supplier.

Changes in Infrastructure

The proposed solar array would be primarily roof-mounted only, with some canopy arrays.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	None.
Waste Production	Any removed parts will be disposed of properly.
Environmental Regulations	Aside from the environmental benefits of increasing energy awareness no other environmental impact is expected.

ECM 12A WATER CONSERVATION (DI)

The key benefits of this ECM include:

- **Reduction in water consumption** from replacing the existing plumbing fixtures to lower water flow rates.
- **Improved performance** of existing systems by optimizing equipment.
- **Reduction in maintenance costs** from new flush valves and tuning each fixture to the right amount of water.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
12A Water Conservation (DI)	●	●	●	●	●	●	●		●	●	●	●	●	●	●	●

ECM Overview

Honeywell will seek to increase the operational performance of your water systems with the minimal water required to provide optimal performance.

Existing Conditions

These are a mixture of wall hung and floor mounted toilets exceeding 1.5 gallons per flush (gpf), in addition to faucet flow aerators which exceed 1.0 gpm. These fixtures use more water than is generally needed to accomplish their task.

Typical Existing Fixtures

Proposed Solution

Flushometers (Toilets and Urinals): Benefits of our proposed approach include:

- Increased Performance and Flush-to-Flush Consistency. The first objective is to ensure every fixture operates properly. Our calibration and tuning via Variable Flow Technology will ensure each fixture is using the right amount of water.
- Standardization and Reduce Maintenance Costs. By having only one valve throughout the campus, staff may eliminate the wide variety of replacement components they now have in inventory. Likewise, the replacement of all wear parts will create a new "zero baseline" for future maintenance.
- Flushometer Scope. As detailed on scope quantities and options.
  - Valve Recommissioning: Replace diaphragm kit and inner cap. Re- engineering of the new kit will provide the proper flush curve for each fixture.
  - Valve Rebuilding: Remove and replace diaphragm kit and inner cap. Re- engineering of the new kit will provide the proper flush curve for each fixture. Replace vacuum breaker, handle assembly and O-Rings.
  - New Valve X-Body: HydraMetrics will remove and replace the valve body assembly for standardization, aesthetic enhancement and a maintenance baseline.
  - Spud and/or Flushtube Replacement: HydraMetrics will remove and replace the fixture spuds and flushtubes (optional or as needed).

Tank Toilet Retrofit Upgrade: Benefits of our proposed approach include:

- Tank Toilet Retrofit Upgrade: HydraMetrics will remove and replace the flapper, flow diverter ballcock assembly, and refill tube. As necessary, to ensure proper operation during the warranty period, HydraMetrics will remove and replace the trip lever and supply line.
- Improved Flushing Effectiveness: all fixtures will operate at the "right" amount of water.
- Establishes New Baseline of Maintenance: all new components will resist the rigors of substantial use. This creates a new "zero baseline" for maintenance and translates into significantly reduced labor and costs for years to come.

Sinks: Benefits of our proposed approach include:

- Pressure Independent Performance. End-users will enjoy the same level of performance regardless of incoming pressure (flow rate is constant at pressures between 20 and 80 psi). Pressure variations within the facility would be transparent to the end-users.
- Invisible to End-Users. Because we carefully apply the appropriate flow rate and pattern to each sink (based upon sink application), end-users will not realize a decline in performance.
- Long-Life. Because our flow components are robust in their construction, these devices will serve you well for years to come. Furthermore, we protect the longevity of these products by applying tamper-resistant technology.
- One Size Fits All. No longer will you need to stock different aerators for the various faucets within your facility. Rather, because we adapt all faucets to accommodate the same-size flow control device, you need only one size.

Changes in Infrastructure

New low-flow water fixture components will be installed as part of this ECM.

Customer Support and Coordination with Utilities

Minor support will be required for the interruption of utilities for brief tie-in periods.

Environmental Issues

Resource Use	Water savings will result from lower water flows through new fixtures.
Waste Production	Old components will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

ECM 13A WINDOW FILM

The key benefits of this ECM include:

- **Energy savings** from reducing unwanted heat transfer.
- **Occupancy comfort and productivity** by way of enhanced temperature control throughout your buildings.

ECM Description	Bradford Elementary School	Bullock Elementary School	Buzz Aldrin Middle School	Edgemont Elementary School	Glenfield Middle School	Community Pre-K	Hillside Elementary School	Central Heating Plant	Board of Education Offices	Montclair High School	George Inness Annex	Nishuane K-2	Northeast Elementary School	Renaissance Middle School	Watchung Elementary School	Woodman Field
13A Window Film	●	●	●	●	●	●	●		●	●	●	●	●	●	●	●

Existing Conditions

Windows throughout the district are not considered energy efficient by modern standards, allowing infrared heat to be radiated out during the winter, and solar energy to increase the load in the classrooms during the warmer months.

Window Film Opportunities

Proposed Solution

Honeywell proposes the installation of new solar/safety window film to the existing windows throughout the district. This film reduces the amount of solar energy which passes through the window glass causing hot rooms and taxing the cooling systems. It also reduces the loss of heat via infrared radiation during the winter, lowering heating usage and costs. Overall, through the implementation of this measure, your district will reduce its heating fuel usage and cooling costs each year. The upgrade will result in savings and improved comfort to students and teachers which in turn will foster a better learning environment.

The window film also acts as a safety mechanism by holding the glass together and preventing unwanted entry in the event that the glass itself is compromised.

Building	Square Footage
Bradford Elementary School	9,286
Bullock Elementary School	11,164
Buzz Aldrin Middle School	9,286
Edgemont Elementary School	7,168
Glenfield Middle School	13,633
Valley Road Complex	15,979
Montclair High School	19,747
George Inness Annex (HS-9th), Athletics	11,507
Nishuane K-2	11,389
Northeast Elementary School	9,159
Renaissance Middle School	7,426
Watchung Elementary School	8,792
Woodman Field	4,423

Window Film Opportunities

Energy Savings Methodology and Results

The energy savings for this ECM are realized at the buildings' HVAC equipment. The improved windows will limit heat gain and loss from the spaces, decreasing energy used by the heating and cooling systems.

Following approach is used to determine savings for this specific measure:

Existing Window Efficiency	U_E = 1/Existing R
Proposed Window Efficiency	U_P = 1/Proposed R
Energy Savings $	= (U_E – U_P) * $Area_{windows}$ * audit hours * ($dTemperature_{BIN}$) * ($1/n_{boiler}$) * fuel unit cost

Changes in Infrastructure

New window film will be installed.

Customer Support and Coordination with Utilities

Minimal coordination efforts will be needed to reduce or limit impact to building occupants.

Environmental Issues

Resource Use	Energy savings will result from reduced HVAC energy usage and better occupant comfort.
Waste Production	Any waste materials generated will be disposed of properly.
Environmental Regulations	No environmental impact is expected.

NOTES:
(1) Includes: Hard costs and project service fees defined in ESCO's PROPOSED "FORM V"
(2) No payments are made by MONTCLAIR BOARD OF EDUCATION during the construction period.
(3) This figure should equal the value indicated on the ESCO's PROPOSED "FORM V". DO NOT include in the Financed Project Costs.

2. Utility and Other Rebates and Incentives

NJ Pay-for-Performance Program (P4P)

Honeywell has been certified as a Pay for Performance Program Partner to provide technical services under direct contract to you. Acting as your energy expert, Honeywell will develop an Energy Reduction Plan for each project with a whole-building technical component of a traditional energy audit, a financial plan for funding the energy efficient measures and a construction schedule for installation. This supports your ability to take a comprehensive, whole-building approach to saving energy in your existing facilities and earn incentives that are directly linked to your savings.

Eligibility

Existing commercial, industrial and institutional buildings with a peak demand over 100 kW for any of the preceding twelve months are eligible to participate including hotels and casinos, large office buildings, multi-family buildings, supermarkets, manufacturing facilities, schools, shopping malls and restaurants. Buildings that fall into the following five customer classes are not required to meet the 100kW demand to participate in the Program: hospitals, public districts and universities, nonprofits, affordable multifamily housing, and local governmental entities. Your Energy Reduction Plan must define a comprehensive package of measures capable of reducing the existing energy consumption of your building by 15% or more to utilize the Pay Performance Program.

ENERGY STAR Portfolio Manager

Pay for Performance takes advantage of the ENERGY STAR Program with Portfolio Manager, EPA's interactive tool that allows facility managers to track and evaluate energy and water consumption across all their buildings. The tool provides the opportunity to load in the characteristics and energy usage of your buildings and determine an energy performance benchmark score. You can then assess energy management goals over time, identify strategic opportunities for savings, and receive EPA recognition for superior energy performance.

Incentives

Incentives for the P4P program are based on the annual electric and natural gas savings produced by the Energy Conservation Measures. There are three incentives to the program; details are included in the follow page. The first incentive is distributed after a finalized project is selected and bid. This usually occurs shortly before construction starts or shortly thereafter. The second incentive is distributed a few months after construction is completed, while the third incentive is distributed usually thirteen to fourteen months after the second incentive - once a year of building usage, post-retrofit, is completed.

Incentives, Rebates and Grants Summary

Honeywell has a great deal of experience in applying for, and successfully securing, all available incentives, rebates and grants for our clients. We have been approved and allocated for over $9M of incentives on behalf of our New Jersey customers alone since the introduction of the Energy Savings Improvement Program legislation in 2009. The New Jersey programs employed included primarily the

Office of Clean Energy's Pay for Performance and Cogeneration Incentives. A table of the incentive amounts on a per project basis is provided below.

NJ Customers	Rebate Amount
Hudson County (Projected)	$2,369,012
East Brunswick Public Schools (Projected)	$1,601,318
West Orange Board of Education	$1,399,747
City of Newark	$1,242,368
Passaic County (Projected)	$1,209,061
Old Bridge Board of Education	$1,085,614
Bridgewater-Raritan Regional District	$963,034
Elizabeth Schools	$934,209
Parsippany-Troy Hills Board of Education	$831,175
Camden County Technical Schools	$734,803
West Orange Board of Education	$644,744
Hillsborough Board of Education	$584,736
NH-Voorhees Regional HS District	$511,558
School District of the Chathams	$419,056
West Morris Regional High School (Projected)	$392,700
Phillipsburg School District	$274,278
Educational Services Commission of NJ	$260,603
Somerset County Vocational	$246,095
Robbinsville Public School District	$231,015
Bloomfield Board of Education	$225,868
Mountain Lakes Board of Education	$194,722
Lower Cape May Regional	$190,658
Verona School District	$171,015
Hanover Township School District	$169,882
City of Perth Amboy	$137,441
Town of Kearny	$84,147
Frankford School District	$30,743

Honeywell has determined that the Montclair BOE is eligible for **$1,202,823** in estimated total incentives for the projects. This includes **$1,135,083** for the P4P program and **$67,740** Permanent Load Reduction Incentives.

Please refer to the tables on below for a breakdown of Montclair BOE incentive levels on a building by building basis for each type of incentive.

P4P Incentives

Building	P4P Incentives			
	First Incentive	Second Incentive	Third Incentive	Total Incentive
Bullock Elementary School	$6,301	$50,915	$50,915	$108,132
Glenfield Middle School	$9,396	$82,853	$82,853	$175,101
Valley Road Complex	$12,908	$231,807	$231,807	$476,521
Montclair High School	$19,714	$177,807	$177,807	$375,329
TOTALS	**$48,319**	**$543,382**	**$543,382**	**$1,135,083**

Permanent Load Reduction Incentives

Description	Permanent Load Reduction Incentives			
	1st Year Incentive	2nd Year Incentive	3rd Year Incentive	4th Year Incentive
Permanent Load Reduction Incentives	**$16,935**	**$16,935**	**$16,935**	**$16,935**

Total Rebates and Incentives

Year	P4P Incentives	Permanent Load Reduction Incentives	Total Incentives
Installation	$48,319	$0	$48,319
Year 1	$543,382	$16,935	$560,317
Year 2	$543,382	$16,935	$560,317
Year 3	$0	$16,935	$16,935
Year 4	$0	$16,935	$16,935
TOTALS	**$1,135,083**	**$67,740**	**$1,202,823**

3. Financing the ESIP

In accordance with P.L.2012, c.55 an ESIP can be financed through energy savings obligations. The term refers to the two primary financing tools, debt and lease-purchase instruments. Each of these options is discussed below.

Energy savings obligations shall not be used to finance maintenance, guarantees, or the required third-party verification of energy conservation measures guarantees. Energy saving obligations, however, may include the costs of an energy audit and the cost of verification of energy savings as part of adopting an energy savings plan or upon commissioning. While the audit and verification costs may be financed, they are not to be considered in the energy savings plan as a cost to be offset with savings.

In all cases, maturity schedules of lease-purchase agreements or energy savings obligations shall not exceed the estimated average useful life of the energy conservation measures.

An ESIP can also include installation of renewable energy facilities, such as solar panels. Under an energy savings plan, solar panels can be installed, and the reduced cost of energy reflected as savings.

The law also provides that the cost of energy saving obligations may be treated as an element of the local unit's utility budget, as it replaces energy costs.

DEBT ISSUANCE

The law specifically authorizes municipalities, school districts, cities, counties, and fire districts to issue refunding bonds as a general obligation, backed with full faith and credit of the local unit to finance the ESIP. Because an ESIP does not effectively authorize new costs or taxpayer obligations, the refunding bond is appropriate, as it does not affect debt limits, or in the case of a board of education, require voter approval. The routine procedures for refunding bonds found in the Local Bond Law and Public School Bond Law would be followed for issuance of debt, along with any required Bond Anticipation Notes as authorized pursuant to law.

Regarding bonds for public schools, the Department of Education (DOE) has concluded that debt financed ESIP projects are not covered by State aid for debt service or a "Section 15 EFFCA Grant" as there is no new local debt being authorized.

TAX-EXEMPT LEASE PURCHASE FINANCING

The tax-exempt lease is a common form of financing for ESIP projects. Tax-exempt leasing is a tool that meets the basic objectives of debt, spreading the cost of financing over the life of an asset, while avoiding constitutional or statutory limitations on issuing public debt. If structured properly, by including non-appropriation language in the financing documents, the tax-exempt lease will not be considered debt for state law purposes but will be considered debt for federal income tax purposes. Thus, for federal purposes, the interest component of the lease payment is tax-exempt.

Under the New Jersey Energy Savings Improvement Program (ESIP), the Montclair BOE may authorize a lease purchase agreement between the Montclair BOE and a financier. Ownership of the equipment or improved facilities will pass to the Montclair BOE when all the lease payments have been made. There are legal expenses and other minimal closing costs associated with this type of structure. The lease purchase agreement may not exceed 15 years (commencing upon completion of the construction work), or 20 years where a combined heat and power or cogeneration plant is included in the project. The primary benefits of a lease are lower rates and the acquisition of essential use property without creating debt.

Under a lease there is typically a single investor. The lease may have non-appropriation language that allows the Montclair BOE to access low tax-exempt rates. Some previous customers have chosen to remove the non-appropriation language which has resulted in lower competitive rates.

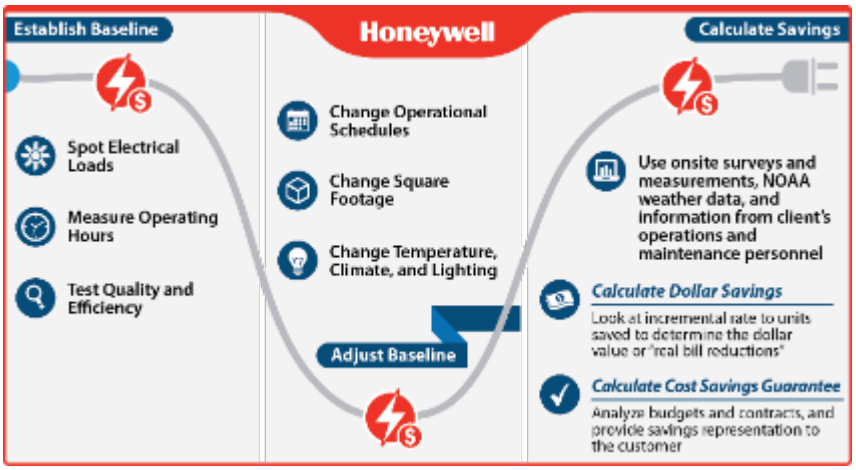
Repayment of the lease payments is tailored to meet the requirements of the Montclair BOE. Payments are typically scheduled to commence after the construction is complete and acceptance of the project has been received by the Montclair BOE. Typically, payment terms are structured so there is no up-front capital expense to the Montclair BOE and payments are aligned within your cash flow and fiscal limits.

CERTIFICATES OF PARTICIPATION (COP'S)

Certificates of Participation are another form of a lease purchase agreement with the differentiating factor being that there are multiple investors participating in the purchase of the lease. COP's require financial disclosure and are typically utilized on higher value projects where one investor doesn't have the capacity to hold a high value lease for a single customer.

ENERGY SAVINGS OBLIGATIONS

Energy Savings Obligations can be issued as refunding bonds in accordance with the requirements of N.J.S.A *40A:11-4.6(c)(3)*. These bonds may be funded through appropriation for the utility services in the annual budget of the contract unit and may be issued as refunding bonds pursuant to N.J.S.40A:2-52 et seq., including the issuance of bond anticipation notes as may be necessary, provided that all such bonds and notes mature within the periods authorized for such energy savings obligations. Energy savings obligations may be issued either through the contracting unit or another public agency authorized to undertake financing on behalf of the unit but does not require bond referendum.



This Page Intentionally Left Blank

SECTION E MEASUREMENT & VERIFICATION AND MAINTENANCE PLAN

1. Baseline

The purpose for establishing a baseline for an energy performance project is to accurately predict what the energy consumption and costs would have been as if the energy project was never completed. The baseline can then be used to measure the improvement in efficiency and determine the overall energy savings of the project. Since the energy consumption of all facilities is somewhat affected by variable weather conditions, a baseline for heating and cooling systems is typically dependent on degree-days or outside temperature. A baseline also needs to incorporate changes in facility use, such as a change in hours of operation or increased levels of outside air. Once again, if these changes would have occurred in the absence of the energy project, they should be incorporated into the project's baseline.

Honeywell will calculate the baseline based on the systems and operating conditions as they currently exist. Honeywell finds baseline development most accurate if specific measurements are taken on equipment over a period of time (early in the audit phase) to determine actual kW, kWh, oil and gas consumption, cfm, gpm, hours of use, etc. A summary of some of the methods, which will be used by Honeywell to establish baselines and support, calculated savings are listed below.

1. Spot measurements of electrical loads such as lighting, fan and pump motors, chillers, electric heat, etc.
2. Measurement of equipment operating hours using electric data recorders.
3. Measurement of existing operating conditions using data recorders for space temperature and humidity, air handler temperatures (mixed, return, cooling and heating coil discharges), and space occupancy using lighting loggers.
4. Spot measurement for boiler efficiencies, water use.
5. Running measurements of chiller operation, including simultaneous measurement of input kWh or steam flow, and chilled water supply and return temperatures and flow (gpm).
6. Records of operating conditions from building management systems and utility-grade meters.

The data from the above is used to calculate existing energy use, which is then reconciled with current facility utility bills, and adjusted as required to provide a mutually agreed baseline.

To provide valid savings evaluations, Honeywell's maintains a significant inventory of metering equipment utilized by its auditors and Energy Engineers to ascertain critical data about the operation of the facility.

Typically, Honeywell's auditors use the following equipment for their onsite measurements:

1. Recording and instantaneous power and harmonic analyzers.
2. Data loggers for pressures, temperatures, flow rates, humidity and CO_2.
3. Lighting level and recording profile/run-hour and occupancy meters.
4. Multimeters, hand held kW meters.
5. Combustion analyzers.
6. Ultrasonic flow meters.
7. Infrared thermometers

The ECMs installed in many projects allow for energy savings to be identified by direct metering or a combination of metering and calculations with accepted assumptions. In the case of lighting, for example, it is relatively easy to meter representative samples of unique fixture types, both before and after a retrofit, to determine the power consumption difference in Watts. When multiplied by the quantity of each fixture type, the total connected load reduction can be derived. In combination with run time assumptions, or meters, the electrical reduction can be accurately determined. Where possible, direct measurement of ECMs during construction (before and after the retrofit) coupled with energy savings calculations is a method the Honeywell finds to be very accurate and cost-effective.

Due to the nature of some ECMs, or when a combination of ECMs is installed, individual (discrete) metering may not be either possible or able to fully document a baseline and calculate savings. Many of these situations can be handled by combining results from metering along with either engineering-based calculations or output from nationally recognized building simulation programs such as DOE II, ASEAM, TRACE or HAP. This method would be used for ECMs such as night setback, and where no other ECMs have significant interaction with the setback measure.

Formulas exercised in energy savings calculations follow the laws of physics, and many are included in the ASHRAE Handbook of Fundamentals. However, such calculations (i.e. equipment operation profiles) must be tempered by experience, past retrofit practice, and expectations of future operating conditions to arrive at achievable values in practice. Honeywell always reviews each and every project, in detail, for the anticipated savings and never hesitates to reduce the anticipated energy calculations where experience dictates necessary. The final result is a coupled project where the final savings are equal to or greater than anticipated.

Calculating the units of energy saved is a critical measure of energy efficiency improvements, but it does not indicate the actual dollars saved. To do this, Honeywell and the Montclair BOE will establish the base rates that will act as "floor" rates in calculating the savings. These are usually the rates that are in effect at the time of the start of the contract or rates used for audit estimated savings.

2. Adjustment to Baseline Methodology[1]

Honeywell's methodology for establishing and adjusting the baseline is determined by the characteristics of the facility, the conservation technology being installed, the technology being replaced, the type of measurement and verification the Montclair BOE requires and the needs of the Montclair BOE for future changes in facility use.

The purpose of this flexible approach is to make the most accurate possible measurement of the changes in energy uses that are specifically attributable to Honeywell installed ECMs. This creates the ability over the life of the contract to continue measuring only savings achieved by Honeywell and leaves the Montclair BOE free to make future changes to the building or systems without affecting the savings agreement. It also necessitates fewer provisions for making adjustments to the baseline.

Modifications to the energy baseline or savings will be made for any of the following:

1. Changes in the number of days in the annual review cycle.
2. Changes in the square footage of the facilities.
3. Changes in the operational schedules of the facilities.
4. Changes in facility indoor temperatures.
5. Significant changes in climate.
6. Significant changes in the amount of equipment or lighting utilized in the facility.

Examples of situations where the baseline needs to be adjusted are: i) changes in the amount of space being air conditioned, ii) changes in auxiliary systems (towers, pumps, etc.) and iii) changes in occupancy or schedule. If the baseline conditions for these factors are not well documented it becomes difficult, if not impossible, to properly adjust them when they change and require changes to payment calculations. To compensate for any addition and deletion of buildings and impact on the baseline model, Honeywell will use sound technical methodologies to adjust the baseline. An example would be to add or delete building energy impact via the calculated cooling load in tons as a percentage of the existing campus tonnage baseline or use indices like W/ft^2 and Btu/ft^2 to calculate the energy consumption of the building and then add or subtract the energy usage to or from the baseline energy consumption.

3. Energy Savings Calculations

In calculating energy savings, Honeywell's highly experienced audit staff uses onsite surveys and measurements, National Oceanic and Atmospheric Administration weather data, detailed discussions with the client's operations and maintenance personnel and engineers, utility records, and other sources to ensure accurate energy, water and O&M savings.
Typically, the following data is gathered:

1. Local weather data.
2. Utility bills and sub-metered consumption trends.

[1] The energy baseline modifications shall use commonly accepted energy engineering methods that are mutually agreeable to both Honeywell and customer. Should agreement on these methods, including the climate adjustments, not be reached between Honeywell and customer, both parties could appeal to an independent engineering.

3. Utility rate structure.
4. Facility use and occupancy data.
5. Internal equipment loads.
6. Interviews of operations and maintenance staff and management.
7. Building construction, age, use and layout.
8. Schematics of energy and water distribution systems.
9. Identification and inventory of HVAC equipment.
10. Identification and inventory of process equipment.
11. Design, configuration and operating characteristics of HVAC systems.
12. Design, configuration and operating characteristics of process systems.
13. Control strategies and sequences of operation for HVAC and other process equipment.
14. Identification and count of all lighting fixtures and determination of power consumption for each type.
15. Identification and inventory of lighting control methods.
16. Measurement of foot-candle levels at sample locations.
17. Power quality and harmonics, power factor.
18. Indoor air quality issues.

Calculating the units of energy saved is a critical measure of energy efficiency improvements, but it does not indicate the actual dollars saved. To do this, Honeywell and the Montclair BOE will establish the base rates that will act as "floor" rates in calculating the savings. These are usually the rates that are in effect at the time of the start of the contract or rates used for audit estimated savings.

The equation below will be used to calculate the annual savings in dollars.

$$AnnualSavings(\$) = \sum_{m=1}^{12} \{\left(Rate_{kWh,Base} \times kWh_{Saved,m}\right) + (Rate_{\,fuel\ Oil,\ Base} \times Fuel\ Oil_{\,Saved,\ gal,\ m}) + (Rate_{\,Steam,\ Base} \times Steam_{\,Saved,\ klbs,\ m}) + (Rate_{\,NG} \times NG_{\,Saved,\ MCF,\ m})\} + Agreed(\$)$$

where:

$Rate_{kWh,Base}$= defined base rate for kWh consumption
$kWh_{Saved,m}$= calculated kWh savings for month *m*

$Rate_{Fuel\ Oil,\ Base}$= defined base rate for fuel Oil savings (XX/gal.)
$Fuel\ Oil_{Saved,m}$= calculated chilled water savings in gal. for month *m*

$Rate_{Steam,Base}$= defined base rate for steam consumption ($XX/MMBtu.)
$Steam_{Saved,m}$= calculated Steam savings in MMBtu. for month *m*

$Rate_{NG,Base}$= defined base rate for natural gas consumption ($XX/Therm)
$NG_{Saved,m}$= calculated natural gas savings in Therms for month *m*

Agreed($)= Annual savings in dollars (water, sewer, maintenance, etc.)

Honeywell assigns dollar values to the true incremental value of savings for energy and water. In other words, we do not combine for example, demand and consumptions numbers so that there is an average value to savings. Honeywell looks at each incremental rate to units saved to properly determine the value (dollar) to the Montclair BOE or “real bill reductions”. As noted in the RFP energy escalation rates will be established in accordance with New Jersey Board of Public Utility guidelines.
Based on this, Honeywell will review all utility bills (hourly data), tariffs, special contracts and commodity contracts to develop the incremental value (costs) of each utility.

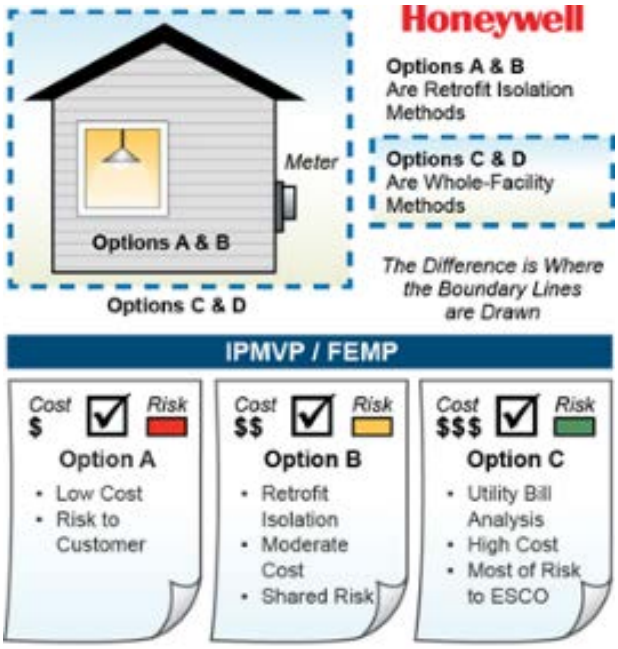
The O&M savings is typically a function of existing the Montclair BOE's budgets (labor & direct costs), maintenance contracts and operations (supplier) contracts. Honeywell will analyze the information to provide a conservative savings representation for the Montclair BOE's review and acceptance. The information will include all calculations and assumptions.

4. Measurement & Verification

The purpose of performing any monitoring and verification is to establish an agreed upon process that provides the customer both a level of satisfaction that the improvements have been delivered and ongoing information as to their operation and performance. Additionally, this effort will be used to assess the actual dollars of savings versus the guarantee level.

It is essential for the success of this program that Honeywell and the Montclair BOE agree on a mutually acceptable methodology for measuring and verifying energy savings that are attributable to the energy conservation measures (ECMs) Honeywell installs. This M&V plan provides the procedures to document the energy and cost savings of each of the proposed ECMs.

The plan for monitoring and verifying energy savings for the proposed ECMs is based on the methods described in the ***International Performance Measurement and Verification Protocol (IPMVP)***[2]. Our approach to M&V is directly consistent with, and in compliance with, the IPMVP. This protocol provides a framework for the most widely accepted and used M&V methods by the industry.



Engineering calculations of energy and cost savings for the project are based on operating parameters (such as weather, temperature settings, run hours, occupancy patterns, and space usage) and equipment performance characteristics. The M&V plan uses the operating parameters established in the baseline for all savings calculations during the term of the project. The intent of the M&V plan is to verify that the ECMs installed by Honeywell will provide the expected energy savings. Therefore, Honeywell will collect data and relative information during the post-retrofit period to demonstrate that the installed equipment is performing at expected levels. It is assumed that the Montclair BOE will continue to be a dynamic institution adding or renovating buildings and desiring to retain the right to set comfort and operating characteristics. To accommodate this, Honeywell will develop its M&V plan in a way that allows the Montclair BOE to adapt to the demands of future campus growth and changes without the need for the Montclair BOE and Honeywell to negotiate energy baseline adjustments.

Our typical M&V plan will utilize broadband Internet access to the appropriate the Montclair BOE's control interfaces to both confirm operating status and to download trend data to verify proper equipment maintenance.

[2] www.ipmvp.org.

One year after the commencement date of the ECMs, Honeywell will submit a report verifying and calculating the energy and cost savings for the first year. This report will be submitted for facility review and approval. For the remaining contract term, Honeywell will provide annual reports. These reports will include results of inspections of the installed equipment/systems, energy and cost savings, and recommendations to provide optimum energy performance.

All permanent measurement equipment will be purchased new with a calibration certificate from the manufacturer. The power multi-meter and the TSI multi-meter will be calibrated annually before using them in the annual inspection.

General Approach to M&V

Energy and water savings are determined by comparing the energy and water use associated with a facility or certain systems within a facility before and after the installation of an ECM or other measure. The “before” case is the baseline. The “after” case is the post-installation or performance period. Baseline and post-installation energy use measurements or estimates can be constructed using the methods associated with M&V options A, B, C, and D, as described in the IPMVP. The challenge of M&V is to balance M&V costs, accuracy, and repeatability with the value of the ECM(s) or systems being evaluated, and to increase the potential for greater savings by careful monitoring and reporting.

M&V Options

The IPMVP guidelines classify the M&V procedures into four categories, Options A, B, C and D. As shown in the table below, these options differ in their approach to the level of complexity of the M&V procedures.

M&V Option	Performance Verification Techniques
Option A Verifying that the measure has the potential to perform and to generate savings.	**Option A** is appropriate for ECMs that have energy use that can be readily quantified, such as the use of high efficiency lighting fixtures, high efficiency constant speed motors, and other standard engineering calculations. Engineering calculations before and after installation spot measurements and use of EMS data points with stipulated values.
Option B Verifying that the measure has the potential to perform and verifying actual performance by end use.	**Option B** is appropriate for ECMs that require periodic or on-going measurements to quantify energy use; such as the use of variable frequency drives on pump or fan motors. Engineering calculations with metering and monitoring strategy throughout term of the contract.

M&V Option	Performance Verification Techniques
Option C Verifying that the measure has the potential to perform and verifying actual performance (whole building analysis.)	**Option C** is used for ECMs for which the energy use or energy savings cannot be measured directly, such as building envelope modifications. Option C is based on the use of utility meters to quantify building energy use. Utility meter billing analysis-using techniques from simple comparison to multivariable regression analysis.
Option D Verifying actual performance and savings through simulation of facility components and/or the whole facility	**Option D** is used for ECMs for which the energy use or energy savings cannot be measured directly, or savings for individual ECMs are heavily interdependent. Calibrated building simulation is used to separate the energy savings attributable to each ECM. Calibrated energy simulation/modeling; calibrated with hourly or monthly utility billing data and/or end-use metering.

In general,

ECM Energy Savings = Baseline Energy Use - Post-Installation Energy Use

And
Energy Cost savings ($) = Total Energy Savings x Contractual Energy Rates

Exceptions to this simple equation are as follows:

Projects where an on/off M&V method is used. For example, after a new energy management system is installed, control features are turned off for a set period of time to recreate baseline conditions. Thus, savings are determined after installation by comparing energy use with and without the control features activated.

Since energy use at a facility is rarely, if ever, constant, another way to define M&V is as a comparison of a facility's post-installation energy use with its usage if the ECM or system had not been installed. This takes into account situations in which baseline energy use must be adjusted to account for changing conditions, such as changes in facility operation, occupancy, or use or external factors such as weather.

Post-Retrofit M&V Activities

There are two components associated with M&V of performance contract projects:

1. Verifying the potential of the ECM to generate savings also stated as confirming that the proper equipment/systems were installed, are performing to specification and have the potential to generate the predicted savings.
2. Determining/verify energy savings achieved by the installed ECM(s).

Verifying the Potential to Generate Savings

Verifying baseline and post-installation conditions involves inspections (or observations), spot measurements, and/or commissioning activities. Commissioning includes the following activities:

- Documentation of ECM or system design assumptions
- Documentation of the ECM or system design intent for use by contractors, agencies and operators
- Functional performance testing and documentation necessary for evaluating the ECM or system for acceptance
- Adjusting the ECM or system to meet actual needs within the capability of the system

Post-Installation Verification

Post-installation M&V verification will be conducted by both Honeywell and the Client to ensure that the proper equipment/systems that were installed are operating correctly and have the potential to generate the predicted savings. Verification methods may include surveys, inspections, and/or spot or short-term metering.

Regular Interval Post-Installation Verification

At least annually, Honeywell will verify that the installed equipment/systems have been properly maintained, continue to operate correctly, and continue to have the potential to generate the predicted savings. Savings report for all the installed ECMs will be submitted each year after the acceptance date of the work performed by Honeywell.

Computation of Energy Savings

After the ECMs are installed, energy and cost savings will be determined annually by Honeywell in accordance with an agreed-upon M&V approach, as defined in a project-specific M&V plan.

Construction/Interim Savings

Construction or Interim savings are usually measured by using the same methodology as described in the detail M&V plan for each ECM. The start and the completion time for each ECM must be agreed to between Honeywell and the Montclair BOE.

Electricity and thermal savings from the ECMs where no detailed long-term data is required to be collected will be stipulated and will be based on the starting and the final completion dates and verification of the operation of the ECMs. For other ECMs where long-term data collection is required by the M&V plan, data will be used to calculate the savings using the same equations as described in the detail plan. For example, to calculate electricity savings for the installation of a VFD, the kW is spot measured at a set speed for selected motors through a sampling plan. The measured kW is subtracted from the baseline kW to calculating the savings. Thermal savings are tied to the electrical savings in the manner described in the detail M&V plan. The results are extrapolated to cover all the VFDs installed by Honeywell.

The savings for each of the monitored VFD is calculated on an interval basis as follows:

$kW_{Saved} = (kW_{Base} – kW_{Spot\ Measured})$
kWh_{Saved} = Estimated operating hours during the interim period * kW_{Saved}
The total kWh savings is the sum of the kWh_{Saved} for all the installed VFDs.

5. Site Specific M&V Plan

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
ECM 1A – LED Lighting	Upgrade Lighting systems: Re-lamp/Re-ballast T8/T12 to LED, Incandescent to LED Metal Halide and Sodium Vapor to LED High Bays	Option A: Pre and Post measurements Line by Line scope and engineering calculations	Pre-M&V: Measurement of kW for 5% sample fixtures in each category. Data log usage hours. Data Log occupancy schedules. Update Line by Line scope with measured kW and usage hours. Post M&V: Measurement of kW for 5% sample fixtures in each category. Usage Hours to remain same. Occupancy schedules to remain same. Energy Savings: Update Line by Line scope with measured kW and usage hours and compare to pre-retrofit calculated savings.
ECM 1B – Lighting Controls	Install lighting control devices	Option A: Pre and Post measurements Line by Line scope and engineering calculations	Pre-M&V: Measurement of kW for 5% sample fixtures in each category. Data log usage hours. Data Log occupancy schedules. Update Line by Line scope with measured kW and usage hours. Post M&V: Measurement of kW for 5% sample fixtures in each category. Usage Hours to remain same. Occupancy schedules to remain same. Energy Savings: Update Line by Line scope with measured kW and usage hours and compare to pre-retrofit calculated savings.
ECM 1C – Vending Misers	Install Vending machine energy management devices	Option A: Pre and Post measurements Line by Line scope and engineering calculations	Pre-M&V: Measurement of kW for 5% sample machines in each category. Data log usage hours. Data Log occupancy schedules. Update Line by Line scope with measured kW and usage hours. Post M&V: Measurement of kW for 5% sample machines in each category. Usage Hours to remain same. Energy Savings scope with measured kW and usage hours and compare to pre-retrofit calculated savings.

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
ECM 1D - De-Stratification Fans	Install De-Stratification fans in Gymnasiums and Multipurpose Rooms to minimize stratification of hot air and maintain hot air flow below the fan level	Option A Engineering calculations based on programmed parameters.	Pre-M&V: Verify existing operating parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified and controls are programmed to match the savings assumptions. Verify savings based on programmed parameters and engineering calculations.
ECM 1E - Plug Load Management via Wi-Fi	Provide Wi-Fi enabled programmed electrical control devices to shut down various plug loads when building is not occupied	Option A: Engineering calculations based on comparison of existing operations and post installation operation.	Pre-M&V: Verify parameters used in the calculations based on data provided by Data loggers on selected pieces of equipment. Post M&V: Verify that the control equipment is installed and programmed as specified. Data log to verify reduced hours of operation.
ECM 2A – Boiler Upgrade	Replace boilers in select locations to handle base load	Option A: Pre and Post measurements and engineering calculations.	Pre-M&V: Perform combustion efficiency test on boilers to be replaced. Post M&V: Perform combustion efficiency test on replaced boilers.
ECM 2A.1 – Vacuum Tank Replacements	Replace condensate return vacuum tanks	Option A: Engineering calculations based on data for the existing and replacement units.	Pre-M&V: Verify existing systems match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified to match the savings assumptions. Verify savings based on installed systems and engineering calculations.
ECM 2B – Boiler Burner Replacements & Controls	Install advanced combustion controls, on existing burners, replace burners where necessary	Option A: Pre and Post measurements and engineering calculations.	Pre-M&V: Perform combustion efficiency test on boilers where burners/controls are to be replaced. Post M&V: Perform combustion efficiency test on boilers where burners/controls were replaced.
ECM 2C – Domestic Hot Water Replacements	Replace existing domestic hot water heaters with condensing natural gas domestic hot water heater	Option A: Engineering calculations based on nameplate and manufacturer supplied data for the existing and replacement units.	Pre-M&V: Verify manufacturer provided data for existing unit efficiency. Post M&V: Verify manufacturer provided data for new unit. Verify the new equipment and controls are installed and commissioned as recommended by manufacturer.
ECM 2D - Rooftop Unit Replacement	Replace antiquated Roof Top Units with new high efficiency Rooftop Units	Option A: Engineering calculations based on nameplate and manufacturer	Pre-M&V: Verify manufacturer provided data for existing unit efficiency (SEER).

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
		supplied data for the existing and replacement units.	Post M&V: Verify manufacturer provided data for new rooftop unit (SEER) – verify the new equipment and controls are installed and commissioned as recommended by manufacturer.
ECM 2E - Kitchen Hood Controls	Install control devices on the Kitchen hoods to control exhaust air in response to the cooking load. Replace fan motors with new premium efficiency motors and VFD drives	Option A: Engineering calculations for VSDs following affinity laws. Engineering calculations based on nameplate, manufacturer supplied data and operating hours for the existing and replacement motors.	Pre-M&V: Verify manufacturer provided data for the motor performance data and motor efficiencies. Post M&V: Obtain trend data for VFD operation from the BMS system to verify baseline calculation assumptions on system loads. Verify efficiency of new motors.
ECM 2F – Walk-In Compressor Controls	Install control device on walk-in freezer and refrigerator evaporators to shut down the fan motor when the compressor is off on duty cycle	Option A: Stipulated Engineering calculations based on case studies for the Intellidyne control.	Pre-M&V: None Post M&V: Savings stipulated based on engineering calculations for the term of contract.
ECM 2G - Motors and VFD Replacements	Install VFDs on select pumps to operate the pump motors in response to the system load. Replace motors with new premium efficiency motors	Option A: Engineering calculations for VFDs following pump affinity laws. Engineering calculations based on nameplate and manufacturer supplied data for the existing and replacement motors.	Pre-M&V: Verify manufacturer provided data for the pump performance data and motor efficiencies. Post M&V: Obtain trend data for VFD operation from the BMS system to verify baseline calculation assumptions on system loads. Verify efficiency of new motors. Verify manufacturer provided data for new VFDs – verify the new equipment and controls are installed and commissioned as recommended by manufacturer.
ECM 2H - Piping Insulation	Insulate Various Piping sizes and runs to prevent thermal losses.	Option A Engineering calculations based on installed systems.	Pre-M&V: Verify existing systems match the baseline calculation assumptions. Verify that systems are installed as specified to match the savings assumptions. Verify savings based on installed systems and engineering calculations.
ECM 2I– Split System Replacements	Replace select split systems with new high efficiency units	Option A: Engineering calculations based on nameplate and manufacturer supplied data for the existing and replacement Units.	Pre-M&V: Verify manufacturer provided data for existing units efficiency (SEER). Post M&V: Verify manufacturer provided data for new units (SEER) – verify the new equipment and controls are installed and commissioned as recommended by manufacturer.

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
ECM 2J - Steam Trap Replacement	Repair or replace failed steam traps	Option A: Engineering calculations based on data for the existing and replacement units.	Pre-M&V: Verify existing systems match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified to match the savings assumptions. Verify savings based on installed systems and engineering calculations.
ECM 2K - Air Handling Unit Refurbishment	Refurbish antiquated Air Handling Units	Option A: Engineering calculations based on nameplate and manufacturer supplied data for the existing and replacement units.	Pre-M&V: Verify manufacturer provided data for existing unit efficiency (SEER). Post M&V: Verify manufacturer provided data for new air handling unit (SEER). Verify the new equipment and controls are installed and commissioned as recommended by manufacturer. Verify savings based on programmed parameters and engineering calculations.
ECM 3A - Building Management Control System	Upgrade Building Management Systems to DDC and integrate all systems to a central platform such that the systems may be monitored and controlled as programmed to maintain global settings such as night set back, optimum stop-start etc.	Option A Engineering calculations based on programmed parameters.	Pre-M&V: Verify existing operating parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified and controls are programmed to match the savings assumptions. Verify savings based on programmed parameters and engineering calculations.
ECM 3B – Demand Control Ventilation	Install CO2 sensor controls to limit OA based on occupancy of space	Option A: Engineering calculations based on programmed parameters.	Pre-M&V: Verify existing operating parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified and controls are programmed to match the savings assumptions. Verify savings based on programmed parameters and engineering calculations.
ECM 3C – Exhaust Fan Controls	Integrate exhaust fans into BMS to control operating times	Option A: Engineering calculations based on programmed parameters.	Pre-M&V: Verify existing operating parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified and controls are programmed to match the savings assumptions. Verify savings based on programmed parameters and engineering calculations.
ECM 4A - Building	Install weather stripping on doors, seal roof wall	Option A:	Pre-M&V: Verify existing systems match the baseline calculation assumptions.

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
Envelope Improvements	joints and roof penetrations	Engineering calculations based on programmed parameters.	Post M&V: Verify that systems are installed as specified to match the savings assumptions. Verify savings based on systems installed and engineering calculations.
ECM 5A – Computer Power Management	Install control software to ensure computers revert to sleep mode when not being used.	Option A: Stipulated Engineering calculations based on computer power management Manf. Software information.	Pre-M&V: None Post M&V: Savings stipulated based on engineering calculations for the term of contract.
ECM 6A – Permanent Load Reduction	Participate in PJM permanent load reduction program	N/A	Pre-M&V: N/A Post M&V: N/A
ECM 7A – Transformer Upgrades	Replace existing secondary transformers with high efficiency equivalents	Option A: Engineering calculations based on increase in transformer efficiency.	Pre-M&V: Measure typical existing transformer (typical one for each size) input and output kW to establish transformer losses Post M&V: Measure input and output kW for new transformer (typical one for each size). Verify savings with engineering calculations.
ECM 8A – Combined Heat & Power (CHP)	Install Cogeneration units	Option A Engineering calculations based on nameplate and manufacturer supplied data for the cogeneration units and - engineering calculations based on programmed parameters.	Pre-M&V: Verify parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified and controls are programmed to match the savings assumptions. Measure kW production and Natural gas usage. Verify savings based on programmed parameters and engineering calculations.
ECM 9A – Roof Replacement	Install new high efficiency roofs on select areas/buildings	Option A: Engineering calculations based on system parameters.	Pre-M&V: Verify existing parameters match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified to match the savings assumptions. Verify savings based on installed systems and engineering calculations.
10A Kitchen Equipment Conversion	Convert Electric Kitchen Equipment to Gas	Option A: Engineering calculations based on system parameters.	Pre-M&V: Verify existing operating systems match the baseline calculation assumptions. Post M&V: Verify that systems are installed as specified to match the savings assumptions. Verify savings based on engineering calculations.
ECM 11A – Solar PPA	Install solar PV arrays as part of Power Purchase Agreement	N/A	Pre-M&V: Utilize baseline kWh consumption to determine kWh produced. Post M&V: Measure and Provide a report of the kWh generated.

ECM # and Name	Summary of ECM	Measurement and Verification Methodology / Recommendation	Description of M&V – Pre and Post Process
ECM 11A – Water Conservation	Install low-flow water fixtures (faucets, toilets, urinals)	Option A: Engineering calculations based on decrease in flow rates.	Pre-M&V: Measure typical existing water fixture flow rates to confirm water loss calculations. Post M&V: Confirm installation of new, low-flow water fixtures per scope. Verify savings with engineering calculations.
ECM 13A – Window Film	Install solar film on specified windows	Option A: Electric energy savings - Engineering calculations based on programmed parameters.	Pre-M&V: Verify existing system parameters match the baseline calculation assumptions. Post M&V: Verify that materials are installed as specified to match the savings assumptions. Verify savings based on engineering calculations.

6. Guarantee of Savings

The approach that Honeywell utilizes in this asset management program includes two key components: a *performance guarantee* and *financial savings*. Honeywell guarantees the Montclair BOE that all installations and work performed are subject to final inspection and the Montclair BOE's acceptance. This procedure ensures all work will be to the level of quality the Montclair BOE expects.

Honeywell also guarantees it will meet the objectives mutually defined with the Montclair BOE. Honeywell takes its commitment to partner with the Montclair BOE for the life of the contract seriously, and looks forward to a successful, long-term partnership.

Honeywell considers the guarantee to be the cornerstone of our service to you. To be considered a *performance contract* an energy guarantee is an optional component under the New Jersey Energy Savings Improvement Program (ESIP) legislation. The basis of an energy performance contract is that the majority of risk is shifted from the Montclair BOE to the ESCO. The strength of the Guarantee is only as good as the Company backing it and their financial solvency. With over $40.5 Billion in assets, Honeywell has the financial strength and background to support the Montclair BOE for the long term.

Savings Guarantee: With the understanding that the Montclair BOE must maintain fiscal health and accountability, Honeywell can financially guarantee the results of its programs and clearly support this obligation with the commitment to regular review of program results and reconciliation. **Honeywell's financial strength and stability give it the ability to extend a FIRST-PARTY GUARANTEE to the Montclair BOE. A first party guarantee eliminates the risk on the Montclair BOE and places it directly onto Honeywell.** This differs from some other ESCO's who provide a third-party guarantee, which insulates them from the owner through the use of insurance instruments.

If at the end of any year the program has not met or exceeded the guaranteed savings for that year, Honeywell will refund the difference between the guaranteed amount and what was actually saved.

For all equipment covered by the Energy Savings Guarantee, the Montclair BOE shall be responsible for on-going maintenance and component replacement in accordance with manufacturer's standards. The customer will also be responsible for operating the equipment in accordance with manufacturer's specifications.

Honeywell will develop savings methodologies that follow current industry practice, such as outlined by the New Jersey Board of Public Utilities (BPU) and Federal Energy Management Program's (FEMP) M&V Guidelines: Measurement and Verification for Federal Energy Projects. References to M&V protocols from the International Performance Measurement and Verification Protocol (IPMVP), ASHRAE Guideline 14 and the Air-Conditioning Refrigeration Institute (ARI) are used to further qualify the M&V plan.

As stated above, under the New Jersey ESIP legislation acceptance of a performance guarantee is optional at the Montclair BOE sole discretion. In the same way, the duration of the guarantee is also optional. Many of Honeywell's New Jersey customers have elected to keep the guarantee in force for less than the total performance periods, i.e. three (3) to five (5) years. Others have elected to accept a one (1) year guarantee, while reserving the option to renew for additional years after they have had the

opportunity to review the track record of actual savings results. Obviously, this a very customer specific decision based on the risk management culture of each unique organization. The key point is that Honeywell is flexible regarding the structure and duration of the guarantee. The final terms will be discussed and defined as part of our co-authored ESIP project.

Solely for informational purposes, it is worth noting that if the Montclair BOE does elect to accept a guarantee, New Jersey ESIP law requires that the Montclair BOE contract with a third-party independent firm to verify that the energy savings are realized. To preserve the independent status of this contractor these costs are required to be incurred directly by the Montclair BOE.

Honeywell develops and implements every project with the same high level of detail and confidence and therefore will always provide a Savings Guarantee at no additional cost. However, if the Montclair BOE opts to accept the Savings Guarantee, the fee indicated on Form V in Section D will be applicable to account for on-going Honeywell service costs incurred during the measurement and verification of the savings as indicated in Form V of our RFP response.

All guarantees require that the owner maintain the system in accordance with the manufacturer's specifications. Regardless of guarantee acceptance, ongoing maintenance as recommended by the BPU, Honeywell and / or manufacturer specifications is required to achieve the projected energy savings. Maintenance should also include a periodic verification of the system to make sure the maintenance is properly conducted, and the system is meeting the original specifications and design.

7. Recommended Preventive Maintenance Services

Per the NJ ESIP program, all services are required to be bid by the Montclair BOE for services as desired. Based on Honeywell's vast service organization, we are uniquely qualified to develop design specification for the public bidding per NJ Law.

Honeywell strongly believes that the long-term success of any conservation program is equally dependent upon the appropriate application of energy savings technologies, as well as solid fundamental maintenance and support. One of the primary contributors to energy waste and premature physical plant deterioration is the lack of operations, personnel training and equipment maintenance.

Honeywell recommends routine maintenance on the following systems throughout the Montclair BOE for the duration of an energy guarantee of savings

Maintenance, Repair and Retrofit Services:

- Mechanical Systems
- Building Automation Systems
- Temperature Control Systems
- Air Filtration

Honeywell will work with the Montclair BOE to evaluate current maintenance practices and procedures. This information will be the basis of a preventive maintenance and performance management plan designed to maximize building operating efficiencies, extend the useful life of your equipment and support the designed Energy Savings Plan.

At a minimum, we recommend the following tasks be performed on a quarterly basis with the Montclair BOE Wide Building Management System.

System Support Services

1. Review recent mechanical system operation and issues with customer primary contact, on a monthly basis.
2. Review online automation system operation and event history logs and provide summary status to the customer primary contact. Identify systemic or commonly re-occurring events.
3. Check with customer primary contact and logbook to verify that all software programs are operating correctly.
4. Identify issues and prioritize maintenance requests as required.
5. Provide technical support services for trouble shooting and problem solving as required during scheduled visits.
6. Provide ongoing system review and operations training support; including two semi-annual lunches and learn sessions.
7. Establish dedicated, site-specific emergency stock of spare parts to ensure prompt replacement of critical components. These will be stored in a secure location with controlled access.

Configuration Management

1. Update documentation and software archives with any minor changes to software made during maintenance work.
2. Verify and record operating systems and databases.
3. Record system software revisions and update levels.
4. Archive software in designated offsite Honeywell storage facility, on an annual basis.
5. Provide offline software imaging for disaster recovery procedures, updated on a regular basis.

Front End / PC Service

1. Verify operation of personal computer and software:
2. Check for PC errors on boot up
3. Check for Windows errors on boot up
4. Check for software operations and performance, responsiveness of system, speed of software
5. Routinely backup system files, on an annual basis:
6. Trend data, alarm information and operator activity data
7. Custom graphics and other information
8. Ensure disaster recovery procedures are updated with current files
9. Clean drives and PC housing, on an annual basis:
10. Open PC and remove dust and dirt from fans and surfaces
11. Open PC interface assemblies and remove dust and dirt
12. Clean and verify operation of monitors.
13. Verify printer operation, check ribbon or ink.
14. Initiate and check log printing functions.
15. Verify modem operation (if applicable).
16. Review IVR schedule for alarms and review (if applicable).

Temperature Controls

UNIT VENTS

Services Performed

Annual Inspection

1. Inspect motor and lubricate.
2. Lubricate fan bearings.
3. Inspect coil(s) for leaks.
4. Vacuum interior.
5. Test operation of unit controls.

PUMPS

Services Performed

Preseason Inspection

1. Tighten loose nuts and bolts.
2. Check motor mounts and vibration pads.
3. Inspect electrical connections and contactors.

Seasonal Start-up

1. Lubricate pump and motor bearings per manufacturer's recommendations.
2. Visually check pump alignment and coupling.
3. Check motor operating conditions.
4. Inspect mechanical seals or pump packing.
5. Check hand valves.

Mid-season Inspection

1. Lubricate pump and motor bearings as required.
2. Inspect mechanical seals or pump packing.
3. Ascertain proper functioning.

Seasonal Shut-down

1. Switch off pump.
2. Verify position of hand valves.
3. Note repairs required during shut-down.

PACKAGED AIR-CONDITIONING SYSTEMS

Services Performed

Preseason Inspection

1. Energize crankcase heater.
2. Lubricate fan and motor bearings per manufacturer's recommendations.
3. Check belts and sheaves. Adjust as required.
4. Lubricate and adjust dampers and linkages.
5. Check condensate pan.

Seasonal Start-up

1. Check crankcase heater operation.

2. Check compressor oil level.
3. Inspect electrical connections, contactors, relays, operating and safety controls.
4. Start compressor and check operating conditions. Adjust as required.
5. Check refrigerant charge.
6. Check motor operating conditions.
7. Inspect and calibrate temperature, safety and operational controls, as required.
8. Secure unit panels.
9. Pressure wash all evaporator and condenser coils (if applicable)
10. Log all operating data.

Mid-season Inspection

1. Lubricate fan and motor bearings per manufacturer's recommendations.
2. Check belts and sheaves. Adjust as required.
3. Check condensate pan and drain.
4. Check operating conditions. Adjust as required.
5. Log all operating data.

Seasonal Shut-down *

1. Shut down per manufacturer's recommendations.

* If no Shut-down is required then (2) Mid-season Inspections are performed

BOILERS

Services Performed

Preseason Inspection

1. Inspect fireside of boiler and record condition.
2. Brush and vacuum soot and dirt from flues (not chimneys) and combustion chamber.
3. Inspect firebrick and refractory for defects.
4. Visually inspect boiler pressure vessel for possible leaks and record condition.
5. Disassemble, inspect and clean low-water cutoff.
6. Check hand valves and automatic feed equipment. Repack and adjust as required.
7. Inspect, clean and lubricate the burner and combustion control equipment.
8. Reassemble boiler.
9. Check burner sequence of operation and combustion air equipment.
10. Check fuel piping for leaks and proper support.
11. Review manufacturer's recommendations for boiler and burner start-up.
12. Check fuel supply.
13. Check auxiliary equipment operation.

Seasonal Start-up

1. Inspect burner, boiler and controls prior to start-up.
2. Start burner and check operating controls.
3. Test safety controls and pressure relief valve.
4. Perform combustion analysis.
5. Make required control adjustments.
6. Log all operating conditions.

7. Review operating procedures and owner's log with boiler operator.

Mid-season Inspection

1. Review operator's log.
2. Check system operation.
3. Perform combustion analysis.
4. Make required control adjustments.
5. Log all operating conditions.
6. Review operating procedures and log with boiler operator.

Seasonal Shut-down

1. Review operator's log.
2. Note repairs required.

SECTION F DESIGN APPROACH

In accordance with the ESIP PL 2012, c.55 as part of the implementation process, an agreement between the Montclair BOE and Honeywell will determine the energy conservation measures (ECM's) to be implemented. The services of a NJ Licensed Engineering firm and / or Architectural firm shall then be secured to properly comply with local building codes, compliance issues and NJ Public contracts law. Specifications will be designed and developed to exact standards as recommended by Honeywell to achieve all savings outlined in this Energy Savings Plan (ESP). Once specifications are completed, Honeywell will publicly solicit contractors capable of meeting the requirements of the specification for each trade. However, even before the completion of the bidding process, Honeywell project management will be engaged to maintain the overall project schedule and ensure the Montclair BOE's expectations are met. An overview of these activities and functions are detailed below.

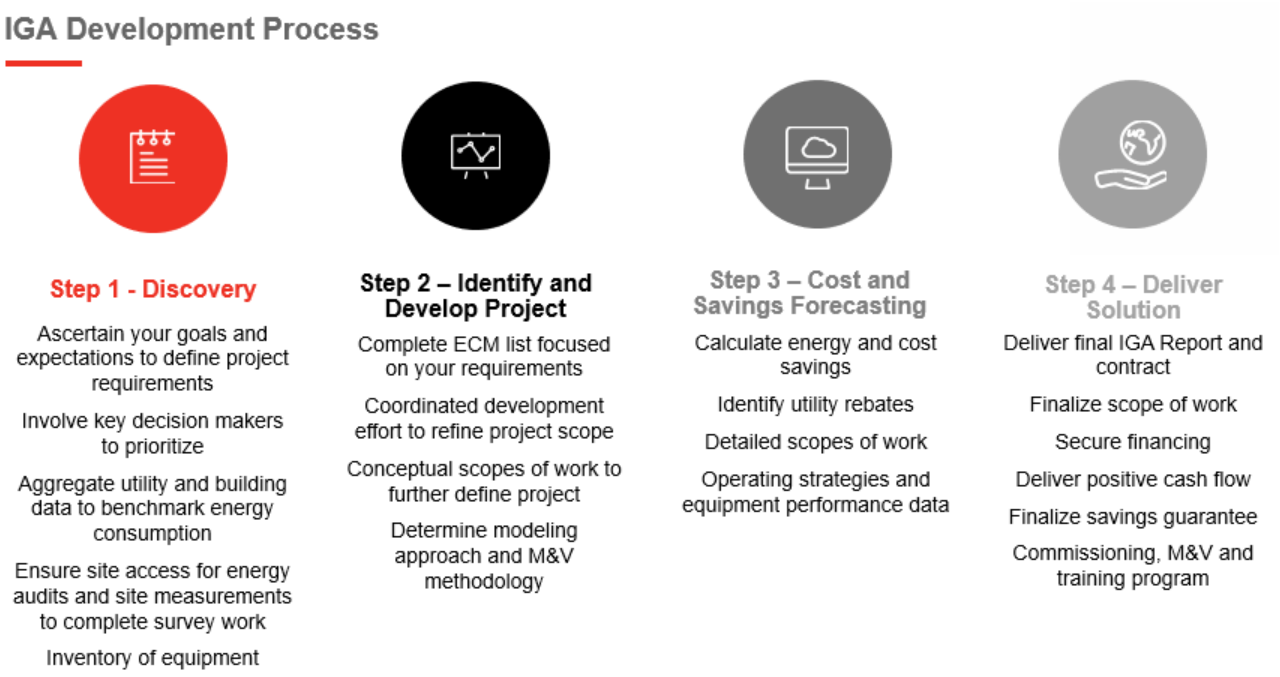
1. Safety Management Plan

All of Honeywell's Project Management Plans begin with safety. By integrating health, safety and environmental considerations into all aspects of our business, we protect our customers, our people and the environment, achieve sustainable growth and accelerated productivity, drive compliance with all applicable regulations and develop the technologies that expand the sustainable capacity of our world. Our health, safety and environment management systems reflect our values and help us meet our customer's needs and our business objectives.

Honeywell's Safety Management Plan is provided in Appendix 4.

2. Project Management Process

Honeywell approaches any ESIP project with a systematic, tested and proven delivery process based upon industry best practices including strong project management, open and collaborative communication, superior technical design and state of the art technologies. We go above and beyond, with multiple NJ delivery teams to ensure sufficient resources, meticulous and thorough training and commissioning, and robust maintenance planning that goes the extra mile for the long term. Honeywell excels at project delivery because of our experience in New Jersey delivering ESIP projects with results that meet or exceed expectations.



Honeywell will demonstrate our partnership-based commitment to The Montclair BOE throughout the development and delivery of your ESIP project, as we have done for dozens of other public entities throughout New Jersey under the ESIP Law. Our approach is backed by our references and track record and highly experienced engineering resources, which will be fully utilized to help you achieve your unique project goals and requirements.

Honeywell prescribes four phases in the ESIP Process that constitutes your project, including:

- Phase 1: Investment Grade Energy Audit (IGEA)
- Phase 2: Project Implementation
- Phase 3: Commissioning and Training
- Phase 4: Energy Savings Guarantee Period

The IGEA will commence with a kickoff meeting between key project stakeholders of the Montclair BOE and Honeywell to review the ESIP Process, including the expectations of both parties during the IGEA, audit parameters, reporting methods, building access protocols, availability of utility and building data, et cetera. Phase 2 will commence after our kickoff meeting has concluded with agreed upon next steps.

Honeywell takes a holistic approach in development of a comprehensive solution that is customized to meet your operational and facility needs and project goals. Our integrated project delivery approach supports continuous and collaborative communication between key stakeholders throughout the process. Our IGEA development process includes the following steps:

Step 1 Discovery

The first step of your IGEA is to gain a thorough comprehension of the Montclair BOE's key priorities and requirements. Honeywell will work with you to identify what your key needs and goals include and investigate your buildings and systems with that in mind during this step.

Honeywell will initiate your IGEA shortly after formal selection with a kickoff meeting involving all key project decision makers of the Montclair BOE and Honeywell. The purpose of this meeting is to establish preliminary project expectations and define key next steps of the process to inform the IGEA.

Honeywell will develop a customized plan for developing an efficient, cost effective and solutions-based project including schedule, finance, performance requirements and scheduling activities.

Honeywell will schedule site visits to commence at the earliest convenience. Utility data is a key component used for establishing your energy baseline to project potential energy savings. Building plans and operating schedules will assist Honeywell to focus our time during the site visits and serve to provide

the means for our engineers to complete their calculations. Data required for this step includes 24 months of electric, thermal, water/sewer data, original and renovation drawings, equipment lists, equipment operating schedules, occupancy data and maintenance records and repair costs.

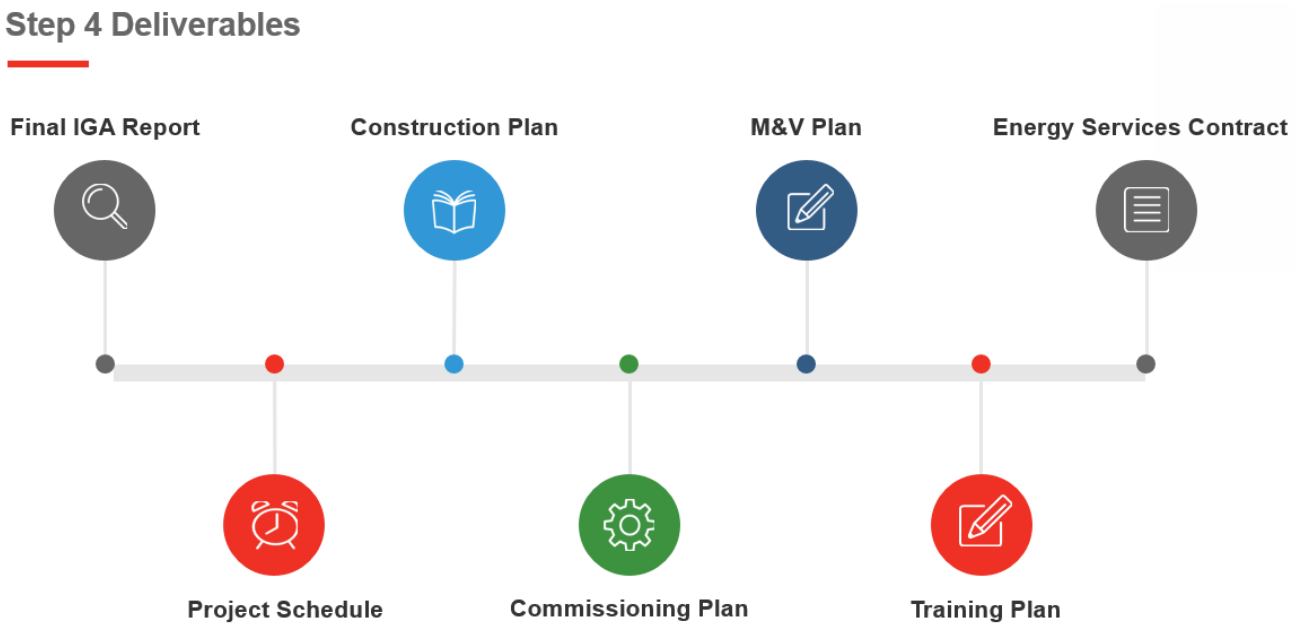
Our goal for the site surveys is to understand your systems in each facility and to identify potential energy conservation measures (ECMs) for inclusion in your final project scope. This step allows Honeywell to determine needed improvements by evaluating each building and its systems in terms of condition, performance and age, including lighting and HVAC systems, Building Automation Systems, building envelopes, electrical distribution, domestic water and heating systems, et cetera.

Step 2 Identify and Develop Project

Honeywell will take the findings of our earlier diagnostic phase to develop solutions that address your priorities and key needs as ascertained in Step 1. Our collaborative, solutions-based approach will allow you to maximize savings to invest more into modernizing buildings and generate maximum rebates to help deliver the most positive cash flow available.

Our primary objective is to ensure quality control and on time delivery throughout your project. Your project will have a dedicated team consisting of project management and engineering who have helped deliver similarly sized project under ESIP in recent past.

Honeywell will create an exhaustive ECM list following the completion of the site survey process. Each opportunity is then analyzed individually to determine both economic and construction feasibility. Input from the Montclair BOE is critical to determine how each ECM fits within your overall project priorities. Honeywell's ECM Opportunity Funnel will help further narrow down the list of potential ECMs to your final ESIP project scope, by analyzing all aspects of your energy consumption to deliver an optimal project scope based on realistic savings potential. Our unique collaborative approach ensures that we deliver on your expectations while providing for turnkey solutions that are cost effective.



Step 3 Cost and Savings Forecasting

Honeywell will then move on to analyze and quantify your unique savings guarantee utilizing the Montclair BOE's dedicated ESIP Team. During this step, we will quantify energy savings by identifying the scope of work and its impact on your facilities and systems. We will measure individual ECMs based on how they will impact future performance of the building as a whole. This will help to ensure that the ECM savings are accounted for only once. Results are then subject to peer reviews to verify accurate modeling and savings forecasts based on the proposed scope of work. Honeywell's unique approach to engineering is why we often exceed the savings guarantee of our contracts.

Step 4 Deliver Solution

Honeywell will leverage our experience delivering more than two dozen NJ ESIP projects since 2009 to help the Montclair BOE complete a successful project on time that maximizes realistic savings, cash rebates and positive cash flow. We have learned through this unrivaled experience that what matters most is to meet your expectations and ensure your involvement in the decision-making process. REACT (Rebate Energy Analysis Constructability Tool) will provide for an interactive solution development experience designed to maximize New Jersey Office of Clean Energy rebates. Our No Change Orders policy (which helps distinguish Honeywell from the competition) will further reduce risk and enhance project results. And our in-house finance team (Honeywell Global Finance) will work to ensure that you secure the most competitive financial offering and interest rate available. No ESCO offers more value throughout the ESIP Process than Honeywell.

Our deliverables during this final phase will include:

A. HONEYWELL PERFORMANCE CONTRACTING

Honeywell is the undisputed performance contracting market leader in the Northeast. Honeywell's Guaranteed Performance Contracting, which we pioneered in the early 1980's, has surpassed the $2 billion mark in cumulative sales. Our performance contracting business features specialized and dedicated resources, including people with expertise specifically to address the needs of our customers. Our portfolio of business experience in the region is over 400 projects and over $500 million in project investment.

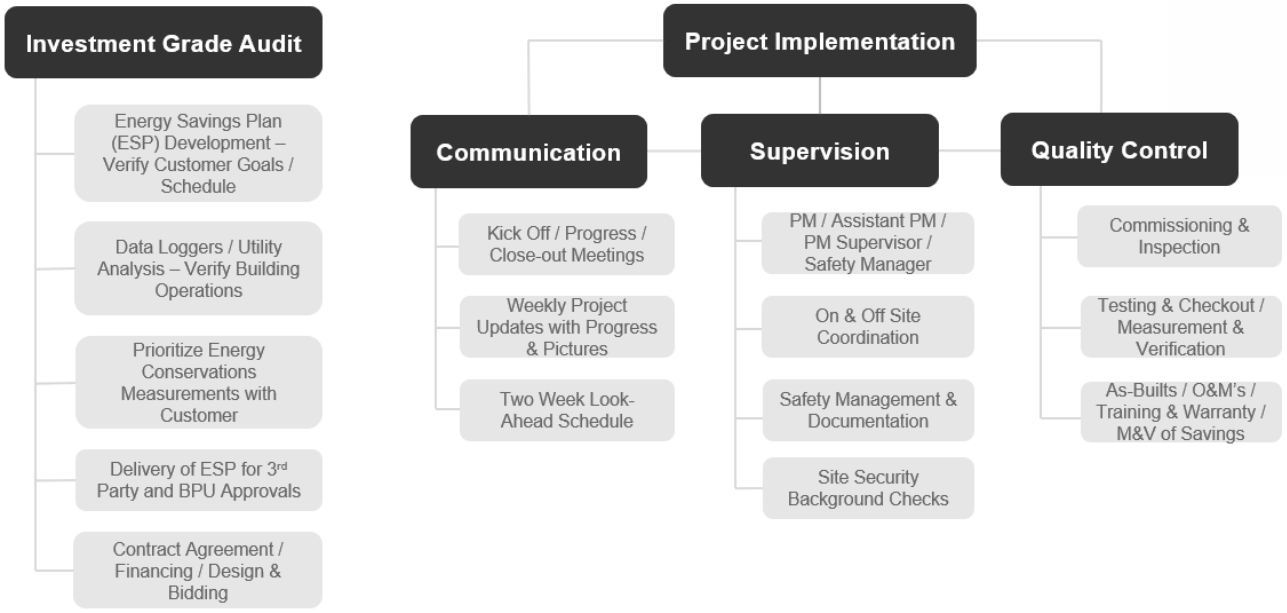
B. PROJECT MANAGEMENT POLICY - HONEYWELL'S COMMITMENT TO HEALTH, SAFETY, THE ENVIRONMENT AND SCHOOL

All of Honeywell's Project Management Plans begin with safety. By integrating health, safety and environmental considerations into all aspects of our business, we protect our customers, our people and the environment, achieve sustainable growth and accelerated productivity, drive compliance with all applicable regulations and develop the technologies that expand the sustainable capacity of our world. Our health, safety and environment management systems reflect our values and help us meet our customer's needs and our business objectives.

Our Safety Commitment to the Montclair BOE

In today's world, nothing is more important than safeguarding our families at home, at work and at school. Through Honeywell's safety awareness process, we commit to our customers to protect and safeguard our construction sites, our employees, sub-contractors, and your staff.

Our projects all begin with the following steps:



- Safety Training for Employee's and Sub-contractors
- Detailed Work Schedules around the day
- Detailed Background Checks of Personnel
- Detail Logs of Sub Contractor Personnel
- On-Site Logs of Time Sheets, Contact Information for All Personnel
- Clearly Displayed Identification Badges of All Construction Personnel
- On-Site Daily Supervision of All Sub-contractors
- Detailed and Weekly Reviews of Accident Reports and Remediation Strategy

We protect the safety and health of our customers and employees through prevention of illness, injury and pollution.

- We actively promote and develop opportunities for expanding sustainable capacity by increasing fuel efficiency, improving security and safety, and reducing emissions of harmful pollutants.
- We are committed to compliance with all of our health, safety, environmental and legal requirements everywhere we operate
- Our commitment to health, safety and the environment is an integral aspect of our design of products, processes and services, and of the lifecycle management of our products.
- Our management systems apply a global standard that provides protection of both human health and the environment during normal and emergency situations
- We identify, control and endeavor to reduce emissions, waste and inefficient use of resources and energy.
- We abide by the company's own strict standards in cases where local laws are less stringent.
- Our senior leadership and individual employees are accountable for their role in meeting our commitments.
- We measure and periodically review our progress and strive for continuous improvement.
- These are our commitments to health, safety, and the environment, and to creating a safe, clean environment everywhere we operate.

C. PROJECT MANAGEMENT PROCESS

Project Management Process

The project management process applies technical knowledge, people and communication skills, and management talent in an on-site, pro-active manner to ensure that our contract commitments are met on time, within budget, and at the quality you expect.

A Honeywell Project Management Plan defines plans and controls the tasks that must be completed for your project. But more than task administration, our project management process oversees the efficient allocation of resources to complete those tasks.

Each project and each customer's requirements are unique. At Honeywell, we address customer needs through a formal communication process. This begins by designating one of our project managers to be responsible for keeping the customer abreast of the status of the project.

As the facilities improvements portion of the partnership begins, the Project Manager serves as a single focal point of responsibility for all aspects of the partnership. The Project Manager monitors labor, material, and project modifications related to the Montclair BOE/Honeywell partnership and makes changes to ensure achievement of performance requirements in the facilities modernization component. The Project Manager regularly reviews the on-going process of the project with the customers.

The Project Manager will develop and maintain effective on-going contact with the Montclair BOE and all other project participants to resolve issues and update project status.

There are several challenges in this position. The Project Manager must staff the project and create a work force capable of handling the technologies associated with the project (pneumatic or

electric/electronic controls, mechanical systems, etc.), and plan for and use these personnel to achieve optimum results focused on occupant comfort and guarantee requirements.

3. Construction Management

Prior to any work in the buildings, our Project Manager will sit down with your administrative and building staff to outline the energy conservation upgrades that we will be installing in their building. We will discuss proper contractor protocol of checking in and out of the buildings on a daily basis, wearing identifiable shirts, identification badges, and checking in with your facilities staff. We will coordinate certain projects for different times of the day, so we do not interrupt the building and learning environments. Our staff will work a combination of first and second shifts to accomplish the pre-set implementation schedule.

Communication is the key success factor in any construction management plan, and our project manager will be the key focal point during the installation process.
Our team will prevent schedule slippages by continuously tracking the location of all equipment and components required for the project. We make sure all equipment and components will be delivered on time prior to the scheduled date of delivery. Our thorough survey, evaluation and analysis of existing conditions, performed prior to the commencement of construction, will also prevent schedule slippages.

Honeywell is required to subcontract various portions of our projects to contractors. Within the Montclair BOE project, all subcontractors will be selected in accordance with New Jersey public contracts law. Typical areas that are subcontracted are as follows:

- Electrical Installation
- Lighting Retrofits
- HVAC Installation (depends upon the project size and scope)
- Associated General Contracting specialty items to support the project etc., (ceilings, windows, concrete, structural steel, roofing, demolition and removal of equipment, painting and rigging)

Where possible under New Jersey public contracts law, Honeywell uses the following guidelines in hiring subcontractors to perform work on our projects.

- Local Presence in the Community (Customer Recommendations)
- Firm’s Qualifications and WBE/MBE Status
- Firm’s Financial Stability
- Ability to perform the work within the project timeline
- Price
- Ability to provide service on the equipment or materials installed over a long period of time.

Approval of subcontractors that Honeywell proposes to use lies with the Montclair BOE.

4. Commissioning

Honeywell provides full commissioning of energy conservation measures (ECM’s) as part of our responsibility on this project. We will customize this process based on the complexity of ECMs. Specifically, Honeywell will be responsible for start-up and commissioning of the new equipment and systems to be installed during the project. This will include verifying that the installed equipment meets specifications, is installed and started up in accordance with manufacturer’s recommendations and

operates as intended. A commissioning plan will be prepared that describes the functional tests to be performed on the equipment and the acceptance criteria.

Prior to customer acceptance of the project, Honeywell submits the final commissioning report containing signed acceptance sheets for each ECM. Signed acceptance sheets are obtained upon demonstrating the functionality of each ECM to a Montclair BOE appointed representative.

Additionally, Honeywell provides training for facility operators and personnel as needed when each ECM is completed and placed into service. All training is documented in the final commissioning report.

After the completion of the Honeywell commissioning effort, in accordance with New Jersey ESIP legislation, the Montclair BOE will be required to secure the services of a 3rd party independent firm to verify that the new equipment and systems meet the standards set forth in the Energy Savings Plan. To maintain the independence of this review, these costs must be born directly by the Montclair BOE. However, at the option of the Montclair BOE, these services can be financed as a portion of the total project cost.

5. Installation Standards

When Honeywell designs a solution, we consider current and future operations. For any upgrades, we install, we follow building codes/standards, which dictate certain standards for energy or building improvements. Listed in tables following this section are standards for building design. During the life of the agreement, there is a partnership approach to maintaining these standards for reasons of comfort and reliability. For lighting our standard is to meet or exceed Illuminating Engineering Society (IES) light level requirements, achieving the relevant standards wherever possible.

In the case of fluorescent lighting upgrades, we recommend that a group re-lamping of lamps be done approximately five years after the initial installation depending upon run times. Your building facility staff, on an as needed basis, can complete normal routine maintenance of lamps and ballasts. This maintains the quality of the lighting levels, and color rendering qualities of the lamps.

Space temperatures will be set by the energy management system and local building controls and will be maintained on an annual basis. Flexibility will be maintained to regulate space temperatures as required to accommodate building occupant needs.

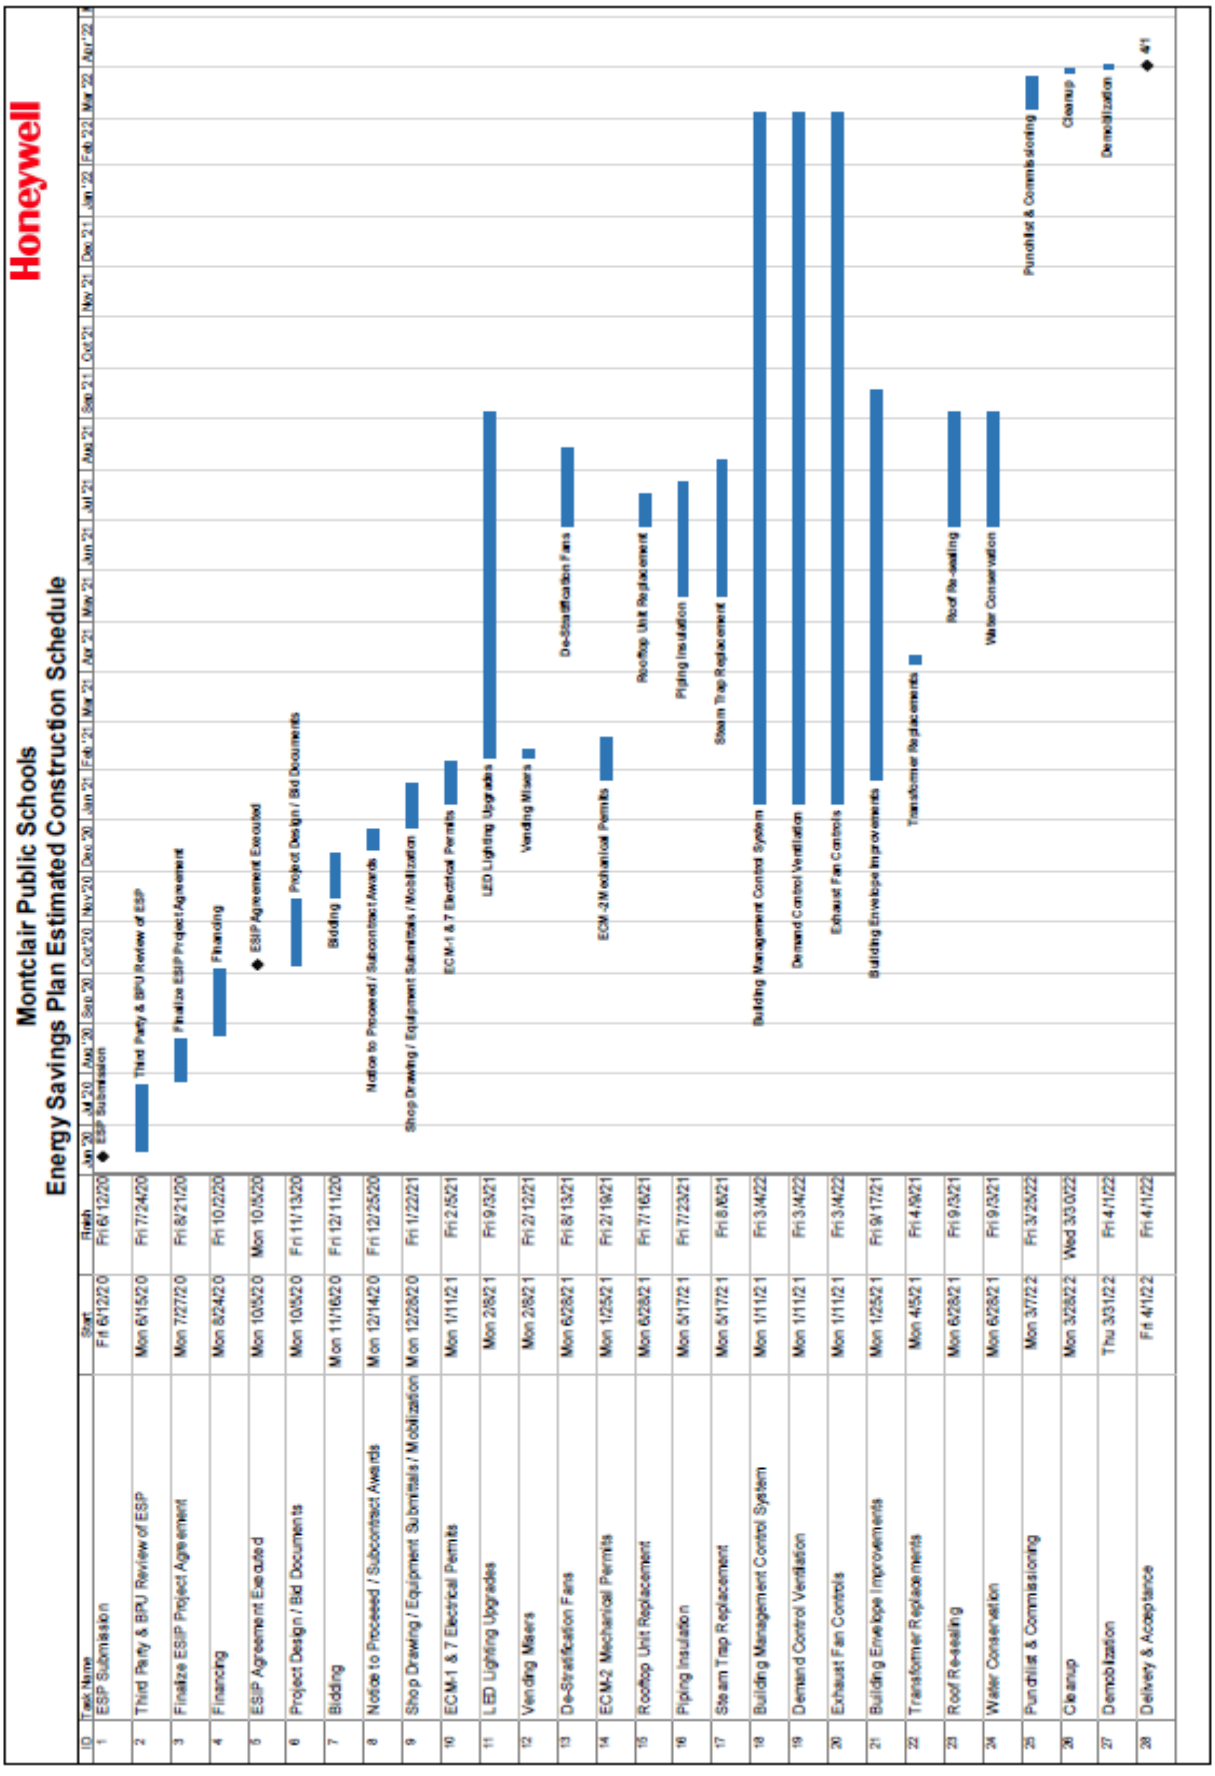
Your facility staff and building personnel will operate the energy management system with ongoing training and support from Honeywell. Therefore, both the Montclair BOE and Honeywell will maintain the standards of comfort. The comfort standards will be maintained throughout the life of the agreement through sound maintenance planning and services recommended as part of this ESP.
Regarding ventilation, Honeywell will upgrade ventilation to meet current standards in those areas where our scope of work involves upgrades to or replacement of systems providing building ventilation. We generally will not upgrade ventilation in those areas where our work doesn't involve the upgrade or replacement of systems or equipment providing ventilation to a building or facility.

Heating and Cooling Standards

Heating Temperatures	Cooling Temperatures	Unoccupied Temperatures
70-72° F	72-74° F	58-62° F

Honeywell uses a variety of in-house labor as well as subcontractors to install the energy conservation measures. We have on staff trained professionals in fire, security, energy management systems, all temperature control systems, and HVAC. However, per the ESIP law, all trades will be publicly bid except for specific controls applications. Listed below is a sampling of some of the disciplines that would apply to the Montclair BOE:

Improvements	Honeywell	Subcontractor
Engineering Design/Analysis	●	
Technical Audit	●	
Construction Administration/Management	●	
On-Site Construction Supervision	●	
Installation of Energy Management System	●	●
Manufacturer of Energy Management Equipment	●	●
Installation of HVAC/Mechanical Equipment		●
Installation of Renewable Technology		●
Installation of Building Envelope		●
Energy Supply Management Analysis/Implementation	●	
Installation of Boilers		●
Maintenance of Energy Management Equipment	●	●
Manufacturer/Installation of Temperature Controls	●	●
Monitoring/Verification Guarantee	●	
Training of Owner Staff	●	
Financial Responsibility for Energy Guarantees	●	



Hazardous Waste Disposal or Recycling

Honeywell disposes of all PCB ballasts or mercury containing materials removed as part of the project per EPA guidelines. Honeywell will complete all the required paperwork on behalf of the Montclair BOE. Honeywell will work with the Montclair BOE to review your hazardous material reports and will identify the areas where work will be completed so that the Montclair BOE can contract to have any necessary material abatement completed.

Honeywell can help schedule or coordinate waste removal, but does not contract for, or assume responsibility for, the abatement work. Honeywell also has the capabilities to assist the Montclair BOE in working with the EPA under compliance management issues. We also develop and manufacture automated systems to track and report a wide variety of environmental factors.

6. Implementation Schedule

Attached please find a sample schedule for construction and completion of the Project.

ID	Task Name	Start	Finish
1	ESP Submission	Fri 6/12/20	Fri 6/12/20
2	Third Party & BPU Review of ESP	Mon 6/15/20	Fri 7/24/20
3	Finalize ESIP Project Agreement	Mon 7/27/20	Fri 8/21/20
4	Financing	Mon 8/24/20	Fri 10/2/20
5	ESIP Agreement Executed	Mon 10/5/20	Mon 10/5/20
6	Project Design / Bid Documents	Mon 10/5/20	Fri 11/13/20
7	Bidding	Mon 11/16/20	Fri 12/11/20
8	Notice to Proceed / Subcontract Awards	Mon 12/14/20	Fri 12/25/20
9	Shop Drawing / Equipment Submittals / Mobilization	Mon 12/28/20	Fri 1/22/21
10	ECM-1 & 7 Electrical Permits	Mon 1/11/21	Fri 2/5/21
11	LED Lighting Upgrades	Mon 2/8/21	Fri 9/3/21
12	Vending Misers	Mon 2/8/21	Fri 2/12/21
13	De-Stratification Fans	Mon 6/28/21	Fri 8/13/21
14	ECM-2 Mechanical Permits	Mon 1/25/21	Fri 2/19/21
15	Rooftop Unit Replacement	Mon 6/28/21	Fri 7/16/21
16	Piping Insulation	Mon 5/17/21	Fri 7/23/21
17	Steam Trap Replacement	Mon 5/17/21	Fri 8/6/21
18	Building Management Control System	Mon 1/11/21	Fri 3/4/22
19	Demand Control Ventilation	Mon 1/11/21	Fri 3/4/22
20	Exhaust Fan Controls	Mon 1/11/21	Fri 3/4/22

Reproduction or distribution of the whole, or any part of the contents of this document without written permission of TRC is prohibited. Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Buzz Aldrin Middle School.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey local governments and school districts in controlling their energy costs and help protect our environment by encouraging more efficient usage of energy resources statewide.

1.1 Facility Summary

Buzz Aldrin Middle School is a 58,128 square foot facility comprised of various space types within a single building. The school building is three floors. It includes classrooms, offices, gyms, locker rooms, a cafeteria, and an auditorium.

Interior lighting at Buzz Aldrin Middle School consists mostly of 1, 2, and 4-lamp T8 linear fluorescent fixtures. There are also many incandescent bulbs used in recessed cans, wall sconces, and ceiling fixtures in the auditorium. The ceiling fixtures in the front foyer and the post lighting by the main entrance also use incandescent bulbs. The exterior perimeter of the building is lit by High Intensity Discharge (HID) spotlight fixtures.

Heating is supplied by the school's two main boilers. They are Weil-McLain low-pressure steam boilers, each with a rated output of 6,100 MBh (@5 psi). Only about 25% of the building's total space is air conditioned. There are approximately 43 window air conditioning (AC) units, which are used to cool some classrooms and 11 packaged terminal air conditioning (PTAC) serving some administrative offices. A thorough description of the facility and our observations are provided in Section 2.

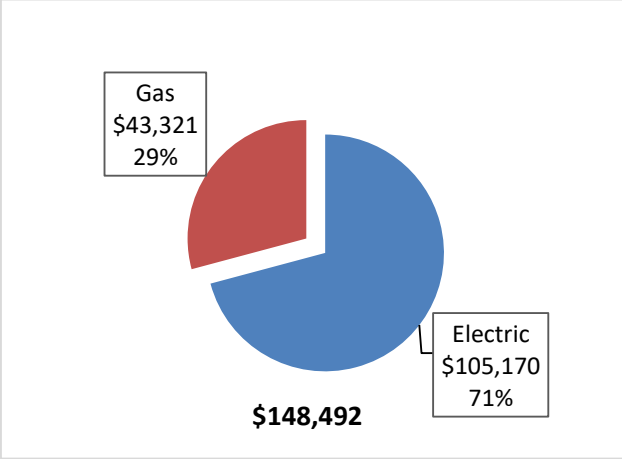
1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated eight potential energy efficient upgrades. We recommend seven ECMs for implementation. The seven ECMs together represent an opportunity for Buzz Aldrin Middle School to reduce annual energy costs by roughly $39,607 and annual greenhouse gas emissions by 242,568 lbs CO_2e. We estimate that if all recommended measures are implemented, the project would pay for itself in energy savings alone in about 3.3 years. The breakdown of existing utility costs is shown in Figure 1. The potential energy savings, following project implementation, is shown in Figure 2. Together these measures represent an opportunity to reduce Buzz Aldrin Middle School's annual energy usage by about 11% overall.

We evaluated the cost and savings for replacement of the school's two main boilers. However, we chose not to include that measure among our recommended ECMs. We estimate that replacement of the main boilers with higher efficiency units could save the school an additional $2,009 per year, but energy savings alone is not sufficient to justify the high cost of that measure. Adding replacement of the boilers to the list of recommended measures would increase overall energy savings to about 15%, but the combined payback period would increase to 8.2 years. (See Figure 3 below).

Figure 1 – Previous 12 Month Utility Costs



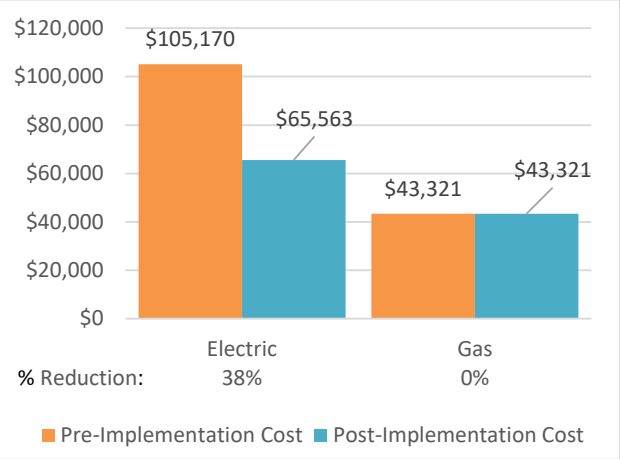


Figure 2 – Potential Post-Implementation Costs

A detailed description of Buzz Aldrin Middle School's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the proposed energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**207,198**	**51.0**	**0.0**	**$34,068.52**	**$120,707.89**	**$22,415.00**	**$98,292.89**	**2.9**	**208,647**
ECM 1	Install LED Fixtures	Yes	15,380	3.3	0.0	$2,528.88	$7,211.34	$1,200.00	$6,011.34	2.4	15,488

ECM 3	Retrofit Fixtures with LED Lamps	Yes	190,978	47.5	0.0	$31,401.55	$112,244.11	$21,195.00	$91,049.11	2.9	192,313
ECM 4	Install LED Exit Signs	Yes	423	0.1	0.0	$69.58	$860.44	$0.00	$860.44	12.4	426
Lighting Control Measures			**32,074**	**8.6**	**0.0**	**$5,273.74**	**$35,926.00**	**$4,245.00**	**$31,681.00**	**6.0**	**32,298**
ECM 5	Install Occupancy Sensor Lighting Controls	Yes	30,452	8.5	0.0	$5,007.14	$32,326.00	$4,245.00	$28,081.00	5.6	30,665
ECM 6	Install High/Low Lighitng Controls	Yes	1,621	0.1	0.0	$266.60	$3,600.00	$0.00	$3,600.00	13.5	1,633
Gas Heating (HVAC/Process) Replacement			**0**	**0.0**	**234.4**	**$2,009.23**	**$209,050.93**	**$0.00**	**$209,050.93**	**104.0**	**27,442**
	Install High Efficiency Steam Boilers	No	0	0.0	234.4	$2,009.23	$209,050.93	$0.00	$209,050.93	104.0	27,442
Plug Load Equipment Control - Vending Machine			**1,612**	**0.0**	**0.0**	**$265.03**	**$460.00**	**$0.00**	**$460.00**	**1.7**	**1,623**
ECM 7	Vending Machine Control	Yes	1,612	0.0	0.0	$265.03	$460.00	$0.00	$460.00	1.7	1,623
TOTAL FOR PROPOSED MEASURES			**240,884**	**59.7**	**0.0**	**$39,607.29**	**$157,093.89**	**$26,660.00**	**$130,433.89**	**3.3**	**242,568**
TOTAL FOR ALL MEASURES			**240,884**	**59.7**	**234.4**	**$41,616.52**	**$366,144.82**	**$26,660.00**	**$339,484.82**	**8.2**	**270,010**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Gas Heating (HVAC/Process) measures generally involve replacing older inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide equivalent heating compared to older systems at a reduced energy cost. These measures save energy by reducing the fuel demands for heating, due to improved combustion and heat transfer efficiency.

Plug Load Equipment control measures generally involve installing automated devices that limit the power usage or operation of equipment that is plugged into an electric outlet when not in use.

Energy Efficient Practices

TRC also identified five low-cost (or no-cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Buzz Aldrin Middle School include:

- Close Doors and Windows
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for Buzz Aldrin Middle School. Based on the configuration of the site and its loads there appears to be a high potential for cost-effective installation of a rooftop solar photovoltaic (PV) array at this site.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	94	kW DC STC
Electric Generation	111,989	kWh/yr
Displaced Cost	$9,740	/yr
Installed Cost	$268,800	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 16, 2016, TRC performed an energy audit at Buzz Aldrin Middle School located in Montclair, New Jersey. TRC's team met with (former Director of Facilities) Leonard Saponara to review the facility operations and help focus our investigation on specific energy-using systems.

Buzz Aldrin Middle School is a 58,128 square foot facility comprised of various space types within a single building. The school building is three floors. It includes classrooms, offices, gyms, locker rooms, a cafeteria, and an auditorium. It is a STEM magnet school for grades 6, 7, and 8.

The original building was constructed in 1909. Additions were constructed in 1920, 1924, 1930, and 1972. A greenhouse was added in 2000. It was originally known as the Mount Hebron School. In 2016, it was renamed in honor of Apollo 11 Astronaut Buzz Aldrin, a school alumnus.

2.3 Building Occupancy

The school building is typically open Monday to Friday, 7:00 AM to 3:30 PM, from September through June. The typical schedule is presented in the table below. During a typical day, the facility is occupied by approximately 600 students and staff.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Buzz Aldrin Middle School	Weekday	7:00 AM - 3:30 PM
Buzz Aldrin Middle School	Weekend	CLOSED

2.4 Building Envelope

The building is constructed of concrete block and structural steel with a brick facade. Around the perimeter, the building has a sloped roof with slate shingles. The center of the building has flat roof covered by a rubber membrane. The building has mostly double-paned, operable windows, which are in good condition. Doors are mostly steel with double-paned glass. All door and window seals appeared tight. No sign of excessive air infiltration was noted.

Image 1: Buzz Aldrin Middle School - Front Exterior

2.5 On-Site Generation

Buzz Aldrin Middle School does not have any on-site electric generation.

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Interior lighting at Buzz Aldrin Middle School consists mostly of 1, 2, and 4-lamp T8 linear fluorescent fixtures. There are also many incandescent bulbs used in recessed cans, wall sconces, and ceiling fixtures in the auditorium. The ceiling fixtures in the front foyer and the post lighting by the main entrance also use incandescent bulbs.

The exterior perimeter of the building is lit by High Intensity Discharge (HID) spotlight fixtures.

Image 2: Lighting Fixtures at Buzz Aldrin Middle School

The exterior lighting is controlled by timers or photocells. Interior lighting is controlled by manual switches.

Steam Heating System

Heating is supplied by the school's two main boilers. They are Weil-McLain gas-fired low-pressure steam boilers, each with a rated output of 6,100 MBh. Steam is supplied to radiators throughout the building at 5 psi. The boilers are 26 years old. They are estimated to be about 80% efficient.

The ASHRAE rated useful lifetime for this type of equipment is 25 years. Though the boilers are at the end of their rated useful life, they are not in bad condition. They are not in critical need of replacement at this time. Replacing them with a high efficiency steam boiler (~85% efficient) is a significant capital expense which would be cost effective on the basis of energy savings alone.

Image 3: HVAC at Buzz Aldrin Middle School

Air Conditioning (AC)

Only about 25% of the building's total space is air conditioned. Cooling is supplied to classrooms by approximately 43 window AC units. The main office and nurse's office are cooled by a total of 11 packaged terminal air conditioning (PTAC) units.

Some of the window AC units are old and in need of repair or replacement, but most were found in good condition. The classrooms are generally not used through the summer months, so replacement of these units with higher efficiency models cannot be justified on the basis of energy savings alone.

Domestic Hot Water Heating System

The domestic hot water is provided by a 75-gallon Bradford-White gas-fired water heater, which is located in the boiler room. It is a fairly efficient model and in good condition.

Image 4: Domestic Hot Water at Buzz Aldrin Middle School

Refrigeration

TRC counted six refrigerators at the school. There are two large Traulsen commercial refrigerators in the kitchen and one glass door refrigerator in the cafeteria for beverages. The rest are standard small to medium sized units used by school staff.

Image 5: Refrigeration Equipment at Buzz Aldrin Middle School

Building Plug Load

Plug-Load equipment at the school appeared to be fairly typical for a building of this size and type. The school has approximately 187 desktop computers and monitors, about a dozen small printers, four large copy machines, six large flat screen TVs, and about six computer servers. There are also many microwaves, toaster ovens, coffee makers, and other devices used by school staff. Also found were one clothes washer, one dryer, and three electric stoves.

The school has just two vending machines (one beverage machine and one snack machine) located in the teacher's room.

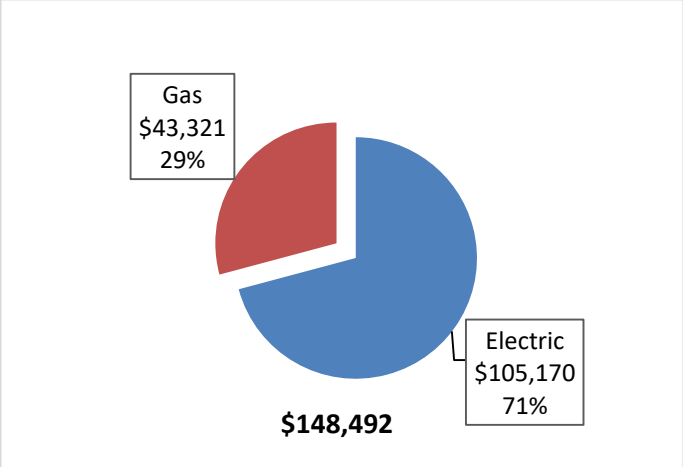
2.7 Water-Using Systems

There are approximately 15 restrooms at this facility. In our sampling of restrooms fixtures, all faucets appeared to meet current guidelines for "low-flow" water conserving devices for public restrooms. All toilets and urinals also appeared to be low-flow devices. For more on current water conservation standards, see Section 5.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on a recent 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 7 - Utility Summary

Utility Summary for Buzz Aldrin Middle School		
Fuel	**Usage**	**Cost**
Electricity	639,624 kWh	$105,170
Natural Gas	50,534 Therms	$43,321
Total		**$148,492**

The current annual energy cost for this facility is $148,492 as shown in the chart below.

Figure 8 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric rate over a recent 12-month period was found to be $0.164/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Electric usage appears to be fairly constant throughout the year, with a slight decline in the summer months due to lack of occupancy.

Figure 9 - Electric Usage & Demand

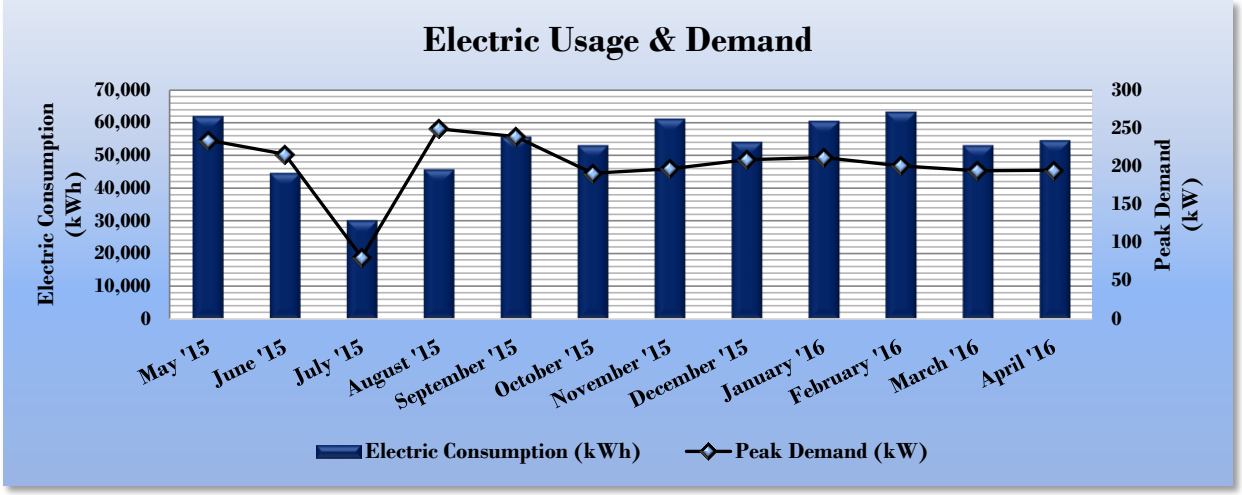


Figure 10 - Electric Usage & Demand

Electric Billing Data for Buzz Aldrin Middle School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
6/15/15	31	61,910	234	$4,858	$12,000
7/15/15	30	44,623	216	$4,154	$10,064
8/13/15	29	30,171	81	$2,089	$6,889
9/14/15	32	45,701	249	$4,422	$10,215
10/13/15	29	55,673	239	$2,445	$8,909
11/11/15	29	53,095	191	$2,179	$8,441
12/14/15	33	61,175	197	$2,169	$9,066
1/14/16	31	54,088	209	$1,825	$8,037
2/12/16	29	60,533	212	$1,807	$8,083
3/15/16	32	63,259	201	$1,722	$8,243
4/14/16	30	53,058	194	$1,603	$7,453
5/13/16	29	54,586	195	$1,621	$7,481
Totals	**364**	**637,872**	**249.1**	**$30,893**	**$104,882**
Annual	**365**	**639,624**	**249.1**	**$30,978**	**$105,170**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average natural gas rate for a recent 12-month period was found to be $0.857/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below. Gas usage appears to be fairly typical for a facility of this size and type, which is heated by natural gas with little or no other significant gas usage during non-heating months.

Figure 11 - Natural Gas Usage

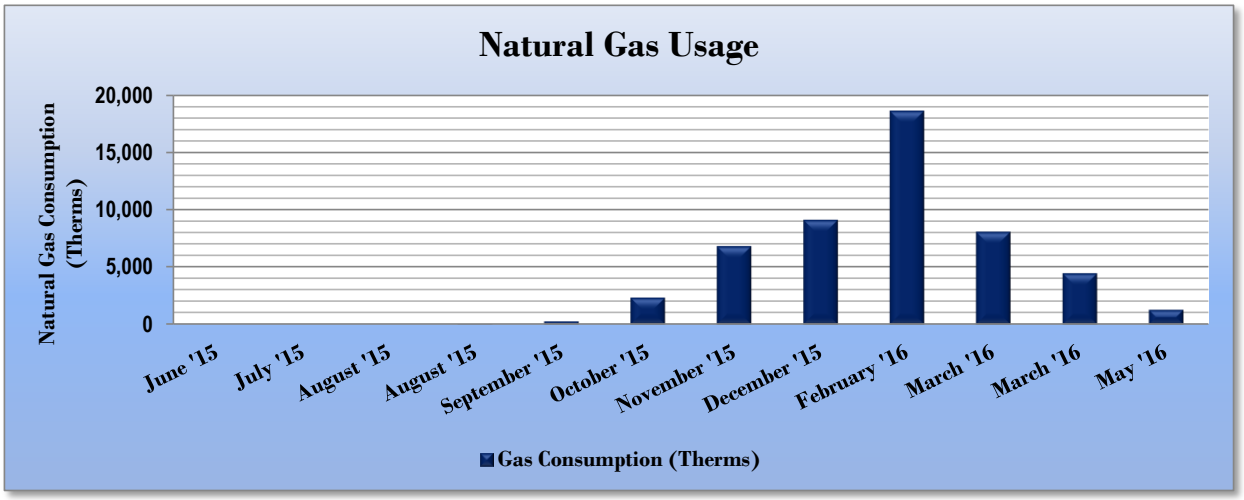

Figure 12 - Natural Gas Usage

Gas Billing Data for Buzz Aldrin Middle School				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/16/15	32	0	$103	No
7/20/15	34	0	$103	No
8/17/15	28	0	$103	No
9/15/15	29	22	$117	No
10/14/15	29	248	$241	No
11/12/15	29	2,325	$4,086	Yes
12/15/15	33	6,806	$6,808	No
1/15/16	31	9,120	$8,214	No
2/18/16	34	18,620	$13,495	Yes
3/17/16	28	8,083	$7,102	No
4/15/16	29	4,458	$2,513	No
5/17/16	32	1,268	$793	No
Totals	**368**	**50,949**	**$43,677**	2
Annual	**365**	**50,534**	**$43,321**	

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 13 - Energy Use Intensity Comparison – Existing Conditions

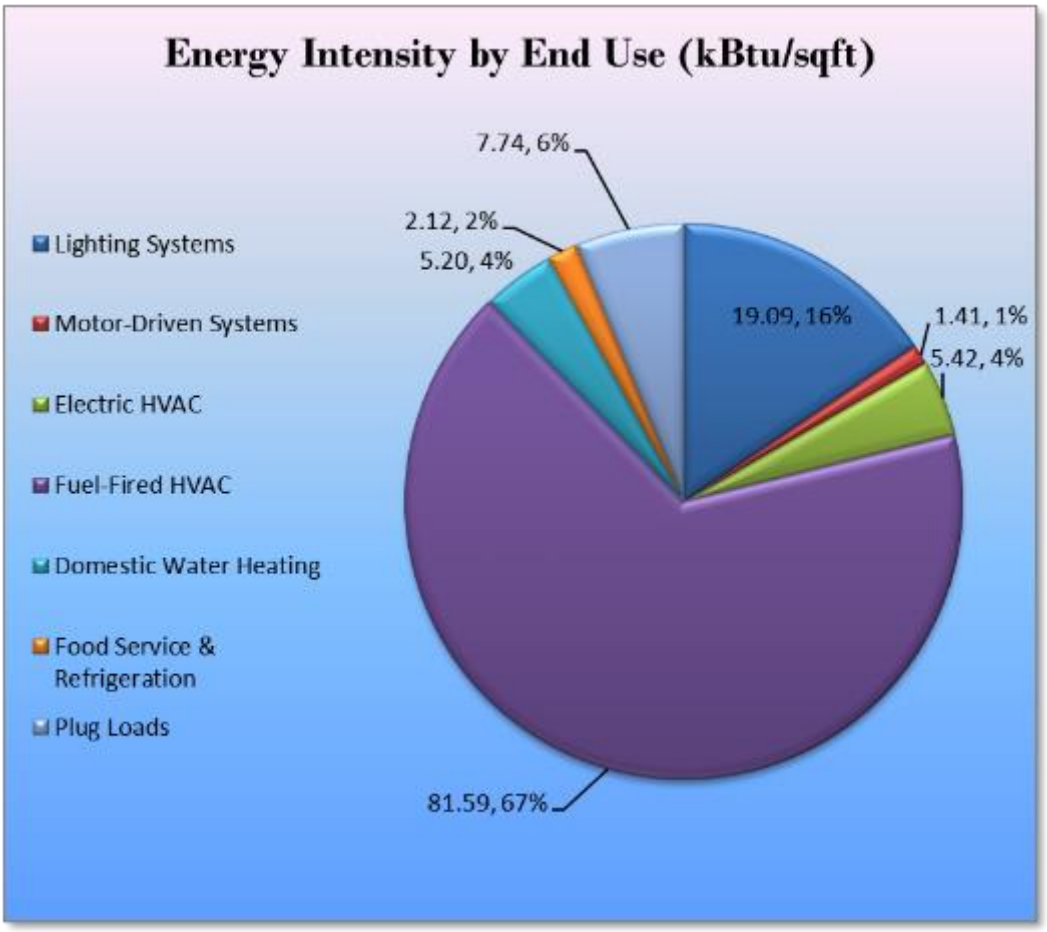
Energy Use Intensity Comparison - Existing Conditions		
	Buzz Aldrin Middle School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	209.2	141.4
Site Energy Use Intensity (kBtu/ft^2)	124.5	58.2

Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 14 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Buzz Aldrin Middle School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	164.8	141.4
Site Energy Use Intensity (kBtu/ft^2)	110.3	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. This facility was estimated to have a current ENERGY STAR® score of 38, which means that it is slightly less efficient than the median value for buildings of its size, age, and type.



A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance. For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 15 - Energy Balance (kBtu/ft² and %)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Buzz Aldrin Middle School regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 16 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**207,198**	**51.0**	**0.0**	**$34,068.52**	**$120,707.89**	**$22,415.00**	**$98,292.89**	**2.9**	**208,647**
ECM 1	Install LED Fixtures	15,380	3.3	0.0	$2,528.88	$7,211.34	$1,200.00	$6,011.34	2.4	15,488
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	417	0.1	0.0	$68.50	$392.00	$20.00	$372.00	5.4	420
ECM 3	Retrofit Fixtures with LED Lamps	190,978	47.5	0.0	$31,401.55	$112,244.11	$21,195.00	$91,049.11	2.9	192,313
ECM 4	Install LED Exit Signs	423	0.1	0.0	$69.58	$860.44	$0.00	$860.44	12.4	426
Lighting Control Measures		**32,074**	**8.6**	**0.0**	**$5,273.74**	**$35,926.00**	**$4,245.00**	**$31,681.00**	**6.0**	**32,298**
ECM 5	Install Occupancy Sensor Lighting Controls	30,452	8.5	0.0	$5,007.14	$32,326.00	$4,245.00	$28,081.00	5.6	30,665
ECM 6	Install High/Low Lighitng Controls	1,621	0.1	0.0	$266.60	$3,600.00	$0.00	$3,600.00	13.5	1,633
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$265.03**	**$460.00**	**$0.00**	**$460.00**	**1.7**	**1,623**
ECM 7	Vending Machine Control	1,612	0.0	0.0	$265.03	$460.00	$0.00	$460.00	1.7	1,623
TOTALS		**240,884**	**59.7**	**0.0**	**$39,607.29**	**$157,093.89**	**$26,660.00**	**$130,433.89**	**3.3**	**242,568**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 17 below. below.

Figure 17 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**207,198**	**51.0**	**0.0**	**$34,068.52**	**$120,707.89**	**$22,415.00**	**$98,292.89**	**2.9**	**208,647**
ECM 1	Install LED Fixtures	15,380	3.3	0.0	$2,528.88	$7,211.34	$1,200.00	$6,011.34	2.4	15,488
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	417	0.1	0.0	$68.50	$392.00	$20.00	$372.00	5.4	420
ECM 3	Retrofit Fixtures with LED Lamps	190,978	47.5	0.0	$31,401.55	$112,244.11	$21,195.00	$91,049.11	2.9	192,313
ECM 4	Install LED Exit Signs	423	0.1	0.0	$69.58	$860.44	$0.00	$860.44	12.4	426

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	8,701	2.4	0.0	$1,430.68	$4,341.06	$0.00	$4,341.06	3.0	8,762
Exterior	6,679	0.9	0.0	$1,098.20	$2,870.28	$1,200.00	$1,670.28	1.5	6,726

Measure Description

We recommend replacing existing fixtures with HID bulbs lamps to new high-performance LED light fixtures. Also included in this measure are upgrades to recessed can ceiling lighting. We recommend that they be upgraded with retrofit kits. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a fluorescent tube and more than 10 times longer than many incandescent lamps.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	417	0.1	0.0	$68.50	$392.00	$20.00	$372.00	5.4	420
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend retrofitting existing T12 fluorescent fixtures by removing fluorescent tubes and ballasts and replacing them with LEDs and LED drivers (if necessary), which are designed to be used retrofitted fluorescent fixtures. The measure uses the existing fixture housing but replaces the rest of the components with more efficient lighting technology. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Some linear fluorescent fixtures can be upgraded to LEDs without changing the existing ballast, but for older T12 fixtures we recommend that the ballast be changed too when the fixture is upgraded.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	187,125	47.0	0.0	$30,767.97	$111,964.30	$21,195.00	$90,769.30	3.0	188,433
Exterior	3,853	0.5	0.0	$633.58	$279.81	$0.00	$279.81	0.4	3,880

Measure Description

We recommend retrofitting most existing fixtures with linear fluorescent, compact fluorescent, or incandescent lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies.

This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 4: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	423	0.1	0.0	$69.58	$860.44	$0.00	$860.44	12.4	426
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend replacing all incandescent or compact fluorescent exit signs with LED exit signs. Most of the school's exit signs already use LEDs, but a few still use older, less efficient incandescent or compact fluorescent bulbs.

LED exit signs require virtually no maintenance and have a life expectancy of at least 20 years. This measure saves energy by installing LED fixtures, which use less power than other technologies with an equivalent lighting output.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 18 below.

Figure 18 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**32,074**	**8.6**	**0.0**	**$5,273.74**	**$35,926.00**	**$4,245.00**	**$31,681.00**	**6.0**	**32,298**
ECM 5	Install Occupancy Sensor Lighting Controls	30,452	8.5	0.0	$5,007.14	$32,326.00	$4,245.00	$28,081.00	5.6	30,665
ECM 6	Install High/Low Lighitng Controls	1,621	0.1	0.0	$266.60	$3,600.00	$0.00	$3,600.00	13.5	1,633

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 5: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
30,452	8.5	0.0	$5,007.14	$32,326.00	$4,245.00	$28,081.00	5.6	30,665

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in many restrooms, storage rooms, classrooms, offices areas, and other areas where occupancy often changes throughout the school day.

Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

ECM 6: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,621	0.1	0.0	$266.60	$3,600.00	$0.00	$3,600.00	13.5	1,633

Measure Description

We recommend installing occupancy sensors to provide dual level lighting control for lighting fixtures in spaces that are infrequently occupied but may require some level of continuous lighting for safety or security reasons. Typical areas for such lighting control are stairwells or other areas where building code requirements dictate that the space needs to be lit 24 hours per day.

Lighting fixtures with these controls operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and infrared sensors. The lighting systems are quickly switched to full lighting levels whenever an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period of time.

Energy savings results from only providing full lighting levels when it is required.

For this type of measure the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage needs to be provided to ensure that lights turn on in each area as an occupant approaches.

Additional savings from reduced lighting maintenance may also result from this measure, due to reduced lamp operation.

4.1.3 Plug Load Equipment Control - Vending Machines

Our recommendations for plug load equipment controls are summarized in Figure 19 below.

Figure 19 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$265.03**	**$460.00**	**$0.00**	**$460.00**	**1.7**	**1,623**
ECM 7	Vending Machine Control	1,612	0.0	0.0	$265.03	$460.00	$0.00	$460.00	1.7	1,623

ECM 7: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,612	0.0	0.0	$265.03	$460.00	$0.00	$460.00	1.7	1,623

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor controls to reduce the energy usage of refrigerated beverage vending machines. These controls power down vending machines when the vending machine area has been vacant for some time, then power up at regular intervals, as needed, to turn machine lights on or keep the product cool. Energy savings are a dependent on vending machine and activity level in the area surrounding the machines.

4.2 ECM Evaluated but Not Recommended

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 20 – Summary of Measure Evaluated, but Not Recommended

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**234.4**	**$2,009.23**	**$209,050.93**	**$0.00**	**$209,050.93**	**104.0**	**27,442**
Install High Efficiency Steam Boilers	0	0.0	234.4	$2,009.23	$209,050.93	$0.00	$209,050.93	104.0	27,442

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Steam Boilers

Measure Description

We evaluated replacement of existing inefficient steam boilers with new high-efficiency steam boilers. Significant improvements have been made in combustion technology resulting in increases in overall boiler efficiency. Energy savings results from improved combustion efficiency and reduced standby losses at low loads.

The existing boilers were installed in 1992. The ASHRAE rated useful lifetime for this type of equipment is 25 years. Though the boilers have reached the end of their rated useful life, they are in good condition. Replacement does not appear to be a critical need at this time.

Reasons for not Recommending

Replacing the existing boilers with high-efficiency steam boilers (~85% efficient) is a significant capital expense, potentially over $200,000. Replacement will likely become more necessary in the near future, but many similar boilers last much longer than 25 years without significant decline in efficiency in later years.

This measure was not recommended for implementation at this time because the energy it would save is not sufficient by itself to justify the large capital expense of replacement.

If the school district chooses to include this measure, it would likely increase the total energy savings for the school to about 15% but would increase the payback period for all measures combined to about 8.2 years.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

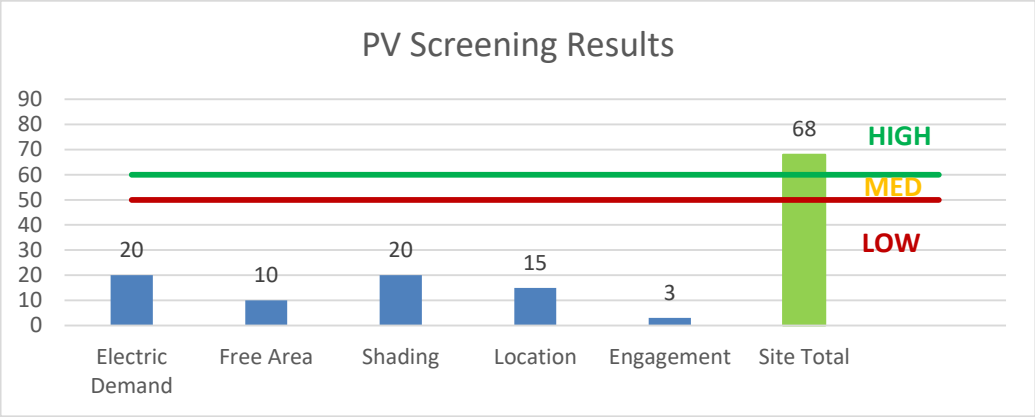
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High Potential** for installing a cost-effective rooftop PV solar array.

Estimated costs and energy savings are shown in the table below. We estimate that the building has sufficient flat, unshaded rooftop space to support a 94-kW solar array. Such an array could offset a significant portion of the school's current electric purchases.

Figure 21 - Photovoltaic Screening

Potential	High	
System Potential	94	kW DC STC
Electric Generation	111,989	kWh/yr
Displaced Cost	$9,740	/yr
Installed Cost	$268,800	

The estimated savings shown in the table above do **not** include potential SREC (Solar Renewable Energy Certificate) subsidies, which the solar project would likely be eligible to receive for up to 15 years of operation. When SREC subsidies are included, similar projects often have a payback period of 8 years or less. If Buzz Aldrin Middle School is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Solar projects must register their projects in the SREC Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.2 for additional information.

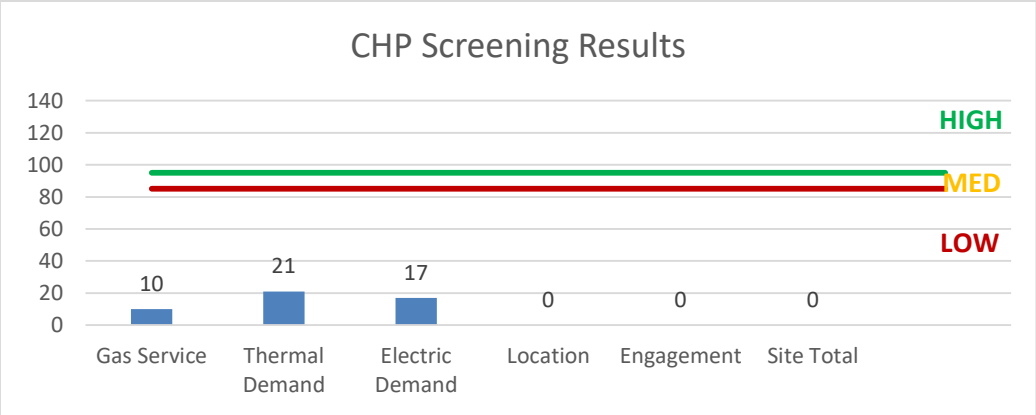
For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar

- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.



CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low Potential** for installing a cost-effective CHP system.

Low and infrequent thermal load and lack of space near the existing boilers are the most significant factors contributing to the potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in New Jersey specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 22 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion, the facility is not a good candidate for DR curtailment program.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 23 for a list of the eligible programs identified for each recommended ECM.

Figure 23 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings
ECM 1	Install LED Fixtures	X			
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	X			
ECM 3	Retrofit Fixtures with LED Lamps	X			
ECM 4	Install LED Exit Signs				
ECM 5	Install Occupancy Sensor Lighting Controls	X			
ECM 6	Install High/Low Lighitng Controls				
ECM 7	Vending Machine Control	X			

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Administration Building.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey educational facilities in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

The Administration Building is a 15,714 square foot facility founded in 1879. The building is a three-story educational support facility including but not limited to offices, hallways, restrooms, and conference areas.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 40-Watt and 75-Watt T12 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several incandescent and compact fluorescent lamps. Exterior lighting is provided by a combination of 100-Watt and 150-Watt high pressure sodium and 200-Watt incandescent lamps. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation is primarily provided by window AC units. Heating is provided by the Central Heating Plant.

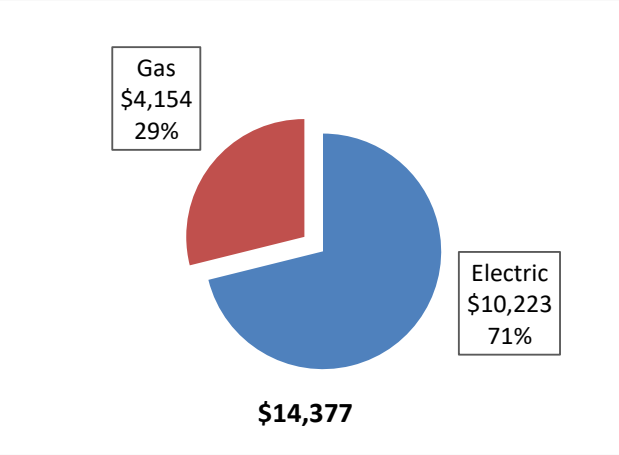
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated six measures and recommended five measures which together represent an opportunity for the Administration Building to reduce annual energy costs by roughly $3,219 and annual greenhouse gas emissions by 21,260 lbs CO_2e. We estimate that if all high priority measures are implemented as recommended, the project will pay for itself in roughly 4.8 years. TRC has defined high priority measures as the evaluated measures that have a simple payback less than the typical equipment life of the proposed equipment. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce Administration Building's annual energy use by 10%.

Figure 1 – Previous 12 Month Utility Costs



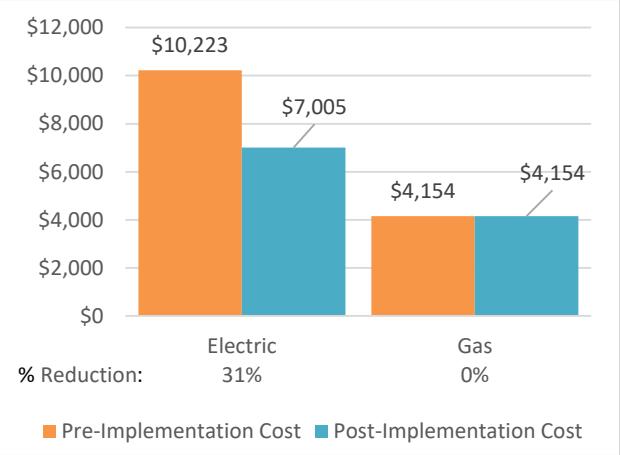


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Administration Building's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the evaluated energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		High Priority?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**19,051**	**4.8**	**0.0**	**$2,904.34**	**$15,256.16**	**$2,565.00**	**$12,691.16**	**4.4**	**19,184**
ECM 1	Install LED Fixtures	Yes	2,165	0.3	0.0	$329.99	$1,562.71	$400.00	$1,162.71	3.5	2,180
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	Yes	1,461	0.3	0.0	$222.73	$1,758.00	$5.00	$1,753.00	7.9	1,471
ECM 3	Retrofit Fixtures with LED Lamps	Yes	15,425	4.2	0.0	$2,351.62	$11,935.45	$2,160.00	$9,775.45	4.2	15,533
Lighting Control Measures			**2,061**	**0.5**	**0.0**	**$314.21**	**$3,030.00**	**$280.00**	**$2,750.00**	**8.8**	**2,076**

Electric Unitary HVAC Measures			**5,213**	**4.1**	**0.0**	**$794.78**	**$33,388.64**	**$0.00**	**$33,388.64**	**42.0**	**5,250**
	Install High Efficiency Electric AC	No	5,213	4.1	0.0	$794.78	$33,388.64	$0.00	$33,388.64	42.0	5,250
TOTALS FOR HIGH PRIORITY MEASURES			**21,112**	**5.3**	**0.0**	**$3,218.56**	**$18,286.16**	**$2,845.00**	**$15,441.16**	**4.8**	**21,260**
TOTALS FOR ALL EVALUATED MEASURES			**26,325**	**9.4**	**0.0**	**$4,013.33**	**$51,674.80**	**$2,845.00**	**$48,829.80**	**12.2**	**26,510**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Electric Unitary HVAC measures generally involve replacing older inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide equivalent cooling to older air condition systems at a reduced energy cost. These measures save energy by reducing the power used by the air conditioning systems, due to improved electrical efficiency.

Energy Efficient Practices

TRC also identified five low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at the Administration Building include:

- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Clean Evaporator/Condenser Coils on AC Systems
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for the Administration Building. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.2 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 09, 2016, TRC performed an energy audit at the Administration Building located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

The Administration Building is a 15,714 square foot facility founded in 1879. The building is a three-story educational support facility including but not limited to offices, hallways, restrooms, and conference areas.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Administration Building	Weekday	8:00 AM - 6:00 PM
Administration Building	Weekend	unoccupied

2.4 Building Envelope

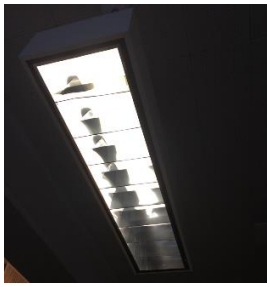
The Administration Building is a three-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with operable frames. The slanted roof is constructed of tile roofing material.

Figure 6 – Building Façade

2.5 On-Site Generation

The Administration Building does not have any on-site electric generation capacity.

2.6 Energy-Using Systems



Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at the Administration Building consists mainly of 32-Watt T8 linear fluorescent fixtures with a few 40-Watt and 75-Watt T12 linear fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. The linear fluorescent fixtures are 4-foot or 8-foot long, mainly troffers with diffusers having 1, 2, 3, or 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 17-Watt compact fluorescent lamps and 60-Watt incandescent lamps. All the exit signs are LED fixtures.

Interior lighting control in the building is provided by a combination of manual switches and occupancy sensors.

Figure 7 - Building Lighting Systems

Linear Fluorescent Fixture	*Exterior Fixture*
	

Exterior lighting is provided by a combination of 100-Watt and 150-Watt high pressure sodium fixtures, and 200-Watt incandescent fixtures.

Heating System

The Central Heating Plant has two natural gas fired Weil McLain steam boilers with an input rating of 7,938 MBh each and a nominal efficiency of 80%. These boilers provide space heating for the Hillside School, the Montclair Community Pre-K, and the district Administration Building.

Figure 8 – Heating System

Steam Boiler

Direct Expansion Air Conditioning System (DX)

Air conditioning (AC) at the facility is primarily provided by window AC units with capacities ranging between 0.42 ton and 2 tons and with efficiencies of around 10.0 EER.

Figure 9 – DX Air Conditioning System

Domestic Hot Water Heating System

The domestic hot water heating system for the facility is provided by the Central Heating Plant.

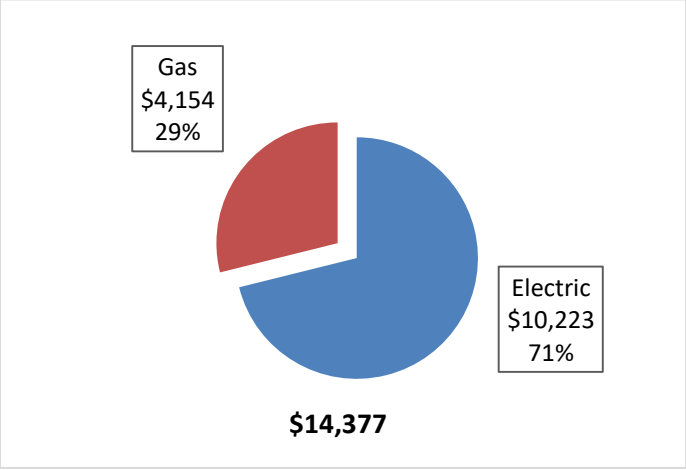
Building Plug Load

The facility contains several plug-load systems which contribute to plug load electric use including but not limited to printers, copiers and microwave.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 10 - Utility Summary

Utility Summary for Administration Building		
Fuel	**Usage**	**Cost**
Electricity	67,061 kWh	$10,223
Natural Gas	5,180 Therms	$4,154
Total		**$14,377**

The current annual energy cost for this facility is $14,377 as shown in the chart below.

Figure 11 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.152/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Electric usage estimation and calibration methodology:

1. The Montclair BOE buildings Hillside School, Administration, Montclair Community Pre-K, and Central Heating Plant are served by three electric meters 65 795 083 02, 67 125 896 06, and 42 007 763 08. There is not a clear delineation of loads served by the meters, therefore demand (kW) was not prorated.
2. Total energy use from all the meters combined is around 638,475 kWh for a 12-month period.
3. Monthly "calculated" energy use from the LGEA analysis tools were used to calculate the percentage contribution of each building. The percentages are:
    a. Hillside School – 70%
    b. Administration Building – 11%
    c. Montclair Community Pre-K – 18%
    d. Central Heating Plant – 1%

The above percentages were applied to the "actual" total monthly energy use from bills to estimate monthly utility energy use to which all the tools were then calibrated.

Figure 12 - Electric Usage & Demand

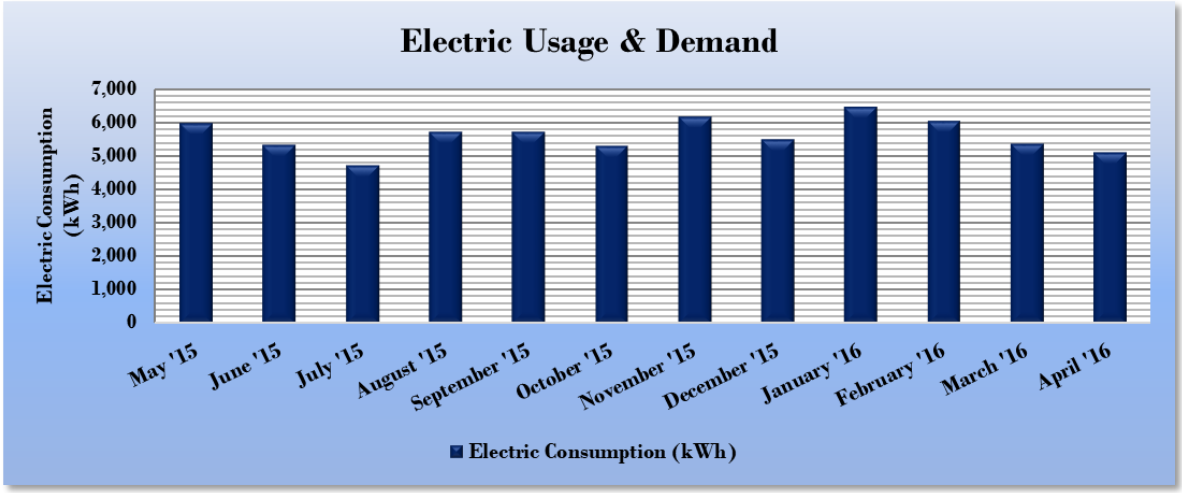


Figure 13 - Electric Usage & Demand

Electric Billing Data for Administration Building				
Period Ending	Days in Period	Electric Usage (kWh)	Total Electric Cost	TRC Estimated Usage?
6/15/15	33	5,955	$1,158	Yes
7/14/15	29	5,311	$1,021	Yes
8/12/15	29	4,697	$897	Yes
9/14/15	33	5,710	$1,048	Yes
10/13/15	29	5,700	$841	Yes
11/10/15	28	5,290	$744	Yes
12/11/15	31	6,172	$846	Yes
1/13/16	33	5,471	$714	Yes
2/11/16	29	6,445	$828	Yes
3/14/16	32	6,026	$774	Yes
4/13/16	30	5,367	$722	Yes
5/13/16	30	5,100	$659	Yes
Totals	**366**	**67,245**	**$10,251**	12
Annual	**365**	**67,061**	**$10,223**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.802/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Natural gas use was allocated to the sites served by the Central Heating Plant using the following method:

1. The Administration Building, Hillside School, Montclair Community Pre-K, and Central Heating Plant are served by two gas meters: 65 795 083 02 and 67 125 896 06. There is not a clear delineation of which buildings and equipment are served by each meter.
2. Total annual gas use for both of the meters combined is 59,235 therms.
3. The calculated gas use from the LGEA analysis for each building was used to determine the percentage of the total historical gas use to be assigned to each building. Total gas use was allocated to the three buildings served by the Central Heating Plant as follows:
    a. Hillside School - 75%
    b. Administration Building - 9%
    c. Montclair Community Pre-K - 16%
4. The above percentages were applied to the total monthly gas use from the utility bills to estimate the monthly gas use for the individual buildings. This estimated monthly gas use is what is provided in each of the reports.

Figure 14 - Natural Gas Usage

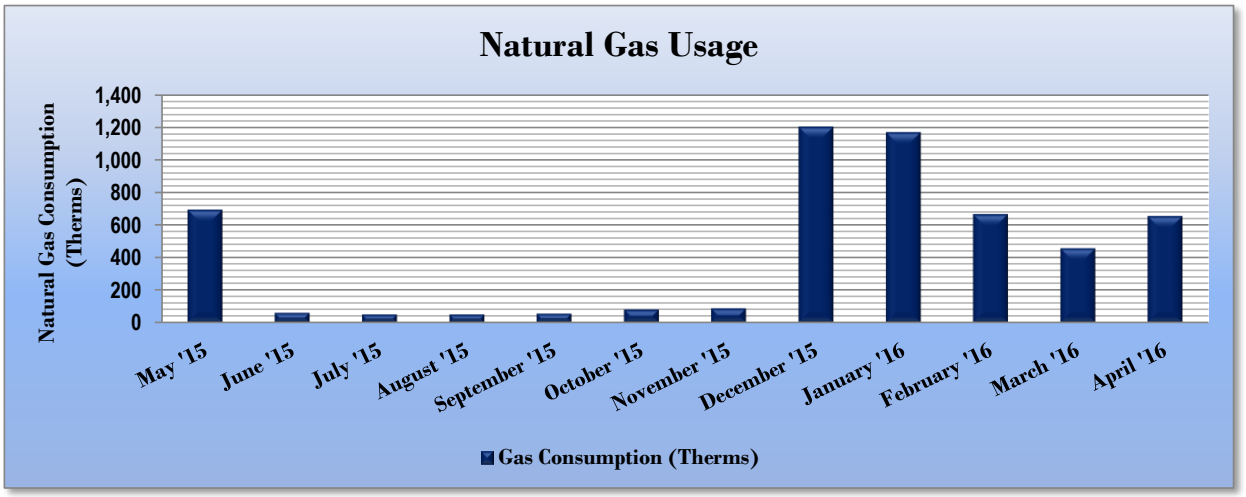

Figure 15 - Natural Gas Usage

Gas Billing Data for Administration Building				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/15/15	33	691	$373	Yes
7/14/15	29	58	$117	Yes
8/12/15	29	49	$49	Yes
9/14/15	33	49	$121	Yes
10/13/15	29	54	$75	Yes
11/10/15	28	79	$84	Yes

Totals	**366**	**5,194**	**$4,165**	12
Annual	**365**	**5,180**	**$4,154**	

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 16 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Administration Building	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	80.3	141.4
Site Energy Use Intensity (kBtu/ft^2)	47.5	58.2

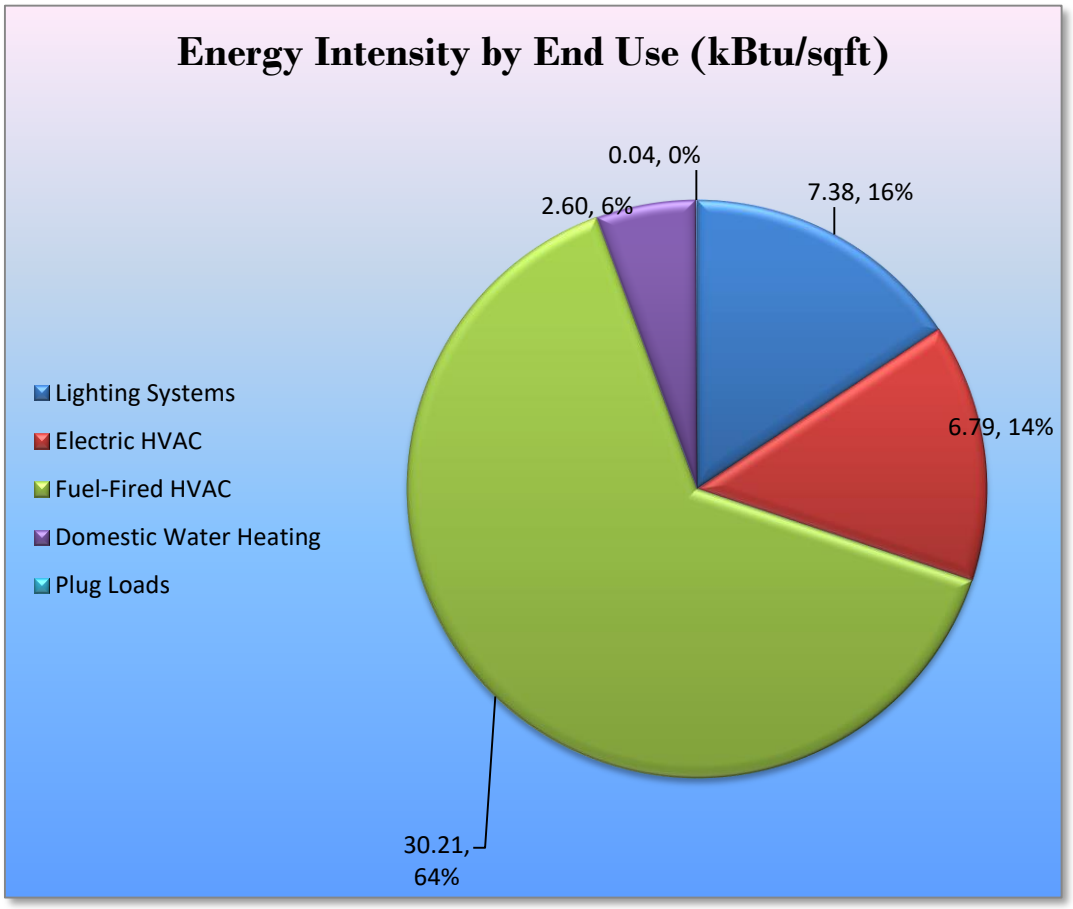
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 17 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Administration Building	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	65.9	141.4
Site Energy Use Intensity (kBtu/ft^2)	42.9	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. The Central Heating Plant and the three buildings served by it have a combined score of 74.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 18 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Administration Building regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 High Priority ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 19 – Summary of High Priority ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**19,051**	**4.8**	**0.0**	**$2,904.34**	**$15,256.16**	**$2,565.00**	**$12,691.16**	**4.4**	**19,184**
ECM 1	Install LED Fixtures	2,165	0.3	0.0	$329.99	$1,562.71	$400.00	$1,162.71	3.5	2,180
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,461	0.3	0.0	$222.73	$1,758.00	$5.00	$1,753.00	7.9	1,471
ECM 3	Retrofit Fixtures with LED Lamps	15,425	4.2	0.0	$2,351.62	$11,935.45	$2,160.00	$9,775.45	4.2	15,533
Lighting Control Measures		**2,061**	**0.5**	**0.0**	**$314.21**	**$3,030.00**	**$280.00**	**$2,750.00**	**8.8**	**2,076**
ECM 4	Install Occupancy Sensor Lighting Controls	1,846	0.4	0.0	$281.45	$2,430.00	$280.00	$2,150.00	7.6	1,859
ECM 5	Install High/Low Lighitng Controls	215	0.0	0.0	$32.76	$600.00	$0.00	$600.00	18.3	216
TOTALS		**21,112**	**5.3**	**0.0**	**$3,218.56**	**$18,286.16**	**$2,845.00**	**$15,441.16**	**4.8**	**21,260**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 20 below.

Figure 20 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**19,051**	**4.8**	**0.0**	**$2,904.34**	**$15,256.16**	**$2,565.00**	**$12,691.16**	**4.4**	**19,184**
ECM 1	Install LED Fixtures	2,165	0.3	0.0	$329.99	$1,562.71	$400.00	$1,162.71	3.5	2,180
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,461	0.3	0.0	$222.73	$1,758.00	$5.00	$1,753.00	7.9	1,471
ECM 3	Retrofit Fixtures with LED Lamps	15,425	4.2	0.0	$2,351.62	$11,935.45	$2,160.00	$9,775.45	4.2	15,533

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Annual Electric Savings (kWh)	Chilled Water Savings (Ton-Hr)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Exterior	2,165	2,165	0	0.3	0.0	$329.99	$1,562.71	$400.00	$1,162.71	3.5	2,180

Measure Description

We recommend replacing exterior fixtures containing high pressure sodium lamps with new high-performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a high-pressure sodium fixture.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Annual Electric Savings (kWh)	Chilled Water Savings (Ton-Hr)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,461	1,461	0	0.3	0.0	$222.73	$1,758.00	$5.00	$1,753.00	7.9	1,471

Measure Description

We recommend retrofitting existing T12 fluorescent fixtures by removing fluorescent tubes and ballasts and replacing them with LEDs and LED drivers (if necessary), which are designed to be used retrofitted fluorescent fixtures. The measure uses the existing fixture housing but replaces the rest of the components with more efficient lighting technology. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a fluorescent tube.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	14,681	4.1	0.0	$2,238.10	$11,881.70	$2,155.00	$9,726.70	4.3	14,783
Exterior	745	0.1	0.0	$113.51	$53.75	$5.00	$48.75	0.4	750

Measure Description

We recommend retrofitting existing T8 linear fluorescent, incandescent, and compact fluorescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 21 below.

Figure 21 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**2,061**	**0.5**	**0.0**	**$314.21**	**$3,030.00**	**$280.00**	**$2,750.00**	**8.8**	**2,076**
ECM 4	Install Occupancy Sensor Lighting Controls	1,846	0.4	0.0	$281.45	$2,430.00	$280.00	$2,150.00	7.6	1,859
ECM 5	Install High/Low Lighitng Controls	215	0.0	0.0	$32.76	$600.00	$0.00	$600.00	18.3	216

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,846	0.4	0.0	$281.45	$2,430.00	$280.00	$2,150.00	7.6	1,859

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in conference rooms, storage rooms, offices areas, etc. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
215	0.0	0.0	$32.76	$600.00	$0.00	$600.00	18.3	216

Measure Description

We recommend installing occupancy sensors to provide dual level lighting control for lighting fixtures in spaces that are infrequently occupied but may require some level of continuous lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors, parking lots, and parking garages.

Lighting fixtures with these controls operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared sensors. The lighting systems are switched to full lighting levels whenever an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period. Energy savings results from only providing full lighting levels when it is required.

For this type of measure the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage needs to be provided to ensure that lights turn on in each area as an occupant approaches.

Additional savings from reduced lighting maintenance may also result from this measure, due to reduced lamp operation.

4.2 Other Evaluated ECM

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 22 – Summary of Other Evaluated ECM

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Electric Unitary HVAC Measures	**5,213**	**4.1**	**0.0**	**$794.78**	**$33,388.64**	**$0.00**	**$33,388.64**	**42.0**	**5,250**
Install High Efficiency Electric AC	5,213	4.1	0.0	$794.78	$33,388.64	$0.00	$33,388.64	42.0	5,250
TOTALS	**5,213**	**4.1**	**0.0**	**$794.78**	**$33,388.64**	**$0.00**	**$33,388.64**	**42.0**	**5,250**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Air Conditioning Units

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
5,213	4.1	0.0	$794.78	$33,388.64	$0.00	$33,388.64	42.0	5,250

Measure Description

We recommend replacing standard efficiency packaged air conditioning units with high efficiency packaged air conditioning units when cost effective. There have been significant improvements in both compressor and fan motor efficiencies over the past several years. Therefore, electricity savings can be achieved by replacing older units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the older unit versus the new high efficiency unit, the average cooling load, and the estimated annual operating hours.

Reasons for not Recommending

This measure has a long payback, more than the rated useful life of the replacement equipment. The measure is not recommended for implementation on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.

6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility does not have a potential for installing a PV array.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility does not have a potential for installing a cost-effective CHP system.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion this building is not is a good candidate for DR.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 23 for a list of the eligible programs identified for each recommended ECM.

Figure 23 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x					
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	x					
ECM 3	Retrofit Fixtures with LED Lamps	x					
ECM 4	Install Occupancy Sensor Lighting Controls	x					
ECM 5	Install High/Low Lighitng Controls						

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Bradford Elementary School.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey higher education facilities in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

Bradford Elementary School is a 58,129 square foot facility constructed in 1927. The building is a three-story educational facility including classrooms, library areas, offices, hallways and mechanical rooms.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 28-Watt T5 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several compact fluorescent and incandescent lamps, as well as metal halide fixtures in the gym. Exterior lighting is provided primarily by 100-Watt and 250-Watt metal halide fixtures, with a few building mounted compact fluorescent and incandescent fixtures. Interior lighting control is provided by manual switches.

Cooling and ventilation is provided by a combination of rooftop packaged AC, window AC, split system AC, and package terminal AC systems. Heating hot water is distributed to the building's rooftop unit from natural draft steam boiler via a heat exchanger.

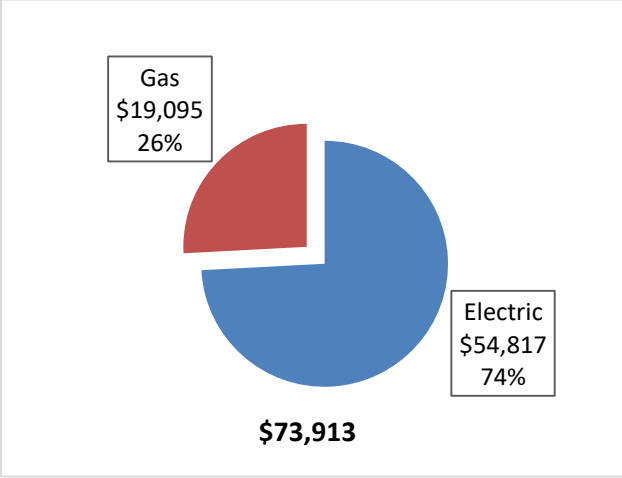
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated eight and recommended seven measures which together represent an opportunity for Bradford Elementary School to reduce annual energy costs by roughly $18,773 and annual greenhouse gas emissions by 115,272 lbs CO_2e. We estimate that if all high priority measures are implemented as recommended, the project will pay for itself in roughly 6.3 years. TRC has defined high priority measures as the evaluated measures that have a simple payback less than the typical equipment life of the proposed equipment. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce Bradford Elementary School's annual energy use by 12%.

Figure 1 – Previous 12 Month Utility Costs



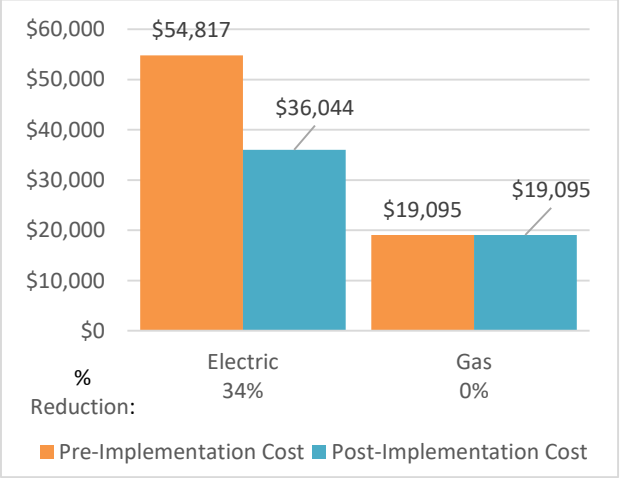


Figure 2 – Potential Post-Implementation Costs

A detailed description of Bradford Elementary School's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the evaluated energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**96,779**	**29.4**	**$15,871.49**	**$104,403.19**	**$11,630.00**	**$92,773.19**	**5.8**	**97,455**

ECM 7	Vending Machine Control	Yes	1,612	0.0	$264.34	$230.00	$0.00	$230.00	0.9	1,623
TOTALS FOR RECOMMENDED MEASURES			**114,471**	**34.3**	**$18,773.07**	**$133,235.21**	**$14,205.00**	**$119,030.21**	**6.3**	**115,272**
TOTALS FOR ALL MEASURES			**117,974**	**36.6**	**$19,347.45**	**$148,302.43**	**$14,205.00**	**$134,097.43**	**6.9**	**118,799**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing older standard efficiency motors with high efficiency standard (IHP 2014). Motors replacements generally assume the same size motors, just higher efficiency. Although occasionally additional savings can be achieved by downsizing motors to better meet current load requirements. This measure saves energy by reducing the power used by the motors, due to improved electrical efficiency.

Variable Frequency Drives (VFDs) are motor control devices. These measures control the speed of a motor so that the motor spins at peak efficiency during partial load conditions. Sensors adapt the speed to flow, temperature, or pressure settings which is much more efficient than using a valve or damper to control flow rates, or running the motor at full speed when only partial power is needed. These measures save energy by controlling motor usage more efficiently.

Electric Unitary HVAC measures generally involve replacing older inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide equivalent cooling to older air condition systems at a reduced energy cost. These measures save energy by reducing the power used by the air conditioning systems, due to improved electrical efficiency.

Plug Load Equipment control measures generally involve installing automated devices that limit the power usage or operation of equipment that is plugged into an electric outlet when not in use.

Energy Efficient Practices

TRC also identified seven low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Bradford Elementary School include:

- Close Doors and Windows
- Ensure Economizers are Functioning Properly
- Clean Evaporator/Condenser Coils on AC Systems
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient Practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for Bradford Elementary School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	90	kW DC STC
Electric Generation	107,224	kWh/yr
Displaced Cost	$9,330	/yr
Installed Cost	$257,400	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

This facility may also qualify for the Direct Install program which can provide turnkey installation of multiple measures, through an authorized network of participating contractors. This program can provide substantially higher incentives than SmartStart, up to 70% of the cost of selected measures, although measure eligibility will have to be assessed and be verified by the designated Direct Install contractor and, in most cases, they will perform the installation work.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.4 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 16, 2016, TRC performed an energy audit at Bradford Elementary School located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Bradford Elementary School is a 58,129 square foot facility constructed in 1927. The building is a three-story educational facility including classrooms, library areas, offices, hallways and mechanical rooms.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 28-Watt T5 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several compact fluorescent and incandescent lamps, as well as metal halide fixtures in the gym. Exterior lighting is provided primarily by 100-Watt and 250-Watt metal halide fixtures, with a few building mounted compact fluorescent and incandescent fixtures. Interior lighting control is provided by manual switches.

Cooling and ventilation is provided by a combination of rooftop packaged AC, window AC, split system AC, and package terminal AC systems. Heating hot water is distributed to the building's rooftop unit from natural draft steam boiler via a heat exchanger.

2.3 Building Occupancy

The typical schedule is presented in the table below, with usage primarily in the non-summer months.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Bradford Elementary School	Weekday	7:00 am - 3:30 pm
Bradford Elementary School	Weekend	CLOSED

2.4 Building Envelope

Bradford Elementary School is a three-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with operable frames. The flat roof is constructed of built-up roofing material.

Figure 7 – Building Façade

2.5 On-Site Generation

TRC evaluated the potential for installing on-site generation for Bradford Elementary School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 8 – Photovoltaic Potential

Potential	High	
System Potential	90	kW DC STC
Electric Generation	107,224	kWh/yr
Displaced Cost	$9,330	/yr
Installed Cost	$257,400	

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at Bradford Elementary School consists mainly of 32-Watt T8 fluorescent fixtures with a few 28-Watt T5 fluorescent fixtures in the library. These sources are inefficient in performance when compared to the latest lighting technology available in the market. Most linear fixtures are 2-foot or 4-foot long troffers with diffusers having 1, 2, 3, and 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 17-Watt compact fluorescent lamps and 60-Watt, 75-Watt, and 200-Watt incandescent lamps. Metal halide sources provide illumination for the gymnasium. All the exit signs are LED based fixtures.

Interior lighting control in the building is provided by manual switches.

Figure 9 - Building Lighting Systems

Fluorescent Fixture	*Exterior Metal Halide Fixture*
	

The building's exterior lighting consists primarily of 100-Watt and 250-Watt metal halide fixtures, although a few incandescent and compact fluorescent fixtures are mounted to the building. Exterior lamps are generally controlled by photocells.

Steam to Hot Water System

The hot water system consists of two Weil-McLain 2,274 kBtu/hr output, natural draft steam boilers. The boilers have a nominal combustion efficiency of 83%. The boilers are configured with a steam to water heat exchanger to convert steam to heating hot water. The hot water is circulated with two hot water pumps. Each boiler is supplied by a dedicated 3 hp pump operating at constant speed. The boilers are in good condition and well maintained.

Figure 10 – Hot Water System

Natural Gas Boiler	*Heating Hot Water Pumps*
	

Direct Expansion Air Conditioning System (DX)

The facility also has several window AC units with capacities ranging between 0.67 tons and 1.25 tons. There are two rooftop package units having capacities of 40-tons and 13-tons. In addition to the window AC units and package units, there are split systems serving the building.

Figure 11 – DX Air Conditioning System

Window AC	*Split Systems*
	

Domestic Hot Water Heating System

The domestic hot water heating system for the facility consists of two A.O. Smith gas fired hot water heaters with an input rating of 75 kBtu/hr and 150 kBtu/hr and nominal efficiencies of 80% and 88% respectively. Storage tank capacities are 75 gallons and 100 gallons.

Figure 12 – Domestic Hot Water System

DHW Heater	*DHW Heater Nameplate*
	

Food Service Equipment

The school has two electric convention ovens (half size) manufactured by Vulcan which has an electric demand of approximately 4.71 kW.

Refrigeration

The school has three stand-up refrigerators. Two refrigerators have 42 cu. ft, and one refrigerator has 22 cu. ft. capacities. Two of the larger units are in the kitchen and the smaller unit is in the break room.

Building Plug Load

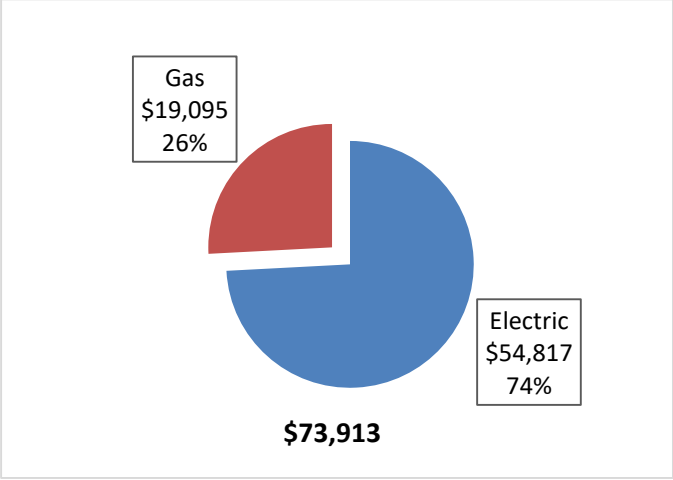
There are roughly 80 computer work stations throughout the facility. All the computers are desktop units with LCD monitors. There is no centralized PC power management software installed.

The facility contains other systems which contribute to plug load including printers, microwaves, and televisions. In addition to the typical plug load equipment, the facility also has a refrigerated vending machine in the teacher's lounge.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 13 - Utility Summary

Utility Summary for Bradford Elementary School		
Fuel	**Usage**	**Cost**
Electricity	334,257 kWh	$54,817
Natural Gas	21,688 Therms	$19,095
Total		**$73,913**

The current annual energy cost for this facility is $73,913 as shown in the chart below.

Figure 14 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.164/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Figure 15 - Electric Usage & Demand

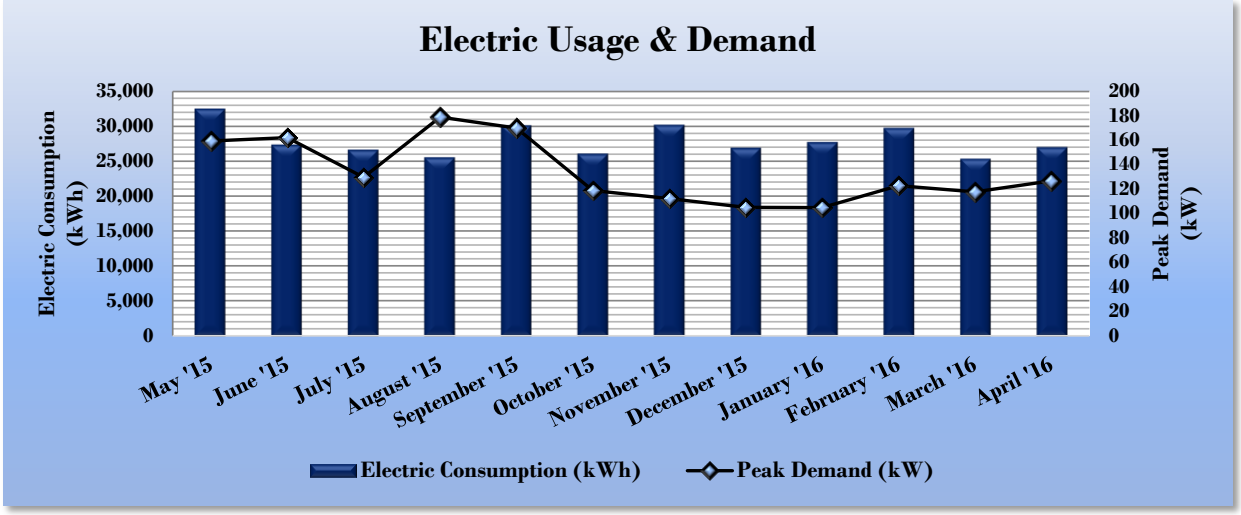


Figure 16 - Electric Usage & Demand

Electric Billing Data for Bradford Elementary School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Total Electric Cost	TRC Estimated Usage?
6/15/15	32	32,388	159	$6,367	No
7/15/15	30	27,300	162	$5,749	No
8/13/15	29	26,550	130	$5,217	No
9/14/15	32	25,483	179	$5,636	No
10/13/15	29	30,032	170	$4,605	No
11/11/15	29	25,988	119	$3,915	No
12/14/15	33	30,113	112	$4,286	No
1/15/16	32	26,860	105	$3,752	No
2/12/16	28	27,645	105	$3,787	No
3/15/16	32	29,678	123	$4,097	No
4/14/16	30	25,278	118	$3,595	No
5/13/16	29	26,942	127	$3,812	No
Totals	**365**	**334,257**	**179**	**$54,817**	0
Annual	**365**	**334,257**	**179**	**$54,817**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.880/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Figure 17 - Natural Gas Usage

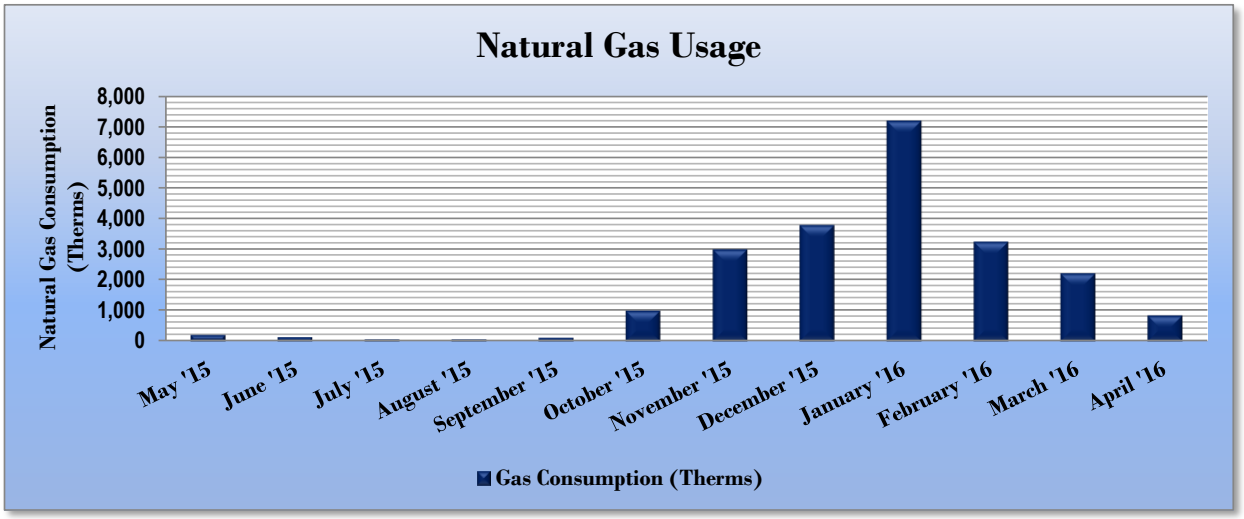

Figure 18 - Natural Gas Usage

Gas Billing Data for Bradford Elementary School			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
6/16/15	32	209	$220
7/20/15	34	133	$178
8/17/15	28	63	$139
9/15/15	29	61	$139
10/14/15	29	112	$168
11/12/15	29	1,003	$1,824
12/15/15	33	2,999	$3,036
1/15/16	31	3,789	$3,516
2/18/16	34	7,186	$5,284
3/16/16	27	3,248	$2,879
4/15/16	30	2,216	$1,304
5/17/16	32	845	$565
Totals	**368**	**21,866**	**$19,252**
Annual	**365**	**21,688**	**$19,095**

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 19 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Bradford Elementary School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	100.8	141.4
Site Energy Use Intensity (kBtu/ft^2)	56.9	58.2

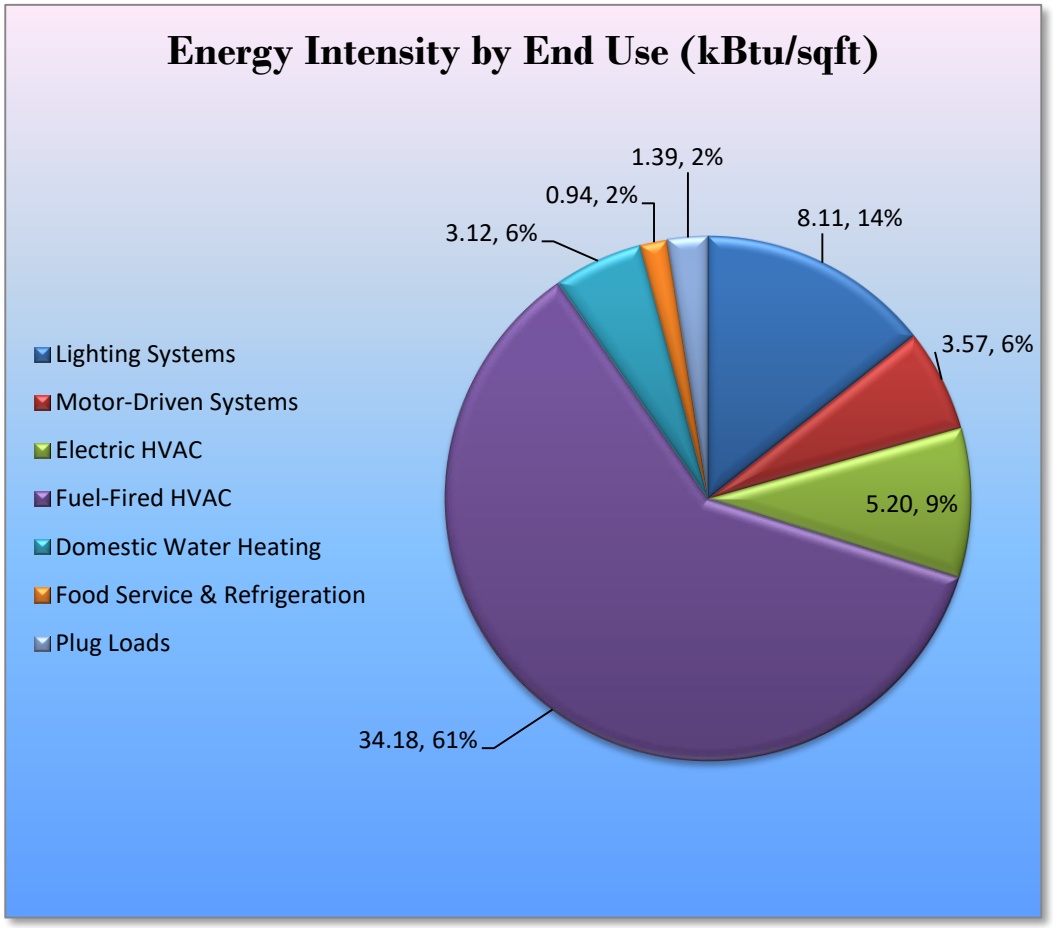
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 20 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Bradford Elementary School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	79.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	50.2	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. This facility has a current score of 65.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 21 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Bradford Elementary School regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 High Priority ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 22 – Summary of High Priority ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**96,779**	**29.4**	**0.0**	**$15,871.49**	**$104,403.19**	**$11,630.00**	**$92,773.19**	**5.8**	**97,455**
ECM 1	Install LED Fixtures	25,461	4.6	0.0	$4,175.59	$55,418.56	$3,690.00	$51,728.56	12.4	25,639
ECM 2	Retrofit Fixtures with LED Lamps	68,305	24.6	0.0	$11,201.92	$47,586.42	$7,940.00	$39,646.42	3.5	68,783

Lighting Control Measures		**12,934**	**4.0**	**0.0**	**$2,121.22**	**$20,834.00**	**$2,575.00**	**$18,259.00**	**8.6**	**13,025**
ECM 4	Install Occupancy Sensor Lighting Controls	12,934	4.0	0.0	$2,121.22	$20,834.00	$2,575.00	$18,259.00	8.6	13,025
Motor Upgrades		**161**	**0.1**	**0.0**	**$26.35**	**$1,752.72**	**$0.00**	**$1,752.72**	**66.5**	**162**
ECM 5	Premium Efficiency Motors	161	0.1	0.0	$26.35	$1,752.72	$0.00	$1,752.72	66.5	162
Variable Frequency Drive (VFD) Measures		**2,986**	**0.8**	**0.0**	**$489.67**	**$6,015.30**	**$0.00**	**$6,015.30**	**12.3**	**3,007**
ECM 6	Install VFDs on Hot Water Pumps	2,986	0.8	0.0	$489.67	$6,015.30	$0.00	$6,015.30	12.3	3,007
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$264.34**	**$230.00**	**$0.00**	**$230.00**	**0.9**	**1,623**
ECM 7	Vending Machine Control	1,612	0.0	0.0	$264.34	$230.00	$0.00	$230.00	0.9	1,623
TOTALS		**114,471**	**34.3**	**0.0**	**$18,773.07**	**$133,235.21**	**$14,205.00**	**$119,030.21**	**6.3**	**115,272**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 23 below.

Figure 23 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**96,779**	**29.4**	**0.0**	**$15,871.49**	**$104,403.19**	**$11,630.00**	**$92,773.19**	**5.8**	**97,455**
ECM 1	Install LED Fixtures	25,461	4.6	0.0	$4,175.59	$55,418.56	$3,690.00	$51,728.56	12.4	25,639
ECM 2	Retrofit Fixtures with LED Lamps	68,305	24.6	0.0	$11,201.92	$47,586.42	$7,940.00	$39,646.42	3.5	68,783
ECM 3	Install LED Exit Signs	3,012	0.2	0.0	$493.98	$1,398.22	$0.00	$1,398.22	2.8	3,033

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	9,791	2.6	0.0	$1,605.72	$48,333.60	$2,700.00	$45,633.60	28.4	9,860
Exterior	15,670	2.0	0.0	$2,569.87	$7,084.96	$990.00	$6,094.96	2.4	15,780

Measure Description

We recommend replacing existing fixtures containing HID lamps with new high-performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output. Exterior fixtures are pole mounted or along the building exterior. Interior fixtures are located in the gymnasiums.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a HID lamp.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	67,252	24.4	0.0	$11,029.27	$47,348.10	$7,920.00	$39,428.10	3.6	67,723
Exterior	1,053	0.1	0.0	$172.65	$238.32	$20.00	$218.32	1.3	1,060

Measure Description

We recommend retrofitting existing incandescent, compact fluorescent, and linear fluorescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 3: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	3,012	0.2	0.0	$493.98	$1,398.22	$0.00	$1,398.22	2.8	3,033
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend replacing all incandescent exit signs with LED exit signs. LED exit signs require virtually no maintenance and have a life expectancy of at least 20 years. This measure saves energy by installing LED fixtures, which use less power than other technologies with an equivalent lighting output.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 24 below.

Figure 24 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**12,934**	**4.0**	**0.0**	**$2,121.22**	**$20,834.00**	**$2,575.00**	**$18,259.00**	**8.6**	**13,025**
ECM 4	Install Occupancy Sensor Lighting Controls	12,934	4.0	0.0	$2,121.22	$20,834.00	$2,575.00	$18,259.00	8.6	13,025

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
12,934	4.0	0.0	$2,121.22	$20,834.00	$2,575.00	$18,259.00	8.6	13,025

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in many classrooms, restrooms, teacher's lounge, etc. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

4.1.3 Motor Upgrades

Our recommendations for motor upgrades are summarized in Figure 25 below.

Figure 25 - Summary of Motor Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades		**161**	**0.1**	**0.0**	**$26.35**	**$1,752.72**	**$0.00**	**$1,752.72**	**66.5**	**162**
ECM 5	Premium Efficiency Motors	161	0.1	0.0	$26.35	$1,752.72	$0.00	$1,752.72	66.5	162

ECM 5: Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
161	0.1	0.0	$26.35	$1,752.72	$0.00	$1,752.72	66.5	162

Measure Description

We recommend replacing standard efficiency motors with IHP 2014 efficiency motors. Our evaluation assumes that existing motors will be replaced with motors of equivalent size and type. Although occasionally additional savings can be achieved by downsizing motors to better meet the motor's current load requirements. The base case motor efficiencies are estimated from nameplate information and our best estimates of motor run hours. Efficiencies of proposed motor upgrades are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016)*. Savings are based on the difference between baseline and proposed efficiencies and the assumed annual operating hours.

This long payback measure is recommended in conjunction with the variable frequency drive measure, ECM 6 in order to assure that an inverter rated motor is in place so that the VFD can function properly.

4.1.4 Variable Frequency Drive Measures

Our recommendations for variable frequency drive (VFD) measures are summarized in Figure 26 below.

Figure 26 – Summary of Variable Frequency Drive ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Variable Frequency Drive (VFD) Measures		**2,986**	**0.8**	**0.0**	**$489.67**	**$6,015.30**	**$0.00**	**$6,015.30**	**12.3**	**3,007**
ECM 6	Install VFDs on Hot Water Pumps	2,986	0.8	0.0	$489.67	$6,015.30	$0.00	$6,015.30	12.3	3,007

ECM 6: Install VFDs on Hot Water Pumps

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,986	0.8	0.0	$489.67	$6,015.30	$0.00	$6,015.30	12.3	3,007

Measure Description

We recommend installing a variable frequency drives (VFD) to control the hot water pumps. This measure requires that a majority of the hot water coils be served by 2-way valves and that a differential pressure sensor is installed in the hot water loop. As the hot water valves close, the differential pressure increases. The VFD modulates pump speed to maintain a differential pressure setpoint. Energy savings results from reducing pump motor speed (and power) as hot water valves close. The magnitude of energy savings is based on the estimated amount of time that the system will operate at reduced load.

4.1.5 Plug Load Equipment Control - Vending Machines

Our recommendations for plug load equipment measures are summarized in Figure 27 below.

Figure 27-Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$264.34**	**$230.00**	**$0.00**	**$230.00**	**0.9**	**1,623**
ECM 7	Vending Machine Control	1,612	0.0	0.0	$264.34	$230.00	$0.00	$230.00	0.9	1,623

ECM 7: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,612	0.0	0.0	$264.34	$230.00	$0.00	$230.00	0.9	1,623

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor controls to reduce the energy use. These controls power down vending machines when the vending machine area has been vacant for some time, then power up at regular intervals, as needed, to turn machine lights on or keep the product cool. Energy savings are a dependent on vending machine and activity level in the area surrounding the machines.

4.2 ECM Evaluated but not Recommended

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 28 – Summary of Measure Evaluated, But Not Recommended

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Electric Unitary HVAC Measures	**3,502**	**2.3**	**0.0**	**$574.38**	**$15,067.21**	**$0.00**	**$15,067.21**	**26.2**	**3,527**
Install High Efficiency Electric AC	3,502	2.3	0.0	$574.38	$15,067.21	$0.00	$15,067.21	26.2	3,527
TOTALS	**3,502**	**2.3**	**0.0**	**$574.38**	**$15,067.21**	**$0.00**	**$15,067.21**	**26.2**	**3,527**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Air Conditioning Units

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
3,502	2.3	0.0	$574.38	$15,067.21	$0.00	$15,067.21	26.2	3,527

Measure Description

We considered and evaluated replacing standard efficiency packaged air conditioning units with high efficiency packaged air conditioning units. There have been significant improvements in both compressor and fan motor efficiencies over the past several years. Therefore, electricity savings can be achieved by replacing older units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the older unit versus the new high efficiency unit, the average cooling load, and the estimated annual operating hours.

Reasons for not Recommending

This measure was evaluated but not recommended due to long payback, which exceeds the useful life of the proposed equipment.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Ensure Economizers are Functioning Properly

Economizers, when properly configured, can be used to significantly reduce mechanical cooling. However, if the outdoor thermostat or enthalpy control is malfunctioning or the damper is stuck or improperly adjusted, benefits from the economizer may not be fully realized. As such, periodic inspection and maintenance is required to ensure proper operation. This maintenance should be scheduled with maintenance of the facility's air conditioning system and should include proper setting of the outdoor thermostat/enthalpy control, inspection of control and damper operation, lubrication of damper connections, and adjustment of minimum damper position. A malfunctioning economizer can significantly increase the amount of heating and mechanical cooling required by introducing excess amounts of cold or hot outside air.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

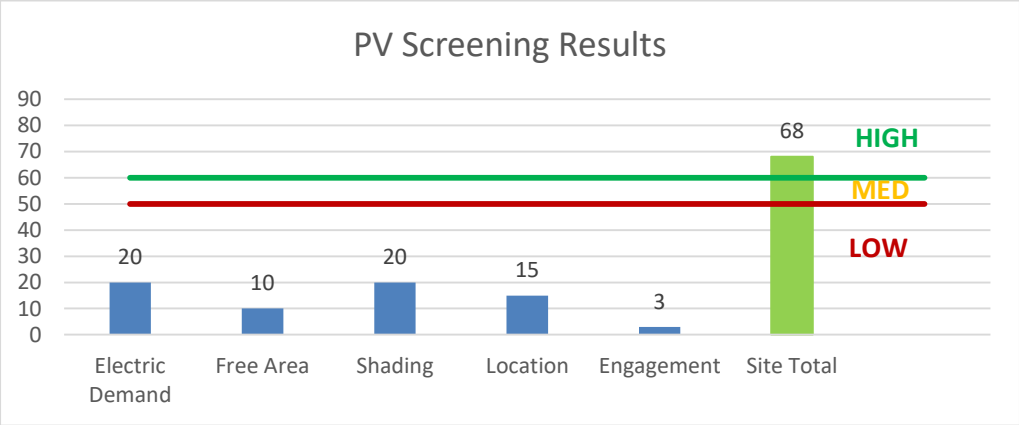
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the high potential for PV at the site. A PV array located on the roof of the building may be feasible. If Bradford Elementary School is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Figure 29 - Photovoltaic Screening

Potential	High	
System Potential	90	kW DC STC
Electric Generation	107,224	kWh/yr
Displaced Cost	$9,330	/yr
Installed Cost	$257,400	

Solar projects must register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

A low or infrequent thermal load is the most significant factor contributing to the potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion this building is not is a good candidate for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 30 for a list of the eligible programs identified for each recommended ECM.

Figure 30 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings
ECM 1	Install LED Fixtures	X		X	
ECM 2	Retrofit Fixtures with LED Lamps	X		X	
ECM 3	Install LED Exit Signs			X	
ECM 4	Install Occupancy Sensor Lighting Controls	X		X	
ECM 5	Premium Efficiency Motors			X	
ECM 6	Install VFDs on Hot Water Pumps			X	
ECM 7	Vending Machine Control			X	

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. This facility does not meet all of the criteria for participating in the P4P program based on the measures identified in this study. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to medium-sized facilities with a peak electric demand that does not exceed 200 kW for any recent 12-month period. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and provide a clear scope of work for installation of selected measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to **70%** of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor who the region of the state where your facility is located. A complete list of Direct Install program partners is provided on the Direct Install website linked below. The contractor will be paid the measure incentives directly by the program which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps and eligibility, while the remaining 30% of the cost is paid to the contractor by the customer.

Since Direct Install offers a free assessment of eligible measures, Direct Install is also available to small businesses and other commercial facilities too that may not be eligible for the more detailed facility audits provided by LGEA.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and com are prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Reproduction or distribution of the whole, or any part of the contents of this document without written permission of TRC is prohibited. Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Central Heating Plant.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey local governments in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

The Central Heating Plant is a 2,078 square foot facility constructed in 1931. The building is a one story central plant type facility including a large mechanical space.

Lighting at the facility consists mainly of 32-Watt T8 linear fluorescent fixtures which is inefficient in performance when compared to the latest lighting technology available in the market. Exterior lighting is provided by 100-Watt incandescent fixtures. Interior lighting control is provided by manual switches.

The Central Heating Plant consists of forced draft steam boilers that provide heating the buildings on the campus.

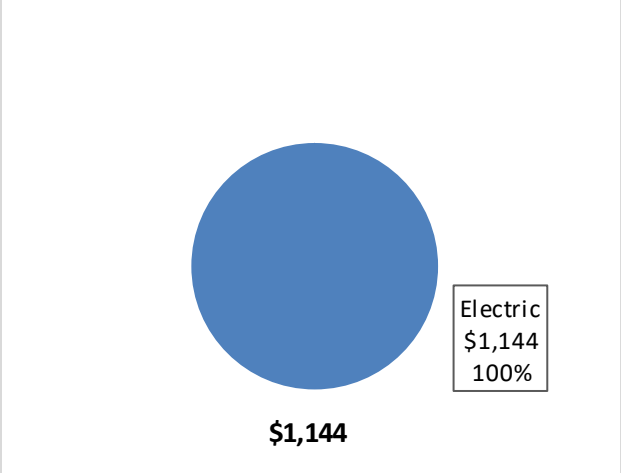
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated one measure which represent an opportunity for the Central Heating Plant to reduce annual energy costs by roughly $333 and annual greenhouse gas emissions by 2,200 lbs CO_2e. We estimate that if all measures were implemented as recommended, the project would pay for itself in 2.4 years. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce the Central Heating Plant's annual energy use by 29%.

Figure 1 – Previous 12 Month Utility Costs



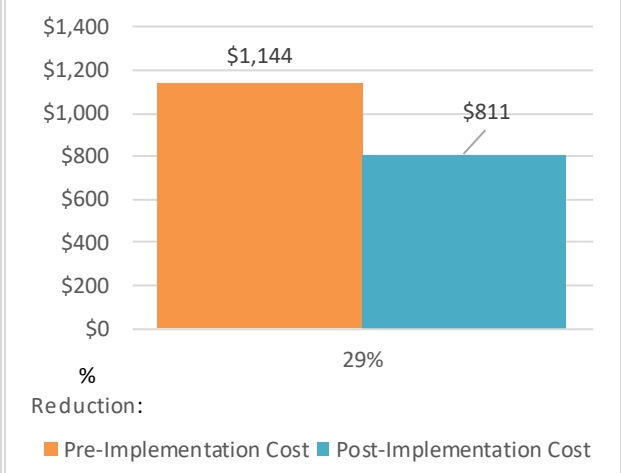


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Central Heating Plant's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the proposed energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**2,184**	**0.3**	**0.0**	**$333.01**	**$979.95**	**$165.00**	**$814.95**	**2.4**	**2,200**
ECM 1	Retrofit Fixtures with LED Lamps	Yes	2,184	0.3	0.0	$333.01	$979.95	$165.00	$814.95	2.4	2,200
TOTALS			**2,184**	**0.3**	**0.0**	**$333.01**	**$979.95**	**$165.00**	**$814.95**	**2.4**	**2,200**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Energy Efficient Practices

TRC also identified five low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Central Heating Plant include:

- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Ensure Lighting Controls Are Operating Properly
- Perform Proper Boiler Maintenance
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for the Central Heating Plant. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.2 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 09, 2016, TRC performed an energy audit of Montclair Board of Education's Central Heating Plant located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Central Heating Plant is a 2,078 square foot facility constructed in 1931. The building is a one-story central plant type facility including a large mechanical space.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Central Heating Plant	Weekday	12:00 AM - 12:00 PM
Central Heating Plant	Weekend	12:00 AM - 12:00 PM

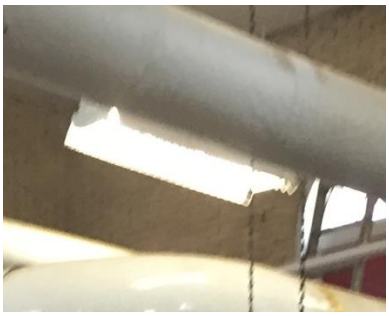
2.4 Building Envelope

The Central Heating Plant is a one-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with fixed frames. The flat roof is constructed of built-up roofing material.

Figure 6 – Building Façade

2.5 On-Site Generation

The Central Heating Plant does not have any on-site electric generation capacity.



2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at the Central Heating Plant consists mainly of 32-Watt T8 linear fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. The linear fluorescent fixtures are 4-foot long, mainly troffers with diffusers having 2-lamp configurations. Interior lighting control in the building is provided by manual switches.

Figure 7 - Building Lighting Systems

Linear Fluorescent Fixture	*Exterior Fixture*
	

Exterior lighting is provided by a 100-Watt incandescent fixture.

Heating System

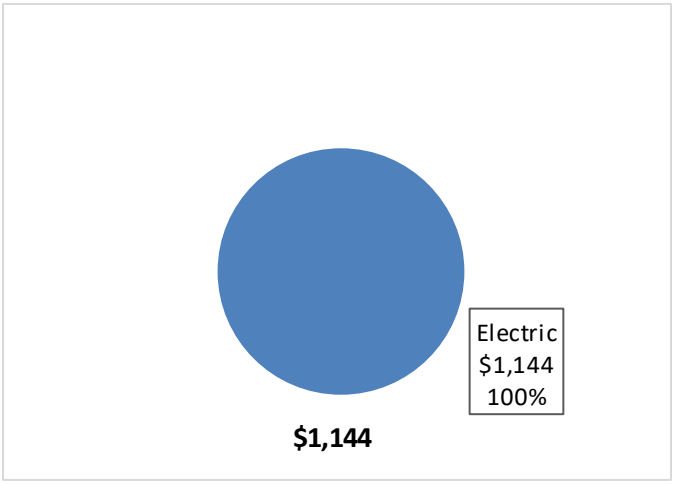
The Central Heating Plant has two natural gas fired Weil McLain steam boilers with an input rating of 7,938 MBh each and a nominal efficiency of 80%. These boilers provide space heating for Hillside School, the Montclair Community Pre-K, and the district Administration Building. According to the audit, the boilers were in good shape and performing well.

Figure 8 - Building Heating Systems

3 SITE ENERGY USE AND COSTS

Utility data for electricity was analyzed to identify opportunities for savings. In addition, data for Electricity was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 9 - Utility Summary

Utility Summary for Central Heating Plant		
Fuel	**Usage**	**Cost**
Electricity	7,506 kWh	$1,144
Total		**$1,144**

The current annual energy cost for this facility is $1,144 as shown in the chart below.

Figure 10 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.152/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Electric usage estimation and calibration methodology:

1. The Montclair BOE buildings Hillside, Administration, Montclair Community Pre-K, and Central Heating Plant are served by three electric meters 65 795 083 02, 67 125 896 06, and 42 007 763 08. There is not a clear delineation of loads served by the meters. Based on this, demand (kW) data was not prorated.
2. Total energy use from all the meters combined is around 638,475 kWh for a 12-month period.
3. Monthly "calculated" energy use from the LGEA analysis tools were used to calculate the percentage contribution of each building. The percentages are:
    a. Hillside School – 70%
    b. Administration Building – 11%
    c. Montclair Community Pre-K – 18%
    d. CHP – 1%
4. The above percentages were applied to the "actual" total monthly energy use from bills to estimate monthly utility energy use to which all the tools were then calibrated.

Figure 11 - Electric Usage & Demand

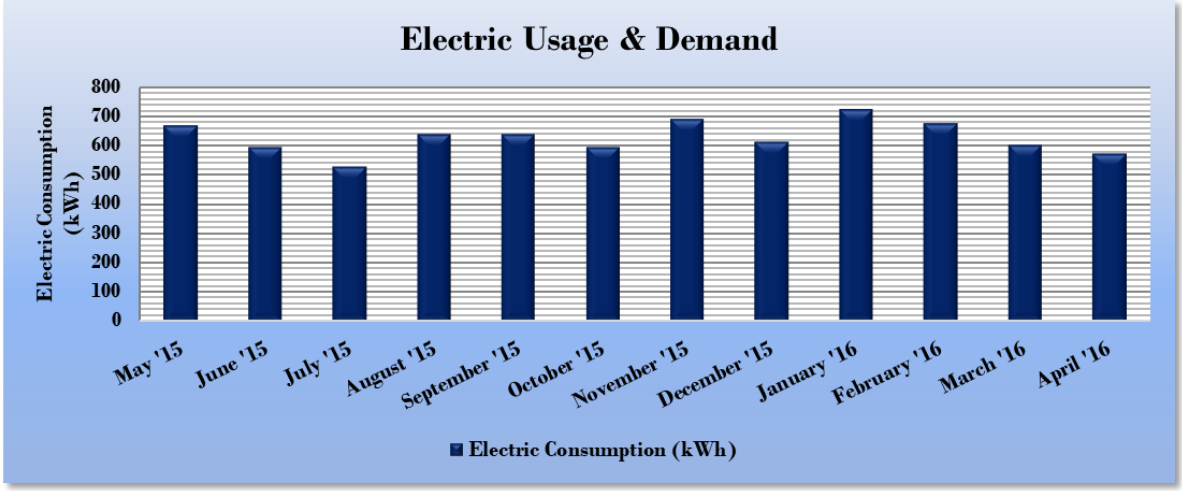


Figure 12 - Electric Usage & Demand

Electric Billing Data for Central Heating Plant				
Period Ending	Days in Period	Electric Usage (kWh)	Total Electric Cost	TRC Estimated Usage?
6/15/15	33	667	$130	Yes
7/14/15	29	594	$114	Yes
8/12/15	29	526	$100	Yes
9/11/15	30	639	$117	Yes
10/12/15	31	638	$94	Yes
11/10/15	29	592	$83	Yes
12/11/15	31	691	$95	Yes
1/13/16	33	612	$80	Yes
2/11/16	29	721	$93	Yes
3/14/16	32	674	$87	Yes
4/13/16	30	601	$81	Yes
5/13/16	30	571	$74	Yes
Totals	**366**	**7,526**	**$1,147**	12
Annual	**365**	**7,506**	**$1,144**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.802/therm, which is the blended rate used throughout the analyses in this report.

Natural gas use was allocated to the sites served by the Central Heating Plant using the following method:

1. The Administration Building, Hillside School, Montclair Community Pre-K, and Central Heating Plant are served by two gas meters: 65 795 083 02 and 67 125 896 06. There is not a clear delineation of which buildings and equipment are served by each meter.
2. Total annual gas use for both of the meters combined is 59,235 therms.
3. The calculated gas use from the LGEA analysis for each building was used to determine the percentage of the total historical gas use to be assigned to each building. Total gas use was allocated to the three buildings served by the Central Heating Plant as follows:
    a. Hillside School - 75%
    b. Administration Building - 9%
    c. Montclair Community Pre-K - 16%
4. The above percentages were applied to the total monthly gas use from the utility bills to estimate the monthly gas use for the individual buildings. This estimated monthly gas use is what is provided in each of the reports.

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 13 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Central Heating Plant	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	38.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	12.3	58.2

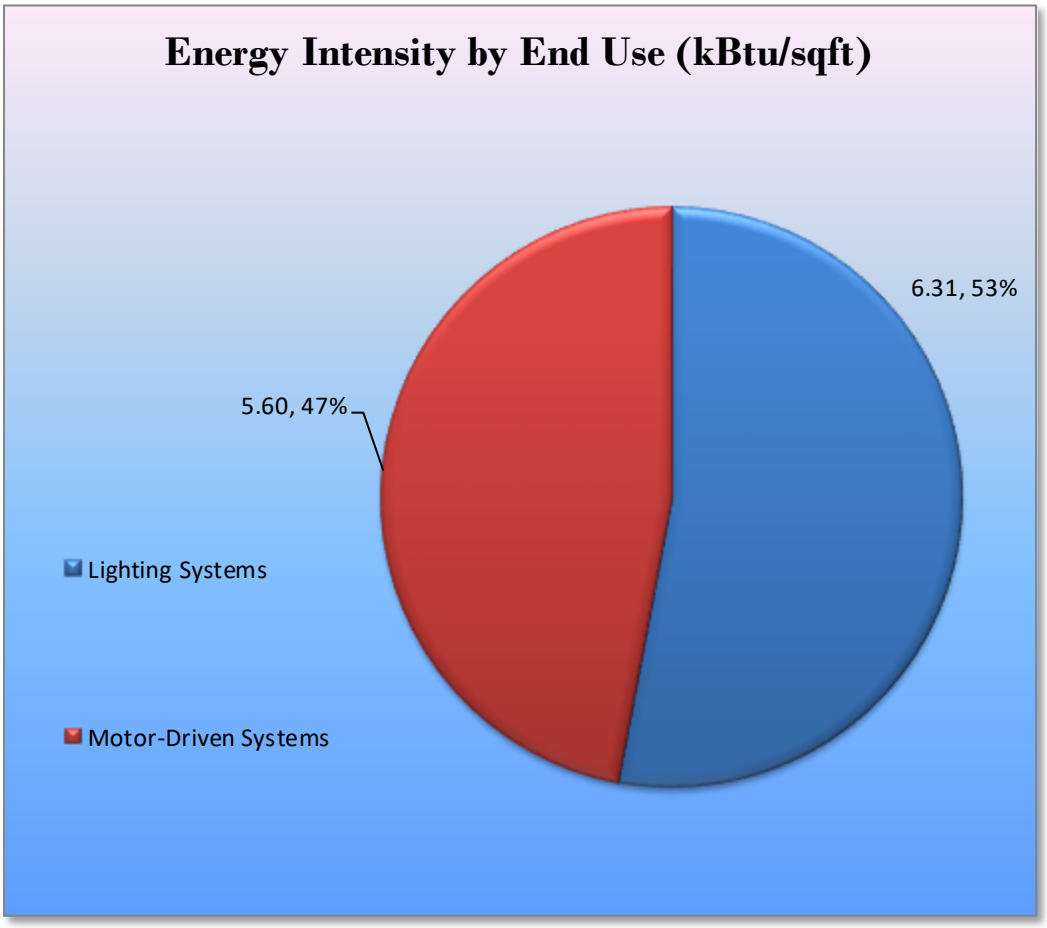
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 14 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Central Heating Plant	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	27.4	141.4
Site Energy Use Intensity (kBtu/ft^2)	8.7	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. The Central Heating Plant and the three buildings served by it have a combined score of 74.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 15 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Central Heating Plant regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 16 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**2,184**	**0.3**	**0.0**	**$333.01**	**$979.95**	**$165.00**	**$814.95**	**2.4**	**2,200**
ECM 1	Retrofit Fixtures with LED Lamps	2,184	0.3	0.0	$333.01	$979.95	$165.00	$814.95	2.4	2,200
TOTALS		**2,184**	**0.3**	**0.0**	**$333.01**	**$979.95**	**$165.00**	**$814.95**	**2.4**	**2,200**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**2,184**	**0.3**	**0.0**	**$333.01**	**$979.95**	**$165.00**	**$814.95**	**2.4**	**2,200**
ECM 1	Retrofit Fixtures with LED Lamps	2,184	0.3	0.0	$333.01	$979.95	$165.00	$814.95	2.4	2,200

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,812	0.3	0.0	$276.26	$936.00	$160.00	$776.00	2.8	1,825
Exterior	372	0.0	0.0	$56.76	$43.95	$5.00	$38.95	0.7	375

Measure Description

We recommend retrofitting existing linear fluorescent and incandescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.

6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a no potential for installing a PV array.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a No potential for installing a cost-effective CHP system.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 18 for a list of the eligible programs identified for each recommended ECM.

Figure 18 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Retrofit Fixtures with LED Lamps	X					

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install (DI) caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Charles H. Bullock School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey local government in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

Charles H. Bullock School is an 84,017 square foot facility constructed in 2010. The building is a two-story educational facility including but not limited to classrooms, library areas, offices, hallways and conference areas.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures and 28-Watt T5 linear fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several incandescent, and compact fluorescent lamps. Exterior lighting is provided by a combination of 250-Watt metal halide fixtures, 28-Watt and 14-Watt T5 linear fluorescent fixtures, and 26-Watt compact fluorescent lamps. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation are provided by a combination of package units and water source heat pumps. Heating is provided by a gas furnace and non-condensing hot water boilers.

A thorough description of the facility and our observations are located in Section 2.

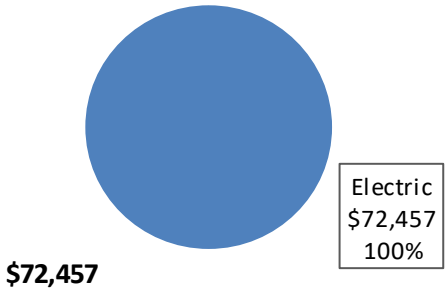
1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

Natural gas billing data was not available when the analysis for this report was done. In addition, the electricity production from the sites solar panels was not available. Therefore, the calculated energy use was checked against typical values for schools located in the same geographical area.

TRC evaluated five projects which represent an opportunity for Charles H. Bullock School to reduce annual energy costs by approximately $20,436 and annual greenhouse gas emissions by 138,873 lbs CO_2e. The measures would pay for themselves in 8.67 years. Figures 1 and 2 present the cost of electricity purchased from PSE&G before and after the measures are implemented. These projects represent an opportunity to reduce Charles H. Bullock School's annual energy use by approximately 11%.

Figure 1 – Previous 12 Month Electricity Costs



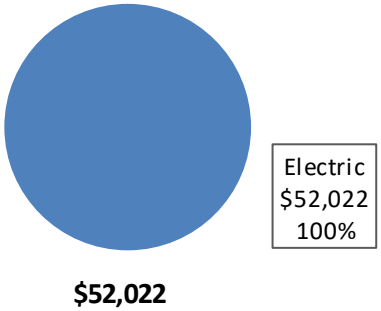


Figure 2 – Potential Post-Implementation Electricity Costs

A description of Charles H. Bullock School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**122,972**	**63.9**	**0.0**	**$18,222.21**	**$174,653.75**	**$19,125.00**	**$155,528.75**	**8.54**	**123,832**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measure save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Plug Load Equipment control measures generally involve installing automation that limits the power use or operation of equipment plugged into an electrical receptacle based on occupancy.

Energy Efficient Practices

TRC also identified 11 low cost (or no) cost energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at Charles H. Bullock School include:

- Reduce Air Leakage
- Close Doors and Windows
- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Ensure Lighting Controls Are Operating Properly
- Perform Routine Motor Maintenance
- Check for and Seal Duct Leakage
- Perform Proper Boiler Maintenance
- Perform Proper Furnace Maintenance
- Perform Proper Water Heater Maintenance
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for Charles H. Bullock School. Based on the configuration of the site and its loads there is a low potential for installing additional PV or combined heat and power self-generation measures.

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.2 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.2 General Site Information

On November 07, 2016, TRC performed an energy audit at Charles H. Bullock School located in Montclair, NewJersey. TRC's team met with Robertz Eles to review the facility operations and focus the investigation on specific energy-using systems.

Charles H. Bullock School is a 74,180 square foot facility constructed in 2010. The building is a two-story educational facility including but not limited to classrooms, library areas, offices, hallways and conference areas.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Charles H. Bullock School	Weekday	8:00 AM - 5:30 PM
Charles H. Bullock School	Weekend	unoccupied

2.4 Building Envelope

Charles. H. Bullock School is a two-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with fixed frames. The flat roof is constructed of built-up roofing material.

Figure 6 – Building Façade

2.5 On-site Generation

The school uses electricity produced from solar panels on-site in addition to utility purchased electricity. Since incomplete historical utility data was provided for the Charles H. Bullock school, calculated energy use was used as the baseline energy use for savings evaluations.

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at the School consists mainly of 32-Watt T8 fluorescent fixtures and 28-Watt T5 linear fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. The linear fluorescent fixtures are 2-foot and 4-foot long, mainly troffers with diffusers having 2, 3, or 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 13-Watt, 26-Watt, and 32-Watt compact fluorescent lamps, 75-Watt halogen incandescent lamps, and 575-Watt incandescent flood lamps used for stage lighting.

Interior lighting control in the building is provided by a combination of manual switches and occupancy sensors.

Figure 7 - Building Lighting Systems

Linear Fluorescent Fixture	*Exterior Fixture*
	

Exterior lighting is provided by a combination of 250-Watt metal halide fixtures, 26-Watt compact fluorescent lamps, and 14-Watt and 28-Watt T5 linear fluorescent fixtures.

Heating System

The hot water system consists of two Lochinvar 1,739 kBtu/hr output, non-condensing hot water boilers. The boilers have a nominal combustion efficiency of 84%. The hot water system has two 5 hp hot water circulation pumps that circulate hot water from boilers through the water source heat pump units.

The boilers are in good condition and appear to be well maintained.

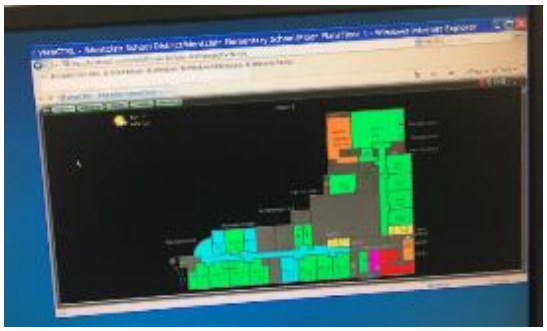
Figure 8 – Heating Systems

Hot Water Boilers	*Hot Water Pumps*
	

Air Conditioning (DX)

There are approximately 77 water-source heat pump units (WSHPs) supplying heating, cooling, and ventilation to the facility. As needed, heat is added to the water loop by a boiler or removed with a cooling geothermal source. The WSHPs are constant air volume units with cooling capacities between 0.83 tons to 23 tons. All of the WSHPs use direct-expansion (DX) coils.

Figure 9 – Air Conditioning (DX) Systems



The facility also has a 5 ton Reznor direct-expansion (DX) package unit with a gas fired furnace. The unit provides constant air volume. The unit utilize a scroll compressor and a DX coil. The gas fired furnace provides heating as needed.

Building Energy Management System

The majority of the facility is controlled with an Automated Logic Corporation's WebCtrl building energy management system (BEMS). The BEMS aggregates the DDC points from throughout the building. The system is capable of providing advanced controls and trends for individual HVAC system.

Figure 10 – Building Energy Management System (BEMS)

Energy Management System (EMS)	*EMS Controller*
	

Domestic Hot Water

The domestic hot water system for the facility consists of one A.O. Smith gas fired domestic hot water heaters with an input rating of 399 kBtu/hr and a nominal efficiency of 84%. The water heater has a 200 gallon storage tank.

Figure 11 – DHW System

Food Service

The facility has several food service equipment including full sized gas convection oven, gas combination/steam cooker, insulated food holding cabinet, and a gas fryer. All equipment was shown to be in good condition and well maintained.

Figure 12 – Steam Cooker and Gas burners

Refrigeration

The facility has five stand up refrigerators with solid door, one low-temperature freezer, one medium temperature freezer, and one ice making head producing around 450 pounds of ice per day.

Figure 13 – Refrigeration Systems

Stand-up Refrigerator	*Ice Maker*
	

Plug load & Vending Machines

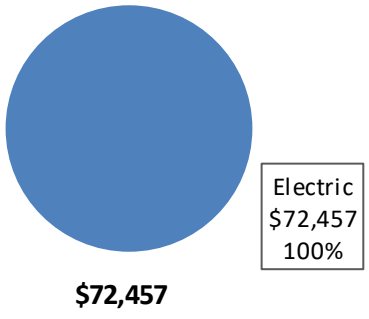
The facility contains several systems which contribute to plug load electric use including but not limited to desktop computers, printers, microwaves, and copiers. In addition to the typical plug load equipment, the facility also has one refrigerated and non-refrigerated vending machines.

3 SITE ENERGY USE AND COSTS

Historical utility data was only provided for purchased electricity. The school also uses electricity produced from solar panels on-site. PSE&G also delivers natural gas to the school. Since incomplete historical utility data was provided for the Charles H. Bullock School, the calculated energy use was used as the baseline energy use for savings evaluations. The calculated energy use was compared to the energy use of a typical school in this geographical area as a reasonableness check.

There are a number of factors that could cause the energy use of this building to vary from the "typical" energy use for other schools. Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12 month period of utility usage data that was provided for each utility.

Figure 14 - Utility Summary

Utility Summary for Charles H. Bullock School		
Fuel	**Usage**	**Cost**
Electricity	488,976 kWh	$72,457
Total		**$72,457**

The current electricity cost for this site is $72,457 as shown in the chart below.

Figure 15 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by the South Jersey Energy Company and transmission is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.148/kWh, which is the blended rate used throughout the analyses in this report. The Charles H. Bullock school also generates electricity with solar panels. The analysis assumes that the savings will come from the utility supplied electricity.

Only records of purchased electricity were provided by the school district. The graph below represents the monthly electricity purchases and does not include any electricity generated on-site.

Figure 16 - Purchased Electric Usage & Demand

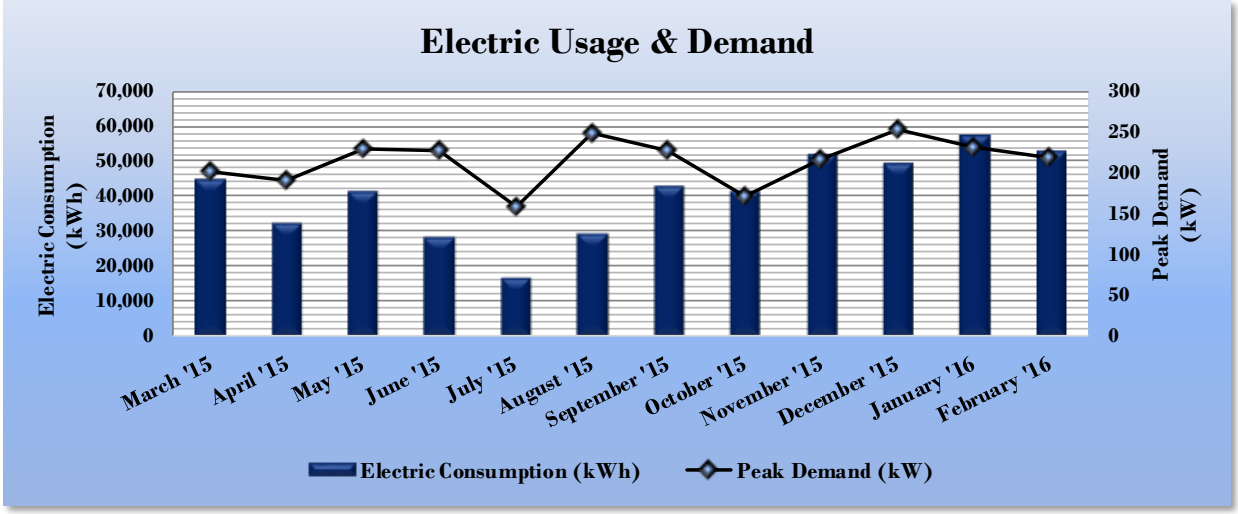


Figure 17 - Electric Usage & Demand

Electric Billing Data for Charles H. Bullock School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
4/15/15	30	44,810	201		$6,352
5/14/15	29	32,242	191		$4,757
6/15/15	32	41,531	230		$7,410
7/15/15	30	28,492	228		$5,777
8/13/15	29	17,008	159		$3,002
9/14/15	32	29,157	248		$5,784
10/13/15	29	42,903	228		$5,912
11/11/15	29	41,309	171		$5,716
12/14/15	33	51,946	215		$6,946
1/14/16	31	49,325	254		$6,710
2/12/16	29	57,470	231		$7,453
3/15/16	32	52,783	218		$6,639
Totals	**365**	**488,976**	**253.9**	**$0**	**$72,457**
Annual	**365**	**488,976**	**253.9**	**$0**	**$72,457**

3.3 Benchmarking

Since complete historical utility data was not provided this facility could not be benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the energy use intensity (EUI) and ENERGY STAR® score.

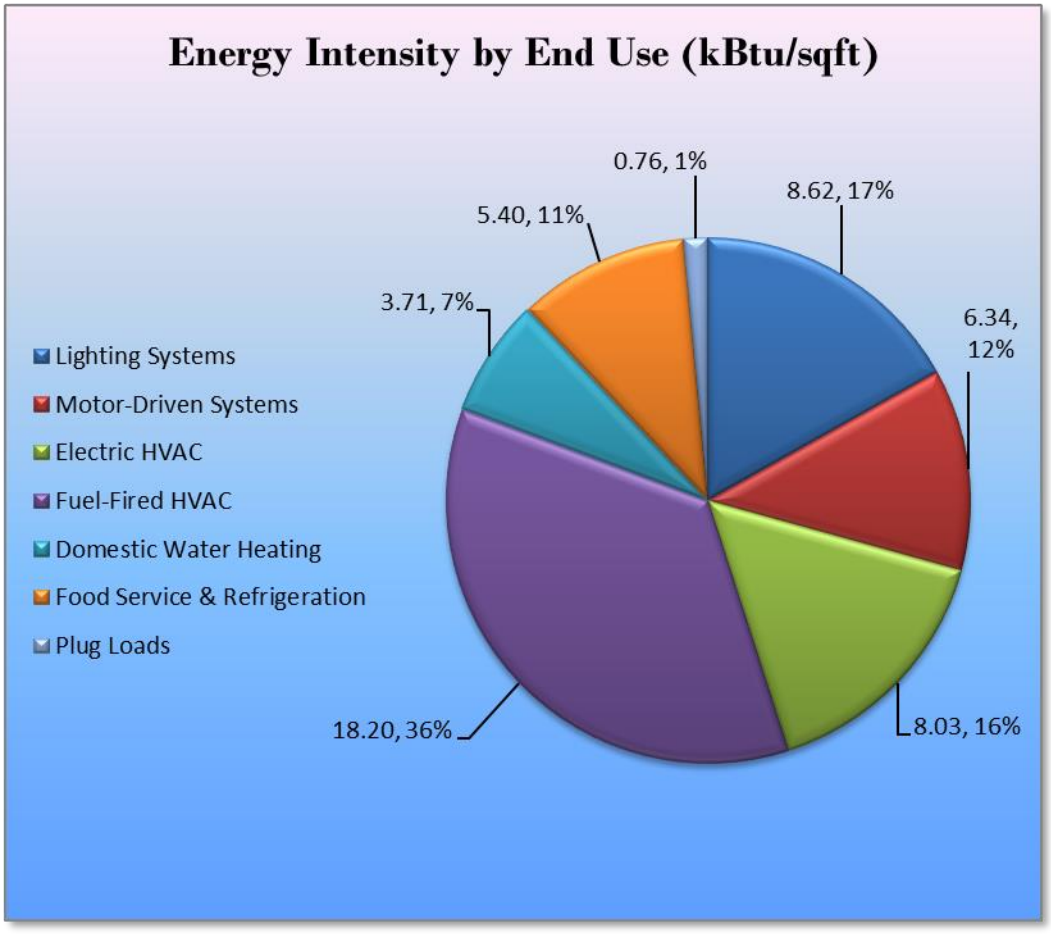
The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

Figure 18 - Energy Use Intensity Comparison – Calculated Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Charles H. Bullock School	National Median Building Type: School (K-12)
Site Energy Use Intensity (kBtu/ft²)	50.8	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 19 - Energy Use Intensity Comparison – Following Installation of Recommended Measures



Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Charles H. Bullock School	National Median Building Type: School (K-12)
Site Energy Use Intensity (kBtu/ft²)	45.2	58.2

Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification.

3.4 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 20 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set Charles H. Bullock School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJ prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures. As shown, the facilities ECM recommendations primarily include lighting and vending machine controls. HVAC, food service and refrigeration equipment were evaluated however no ECM recommendations have been identified for two primary reasons.

1. The facility and associated equipment are less than eight years old.
2. The equipment's respective efficiency is acceptable leaving minimal opportunity for improvement and a cost-effective payback for early retirement.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 21 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**122,972**	**63.9**	**0.0**	**$18,222.21**	**$174,653.75**	**$19,125.00**	**$155,528.75**	**8.54**	**123,832**
ECM 1	Install LED Fixtures	44,072	37.8	0.0	$6,530.68	$87,588.98	$5,720.00	$81,868.98	12.54	44,380
ECM 2	Retrofit Fixtures with LED Lamps	78,900	26.0	0.0	$11,691.53	$87,064.77	$13,405.00	$73,659.77	6.30	79,451
Lighting Control Measures		**13,325**	**4.1**	**0.0**	**$1,974.54**	**$21,714.00**	**$1,435.00**	**$20,279.00**	**10.27**	**13,418**
ECM 3	Install Occupancy Sensor Lighting Controls	8,310	2.6	0.0	$1,231.36	$11,114.00	$1,435.00	$9,679.00	7.86	8,368
ECM 4	Install High/Low Lighitng Controls	5,015	1.5	0.0	$743.18	$10,600.00	$0.00	$10,600.00	14.26	5,050
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$238.85**	**$1,437.60**	**$0.00**	**$1,437.60**	**6.02**	**1,623**
ECM 5	Vending Machine Control	1,612	0.0	0.0	$238.85	$1,437.60	$0.00	$1,437.60	6.02	1,623
TOTALS		**137,909**	**68.0**	**0.0**	**$20,435.60**	**$197,805.35**	**$20,560.00**	**$177,245.35**	**8.67**	**138,873**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for lighting upgrades are summarized in Figure 22 below.

Figure 22 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**122,972**	**63.9**	**0.0**	**$18,222.21**	**$174,653.75**	**$19,125.00**	**$155,528.75**	**8.54**	**123,832**
ECM 1	Install LED Fixtures	44,072	37.8	0.0	$6,530.68	$87,588.98	$5,720.00	$81,868.98	12.54	44,380
ECM 2	Retrofit Fixtures with LED Lamps	78,900	26.0	0.0	$11,691.53	$87,064.77	$13,405.00	$73,659.77	6.30	79,451

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	24,800	35.3	0.0	$3,674.92	$74,588.98	$3,720.00	$70,868.98	19.28	24,973
Exterior	19,272	2.5	0.0	$2,855.77	$13,000.00	$2,000.00	$11,000.00	3.85	19,407

Measure Description

This measure evaluates replacing existing fixtures containing incandescent and metal halide lamps with new high performance LED light fixtures. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output. Typical areas at this facility include the stage lighting, the parking lot lighting, and the roof top mounted exterior fixture.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	73,159	25.3	0.0	$10,840.90	$83,627.46	$13,165.00	$70,462.46	6.50	73,671
Exterior	5,740	0.7	0.0	$850.63	$3,437.32	$240.00	$3,197.32	3.76	5,781

Measure Description

This measure evaluates replacing T5 and T8 linear fluorescent lamps with LED tube lamps and replacing compact fluorescent and incandescent lamps screw-in/plug-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in/plug-in LED lamps can be used as a direct replacement for most other screw-in/plug-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 23 below.

Figure 23 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**13,325**	**4.1**	**0.0**	**$1,974.54**	**$21,714.00**	**$1,435.00**	**$20,279.00**	**10.27**	**13,418**
ECM 3	Install Occupancy Sensor Lighting Controls	8,310	2.6	0.0	$1,231.36	$11,114.00	$1,435.00	$9,679.00	7.86	8,368
ECM 4	Install High/Low Lighitng Controls	5,015	1.5	0.0	$743.18	$10,600.00	$0.00	$10,600.00	14.26	5,050

ECM 3: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
8,310	2.6	0.0	$1,231.36	$11,114.00	$1,435.00	$9,679.00	7.86	8,368

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in classrooms, restrooms and storage rooms. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 4: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
5,015	1.5	0.0	$743.18	$10,600.00	$0.00	$10,600.00	14.26	5,050

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors, parking lots and parking garages. At this facility, the measure has been recommended for corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period.

For this application the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.1.3 Plug Load Equipment Control - Vending Machine

Our recommendations for plug load equipment control measures are summarized in Figure 24 below.

Figure 24-Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$238.85**	**$1,437.60**	**$0.00**	**$1,437.60**	**6.02**	**1,623**
ECM 5	Vending Machine Control	1,612	0.0	0.0	$238.85	$1,437.60	$0.00	$1,437.60	6.02	1,623

ECM 5: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,612	0.0	0.0	$238.85	$1,437.60	$0.00	$1,437.60	6.02	1,623

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor based controls to reduce the energy use. These controls power down the machine when the surrounding area is vacant, then monitor the surrounding temperature and power up the cooling system at regular intervals to keep the product cool. Savings are a function of the activity level around the vending machine. We recommend the measure for the refrigerated vending machine located in the staff room.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Perform Routine Motor Maintenance

Motors consist of many moving parts whose collective degradation can contribute to a significant loss of motor efficiency. In order to prevent damage to motor components, routine maintenance should be performed. This maintenance consists of cleaning surfaces and ventilation openings on motors to prevent overheating, lubricating moving parts to reduce friction, inspecting belts and pulleys for wear and to ensure they are at proper alignment and tension, and cleaning and lubricating bearings. Consult a licensed technician to assess these and other motor maintenance strategies.

Check for and Seal Duct Leakage

Duct leakage in commercial buildings typically accounts for 5% to 25% of the supply airflow. In the case of rooftop air handlers, duct leakage can occur to the outside of the building, significantly increasing cooling and heating costs. By sealing sources of leakage, cooling, heating, and ventilationenergy use can be reduced significantly, depending on the severity of air leakage.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Furnace Maintenance

Preventative furnace maintenance can extend the life of the system, maintain energy efficiency, and ensure safe operation. Following the manufacturer's instructions, a yearly tune-up should include tasks such as checking for gas / carbon monoxide leaks; changing the air and fuel filters; checking components for cracks, corrosion, dirt, or debris build-up; ensuring the ignition system is working properly; testing and adjusting operation and safety controls; inspecting the electrical connections; and ensuring proper lubrication for motors and bearings.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

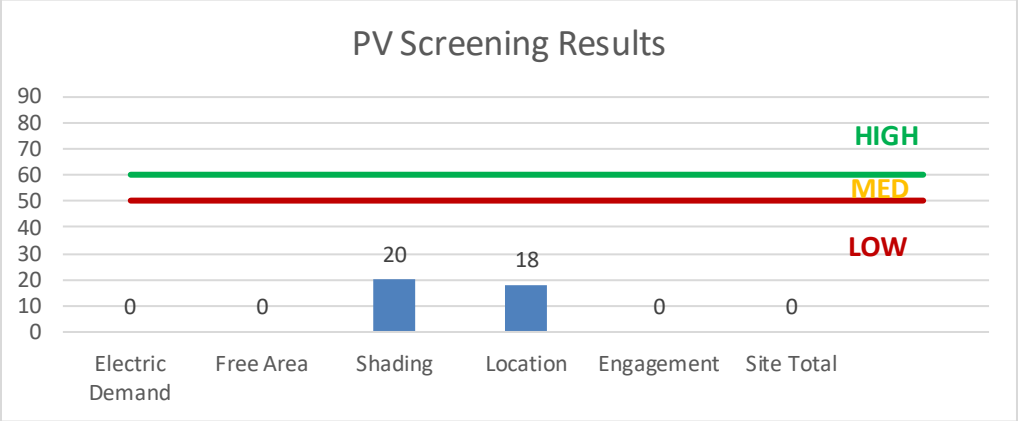
6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.

6.1 Photovoltaic



Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

The school already uses electricity produced from solar panels on-site.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a no potential for installing additional PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear not meet these minimum criteria for an additional cost-effective PV installation.

Figure 25 - Photovoltaic Screening

Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.

CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a no potential for installing a cost-effective CHP system.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 26 for a list of the eligible programs identified for each recommended ECM.

Figure 26 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	X					
ECM 2	Retrofit Fixtures with LED Lamps	X					
ECM 3	Install Occupancy Sensor Lighting Controls	X					
ECM 4	Install High/Low Lighitng Controls						
ECM 5	Vending Machine Control						

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program is comprised of new construction and retrofit components that offer incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives for various energy efficiency equipment based on national/market trends, new technologies or changes in efficiency baselines.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

All customer sizes and types may be served by this program. This program provides an effective mechanism for securing incentives for individual projects that may be completed at once or over several years.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: **www.state.nj.us/bpu/commercial/shopping.html**.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: **www.state.nj.us/bpu/commercial/shopping.html**.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Edgemont School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey district schools in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

Edgemont School is a three-story building totaling 34,638 square foot facility originally constructed in 1925. The building has a pitched roof and exterior walls are finished with brick masonry. Interior lighting consists mainly of linear fluorescent fixtures which are mostly controlled with manual wall switches. Heating is provided by two steam boilers and the cooling system consists of window air conditioners.

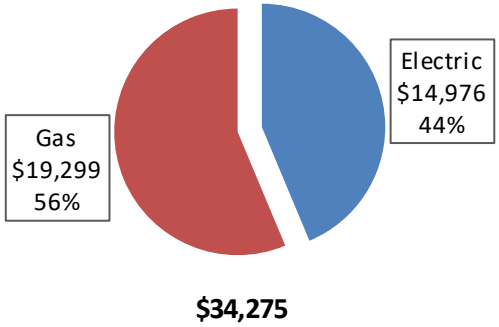
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated eight measures. Five measures were recommended for implementation which represent an opportunity for Edgemont School to reduce annual energy costs by roughly $5,176 and annual greenhouse gas emissions by 38,286 lbs CO_2e. The measures would pay for themselves in roughly 9.12 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce Edgemont School's annual energy use by 5.4%.

Figure 1 – Previous 12 Month Utility Costs



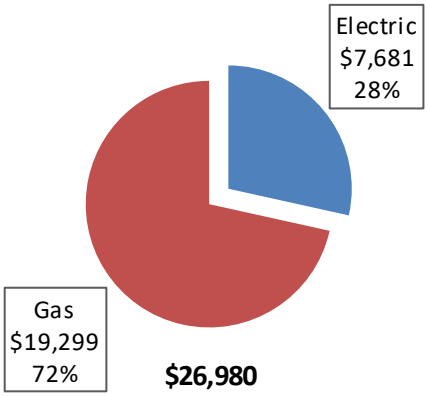


Figure 2 – Potential Post-Implementation Costs

A detailed description of Edgemont School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4. Measures without an "ECM #" in the table below have been evaluated, but are not recommended for implementation.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**32,804**	**14.6**	**$4,465.58**	**$44,872.25**	**$6,060.00**	**$38,812.25**	**8.69**	**33,033**
ECM 1	Install LED Fixtures	Yes	7,516	3.6	$1,023.13	$15,687.69	$1,000.00	$14,687.69	14.36	7,568
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	Yes	1,558	0.7	$212.04	$2,123.50	$200.00	$1,923.50	9.07	1,568
ECM 3	Retrofit Fixtures with LED Lamps	Yes	23,730	10.2	$3,230.42	$27,061.06	$4,860.00	$22,201.06	6.87	23,896
Lighting Control Measures			**5,217**	**2.3**	**$710.13**	**$9,744.00**	**$1,360.00**	**$8,384.00**	**11.81**	**5,253**
ECM 4	Install Occupancy Sensor Lighting Controls	Yes	4,688	2.0	$638.22	$8,544.00	$1,360.00	$7,184.00	11.26	4,721

Motor Upgrades			**177**	**0.3**	**$24.05**	**$1,547.10**	**$0.00**	**$1,547.10**	**64.32**	**178**
	Premium Efficiency Motors	No	177	0.3	$24.05	$1,547.10	$0.00	$1,547.10	64.32	178
Variable Frequency Drive (VFD) Measures			**1,579**	**1.1**	**$214.94**	**$6,015.30**	**$0.00**	**$6,015.30**	**27.99**	**1,590**
	Install VFDs on Boiler Feedwater Pumps	No	1,579	1.1	$214.94	$6,015.30	$0.00	$6,015.30	27.99	1,590
Electric Unitary HVAC Measures			**431**	**0.4**	**$58.66**	**$2,536.81**	**$0.00**	**$2,536.81**	**43.24**	**434**
	Install High Efficiency Electric AC	No	431	0.4	$58.66	$2,536.81	$0.00	$2,536.81	43.24	434
TOTALS FOR RECOMMENDED MEASURES			**38,020**	**16.8**	**$5,175.71**	**$54,616.25**	**$7,420.00**	**$47,196.25**	**9.12**	**38,286**
TOTALS FOR EVALUATED MEASURES			**40,207**	**18.6**	**$5,473.36**	**$64,715.46**	**$7,420.00**	**$57,295.46**	**10.47**	**40,488**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing old standard efficiency motors with motors of the current efficiency standard (EISA 2007). Motors will be replaced with the same size motors. This measure saves energy by reducing the power used by the motors due to improved electrical efficiency.

Variable Frequency Drives measures generally involve controlling the speed of a motor to achieve a flow or temperature rather than using a valve, damper, or no means at all. These measures save energy by slowing a motor which is an extremely efficient method of control.

Electric Unitary HVAC measures generally involve replacing old inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide cooling equivalent to older air condition systems, but use less energy. These measures save energy by reducing the power used by the air condition system due to improved electrical efficiency.

Energy Efficient Practices

TRC Energy Services also identified 12 low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at Edgemont School include:

- Reduce Air Leakage
- Close Doors and Windows
- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Ensure Lighting Controls Are Operating Properly
- Perform Routine Motor Maintenance
- Clean and/or Replace HVAC Filters
- Repair/Replace Steam Traps
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for Edgemont School. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program, you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

This facility also qualifies for the Direct Install program which, through an authorized network of participating contractors, can assist with the implementation of a group of measures versus installing individual measures or phasing implementation. This program is designed to be turnkey and will provide an incentive up to 70% of the cost of the project identified by the designated contractor.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.1 Project Contacts

2.2 General Site Information

On November 09, 2016, TRC performed an energy audit at Edgemont School located in Montclair, New Jersey. TRC's auditor met with Ronald Jones to review the facility operations and focus the investigation on specific energy-using systems.

The 34,638-square foot facility is a three-story building comprised of classrooms, administrative offices, library, multipurpose room, and storage spaces. The building has a mid-level basement which houses mechanical equipment. The original building was constructed in 1925. In 1949, a new section was built to accommodate additional classrooms and the auditorium was built in 1950. The building is used primarily for primary school programs.

2.3 Building Occupancy

The school operates on a 10-month schedule and is open Monday through Friday. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 310 students and staff.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Edgemont School	Weekday	8:00 AM - 3:30 PM
Edgemont School	Weekend	Closed

2.4 Building Envelope

The three-story building with a mid-level basement has a reinforced concrete foundation. The roofing system consists of a pitched concrete tile that is in good condition. The exterior walls are finished with brick masonry. The windows throughout the facility are double-pane, operable with aluminum frames, and are in good condition. Exterior doors are constructed of metal and are in good condition as well. Overall, the building's envelope is in good condition.

Image 1 – Building Envelope

2.5 On-site Generation

Edgemont School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Lighting at the facility is provided predominately by 32-Watt linear fluorescent T8 lamps with electronic ballasts. Most of the building classrooms use 2-lamp or 4-lamp, 2-foot wide by 4-foot long troffers with diffusers. The multipurpose room is illuminated with 250-Watt metal halide lamps while the library office and the boiler room are illuminated with a combination of 32-Watt linear fluorescent T8 and 40-Watt T12 lamps. A small number of compact fluorescent and incandescent lamps are located in spaces such as stairwells and storage rooms. The remaining building spaces are illuminated with linear 32-Watt fluorescent T8 lamps. Exit signs throughout the facility are LED. Lighting control is provided mostly by manual wall switches. The facility exterior lighting system consists of 250-Watt metal halide outdoor wall-mounted area fixtures which are controlled by photocells.

Steam Heating System

The steam heating system consists of two 1,189 MBh steam boilers, each with a nominal combustion efficiency of 83%, plus the associated distribution system. Each boiler has a 3 hp combustion air fan. The boiler also has two 3 hp feed water pumps and a control valve that maintains the boiler water level. Steam is supplied to the radiators and heating unit ventilators at 15 psi. The Nestbitt unit ventilators serving rooms 13, 14, 114, and 115 appear in poor condition. The boilers operate in a lead/lag configuration. Local thermostats are used to control the temperatures in spaces. The boilers are two years old and are well maintained.

Image 2 – Steam Heating System

Air Conditioning

Cooling is provided by 15 window air conditioners with capacity ranging from 0.5 to 1.83 ton, and are relatively in good condition except for the two older less efficient units serving room 9 and the teacher room.

Two air handlers, each equipped with a 1 hp supply fan, provide fresh air to the facility from their location in the fan room.

Domestic Hot Water

The domestic hot water system for the facility consists of one Bradford White gas fired non-condensing hot water heater with an input rating of 76 MBh and a nominal efficiency of 82%. It has a 75-gallon storage tank and is located in the boiler room. The water heater is seven years old and appears in good condition.

Food Service & Refrigeration

The school includes a small institutional kitchen which includes a gas rack convection oven and insulated food holding cabinets, and three stand-up refrigerators. The kitchen is well maintained.

Plug Load & Vending Machines

The building has approximately 35 computers with LCD monitors that are used daily, plus servers, three large photocopiers, and four printers. There is no centralized PC power management software installed. The facility has no refrigerated beverage vending machines.

2.7 Water-Using Systems

There are several restrooms at this facility. A sampling of restrooms found that all the faucets are rated as low flow.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are many factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants regarding operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy

The following energy consumption and cost data is based on the last 12-month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 6 - Utility Summary

Utility Summary for Edgemont School		
Fuel	**Usage**	**Cost**
Electricity	95,970 kWh	$14,976
Natural Gas	22,103 Therms	$19,299
Total		**$34,275**

The current utility cost for this site is $34,275 as shown in the chart below.

Figure 7 - Energy Cost Breakdown

$34,275

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.136/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects lower occupancy in the summer months confirming the 10 months facility operation.

Figure 8 - Electric Usage & Demand

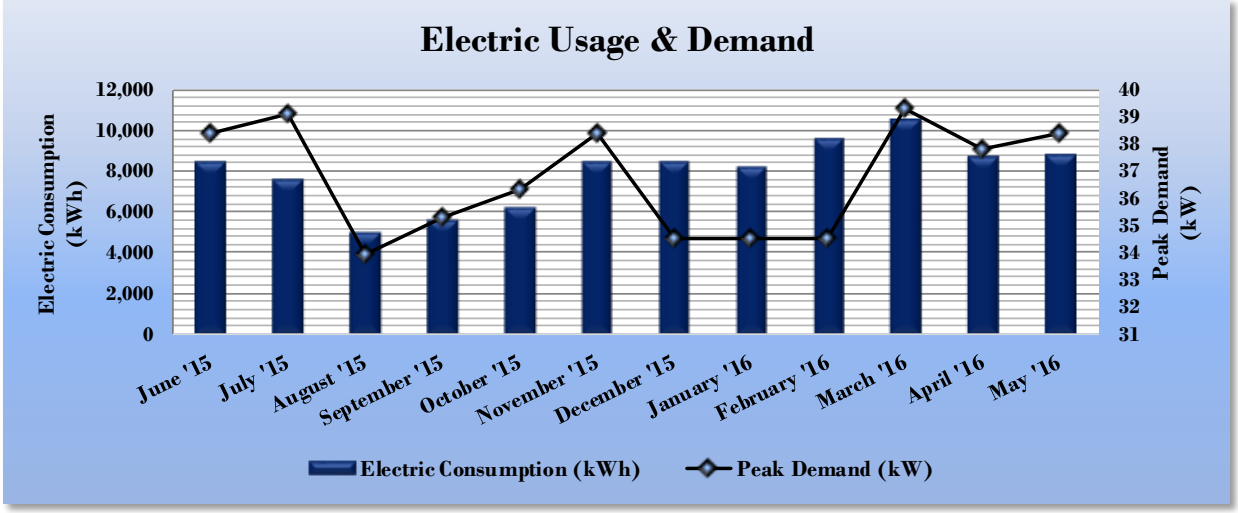

Figure 9 - Electric Usage & Demand

Electric Billing Data for Edgemont School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
6/16/15	30	8,520	38	$167	$1,335
7/18/15	31	7,620	39	$165	$1,508
8/17/15	30	4,990	34	$147	$1,096
9/16/15	31	5,660	35	$149	$1,209
10/16/15	31	6,240	36	$158	$1,273
11/17/15	30	8,490	38	$168	$1,224
12/16/15	31	8,490	35	$151	$1,202
1/16/16	30	8,250	35	$151	$1,115
2/16/16	31	9,600	35	$151	$1,298
3/16/16	31	10,590	39	$171	$1,375
4/16/16	29	8,730	38	$166	$1,166
5/17/16	30	8,790	38	$169	$1,176
Totals	**365**	**95,970**	**39.3**	**$1,912**	**$14,976**
Annual	**365**	**95,970**	**39.3**	**$1,912**	**$14,976**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.873/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 10 - Natural Gas Usage

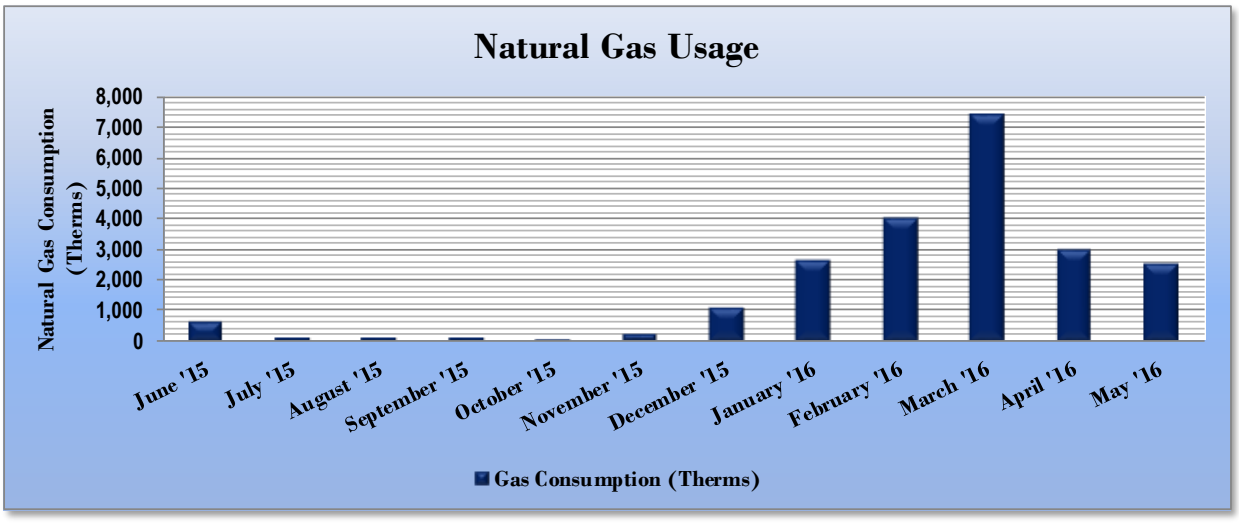

Figure 11 - Natural Gas Usage

Gas Billing Data for Edgemont School				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/16/15	30	625	$429	No
7/18/15	31	133	$177	Yes
8/17/15	30	114	$162	No
9/16/15	31	114	$191	No
10/16/15	31	33	$150	No
11/17/15	30	248	$241	No

Annual	**365**	**22,103**	**$19,299**	

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the energy use intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

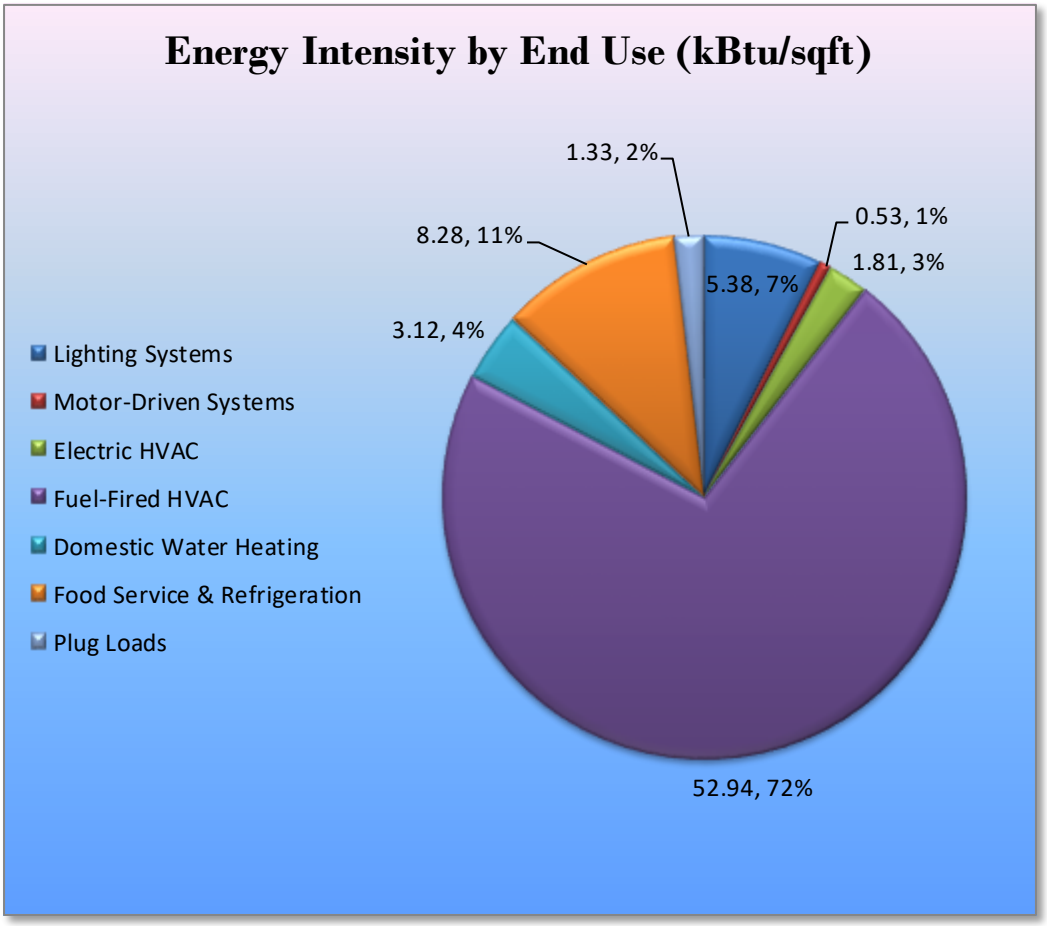
Figure 12 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Edgemont School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	96.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	73.3	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 13 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Edgemont School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	84.9	141.4
Site Energy Use Intensity (kBtu/ft^2)	69.5	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 70.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown

To provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 14 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the Edgemont School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJ prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 15 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**32,804**	**14.6**	**0.0**	**$4,465.58**	**$44,872.25**	**$6,060.00**	**$38,812.25**	**8.69**	**33,033**
ECM 1	Install LED Fixtures	7,516	3.6	0.0	$1,023.13	$15,687.69	$1,000.00	$14,687.69	14.36	7,568
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,558	0.7	0.0	$212.04	$2,123.50	$200.00	$1,923.50	9.07	1,568
ECM 3	Retrofit Fixtures with LED Lamps	23,730	10.2	0.0	$3,230.42	$27,061.06	$4,860.00	$22,201.06	6.87	23,896
Lighting Control Measures		**5,217**	**2.3**	**0.0**	**$710.13**	**$9,744.00**	**$1,360.00**	**$8,384.00**	**11.81**	**5,253**
ECM 4	Install Occupancy Sensor Lighting Controls	4,688	2.0	0.0	$638.22	$8,544.00	$1,360.00	$7,184.00	11.26	4,721
ECM 5	Install High/Low Lighitng Controls	528	0.2	0.0	$71.91	$1,200.00	$0.00	$1,200.00	16.69	532
TOTALS		**38,020**	**16.8**	**0.0**	**$5,175.71**	**$54,616.25**	**$7,420.00**	**$47,196.25**	**9.12**	**38,286**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for lighting measures are summarized in Figure 16 below.

Figure 16 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**32,804**	**14.6**	**0.0**	**$4,465.58**	**$44,872.25**	**$6,060.00**	**$38,812.25**	**8.69**	**33,033**
ECM 1	Install LED Fixtures	7,516	3.6	0.0	$1,023.13	$15,687.69	$1,000.00	$14,687.69	14.36	7,568
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,558	0.7	0.0	$212.04	$2,123.50	$200.00	$1,923.50	9.07	1,568
ECM 3	Retrofit Fixtures with LED Lamps	23,730	10.2	0.0	$3,230.42	$27,061.06	$4,860.00	$22,201.06	6.87	23,896

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	5,808	2.5	0.0	$790.65	$12,171.60	$100.00	$12,071.60	15.27	5,849
Exterior	1,708	1.1	0.0	$232.48	$3,516.09	$900.00	$2,616.09	11.25	1,720

Measure Description

This measure evaluates replacing existing interior and exterior fixtures containing 250-Watt metal halide lamps with new high-performance LED light fixtures. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,558	0.7	0.0	$212.04	$2,123.50	$200.00	$1,923.50	9.07	1,568
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T12 lamps, ballasts, and reflectors with LED tube lamps, reflectors, and drivers specifically designed for existing linear fluorescent fixtures. The retrofit uses the existing fixture housing but replaces the rest of the components with an efficient source and reflectors designed for LEDs. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output and efficiently projects the light into the space.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	23,730	10.2	0.0	$3,230.42	$27,061.06	$4,860.00	$22,201.06	6.87	23,896
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T8 lamps with LED tube lamps and replacing incandescent, halogen incandescent, and compact fluorescent screw-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in LED lamps can be used as a direct replacement for most other screw-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**5,217**	**2.3**	**0.0**	**$710.13**	**$9,744.00**	**$1,360.00**	**$8,384.00**	**11.81**	**5,253**
ECM 4	Install Occupancy Sensor Lighting Controls	4,688	2.0	0.0	$638.22	$8,544.00	$1,360.00	$7,184.00	11.26	4,721
ECM 5	Install High/Low Lighitng Controls	528	0.2	0.0	$71.91	$1,200.00	$0.00	$1,200.00	16.69	532

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,688	2.0	0.0	$638.22	$8,544.00	$1,360.00	$7,184.00	11.26	4,721

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in restrooms, storage rooms, classrooms and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
528	0.2	0.0	$71.91	$1,200.00	$0.00	$1,200.00	16.69	532

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high-level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period

For this application, the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.2 ECMs Evaluated but Not Recommended

The measures below have been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in each measure description section.

Figure 18 – Summary of Evaluated but Not Recommended ECMs

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades	**177**	**0.3**	**0.0**	**$24.05**	**$1,547.10**	**$0.00**	**$1,547.10**	**64.32**	**178**
Premium Efficiency Motors	177	0.3	0.0	$24.05	$1,547.10	$0.00	$1,547.10	64.32	178

Install High Efficiency Electric AC	431	0.4	0.0	$58.66	$2,536.81	$0.00	$2,536.81	43.24	434
TOTALS	**2,187**	**1.8**	**0.0**	**$297.65**	**$10,099.21**	**$0.00**	**$10,099.21**	**33.93**	**2,202**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
177	0.3	0.0	$24.05	$1,547.10	$0.00	$1,547.10	64.32	178

Measure Description

This measure evaluates replacing the two 3 hp boiler feed water pump standard efficiency motors with EISA 2007 efficiency motors. The evaluation assumes existing motors will be replaced with the same size motors. It is important that the speed of each new motor match the speed of the motor it replaces as closely as possible. The base case motor efficiencies are obtained from nameplate information. Proposed case premium motor efficiencies are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016)*. Savings are based on the difference between baseline and proposed efficiencies and the annual operating hours.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install VFDs on Boiler Feedwater Pumps

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,579	1.1	0.0	$214.94	$6,015.30	$0.00	$6,015.30	27.99	1,590

Measure Description

This measure evaluates installing a variable frequency drive (VFD) to control the two 3 hp steam boiler feedwater pumps. The existing level control valve will need to be maintained fully open and its control signal used to modulate the feedwater pump VFD speed. Energy savings result from reducing pump motor speed (and power) at reduced feedwater flow. The magnitude of energy savings is based on the amount of time at reduced loads.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Electric AC

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
431	0.4	0.0	$58.66	$2,536.81	$0.00	$2,536.81	43.24	434

Measure Description

This measure evaluates replacing window air conditioners with high efficiency window air conditioners. There have been significant improvements in both compressor and fan motor efficiencies in the past several years. Therefore, electricity savings can be achieved by replacing old units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the old and new unit, the cooling load, and the annual operating hours.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost-effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Perform Routine Motor Maintenance

Motors consist of many moving parts whose collective degradation can contribute to a significant loss of motor efficiency. In order to prevent damage to motor components, routine maintenance should be performed. This maintenance consists of cleaning surfaces and ventilation openings on motors to prevent overheating, lubricating moving parts to reduce friction, inspecting belts and pulleys for wear and to ensure they are at proper alignment and tension, and cleaning and lubricating bearings. Consult a licensed technician to assess these and other motor maintenance strategies.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Repair/Replace Steam Traps

Properly functioning steam traps ensure that all latent heat in the steam is delivered to the end use by preventing pressurized steam from leaking. Steam traps should be inspected as part of the regular steam system maintenance. Traps that are blocked, venting, or allowing steam to leak through should be repaired or replaced. Repairing or replacing existing steam traps will reduce steam losses.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

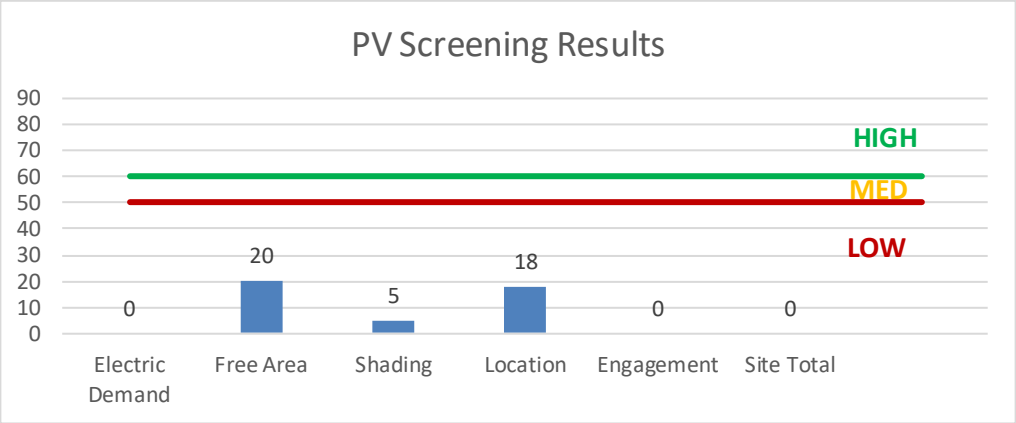
Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before deciding to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **Low** potential for installing a PV array.

To be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear not meet these minimum criteria for cost-effective PV installation.

Figure 19 - Photovoltaic Screening

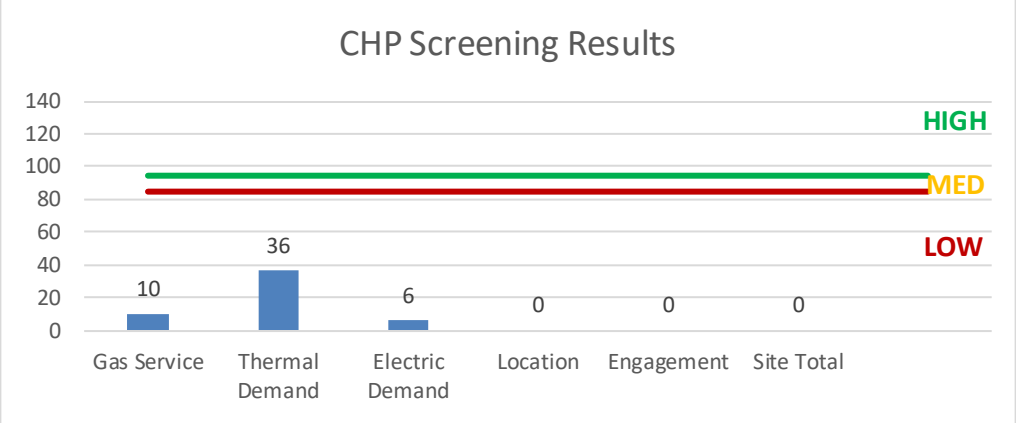
Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 20 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically, an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

In our opinion, this facility is not a good candidate for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP can provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you could participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 21 for a list of the eligible programs identified for each recommended ECM.

Figure 21 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install
ECM 1	Install LED Fixtures	x		x
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	x		x
ECM 3	Retrofit Fixtures with LED Lamps	x		x
ECM 4	Install Occupancy Sensor Lighting Controls	x		x
ECM 5	Install High/Low Lighitng Controls			x

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to mid-sized facilities with a peak electric demand that did not exceed 200 kW in any of the preceding 12 months. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and install those measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program, you will need to contact the participating contractor assigned to the county where your facility is located; a complete list is provided on the Direct Install website identified below. The contractor will be paid the program incentive directly which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps mentioned above, and the remaining 30% of the cost is your responsibility to the contractor.

Since Direct Install offers a free assessment, LGEA applicants that do not meet the audit program eligibility requirements, but do meet the Direct Install requirements, may be moved directly into this program.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

ENERGY STAR® Score[1]

Edgemont Elementary School

Primary Property Type: K-12 School
Gross Floor Area (ft²): 34,638
Built: 1925

For Year Ending: April 30, 2016
Date Generated: December 20, 2017

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Property & Contact Information

Property Address	Property Owner	Primary Contact
Edgemont Elementary School 20 Edgemont Road Montclair, New Jersey 07042	Montclair Board of Education 22 Valley Road Montclair, NJ 07042 (973) 509-4050	Steve DiGeronimo 22 Valley Road Montclair, NJ 07042 (973) 509-4050 bfleischer@montclair.k12.nj.us

Property ID: 5724510

Energy Consumption and Energy Use Intensity (EUI)

Site EUI
73.5 kBtu/ft²

Source EUI
97.1 kBtu/ft²

Annual Energy by Fuel	
Electric - Grid (kBtu)	330,511 (13%)
Natural Gas (kBtu)	2,214,138 (87%)

National Median Comparison	
National Median Site EUI (kBtu/ft²)	88.3
National Median Source EUI (kBtu/ft²)	116.7
% Diff from National Median Source EUI	-17%
Annual Emissions	
Greenhouse Gas Emissions (Metric Tons CO2e/year)	154

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Furlong Field House.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services(TRC), as part of a comprehensive effort to assist New Jersey local governments and public schools in controlling their energy costs and help protect our environment by reducing energy consumption statewide.

1.1 Facility Summary

The Furlong Field House at Woodman Field is a 13,184 square foot facility comprised of a main field house, plus a few smaller buildings adjacent to a large football field with running track and bleachers. The field and bleacher area has no lighting or other energy-using equipment. The Furlong Field House consists primarily of locker rooms, restrooms, and workout areas with gym equipment. There is an adjoining building connected by a covered walkway which contains a large multipurpose room, which is used for awards ceremonies and other special events. Next to the field house is a small building which houses the Building and Grounds Office. This building has a connected garage for storage and a machine shop. There is also small concession stand building with kitchen equipment used to store and prepare food sold at athletic events.

Building occupancy varies widely. The Building and Grounds Office and garage area is usually occupied by facility staff every weekday. The field house and multipurpose room are typically open every weekday (from about 7:00 AM to 5:00 PM) during the school year, with additional hours on some evenings and weekends for sporting events or awards ceremonies. The concession stand is typically occupied only on during sporting events. The field house and multipurpose room is often occupied by just a few students and coaches during most of the day, but may be occupied by hundreds of people when there are sporting events, team practices, or special events.

Interior lighting at Furlong Field House consist mostly of 2 to 4-lamp T8 fluorescent fixtures. There are also some compact fluorescent (CFL) and high intensity discharge (HID) fixtures in some areas. Building exteriors are lit by HID fixtures. The Field House is heated by natural gas. It has a 643-MBh Weil-McLain boiler, plus there are four rooftop units (RTUs) which supply about 790 MBH of supplementary heating and 78 tons of cooling capacity, as needed. The Building and Grounds Office and the garage are heated and cooled by an electric warm air unit heater and a window air conditioning (AC) unit. The concession stand has no heating or cooling. A thorough description of the facility and our observations are located in Section 2.

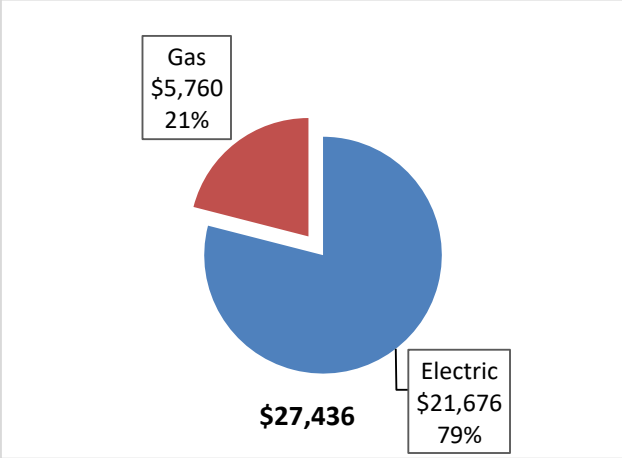
1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated five energy conservation measures (ECMs). We recommend four ECMs for implementation. The four measures together represent an opportunity to reduce the annual energy cost of the facility by about $4,302 and annual greenhouse gas emissions by 29,180 lbs CO_2e. We estimate that if these measures are implemented as recommended, the project would pay for itself in energy savings alone in about 5.0 years. The breakdown of annual utility costs and the potential utility cost savings, following project implementation, are shown in Figure 1 and Figure 2, respectively. We estimate that the four measures together would reduce Furlong Field House's annual energy usage by about 5.3% overall.

A boiler replacement measure was evaluated, but was not recommended for implementation at this time due to the measure's long payback period. If the school district chooses to upgrade the main boiler as well, then that measure could increase overall energy savings by another 5%, but it would likely increase the overall payback period of the project to about 7.5 years.

Figure 1 – Previous 12 Month Utility Costs



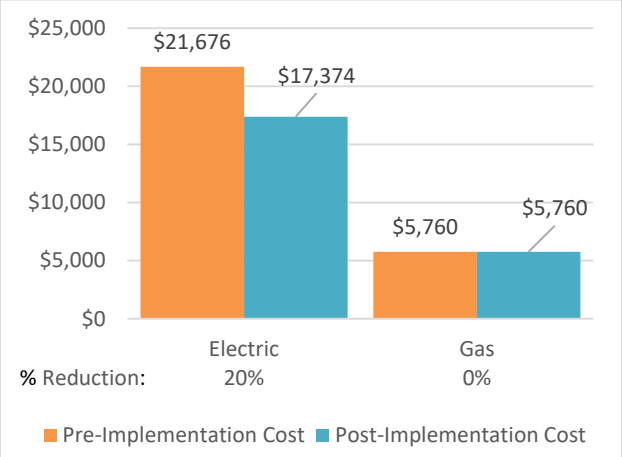


Figure 2 – Potential Post-Implementation Costs

A detailed description of Furlong Field House's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the proposed energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**26,381**	**7.6**	**0.0**	**$3,916.67**	**$17,937.84**	**$1,670.00**	**$16,267.84**	**4.2**	**26,565**
ECM 1	Install LED Fixtures	Yes	6,366	1.2	0.0	$945.08	$3,257.05	$600.00	$2,657.05	2.8	6,410
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	Yes	155	0.0	0.0	$22.98	$117.00	$10.00	$107.00	4.7	156
ECM 3	Retrofit Fixtures with LED Lamps	Yes	19,860	6.3	0.0	$2,948.61	$14,563.79	$1,060.00	$13,503.79	4.6	19,999
Lighting Control Measures			**2,597**	**0.9**	**0.0**	**$385.54**	**$5,750.00**	**$695.00**	**$5,055.00**	**13.1**	**2,615**
ECM 4	Install Occupancy Sensor Lighting Controls	Yes	2,597	0.9	0.0	$385.54	$5,750.00	$695.00	$5,055.00	13.1	2,615
Gas Heating (HVAC/Process) Replacement			**0**	**0.0**	**93.9**	**$394.66**	**$15,434.20**	**$1,414.60**	**$14,019.60**	**35.5**	**10,998**
	Install High Efficiency Hot Water Boilers	No	0	0.0	93.9	$394.66	$15,434.20	$1,414.60	$14,019.60	35.5	10,998
TOTAL FOR PROPOSED MEASURES			**28,977**	**8.4**	**0.0**	**$4,302.20**	**$23,687.84**	**$2,365.00**	**$21,322.84**	**5.0**	**29,180**
TOTAL FOR ALL MEASURES			**28,977**	**8.4**	**93.9**	**$4,696.86**	**$39,122.04**	**$3,779.60**	**$35,342.44**	**7.5**	**40,178**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Gas Heating (HVAC/Process) measures generally involve replacing older inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide equivalent heating compared to older systems at a reduced energy cost. These measures save energy by reducing the fuel demands for heating, due to improved combustion and heat transfer efficiency.

Energy Efficient Practices

TRC also identified four low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at the Furlong Field House include:

- Close Doors and Windows
- Practice Proper Use of Thermostat Schedules and Temperature Resets
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for the Furlong Field House. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- Energy Savings Improvement Program (ESIP)
- Demand Response Energy Aggregator

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

This facility may also qualify for the Direct Install program which can provide turnkey installation of multiple measures, through an authorized network of participating contractors. This program can provide substantially higher incentives than SmartStart, up to 70% of the cost of selected measures, although measure eligibility will have to be assessed and be verified by the designated Direct Install contractor and, in most cases, they will perform the installation work.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 07, 2016, TRC performed an energy audit at Furlong Field House located in Montclair, New Jersey. TRC's team met with Leonard Saponara to review the facility operations and help focus our investigation on specific energy-using systems.

The Furlong Field House at Woodman Field is a 13,184 square foot facility comprised of a main field house, plus a few smaller buildings adjacent to a large football field with running track and bleachers. The field and bleacher area has no lighting or other energy-using equipment.

The Furlong Field House consists primarily of locker rooms, restrooms, and workout areas with gym equipment. There is an adjoining building connected by a covered walkway which contains a large multipurpose room, which is used for awards ceremonies and other special events. Next to the field house is a small building which houses the Building and Grounds Office. This building has a connected garage for storage and a machine shop. There is also small concession stand building with kitchen equipment used to store and prepare food sold at athletic events.

The original date of construction is unknown for the field house and other buildings at Woodman Field. The building's main boiler was installed in 1994. The field house underwent a $5 million renovation in 2008 and was renamed the Furlong Field House.

2.3 Building Occupancy

Building occupancy varies widely. The Building and Grounds Office and garage area is usually occupied by facility staff every weekday. The field house and multipurpose room are typically open every weekday (from about 7:00 AM to 5:00 PM) during the school year, with additional hours on some evenings and weekends for sporting events or awards ceremonies. The concession stand is typically occupied only on during sporting events. The field house and multipurpose room is often occupied by just a few students and coaches during most of the day but may be occupied by hundreds of people when there are sporting events, team practices, or special events.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Furlong Field House	Weekday	7:00am - 5pm
Furlong Field House	Weekend	CLOSED

2.4 Building Envelope

Furlong Field House is a Tudor-style wood-framed building with stucco exterior. It has a sloped roof with asphalt shingles. The windows are doubled-paned with aluminum frames. It has wooden and steel doors with double-paned glass.

The smaller buildings – the Building and Grounds Office, the garages, and the concession stand - are all of similar design with wooden frames, stucco exterior, and sloped shingled roofs.

Door and window seals all appeared tight. No excessive air infiltration was noted for any of the buildings.

Image 1: Furlong Field House - Front Exterior

2.5 On-Site Generation

The Furlong Field House and adjacent buildings have no on-site power generation.

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

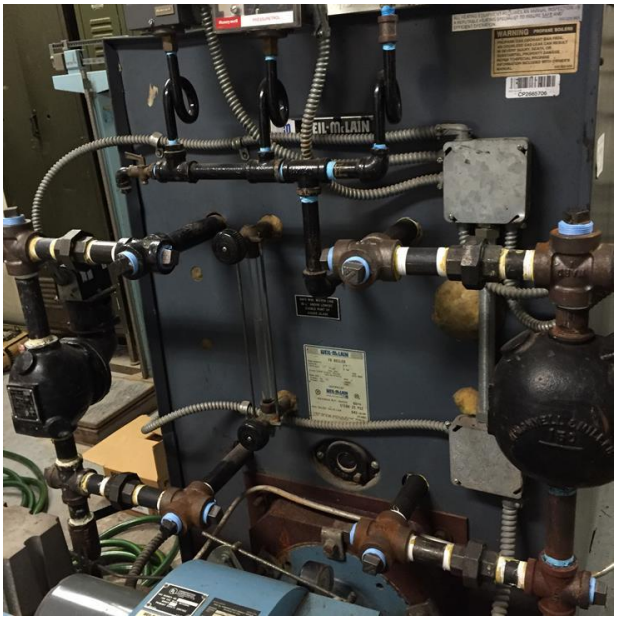
Interior lighting at Furlong Field House consist mostly of 2 to 4-lamp T8 fluorescent fixtures. There are also some compact fluorescent (CFL) and high intensity discharge (HID) fixtures in some areas. Building exteriors are lit mostly by HID fixtures.

Image2: Furlong Field House / Woodman Field - Typical Lighting Fixtures

Heating Ventilation and Air Conditioning (HVAC)

The Furlong Field House is heated by natural gas. It has a 643-MBh Weil-McLain hydronic boiler, which was installed in 1994. The main boiler appears to be in good condition for its age.

There are also four gas/electric rooftop units (RTUs), three Reznor units and one Carrier unit, which together supply 790 MBh of supplementary heating and 78 tons of cooling capacity, as needed.



There are also small exhaust fans on the roof of the building with fractional horsepower motors.

The Building and Grounds Office and the machine shop are heated by a single electric warm air unit heater and cooled a through-the-wall air conditioning unit.

The concession stand and an adjacent storage garage have no heating or cooling.

Temperatures at Furlong Field House are setback at night when the building is closed. HVAC systems at all Montclair BOE properties are scheduled remotely through a contract with a company called Energy for America.

Image 3: Furlong Field House / Woodman Field - HVAC Equipment

Domestic Hot Water Heating System

The domestic hot water heating system at the Furlong Field House consist of two A.O. Smith gas-fired storage hot water heaters, each with 98-gallon storage tanks. These supply all restrooms and locker room showers.

Building Plug Load

Building plug load equipment is minimal, just some office equipment for a few small office spaces. There is also some gym equipment and an ice machine.

There are three refrigerators and a freezer chest to store food at the concession stand. The concession stand also has an electric stove with exhaust hood, which is used only during sporting events.

2.7 Water-Using Systems

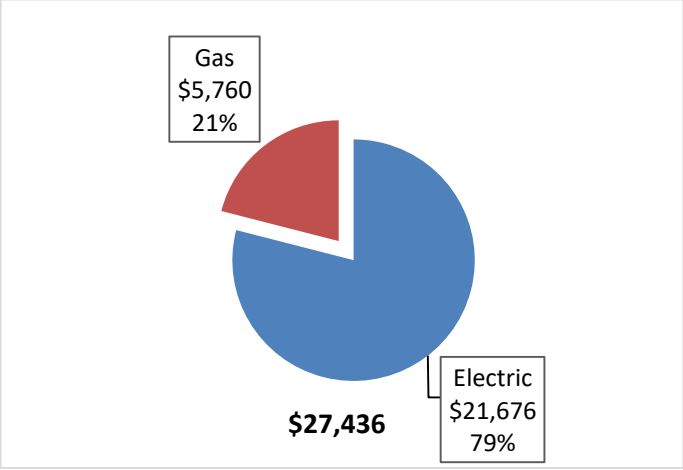
All faucets, showerheads, toilets, and urinals appeared to be low-flow rated devices which meet or exceed current standards for water conservation in commercial buildings.

For more information on current water conservation standards for commercial buildings, see Section 5.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 6 - Utility Summary

Utility Summary for Furlong Field House		
Fuel	**Usage**	**Cost**
Electricity	146,000 kWh	$21,676
Natural Gas	13,709 Therms	$5,760
Total		**$27,436**

The current annual energy cost for this facility is $27,436 as shown in the chart below.

Figure 7 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over a recent past 12-month period was found to be $0.148/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Figure 8 - Electric Usage & Demand

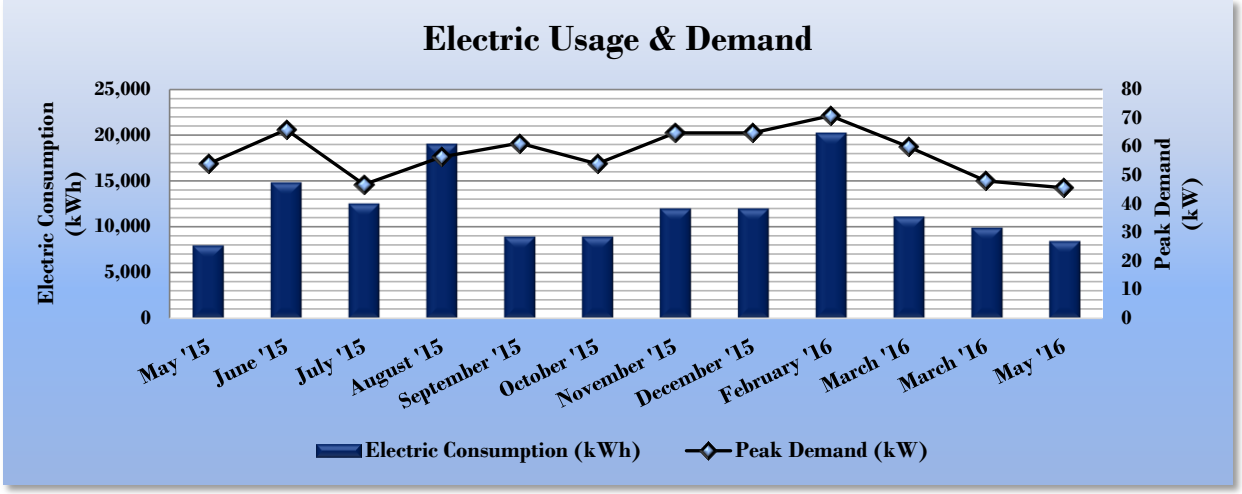


Figure 9 - Electric Usage & Demand

Electric Billing Data for Furlong Field House				
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Total Electric Cost
6/15/15	26	7,920	54	$1,745
7/15/15	30	14,760	66	$2,814
8/13/15	29	12,480	47	$2,238
9/14/15	32	18,960	56	$3,190
10/13/15	29	8,880	61	$1,358
11/12/15	30	8,880	54	$1,358
12/15/15	33	11,940	65	$1,115
1/15/16	31	11,940	65	$1,115
2/18/16	34	20,160	71	$2,596
3/16/16	27	11,040	60	$1,527
4/15/16	30	9,840	48	$1,338
5/17/16	32	8,400	46	$1,163
Totals	**363**	**145,200**	**70.8**	**$21,558**
Annual	**365**	**146,000**	**70.8**	**$21,676**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost over a recent 12-month period was found to be $0.420/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Please Note: The natural gas consumption appears to be adequate for a building of this size, however the billed rate seems to be way below current market averages, less than half of what it should be. We believe there are likely some third-party gas supplier bills that were missing from the utility data provided.

Figure 10 - Natural Gas Usage

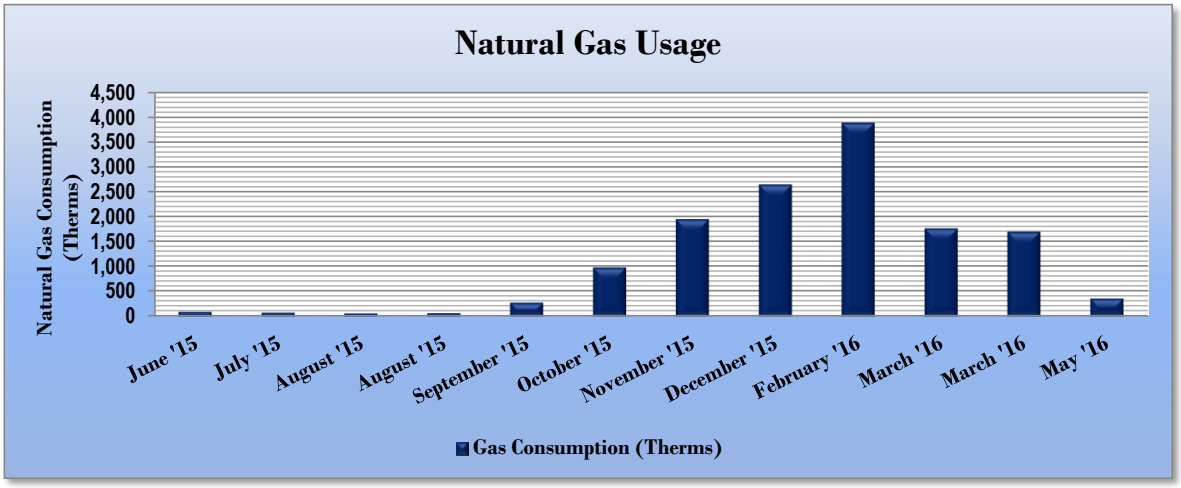

Figure 11 - Natural Gas Usage

Gas Billing Data for Furlong Field House			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
6/16/15	32	92	$112
7/20/15	34	72	$110
8/17/15	28	59	$109
9/15/15	29	62	$111
10/14/15	29	274	$132
11/12/15	29	980	$836
12/15/15	33	1,944	$979
1/15/16	31	2,641	$1,084
2/18/16	34	3,881	$1,146
3/16/16	27	1,764	$803
4/15/16	30	1,696	$247
5/17/16	32	357	$137
Totals	**368**	**13,822**	**$5,807**
Annual	**365**	**13,709**	**$5,760**

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 12 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Furlong Field House	National Median Building Type: Rec./Entertainment/Parks
Source Energy Use Intensity (kBtu/ft^2)	227.8	96.8
Site Energy Use Intensity (kBtu/ft^2)	141.8	41.2

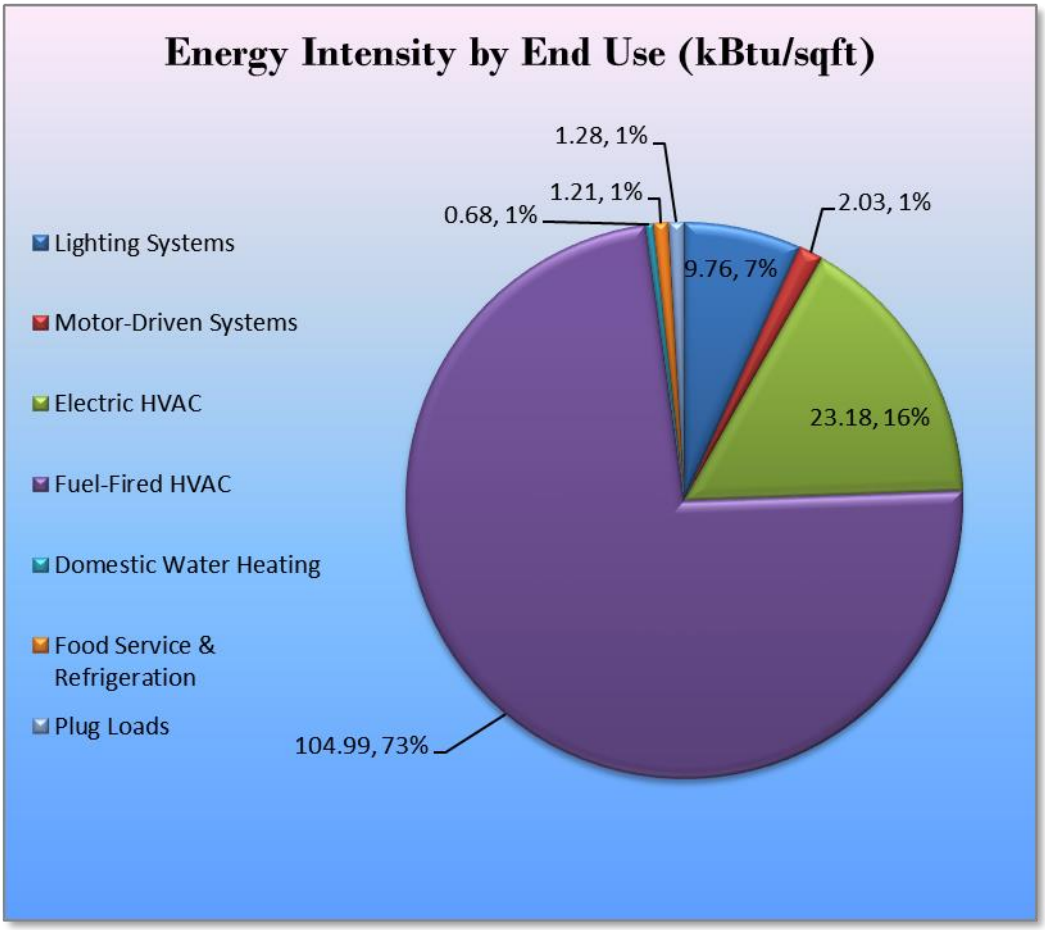
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 13 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Furlong Field House	National Median Building Type: Rec./Entertainment/Parks
Source Energy Use Intensity (kBtu/ft^2)	204.3	96.8
Site Energy Use Intensity (kBtu/ft^2)	134.3	41.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. This building does not belong to one of the building categories that are currently eligible to receive an ENERGY STAR® score.

The EUI scores appear to be higher than the median for this building category, though the discrepancy might be due simply to the broad range of different building types and activities included for that particular building category. However, it might also indicate that there may be additional opportunities to save energy for these buildings through more precise scheduling of HVAC equipment and lighting controls, so that energy usage is kept to a minimum when spaces are unoccupied.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 14 - Energy Balance (kBtu/ft² and %)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Furlong Field House regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 15 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**26,381**	**7.6**	**0.0**	**$3,916.67**	**$17,937.84**	**$1,670.00**	**$16,267.84**	**4.2**	**26,565**
ECM 1	Install LED Fixtures	6,366	1.2	0.0	$945.08	$3,257.05	$600.00	$2,657.05	2.8	6,410
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	155	0.0	0.0	$22.98	$117.00	$10.00	$107.00	4.7	156
ECM 3	Retrofit Fixtures with LED Lamps	19,860	6.3	0.0	$2,948.61	$14,563.79	$1,060.00	$13,503.79	4.6	19,999
Lighting Control Measures		**2,597**	**0.9**	**0.0**	**$385.54**	**$5,750.00**	**$695.00**	**$5,055.00**	**13.1**	**2,615**
ECM 4	Install Occupancy Sensor Lighting Controls	2,597	0.9	0.0	$385.54	$5,750.00	$695.00	$5,055.00	13.1	2,615
TOTALS		**28,977**	**8.4**	**0.0**	**$4,302.20**	**$23,687.84**	**$2,365.00**	**$21,322.84**	**5.0**	**29,180**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 16 below.

Figure 16 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**26,381**	**7.6**	**0.0**	**$3,916.67**	**$17,937.84**	**$1,670.00**	**$16,267.84**	**4.2**	**26,565**
ECM 1	Install LED Fixtures	6,366	1.2	0.0	$945.08	$3,257.05	$600.00	$2,657.05	2.8	6,410
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	155	0.0	0.0	$22.98	$117.00	$10.00	$107.00	4.7	156
ECM 3	Retrofit Fixtures with LED Lamps	19,860	6.3	0.0	$2,948.61	$14,563.79	$1,060.00	$13,503.79	4.6	19,999

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,273	0.4	0.0	$188.94	$1,003.85	$0.00	$1,003.85	5.3	1,281
Exterior	5,093	0.8	0.0	$756.14	$2,253.20	$600.00	$1,653.20	2.2	5,129

Measure Description

We recommend replacing most existing HID fixtures with new high-performance LED light fixtures. Although most HID fixtures can now be simply retrofitted with compatible LED lamps instead, many customers prefer to replace the whole HID fixture with an LED fixture instead.

This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output. Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	155	0.0	0.0	$22.98	$117.00	$10.00	$107.00	4.7	156
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

For older, inefficient T12 linear fluorescent fixtures recommend retrofitting existing fixtures with new LED lamps and replacing ballasts with LED drivers as well. T12 fixtures often contain older, inefficient magnetic ballasts, instead of modern electronic ballasts.

This measure uses the existing fixture housing but replaces the rest of the components with more efficient lighting technology. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	19,370	6.2	0.0	$2,875.86	$14,388.29	$1,030.00	$13,358.29	4.6	19,506
Exterior	490	0.1	0.0	$72.75	$175.50	$30.00	$145.50	2.0	493

Measure Description

We recommend replacing all existing fixtures containing linear fluorescent and compact florescent lamps with new high-performance LED lamps. Decorative exterior wall sconces with HID lamps near the field house's main entrances were also recommended for retrofit with compatible LED lamps, rather than full fixture replacement.

This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space. Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than ten times longer than many incandescent lamps.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**2,597**	**0.9**	**0.0**	**$385.54**	**$5,750.00**	**$695.00**	**$5,055.00**	**13.1**	**2,615**
ECM 4	Install Occupancy Sensor Lighting Controls	2,597	0.9	0.0	$385.54	$5,750.00	$695.00	$5,055.00	13.1	2,615

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 4: Install Occupancy Sensor Lighting Controls

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,597	0.9	0.0	$385.54	$5,750.00	$695.00	$5,055.00	13.1	2,615

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in all restrooms, locker rooms, storage rooms, classrooms, offices areas, and other area where occupancy often varies throughout the day, in order prevent unneeded lights from operating after all occupants have left the room.

Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

4.2 ECM Evaluated, But Not Recommended

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 18 – Summary of Measure Evaluated, But Not Recommended

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**119.6**	**$502.66**	**$15,434.20**	**$1,414.60**	**$14,019.60**	**27.9**	**14,008**
Install High Efficiency Hot Water Boilers	0	0.0	119.6	$502.66	$15,434.20	$1,414.60	$14,019.60	27.9	14,008
TOTALS	**0**	**0.0**	**119.6**	**$502.66**	**$15,434.20**	**$1,414.60**	**$14,019.60**	**27.9**	**14,008**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Hot Water Boilers

Measure Description

We considered recommending replacement of the field house's main boiler with a new high-efficiency condensing hot water boilers. Significant improvements have been made in combustion technology resulting in increased overall boiler efficiency. Energy savings results from improved combustion efficiency and reduced standby losses at low loads.

The most notable efficiency improvement is condensing hydronic boilers that can achieve over 90% efficiency under the proper conditions. Condensing hydronic boilers typically operate at efficiencies between 85% and 87% (comparable to other high efficiency boilers) when the return water temperature is above 130°F. The boiler efficiency increases as the return water temperature drops below 130°F. Therefore, condensing hydronic boilers were only evaluated when the return water temperature is less than 130°F during most of the operating hours. As a result, condensing hydronic boilers are recommended for this site, if the hot water heating system can operate at those temperature.

Further study may be necessary to determine feasibility of switching to a high-efficiency condensing boiler. If feasible, a condensing boiler system would provide the most energy savings over the existing unit. If not, then the boiler must be replaced with a less efficient non-condensing model.

Reasons for not Recommending

We chose not to recommend main boiler replacement at this time due the measure's long payback period (~27.9 yrs).

However, the school district may choose to include this upgrade, along with the other recommended ECMs, rather than wait until boiler replacement becomes more necessary. If the school district chooses to include this optional measure, then we estimate that the energy savings for the total payback of measures would increase to 10.3%, though the payback period would increase to 7.5 years (or longer if the existing unit is replaced with a non-condensing boiler).

Note: The payback period for this measure might improve, if the gas rate is revised (see Section 3.3) and/or if the assumed incentive amount is increased, possibly through qualification and participation in the Direct Install program (see Section 8.2).

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Practice Proper Use of Thermostat Schedules and Temperature Resets

Ensure thermostats are correctly set back. By employing proper set back temperatures and schedules, facility heating and cooling costs can be reduced dramatically during periods of low or no occupancy. As such, thermostats should be programmed for a setback of 5-10°F during low occupancy hours (reduce heating setpoints and increase cooling setpoints). Cooling load can be reduced further by increasing the facility's occupied setpoint temperature. In general, during the cooling season, thermostats should be set as high as possible without sacrificing occupant comfort.

For buildings where occupancy varies widely, making sure that heating or cooling is setback or turned off in unoccupied areas is often the most cost-effective way to achieve energy savings.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

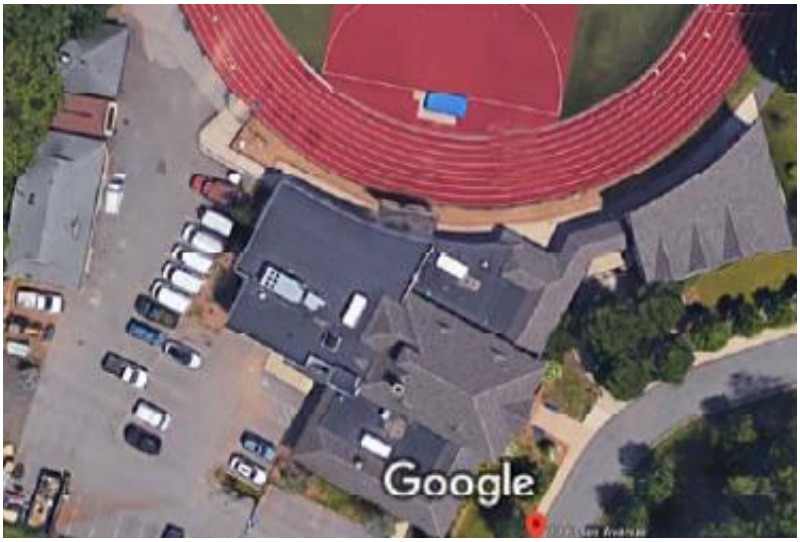
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



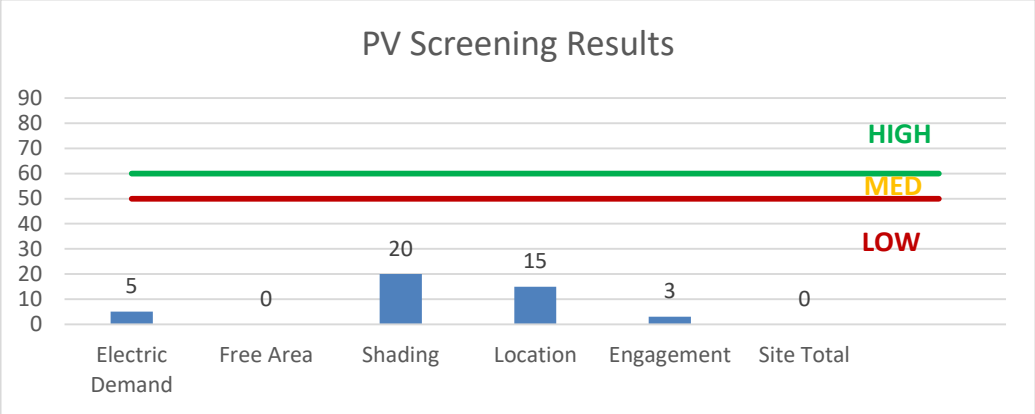
6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **low potential** for installing a cost-effective PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the potential for PV at the site.

Image 4: Aerial View of the Facility



In order to be cost-effective, a solar PV array needs certain minimum criteria, such as flat or south-facing rooftop or other unshaded space on which to place the PV panels.

Most of the building rooftop areas are sloped. Flat roofs are easier for PV installation, but as the image below shows only a relatively small section of roof is flat and unobstructed. In our opinion, the facility does appear not meet these minimum criteria for cost-effective PV installation.

We estimate that the potentially usable area is only about 3,100 ft^2, which might be enough for a small array, but other Montclair BOE properties would probably be more cost-effective to develop for PV solar electric generation.

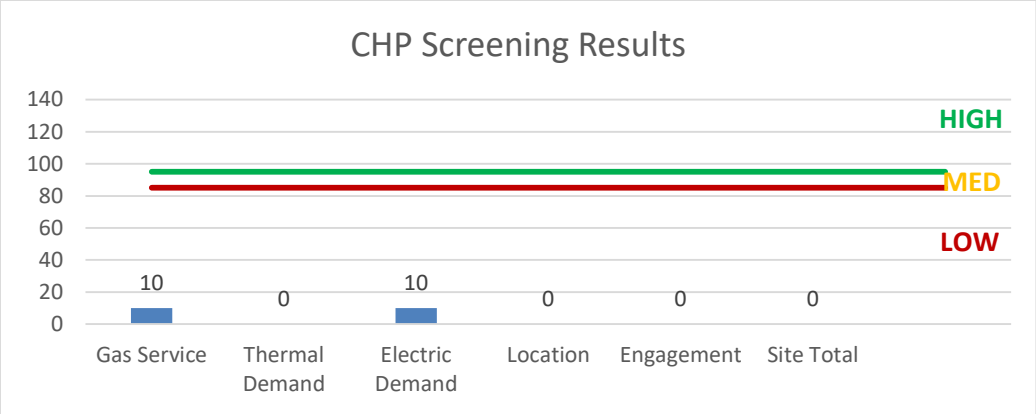
Figure 19 - Photovoltaic Screening

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.



CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **low** potential for installing a cost-effective CHP system.

An infrequent thermal load and lack of space near the existing boilers are among the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in New Jersey specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 20 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 21 for a list of the eligible programs identified for each recommended ECM.

Figure 21 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings
ECM 1	Install LED Fixtures	X		X	
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	X		X	
ECM 3	Retrofit Fixtures with LED Lamps	X		X	
ECM 4	Install Occupancy Sensor Lighting Controls	X		X	

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to medium-sized facilities with a peak electric demand that does not exceed 200 kW for any recent 12-month period. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and provide a clear scope of work for installation of selected measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to **70%** of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor who the region of the state where your facility is located. A complete list of Direct Install program partners is provided on the Direct Install website linked below. The contractor will be paid the measure incentives directly by the program which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps and eligibility, while the remaining 30% of the cost is paid to the contractor by the customer.

Since Direct Install offers a free assessment of eligible measures, Direct Install is also available to small businesses and other commercial facilities too that may not be eligible for the more detailed facility audits provided by LGEA.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

8.4 Demand Response Energy Aggregator

The first step toward participation in a Demand Response (DR) program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

See Section 7 for additional information.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

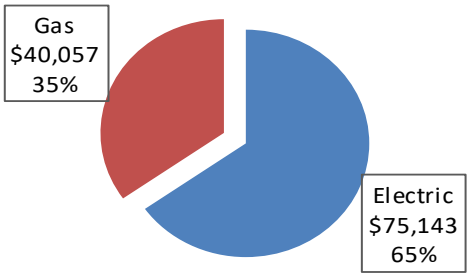
The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the George Inness High School Annex.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey school districts in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

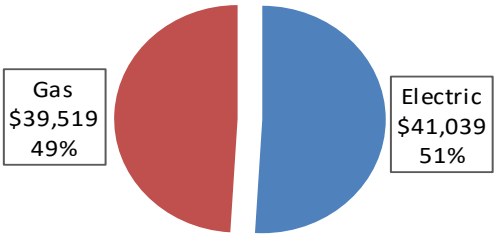
The George Inness High School Annex is a three-story building totaling 89,261 square foot facility and originally constructed in 1925. The building has both pitched and flat roof sections. Exterior walls are finished with brick masonry. Interior lighting consists mainly of linear fluorescent lamps and fixtures which are mostly controlled with manual wall switches. Heating is provided by two steam boilers and gas-fired furnaces. The cooling system consists of window air conditioners (ACs), split system ACs, two air-cooled scroll chillers and rooftop packaged units.



A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures



TRC evaluated 13 measures. Five measures were recommended for implementation which together represent an opportunity for George Inness High School Annex to reduce annual energy costs by roughly $27,952 and annual greenhouse gas emissions by 208,065 lbs CO_2e. The measures would pay for themselves in roughly 4.4 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce the George Inness High School Annex's annual energy use by 12.1%.

Figure 1 – Previous 12 Month Utility Costs

$115,200

Figure 2 – Potential Post-Implementation Costs

$80,558

A detailed description of the George Inness High School Annex's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4. Measures without an "ECM #" in the table below have been evaluated, but are not recommended for implementation.

Figure 3 – Summary of Energy Reduction Opportunities

	Energy Conservation Measure	Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**164,362**	**56.3**	**0.0**	**$22,561.48**	**$118,805.52**	**$13,970.00**	**$104,835.52**	**4.65**	**165,512**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing old standard efficiency motors with motors of the current efficiency standard (EISA 2007). Motors will be replaced with the same size motors. This measure saves energy by reducing the power used by the motors due to improved electrical efficiency.

Electric Unitary HVAC measures generally involve replacing old inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide cooling equivalent to older air condition systems, but use less energy. These measures save energy by reducing the power used by the air condition system due to improved electrical efficiency.

Gas Heating (HVAC/Process) measures generally involve replacing old inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide heating equivalent to older systems, but use less energy. These measures save energy by reducing the fuel used by the heating due to improved combustion and heat transfer efficiency.

HVAC System Improvements generally involve the installation of automated controls to reduce heating and cooling demand when conditions allow. These measures could encompass changing temperature setpoints, using outside air for free cooling, or limiting excessive outside air during extreme outdoor air temperatures. These measures save energy by reducing the demand on the systems and the amount of time systems operate.

Domestic Water Heating upgrade measures generally involve replacing old inefficient domestic water heating systems with modern energy efficient systems. New domestic water heating systems can provide equivalent or greater capacity as older systems, but use less energy. These measures save energy by reducing the fuel used by the domestic water heating systems due to improved efficiency or the removal of standby losses.

Plug Load Equipment control measures generally involve installing automation that limits the power use or operation of equipment plugged into an electrical receptacle based on occupancy.

Energy Efficient Practices

TRC also identified nine low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at the George Inness High School Annex include:

- Reduce Air Leakage
- Close Doors and Windows
- Ensure Lighting Controls Are Operating Properly
- Practice Proper Use of Thermostat Schedules and Temperature Resets
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for the George Inness High School Annex. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- Pay for Performance - Existing Building (P4P EB)
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program, you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.4 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.1 Project Contacts

Figure 4 – Project Contacts

Name	Role	E-Mail	Phone #

TRC Energy Services			
Moussa Traore	Auditor	mtraore@trcsolutions.com	732-855-0033

2.2 General Site Information

On November 08, 2016, TRC performed an energy audit at the George Inness High School Annex located in Montclair, New Jersey. TRC's auditor met with Eric Bonilla to review the facility operations and focus the investigation on specific energy-using systems.

Image 1 – Auditorium

The 89,261-square foot facility is a three-story building comprised of classrooms, administrative offices, gymnasium, auditorium, locker rooms, cafeteria, kitchen, storage and mechanical spaces. The original building was constructed in 1925. Three years later in 1928, the auditorium stage and dressing rooms were added. A new section comprised of a kitchen, a cafeteria and additional classrooms was constructed in 2003. The building is used primarily for high school programs.

2.3 Building Occupancy

The school operates on an 11-month schedule and is open Monday through Friday. The gymnasium and auditorium are used after school hours. The school is also used in the summer for various classes and events. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 475 students and staff

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
George Inness High School Annex	Weekday	7:00 AM - 6:30 PM
George Inness High School Annex	Weekend	Closed

2.4 Building Envelope

Image 2 – Building Envelope

The three-story building with basement has a reinforced concrete foundation. The roofing system consists of a pitched asphalt shingled roof on the front facing section and perimeter, and a membrane type flat roof on the back of the building where the HVAC equipment resides. The exterior walls are finished with brick masonry. The windows throughout the facility are operable double-pane with aluminum frames. Windows are in acceptable condition with little sign of outside air infiltration. Exterior doors are constructed of metal and are in good condition. Overall, the building's envelope is in good condition.

2.5 On-site Generation

The George Inness High School Annex does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Lighting at the facility is provided predominately by 32-Watt linear fluorescent T8 lamps with electronic ballasts as well as linear 40-Watt fluorescent T12 and incandescent lamps. Most of the building classrooms use 2-lamp or 4-lamp, 2-foot wide by 4-foot long troffers with diffusers. The girl's and the boy's gymnasiums are illuminated with 350-Watt and 400-Watt metal halide respectively. The boiler room, auditorium stage, fitting room are illuminated with a combination of 32-Watt linear fluorescent T8 and 40-Watt fluorescent T12 lamps while the auditorium is lit with 40 and 55-Watt Candelabra and 100-Watt incandescent screw-in lamps. The attic is also illuminated with 100-Watt incandescent lamps. A small number of 60 and 150-Watt incandescent are found in spaces such as closets, storage and boiler rooms. Remaining building spaces are illuminated by 32-Watt linear fluorescent T8 lamps. Lighting control is provided mostly by manual wall switches. The facility exterior lighting system consists of 150-Watt incandescent and 45-Watt LED outdoor wall-mounted area fixture, controlled by photocells.

Steam Heating System

Image 3 – Steam System

The steam system consists of two 3,772 MBh output steam boilers, each with an estimated combustion efficiency of 75%, plus the associated distribution system. Each boiler has a 1 hp combustion air fan, a 3 hp feed water pump and a control valve that maintains the boiler water level. The boilers operate in a lead/lag configuration. The boilers are 29 years old and have passed their useful service life. Steam is supplied to the radiators and heating unit ventilators at 15 psi. Local thermostats are used to control the temperatures in spaces. The school should consider re-evaluating the building heating load and installing modular boilers when existing equipment is replaced.

Air Side Conditioning Systems

Cooling is provided by a combination of window air conditioners (ACs), split system ACs, two air-cooled scroll chillers and rooftop packaged units. There are 12 window ACs ranging from 0.7 to 1.9 ton. They are in relatively good condition and serve spaces such as offices, data room, teacher room, and nurse office. The cafeteria office is served by 1-ton Mitsubishi split AC while the auditorium control center and room 500A are served by a 4-ton Trane split AC. The split system ACs are in good condition. The two 60-ton Trane air-cooled scroll chillers all located on the roof and are used to condition the cafeteria and auditorium. They are eight years old and appear in good condition.

Two 16-ton AAON rooftop packaged units (RTU1-RTU2) equipped with a gas fired furnace section are used to condition rooms 600B and 602. The units are constant air volume, utilize a scroll compressor and a direct-expansion (DX) coil. They appear in good condition. A McQuay rooftop unit equipped with a gas-fired furnace section provides supplemental heating to the auditorium. One Greenheck energy recovery ventilation unit (ERV) is used to condition the kitchen and is in good condition as well. The rooftop packaged units are controlled by Energy of America remote building energy management system. Air is exhausted from the kitchen and cafeteria through the roof exhausters.

Image 4 – Air Conditioning

Building Energy Management System

Most of the rooftop units are controlled by Energy of America remote control system which was not accessible during the survey.

Domestic Hot Water

Domestic hot water is provided by two natural gas fired water heaters. One eight-year-old, Bradford White 75-gallon storage tank non-condensing 76 Mbh water heater is located in the boiler room. It appears in good condition and serves the kitchen and cafeteria. The primary water heater is a 150 Mbh A.O. Smith 15-year-old condensing unit that appears in poor condition. It has a 100-gallon storage tank and is located in the custodial closet. Both heaters are nominally 85% efficient.

Image 5 – Hot Water System

Food Service & Refrigeration

The school houses one small kitchen and a cafeteria. The kitchen includes gas convection ovens and insulated food holding cabinets, two standup refrigerators, one walk-in cooler and one walk-in medium freezer. The kitchen is well maintained. Two other standup refrigerators are in the teacher's and nurse's rooms.

Plug load & Vending Machines

The building has approximately 105 computers with LCD monitors that are used daily, plus servers, three large photocopiers, and seven printers. The computers, monitors, and printers seemed to be all recent models designed with power management software to reduce power when they sit idle for more than a few minutes. The building has two vending machines located in the cafeteria and teacher room.

Image 6 – Typical Plug Load Equipment

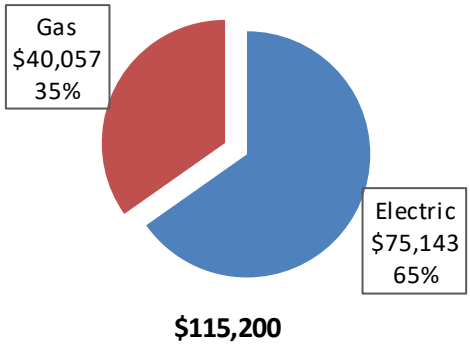
2.7 Water-Using Systems

There are several restrooms at this facility. A sampling of restrooms found that the faucets are rated for 2.2 gallons per minute (gpm) or higher, the toilets are rated at 2.5 gallons per flush (gpf)and the urinals are rated at 2 gpf. The kitchen has four faucets that are rated for 3 gpm.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are many factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 6 - Utility Summary

Utility Summary for George Inness High School Annex		
Fuel	**Usage**	**Cost**
Electricity	494,368 kWh	$75,143
Natural Gas	44,225 Therms	$40,057
Total		**$115,200**

The current utility cost for this site is $115,200 as shown in the chart below.

Figure 7 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.137/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects high occupancy in the summer months.

Figure 8 - Electric Usage & Demand

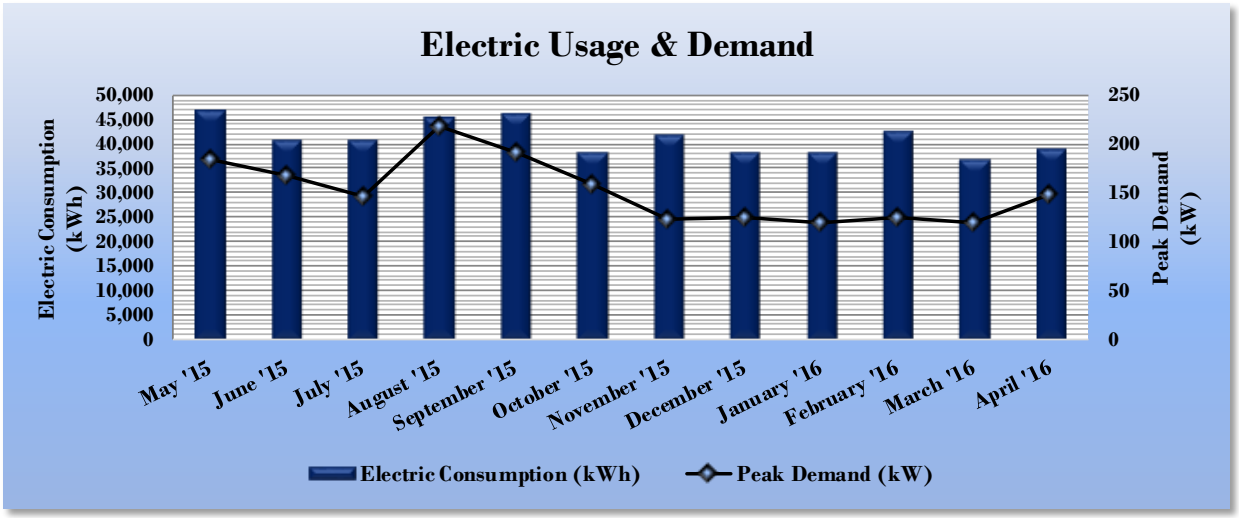


Figure 9 - Electric Usage & Demand

Electric Billing Data for George Inness High School Annex					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
6/15/15	30	46,969	183	$482	$8,486
7/15/15	31	40,814	167	$647	$7,495
8/13/15	30	40,617	146	$661	$7,150
9/14/15	30	45,448	218	$602	$8,524
10/13/15	31	45,968	191	$526	$6,601
11/12/15	30	38,083	159	$1,314	$5,509
12/14/15	30	41,857	123	$693	$5,694
1/14/16	31	38,129	124	$576	$5,082
2/12/16	31	38,163	119	$446	$4,992
3/15/16	31	42,398	125	$451	$5,509
4/14/16	29	36,928	118	$431	$4,884
5/13/16	31	38,994	148	$455	$5,220
Totals	**365**	**494,368**	**218**	**$7,283**	**$75,143**
Annual	**365**	**494,368**	**218**	**$7,283**	**$75,143**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.906/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 10 - Natural Gas Usage

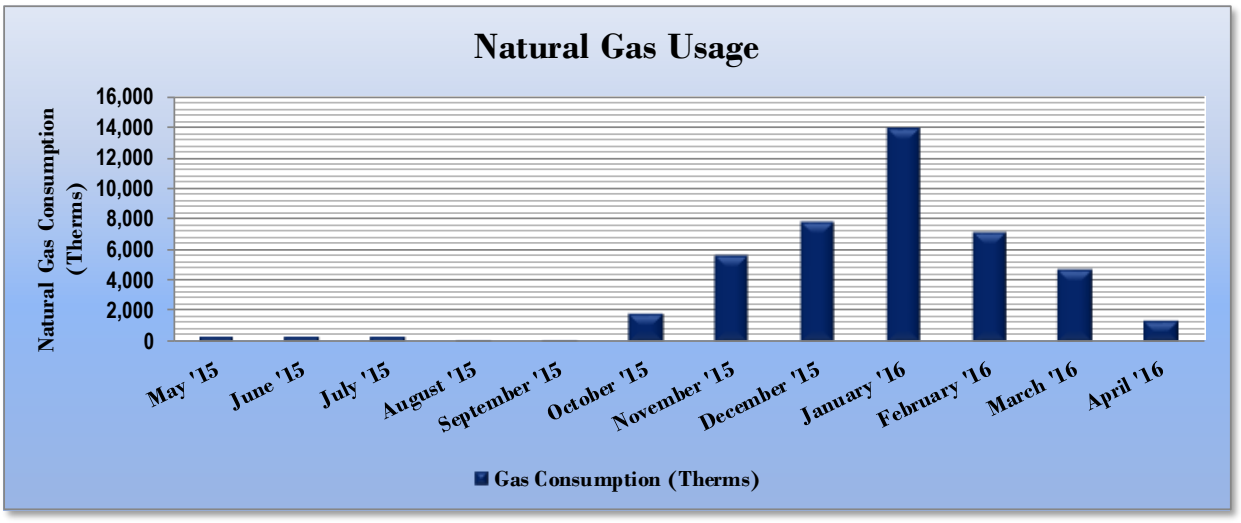

Figure 11 - Natural Gas Usage

Gas Billing Data for George Inness High School Annex				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/16/15	30	388	$404	Yes
7/20/15	31	377	$402	Yes
8/17/15	30	365	$275	No
9/15/15	30	169	$219	No
10/14/15	31	174	$213	No
11/12/15	30	1,830	$4,049	Yes
12/15/15	30	5,667	$6,379	No
1/15/16	31	7,829	$7,709	No
2/16/16	31	14,004	$10,476	No
3/17/16	31	7,164	$6,143	Yes
4/15/16	29	4,790	$2,787	No
5/17/16	31	1,468	$1,001	No
Totals	**365**	**44,225**	**$40,057**	4
Annual	**365**	**44,225**	**$40,057**	

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the Energy Use Intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

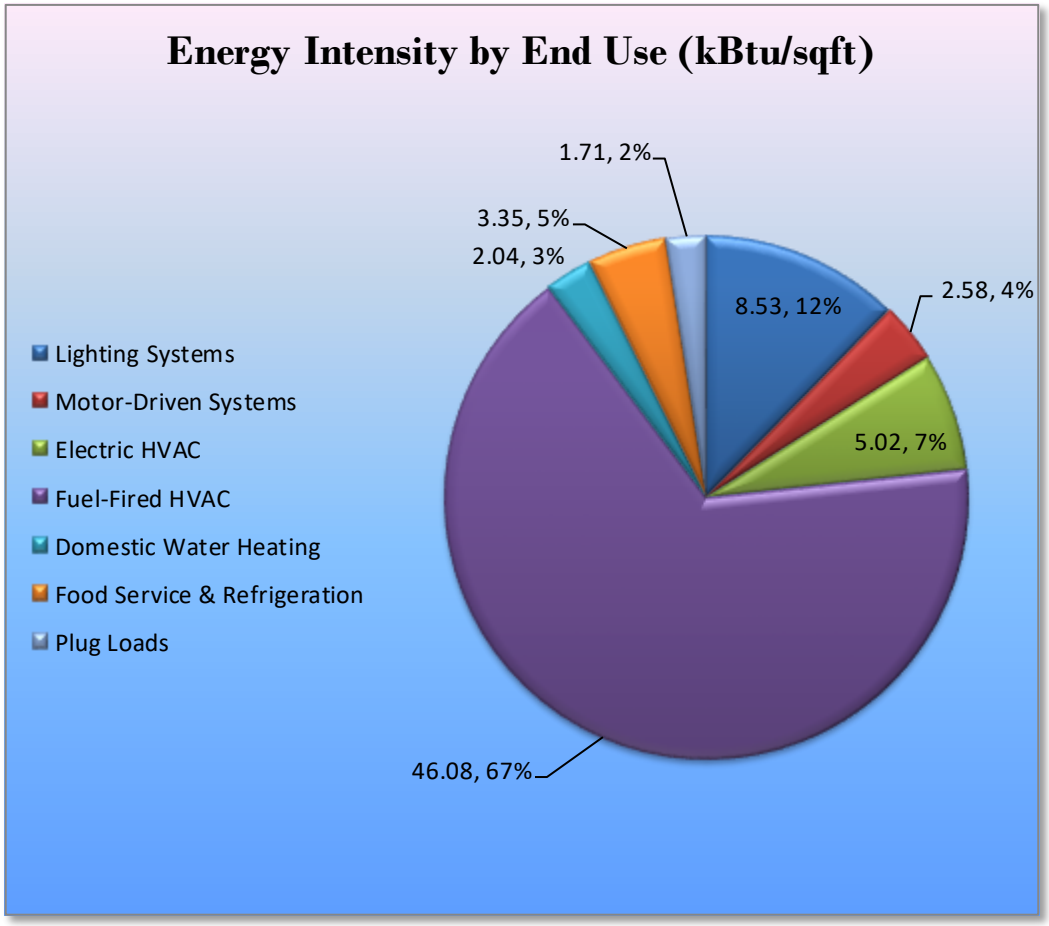
Figure 12 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	George Inness High School Annex	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	111.4	141.4
Site Energy Use Intensity (kBtu/ft^2)	68.4	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 13 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	George Inness High School Annex	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	86.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	60.1	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 67.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 14 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the George Inness High School Annex on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJ prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 15 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**164,362**	**56.3**	**0.0**	**$22,561.48**	**$118,805.52**	**$13,970.00**	**$104,835.52**	**4.65**	**165,512**
ECM 1	Install LED Fixtures	81,117	30.1	0.0	$11,134.72	$54,426.60	$1,900.00	$52,526.60	4.72	81,685
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	5,345	1.8	0.0	$733.72	$5,499.00	$450.00	$5,049.00	6.88	5,383
ECM 3	Retrofit Fixtures with LED Lamps	77,900	24.4	0.0	$10,693.04	$58,879.92	$11,620.00	$47,259.92	4.42	78,444
Lighting Control Measures		**21,288**	**6.6**	**0.0**	**$2,922.15**	**$18,068.00**	**$2,305.00**	**$15,763.00**	**5.39**	**21,437**
ECM 4	Install Occupancy Sensor Lighting Controls	19,148	6.0	0.0	$2,628.41	$15,468.00	$2,305.00	$13,163.00	5.01	19,282
ECM 5	Install High/Low Lighitng Controls	2,140	0.6	0.0	$293.74	$2,600.00	$0.00	$2,600.00	8.85	2,155
HVAC System Improvements		**9,233**	**2.1**	**0.0**	**$1,267.34**	**$1,800.00**	**$500.00**	**$1,300.00**	**1.03**	**9,297**
ECM 6	Install Dual Enthalpy Outside Economizer Control	9,233	2.1	0.0	$1,267.34	$1,800.00	$500.00	$1,300.00	1.03	9,297
Domestic Water Heating Upgrade		**0**	**0.0**	**59.4**	**$537.57**	**$100.38**	**$0.00**	**$100.38**	**0.19**	**6,949**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	59.4	$537.57	$100.38	$0.00	$100.38	0.19	6,949
Plug Load Equipment Control - Vending Machine		**4,836**	**0.0**	**0.0**	**$663.76**	**$2,156.40**	**$0.00**	**$2,156.40**	**3.25**	**4,869**
ECM 8	Vending Machine Control	4,836	0.0	0.0	$663.76	$2,156.40	$0.00	$2,156.40	3.25	4,869
TOTALS		**199,719**	**65.0**	**59.4**	**$27,952.30**	**$140,930.30**	**$16,775.00**	**$124,155.30**	**4.44**	**208,065**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for lighting upgrades are summarized in Figure 16 below.

Figure 16 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**164,362**	**56.3**	**0.0**	**$22,561.48**	**$118,805.52**	**$13,970.00**	**$104,835.52**	**4.65**	**165,512**
ECM 1	Install LED Fixtures	81,117	30.1	0.0	$11,134.72	$54,426.60	$1,900.00	$52,526.60	4.72	81,685
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	5,345	1.8	0.0	$733.72	$5,499.00	$450.00	$5,049.00	6.88	5,383
ECM 3	Retrofit Fixtures with LED Lamps	77,900	24.4	0.0	$10,693.04	$58,879.92	$11,620.00	$47,259.92	4.42	78,444

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	81,117	30.1	0.0	$11,134.72	$54,426.60	$1,900.00	$52,526.60	4.72	81,685
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing existing metal halide fixtures located in the gymnasiums and halogen incandescent auditorium stage lighting with new high-performance LED light fixtures. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	5,345	1.8	0.0	$733.72	$5,499.00	$450.00	$5,049.00	6.88	5,383
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T12 lamps, ballasts, and reflectors with LED tube lamps, reflectors, and drivers specifically designed for existing linear fluorescent fixtures. The retrofit uses the existing fixture housing but replaces the rest of the components with an efficient source and reflectors designed for LEDs. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output and efficiently projects the light into the space.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	74,701	24.0	0.0	$10,254.00	$58,390.65	$11,570.00	$46,820.65	4.57	75,224
Exterior	3,198	0.4	0.0	$439.05	$489.27	$50.00	$439.27	1.00	3,221

Measure Description

This measure evaluates replacing linear fluorescent T5 and T8 lamps with LED tube lamps and replacing incandescent screw-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in lamps can be used as a direct replacement for most other screw-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**21,288**	**6.6**	**0.0**	**$2,922.15**	**$18,068.00**	**$2,305.00**	**$15,763.00**	**5.39**	**21,437**
ECM 4	Install Occupancy Sensor Lighting Controls	19,148	6.0	0.0	$2,628.41	$15,468.00	$2,305.00	$13,163.00	5.01	19,282

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
19,148	6.0	0.0	$2,628.41	$15,468.00	$2,305.00	$13,163.00	5.01	19,282

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in some restrooms, storage rooms, classrooms and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,140	0.6	0.0	$293.74	$2,600.00	$0.00	$2,600.00	8.85	2,155

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are interior corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high-level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period.

For this application, the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.1.3 HVAC System Improvements

Our recommendations for HVAC system improvement measures are summarized in Figure 18 below.

Figure 18 - Summary of HVAC System Improvement ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
HVAC System Improvements		**9,233**	**2.1**	**0.0**	**$1,267.34**	**$1,800.00**	**$500.00**	**$1,300.00**	**1.03**	**9,297**
ECM 6	Install Dual Enthalpy Outside Economizer Control	9,233	2.1	0.0	$1,267.34	$1,800.00	$500.00	$1,300.00	1.03	9,297

ECM 6: Install Dual Enthalpy Outside Economizer Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
9,233	2.1	0.0	$1,267.34	$1,800.00	$500.00	$1,300.00	1.03	9,297

Measure Description

Dual enthalpy economizers of the packaged units are used to control a ventilation system's outside air intake in order to reduce a facility's total cooling load. A dual enthalpy economizer monitors the air temperature and humidity of both the outside and return air. The control supplies the lowest energy (temperature and humidity) air to the air handling system. When outside air conditions allow, outside air can be used for cooling in place of the air handling system's compressor. This reduces the demand on the cooling system, lowering its usage hours, saving energy.

Savings result from using outside air instead of mechanical cooling whenever possible. The retrofit measure is recommended for RTU 1 and RTU 2.

4.1.4 Domestic Water Heating Upgrade

Our recommendations for domestic water heating measures are summarized in Figure 19 below.

Figure 19 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**59.4**	**$537.57**	**$100.38**	**$0.00**	**$100.38**	**0.19**	**6,949**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	59.4	$537.57	$100.38	$0.00	$100.38	0.19	6,949

ECM 7: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	59.4	$537.57	$100.38	$0.00	$100.38	0.19	6,949

Measure Description

This measure evaluates the savings from installing low flow domestic water devices to reduce overall water flow in general and hot water flow in particular. Low flow faucet aerators reduce the water flow, relative to standard aerators, from the fixture

All of the low flow devices reduce the overall water flow from the fixture which generally reduces the amount of hot water used resulting in energy and water savings.

4.1.5 Plug Load Equipment Control - Vending Machine

Our recommendations for plug load equipment control measures are summarized in Figure 20 below.

Figure 20 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Natural Gas Savings (MMBtu)	Annual N/A Savings (MMBtu)	Annual N/A Savings (MMBtu)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**4,836**	**0.0**	**0.0**	**0.0**	**0.0**	**0.0**	**$663.76**	**$2,156.40**	**$0.00**	**$2,156.40**	**3.25**	**4,869**
ECM 8	Vending Machine Control	4,836	0.0	0.0	0.0	0.0	0.0	$663.76	$2,156.40	$0.00	$2,156.40	3.25	4,869

ECM 8: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,836	0.0	0.0	$663.76	$2,156.40	$0.00	$2,156.40	3.25	4,869

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor based controls to reduce the energy use. These controls power down the machine when the surrounding area is vacant, then monitor the surrounding temperature and power up the cooling system at regular intervals to keep the product cool. Savings are a function of the activity level around the vending machine.

4.2 ECMs Evaluated but Not Recommended

The measures below have been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in each measure description section.

Figure 21 – Summary of Evaluated but Not Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades		**550**	**0.4**	**0.0**	**$75.47**	**$1,596.51**	**$0.00**	**$1,596.51**	**21.15**	**554**

	Install High Efficiency Furnaces	0	0.0	13.3	$120.32	$18,397.75	$1,200.00	$17,197.75	142.93	1,555
Domestic Water Heating Upgrade		**0**	**0.0**	**9.9**	**$89.59**	**$4,912.15**	**$170.00**	**$4,742.15**	**52.93**	**1,158**
	Install High Efficiency Gas Water Heater	0	0.0	9.9	$89.59	$4,912.15	$170.00	$4,742.15	52.93	1,158
TOTALS		**5,507**	**4.6**	**82.4**	**$1,502.15**	**$209,724.82**	**$11,442.00**	**$198,282.82**	**132.00**	**15,192**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
550	0.4	0.0	$75.47	$1,596.51	$0.00	$1,596.51	21.15	554

Measure Description

This measure evaluates replacing standard efficiency condenser water pumps motors with EISA 2007 efficiency motors. The evaluation assumes existing motors will be replaced with the same size motors. It is important that the speed of each new motor match the speed of the motor it replaces as closely as possible. The base case motor efficiencies are obtained from nameplate information. Proposed case premium motor efficiencies are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016)*. Savings are based on the difference between baseline and proposed efficiencies and the annual operating hours.

Reasons for not Recommending

The measure was evaluated for the condenser water pump, partially due to its advanced age. The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Electric AC

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,957	4.2	0.0	$680.44	$44,603.20	$2,528.00	$42,075.20	61.84	4,992

Measure Description

This measure evaluates replacing package air conditioners with high efficiency package air conditioners. There have been significant improvements in both compressor and fan motor efficiencies in the past several years. Therefore, electricity savings can be achieved by replacing old units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the old and new unit, the cooling load, and the annual operating hours.

Reasons for not Recommending

The measure was evaluated for RTU-1 and RTU-2. The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Steam Boilers

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	59.2	$536.32	$140,215.20	$7,544.00	$132,671.20	247.37	6,933

Measure Description

This measure evaluates replacing the two old inefficient steam boilers with high efficiency steam boilers. Significant improvements have been made in combustion technology resulting in increases in overall boiler efficiency. Savings result from improved combustion efficiency and reduced standby losses at low loads. The school should consider re-evaluating the building heating load and installing modular steam boilers when these are replaced.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful live of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Furnaces

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	13.3	$120.32	$18,397.75	$1,200.00	$17,197.75	142.93	1,555

Measure Description

This measure evaluates replacing existing standard furnaces of the packaged units with condensing furnaces. Improved combustion technology and heat exchanger design optimize the heat recovery from the combustion gases which significantly improves the furnace efficiency. Savings result from improved system efficiency. Condensing furnaces do have acidic condensate that needs to be drained.

Reasons for not Recommending

The measure was evaluated for rooftop air handling units. The simple payback of replacing the furnace section exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone. Considering efficient package furnaces when replacing rooftop heating units.

Install High Efficiency Gas Water Heater

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	9.9	$89.59	$4,912.15	$170.00	$4,742.15	52.93	1,158

Measure Description

This measure evaluates the savings from replacing a tank water heater with a high efficiency tank water heater. Improvements in combustion efficiency and reductions in heat loss have improved the overall efficiency of water heaters. Savings result from less gas used during combustion and less time operating during standby to maintain the water tank temperature.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost-effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Practice Proper Use of Thermostat Schedules and Temperature Resets

Ensure thermostats are correctly set back. By employing proper set back temperatures and schedules, facility heating and cooling costs can be reduced dramatically during periods of low or no occupancy. As such, thermostats should be programmed for a setback of 5-10°F during low occupancy hours (reduce heating setpoints and increase cooling setpoints). Cooling load can be reduced further by increasing the facility's occupied setpoint temperature. In general, during the cooling season, thermostats should be set as high as possible without sacrificing occupant comfort.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

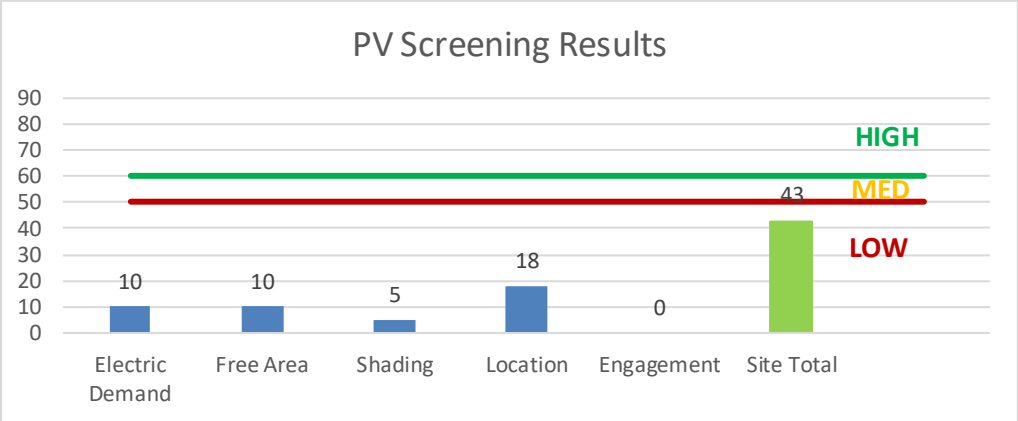
Refer to Section 4.1.4 for any low-flow ECM recommendations.

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before deciding to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **Low** potential for installing a PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear not meet these minimum criteria for cost-effective PV installation.

Figure 22 - Photovoltaic Screening

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

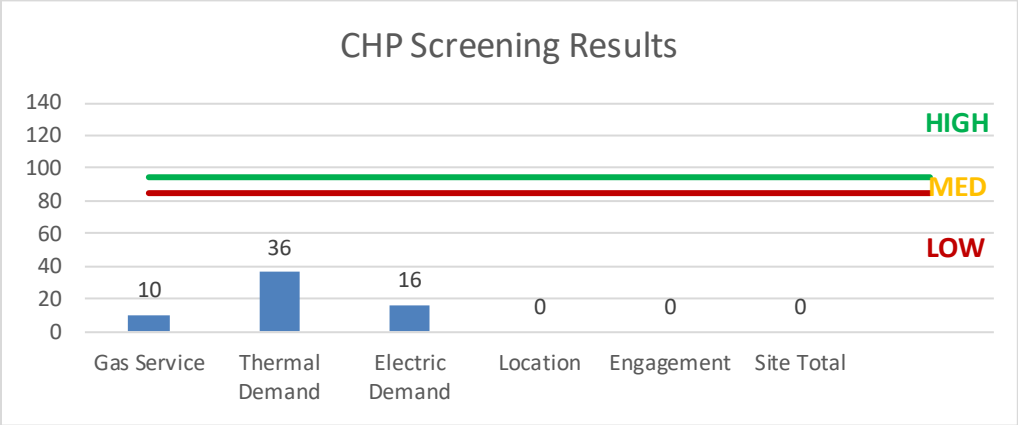
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 23 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

In our opinion, this facility has a moderate potential for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 24 for a list of the eligible programs identified for each recommended ECM.

Figure 24 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x		x	x		
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	x		x	x		
ECM 3	Retrofit Fixtures with LED Lamps	x		x	x		
ECM 4	Install Occupancy Sensor Lighting Controls	x		x	x		
ECM 5	Install High/Low Lighitng Controls				x		
ECM 6	Install Dual Enthalpy Outside Economizer Control			x	x		
ECM 7	Install Low-Flow Domestic Hot Water Devices			x	x		
ECM 8	Vending Machine Control	x		x	x		

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

All customer sizes and types may be served by this program. This program provides an effective mechanism for securing incentives for individual projects that may be completed at once or over several years.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Pay for Performance - Existing Buildings

Overview

The Pay for Performance – Existing Buildings (P4P EB) program is designed for larger customers with a peak demand over 200 kW in any of the preceding 12 months. Under this program the minimum installed scope of work must include at least two unique measures resulting in at least 15% energy savings, where lighting cannot make up the majority of the savings. P4P is a generally a good option for medium to large sized facilities looking to implement as many measures as possible under a single project in order to achieve deep energy savings. This program has an added benefit of evaluating a broad spectrum of measures that may not otherwise qualify under other programs. Many facilities pursuing ESIP also utilize the P4P program.

Incentives

Incentives are calculated based on estimated and achieved energy savings ranging from $0.18-$0.22/kWh and $1.80-$2.50/therm, capped at the lesser of 50% total project cost, or $1 million per electric account and $1 million per natural gas account, per fiscal year, not to exceed $2 million per project. An incentive of $0.15/square foot is also available to offset the cost of developing the Energy Reduction Plan (see below) contingent on the project moving forward with measure installation.

How to Participate

To participate in the P4B EB program you will need to contact one of the pre-approved consultants and contractors ("Partners"). Under direct contract to you, the Partner will help further evaluate the measures identified in this report through development of the Energy Reduction Plan (ERP), assist you in implementing selected measures, and verify actual savings one year after the installation. At each of these three milestones your Partner will also facilitate securing program incentives.

Approval of the final scope of work is required by the program prior to installation completion. Although installation can be accomplished by a contractor of your choice (some P4P Partners are also contractors) or by internal personnel, the Partner must remain involved to ensure compliance with the program guidelines and requirements.

Detailed program descriptions, instructions for applying, applications and list of Partners can be found at: www.njcleanenergy.com/P4P.

8.3 Direct Install

Direct Install is a turnkey program available to existing small to medium-sized facilities with an average peak electric demand that does not exceed 200 kW over the recent 12-month period. You work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and provide a clear scope of work for installation of selected measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Each entity is limited to incentives up to $250,000 per fiscal year.

How to Participate

To participate in Direct Install, you will need to contact the participating contractor assigned to the region of the state where your facility is located. A complete list of Direct Install program partners is provided on the Direct Install website linked below. The contractor will be paid the measure incentives directly by the program which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps and eligibility, while the remaining 30% of the cost is paid to the contractor by the customer.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

ENERGY STAR® Score[1]

George Inness High School Annex

Primary Property Type: K-12 School
Gross Floor Area (ft²): 89,261
Built: 1925

For Year Ending: April 30, 2016
Date Generated: December 13, 2017

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Property & Contact Information

Property Address	Property Owner	Primary Contact
George Inness High School Annex 141 Park Street Montclair, New Jersey 07042	_____ , (___)___-_____	___ _____ , (___)___-_____ _____

Property ID: 5724956

Energy Consumption and Energy Use Intensity (EUI)

Site EUI
68 kBtu/ft²

Source EUI
111 kBtu/ft²

Annual Energy by Fuel	
Natural Gas (kBtu)	4,376,478 (72%)
Electric - Grid (kBtu)	1,690,758 (28%)

National Median Comparison	
National Median Site EUI (kBtu/ft²)	79.7
National Median Source EUI (kBtu/ft²)	130.1
% Diff from National Median Source EUI	-15%
Annual Emissions	
Greenhouse Gas Emissions (Metric Tons CO2e/year)	420

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

Table of Contents

1 Executive Summary 1

1.1 Facility Summary 1
1.2 Your Cost Reduction Opportunities 1

Energy Conservation Measures 1
Energy Efficient Practices 3
Self-Generation Measures 3

1.3 Implementation Planning 3

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Glenfield School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey school districts in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

Glenfield School is a three-story building with mid-level basement totaling 125,281 square feet. The original school was built in 1896. The roofing systems consist of a mix of flat and pitched roofs sections. Exterior walls are finished with brick masonry and concrete block. The windows throughout the facility are a combination of single and double paned. Interior lighting consists mainly of linear T8 fluorescent lamps and fixtures. Lighting control is provided by both occupancy sensors and manual wall switches. Heating is provided by three condensing gas fired boilers and the cooling system consists of window and split system air conditioners.

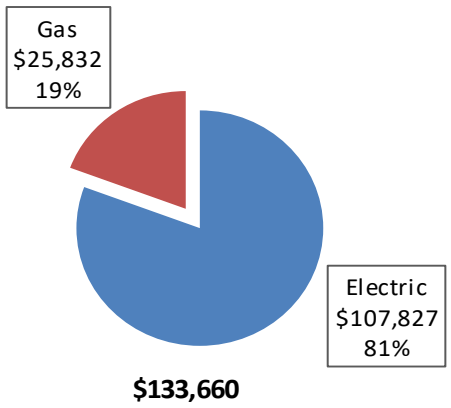
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated nine measures which represent an opportunity for the Glenfield School to reduce annual energy costs by roughly $35,073 and annual greenhouse gas emissions by 274,524 lbs CO_2e. The measures would pay for themselves in roughly 3.66 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce Glenfield School's annual energy use by 16.0%.

Figure 1 – Previous 12 Month Utility Costs



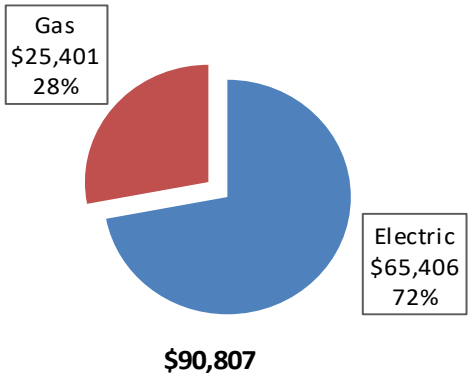


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Glenfield School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**235,829**	**46.0**	**0.0**	**$30,720.41**	**$130,406.63**	**$24,165.00**	**$106,241.63**	**3.46**	**237,478**
ECM 1	Install LED Fixtures	Yes	78,457	10.3	0.0	$10,220.20	$36,662.24	$8,700.00	$27,962.24	2.74	79,005
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	Yes	15,901	3.4	0.0	$2,071.41	$15,458.33	$840.00	$14,618.33	7.06	16,013
ECM 3	Retrofit Fixtures with LED Lamps	Yes	141,471	32.3	0.0	$18,428.80	$78,286.05	$14,625.00	$63,661.05	3.45	142,460
Lighting Control Measures			**22,294**	**4.8**	**0.0**	**$2,904.10**	**$18,692.00**	**$1,610.00**	**$17,082.00**	**5.88**	**22,450**
ECM 4	Install Occupancy Sensor Lighting Controls	Yes	16,907	3.6	0.0	$2,202.39	$13,092.00	$1,610.00	$11,482.00	5.21	17,025
ECM 5	Install High/Low Lighitng Controls	Yes	5,387	1.2	0.0	$701.71	$5,600.00	$0.00	$5,600.00	7.98	5,424
Motor Upgrades			**1,678**	**0.4**	**0.0**	**$218.57**	**$1,153.79**	**$0.00**	**$1,153.79**	**5.28**	**1,690**
ECM 6	Premium Efficiency Motors	Yes	1,678	0.4	0.0	$218.57	$1,153.79	$0.00	$1,153.79	5.28	1,690
Electric Unitary HVAC Measures			**1,299**	**0.8**	**0.0**	**$169.18**	**$1,633.14**	**$0.00**	**$1,633.14**	**9.65**	**1,308**
ECM 7	Install High Efficiency Electric AC	Yes	1,299	0.8	0.0	$169.18	$1,633.14	$0.00	$1,633.14	9.65	1,308
Domestic Water Heating Upgrade			**0**	**0.0**	**57.5**	**$431.17**	**$100.38**	**$0.00**	**$100.38**	**0.23**	**6,730**
ECM 8	Install Low-Flow Domestic Hot Water Devices	Yes	0	0.0	57.5	$431.17	$100.38	$0.00	$100.38	0.23	6,730
Plug Load Equipment Control - Vending Machine			**4,836**	**0.0**	**0.0**	**$629.90**	**$2,156.40**	**$0.00**	**$2,156.40**	**3.42**	**4,869**
ECM 9	Vending Machine Control	Yes	4,836	0.0	0.0	$629.90	$2,156.40	$0.00	$2,156.40	3.42	4,869
TOTALS			**265,935**	**52.0**	**57.5**	**$35,073.33**	**$154,142.34**	**$25,775.00**	**$128,367.34**	**3.66**	**274,524**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing old standard efficiency motors with motors of the current efficiency standard (EISA 2007). Motors will be replaced with the same size motors. This measure saves energy by reducing the power used by the motors due to improved electrical efficiency.

Electric Unitary HVAC measures generally involve replacing old inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide cooling equivalent to older air condition systems, but use less energy. These measures save energy by reducing the power used by the air condition system due to improved electrical efficiency.

Domestic Water Heating upgrade measures generally involve replacing old inefficient domestic water heating systems with modern energy efficient systems. New domestic water heating systems can provide equivalent or greater capacity as older systems, but use less energy. These measures save energy by reducing the fuel used by the domestic water heating systems due to improved efficiency or the removal of standby losses.

Plug Load Equipment control measures generally involve installing automation that limits the power use or operation of equipment plugged into an electrical receptacle based on occupancy.

Energy Efficient Practices

TRC also identified four low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at the Glenfield School include:

- Reduce Air Leakage
- Ensure Lighting Controls Are Operating Properly
- Clean and/or Replace HVAC Filters
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for the Glenfield School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	200	kW DC STC
Electric Generation	238,274	kWh/yr
Displaced Cost	$20,730	/yr
Installed Cost	$520,000	

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8. You may also check the following website for further information on available rebates and incentives: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2.2 General Site Information

On November 07, 2016, TRC performed an energy audit at Glenfield School located in Montclair, New Jersey. TRC's auditor met with Luis R. Solis Jr to review the facility operations and focus the investigation on specific energy-using systems.

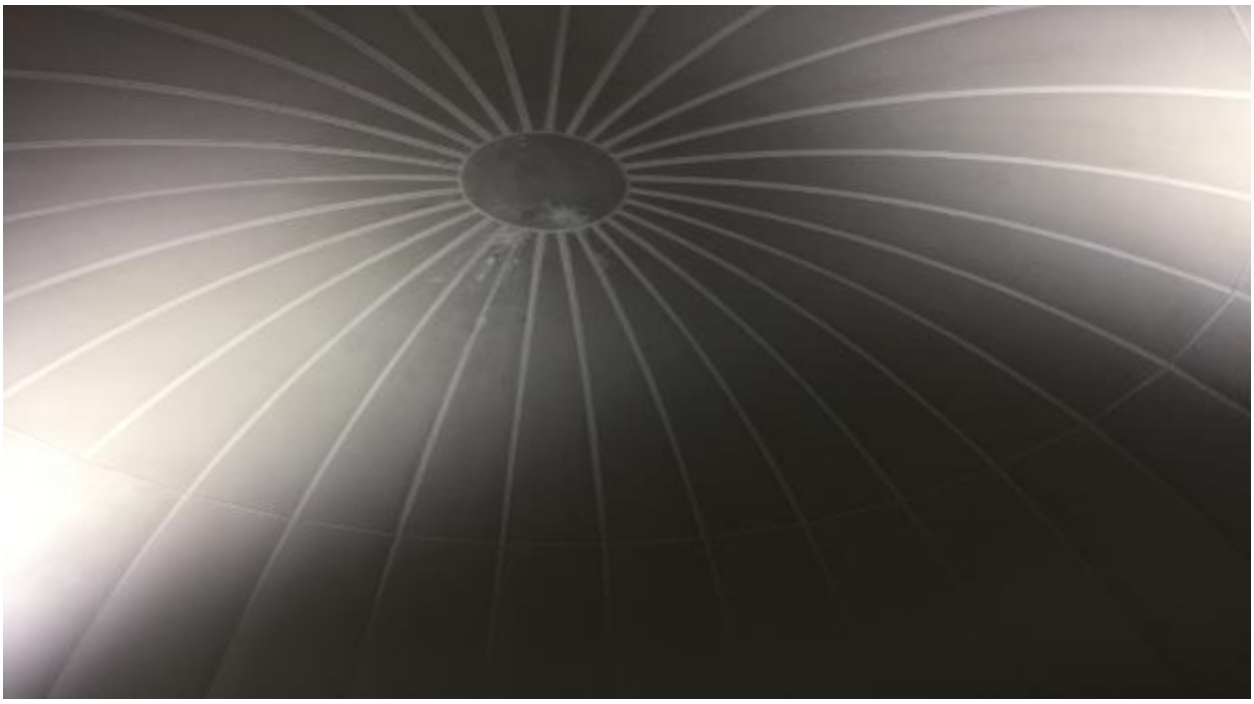

Image 1 – Planetarium Roof

The 125,281-square foot school building has three-stories with a mid-level basement. It is comprised of classrooms, gymnasium, locker rooms, planetarium, dance room, kitchen, cafeteria, administrative offices, library, an indoor garage, storage and mechanical spaces. The original building was constructed in 1896 and expanded to accommodate additional classrooms and other spaces in 1922, 1924, 1928, 1933, and 1980. The roof of the planetarium was under renovation during the survey. The building is primarily used for middle school programs.

2.3 Building Occupancy

The school operates on a 10-month schedule and is open Monday through Friday. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 684 students and 85 staff.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Glenfield School	Weekday	7:00 AM - 6:30:00 PM
Glenfield School	Weekend	Closed

2.4 Building Envelope

Image 2 – Building Envelope

The building has cast-in-place concrete perimeter wall footings with concrete foundation walls. The roofing systems consist of a mix of flat and pitched roof sections which were not accessible during the survey. The gymnasium and the auditorium have a flat roof. Exterior walls are finished with brick masonry and concrete block. The windows throughout the facility are single and double pane glass with aluminum frames and are in acceptable condition with some units showing little signs of outside air infiltration. Exterior doors are constructed of metal. Some door seals were found to be worn out, increasing the level of outside air-infiltration. Although aging, the building envelope appears to be in acceptable condition.

2.5 On-site Generation

Glenfield School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Lighting at the facility is provided predominately by linear 32-Watt fluorescent T8 lamps with electronic ballasts as well as some linear 40-Watt fluorescent T12 lamps. Most of the building spaces use 2-lamp or 4-lamp, 2-foot wide by 4-foot long troffers with diffusers. The gymnasium, auditorium, and planetarium lighting systems have been retrofitted to LED fixtures. The library, fan room, rooms 227, 109, 131 are still using old and inefficient linear 40-Watt fluorescent T12 lamps. The stairwells are primarily illuminated with compact fluorescent lamps while other small spaces such as restrooms, closets and storage rooms use incandescent screw-in lamps. The indoor parking garage is lit with a combination of 175-Watt mercury vapor, linear 32-Watt fluorescent T8 and incandescent lamps. The remaining interior spaces are illuminated with linear 32-Watt fluorescent T8 lamps. Interior lighting control is provided by both occupancy sensors and manual wall switches. Exterior lighting system consists of wall mounted 150 and 400-Watt metal halide, 250-Watt mercury vapor and 34-Watt compact fluorescent lamps. They are controlled with photocells.

Hot Water Heating

Image 3 – Hot Water Heating System

Heating hot water for the building is provided by three AERCO condensing hot water boilers that were installed in 2014 as part of minor mechanical upgrade. Each boiler has an output capacity of 2,790 MBh and a nominal combustion efficiency of 93%. Two 15 HP variable speed hot water pumps configured to operate as "lead/lag" distribute the heating hot water to the heating zones. Distribution devices include the new classroom unit ventilators, cabinet heaters, fan coils and heating coils in air handling units. The heating hot water system is controlled by a district wide building energy management system (BEMS). The hot water system is enable based upon outside air temperature (70°F adjustable). Boilers are automatically rotated based on run time: The boiler with the least amount of run time will become the lead boiler, and the boiler that logs more run time than the others will become the last boiler fired. The unit ventilators are equipped with hot water coils as well as with direct-expansion (DX) coils for cooling and dehumidification in the classrooms. The boilers are in good condition and well maintained.

Air Conditioning (DX)

Cooling is provided by a combination of window and split system air conditioners (ACs). The rooftop units were not accessible during the site survey; therefore, the capacity of the units was estimated.

There are six window units which are sized from 0.67 to 1.9 tons and are in relatively good condition except the unit serving room 116. The computer room is served by one 1-ton split AC.

TRC estimated the library and its offices to be served by four 4-ton split system ACs. We also estimated the planetarium to be served by a 4-ton split system AC.

Image 4 – DX Cooling Equipment

Ventilation – Air-Handling System

There are two AAF central station air-handler units in the facility, located in the mid-level basement. These units provide tempered air via duct distribution systems to the spaces for heating and cooling. Each air handler has one 7.5 hp constant speed supply fan.

Ventilation for the gymnasium is provided by an air-handler equipped with a constant speed 15 hp fan.

The units appear very old and are in fair condition.

Image 5 – Air Handling Equipment

Domestic Hot Water

The domestic hot water system for the facility consists of one Rheem gas fired non-condensing hot water heater with an input rating of 200 MBh and a nominal efficiency of 80%. It has a 100-gallon storage tank and is located in the boiler room. Two small recirculation pumps distribute 120°F water to the entire site. The water heater is three years old and is in good condition.

Food Service & Refrigeration

The school houses a small institutional kitchen and a cafeteria. The kitchen includes gas cooking ovens, four stand up stand up refrigerators and freezers. The kitchen is well maintained. In addition to the kitchen, the school has a cooking classroom with additional electrical cooking and laundry equipment.

Plug load & Vending Machines

There are approximately 81 computer work stations throughout the facility and they are mostly desktop units with LCD monitors. There is no centralized PC power management software installed.

The facility has three refrigerated beverage vending machine located in the cafeteria and room 237.

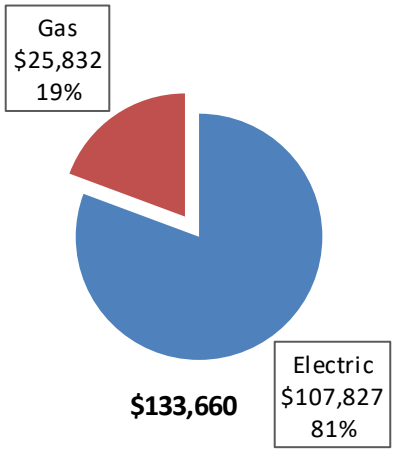
2.7 Water-Using Systems

There are 14 restrooms at this facility. A sampling of restrooms found that the faucets are rated for 2.2 gallons per minute (gpm) or higher, the toilets are rated at 2.5 gallons per flush (gpf) and the urinals are rated at 2 gpf. The kitchen has two faucets that are rated for 3 gpm. There are no restrooms with showers.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 7 - Utility Summary

Utility Summary for Glenfield School		
Fuel	**Usage**	**Cost**
Electricity	761,052 kWh	$107,827
Natural Gas	34,436 Therms	$25,832
Total		**$133,660**

The current utility cost for this site is $133,660 as shown in the chart below.

Figure 8 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.130/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects lower occupancy in the summer months and confirms the school 10 months operation.

Figure 9 - Electric Usage & Demand

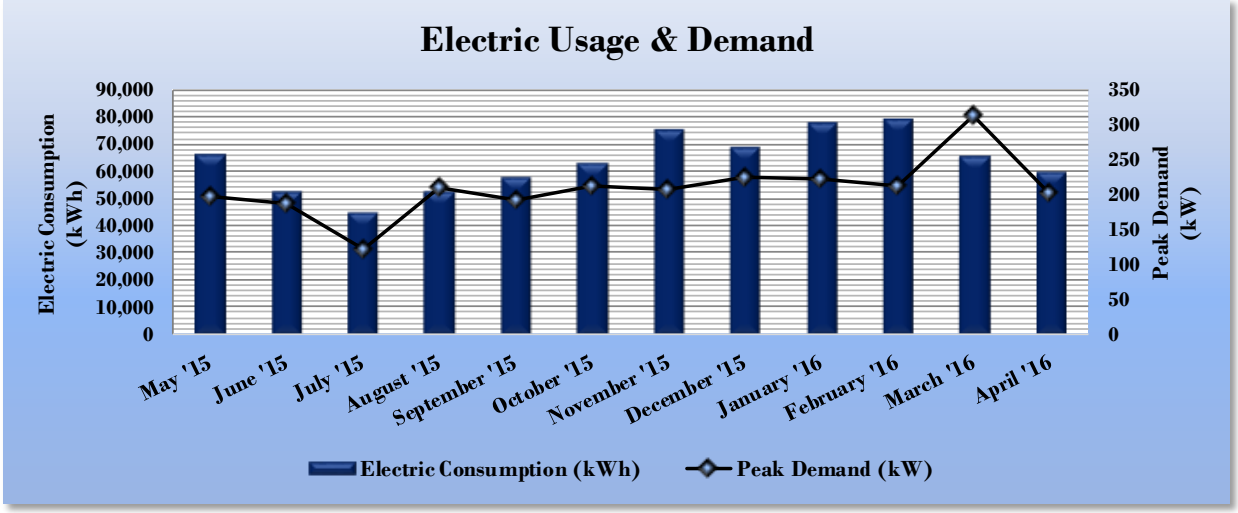


Figure 10 - Electric Usage & Demand

Electric Billing Data for Glenfield School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
6/15/15	30	66,473	197	$711	$11,101
7/14/15	30	52,673	187	$674	$9,219
8/13/15	31	44,945	122	$440	$7,393
9/14/15	30	52,833	209	$754	$9,306
10/13/15	30	57,820	192	$696	$8,030
11/11/15	31	62,833	212	$769	$8,668
12/14/15	31	75,048	207	$752	$9,878
1/14/16	31	68,582	225	$814	$8,843
2/12/16	29	77,540	222	$805	$9,695
3/12/16	31	79,446	211	$770	$9,916
4/13/16	31	65,342	314	$783	$8,373
5/11/16	31	59,602	203	$744	$7,701
Totals	**366**	**763,137**	**313.8**	**$8,712**	**$108,123**
Annual	**365**	**761,052**	**313.8**	**$8,688**	**$107,827**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.750/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 11 - Natural Gas Usage

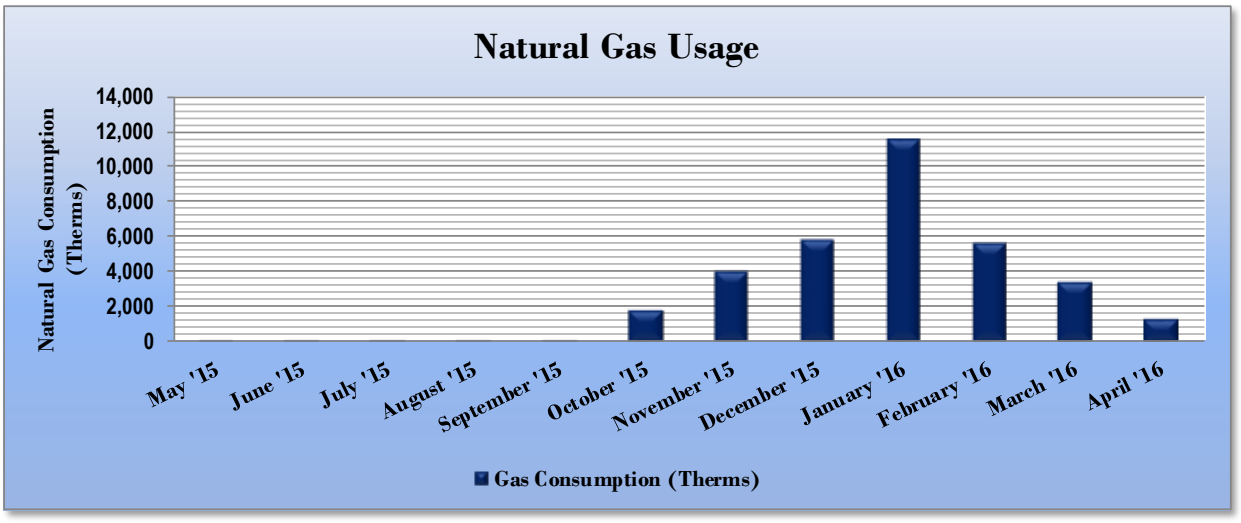

Figure 12 - Natural Gas Usage

Gas Billing Data for Glenfield School			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
6/15/15	30	116	$100
7/14/15	31	95	$84
8/13/15	30	74	$68
9/14/15	31	74	$68
10/13/15	31	116	$99
11/11/15	30	1,854	$1,538
12/14/15	31	4,073	$3,151
1/14/16	30	5,846	$4,385
2/12/16	31	11,652	$8,564
3/12/16	31	5,710	$4,955
4/13/16	29	3,438	$1,963
5/11/16	30	1,388	$858
Totals	**365**	**34,436**	**$25,832**
Annual	**365**	**34,436**	**$25,832**

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the Energy Use Intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

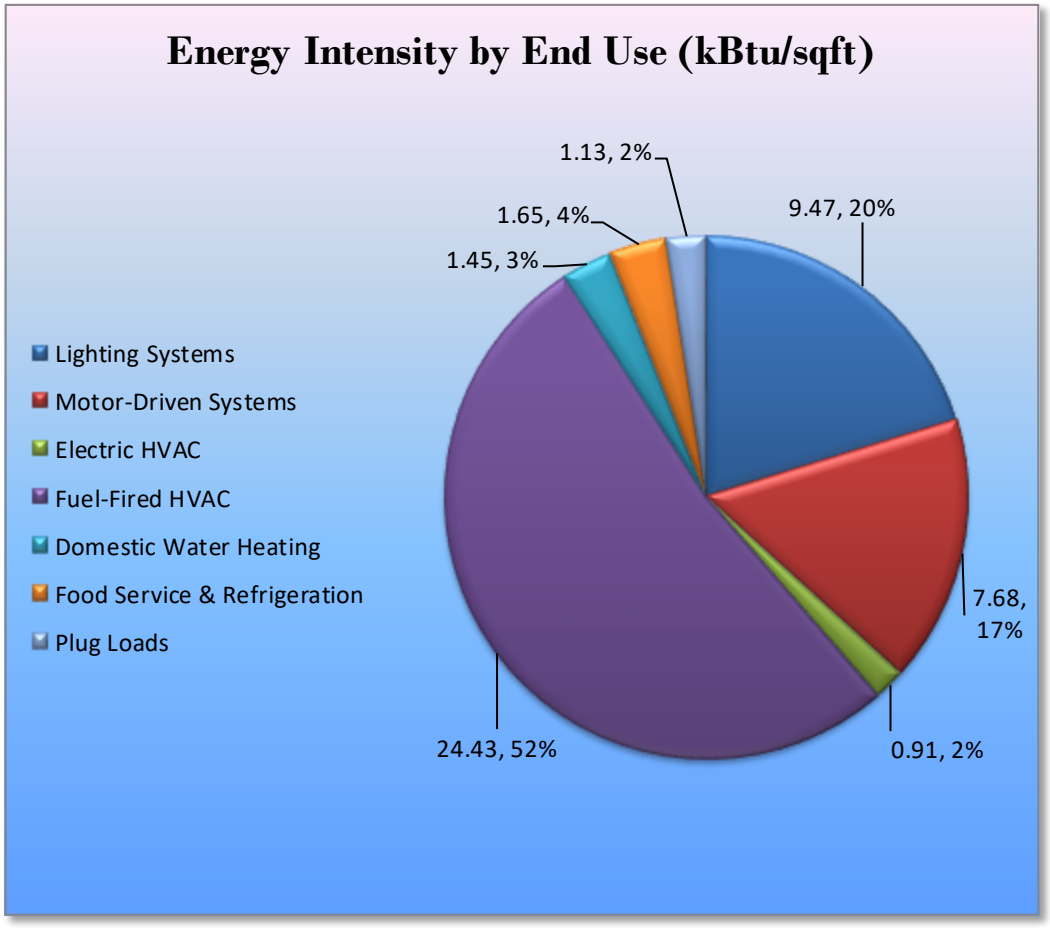
Figure 13 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Glenfield School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	93.9	141.4
Site Energy Use Intensity (kBtu/ft^2)	48.2	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 14 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Glenfield School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	70.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	40.5	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 35.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 15 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the Glenfield School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJ prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 16 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**235,829**	**46.0**	**0.0**	**$30,720.41**	**$130,406.63**	**$24,165.00**	**$106,241.63**	**3.46**	**237,478**
ECM 1	Install LED Fixtures	78,457	10.3	0.0	$10,220.20	$36,662.24	$8,700.00	$27,962.24	2.74	79,005
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	15,901	3.4	0.0	$2,071.41	$15,458.33	$840.00	$14,618.33	7.06	16,013
ECM 3	Retrofit Fixtures with LED Lamps	141,471	32.3	0.0	$18,428.80	$78,286.05	$14,625.00	$63,661.05	3.45	142,460
Lighting Control Measures		**22,294**	**4.8**	**0.0**	**$2,904.10**	**$18,692.00**	**$1,610.00**	**$17,082.00**	**5.88**	**22,450**
ECM 4	Install Occupancy Sensor Lighting Controls	16,907	3.6	0.0	$2,202.39	$13,092.00	$1,610.00	$11,482.00	5.21	17,025
ECM 5	Install High/Low Lighitng Controls	5,387	1.2	0.0	$701.71	$5,600.00	$0.00	$5,600.00	7.98	5,424
Motor Upgrades		**1,678**	**0.4**	**0.0**	**$218.57**	**$1,153.79**	**$0.00**	**$1,153.79**	**5.28**	**1,690**
ECM 6	Premium Efficiency Motors	1,678	0.4	0.0	$218.57	$1,153.79	$0.00	$1,153.79	5.28	1,690
Electric Unitary HVAC Measures		**1,299**	**0.8**	**0.0**	**$169.18**	**$1,633.14**	**$0.00**	**$1,633.14**	**9.65**	**1,308**
ECM 7	Install High Efficiency Electric AC	1,299	0.8	0.0	$169.18	$1,633.14	$0.00	$1,633.14	9.65	1,308
Domestic Water Heating Upgrade		**0**	**0.0**	**57.5**	**$431.17**	**$100.38**	**$0.00**	**$100.38**	**0.23**	**6,730**
ECM 8	Install Low-Flow Domestic Hot Water Devices	0	0.0	57.5	$431.17	$100.38	$0.00	$100.38	0.23	6,730
Plug Load Equipment Control - Vending Machine		**4,836**	**0.0**	**0.0**	**$629.90**	**$2,156.40**	**$0.00**	**$2,156.40**	**3.42**	**4,869**
ECM 9	Vending Machine Control	4,836	0.0	0.0	$629.90	$2,156.40	$0.00	$2,156.40	3.42	4,869
TOTALS		**265,935**	**52.0**	**57.5**	**$35,073.33**	**$154,142.34**	**$25,775.00**	**$128,367.34**	**3.66**	**274,524**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for lighting upgrades are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**235,829**	**46.0**	**0.0**	**$30,720.41**	**$130,406.63**	**$24,165.00**	**$106,241.63**	**3.46**	**237,478**
ECM 1	Install LED Fixtures	78,457	10.3	0.0	$10,220.20	$36,662.24	$8,700.00	$27,962.24	2.74	79,005
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	15,901	3.4	0.0	$2,071.41	$15,458.33	$840.00	$14,618.33	7.06	16,013
ECM 3	Retrofit Fixtures with LED Lamps	141,471	32.3	0.0	$18,428.80	$78,286.05	$14,625.00	$63,661.05	3.45	142,460

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	840	0.2	0.0	$109.36	$2,546.04	$0.00	$2,546.04	23.28	845
Exterior	77,617	10.1	0.0	$10,110.84	$34,116.20	$8,700.00	$25,416.20	2.51	78,160

Measure Description

This measure evaluates replacing existing fixtures containing high intensity discharge (HID) lamps with new high-performance LED light fixtures. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	15,901	3.4	0.0	$2,071.41	$15,458.33	$840.00	$14,618.33	7.06	16,013
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T12 lamps, ballasts, and reflectors with LED tube lamps, reflectors, and drivers specifically designed for existing linear fluorescent fixtures. The retrofit uses the existing fixture housing but replaces the rest of the components with an efficient source and reflectors designed for LEDs. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output and efficiently projects the light into the space.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	139,418	31.8	0.0	$18,161.34	$77,395.13	$14,455.00	$62,940.13	3.47	140,393
Exterior	2,053	0.4	0.0	$267.46	$890.92	$170.00	$720.92	2.70	2,068

Measure Description

This measure evaluates replacing linear fluorescent T8 lamps with LED tube lamps and replacing incandescent and compact fluorescent screw-in/plug-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in/plug-in LED lamps can be used as a direct replacement for most other screw-in/plug-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 18 below.

Figure 18 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**22,294**	**4.8**	**0.0**	**$2,904.10**	**$18,692.00**	**$1,610.00**	**$17,082.00**	**5.88**	**22,450**
ECM 4	Install Occupancy Sensor Lighting Controls	16,907	3.6	0.0	$2,202.39	$13,092.00	$1,610.00	$11,482.00	5.21	17,025
ECM 5	Install High/Low Lighitng Controls	5,387	1.2	0.0	$701.71	$5,600.00	$0.00	$5,600.00	7.98	5,424

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
16,907	3.6	0.0	$2,202.39	$13,092.00	$1,610.00	$11,482.00	5.21	17,025

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in restrooms, storage rooms, classrooms and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
5,387	1.2	0.0	$701.71	$5,600.00	$0.00	$5,600.00	7.98	5,424

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high-level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period.

For this application, the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

.

4.1.3 Motor Upgrades

Our recommendations for motor upgrades are summarized n Figure 19 below.

Figure 19 - Summary of Motor Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades		**1,678**	**0.4**	**0.0**	**$218.57**	**$1,153.79**	**$0.00**	**$1,153.79**	**5.28**	**1,690**
ECM 6	Premium Efficiency Motors	1,678	0.4	0.0	$218.57	$1,153.79	$0.00	$1,153.79	5.28	1,690

ECM 6: Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,678	0.4	0.0	$218.57	$1,153.79	$0.00	$1,153.79	5.28	1,690

Measure Description

This measure evaluates replacing the 7.5 hp indoor handler standard efficiency motor with EISA 2007 efficiency motor. The evaluation assumes existing motor will be replaced with the same size motor. It is important that the speed of each new motor match the speed of the motor it replaces as closely as possible. The base case motor efficiencies are obtained from nameplate information. Proposed case premium motor efficiencies are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016*). Savings are based on the difference between baseline and proposed efficiencies and the annual operating hours.

4.1.4 Electric Unitary HVAC Measures

Our recommendations for unitary HVAC measures are summarized in Figure 20 below.

Figure 20 - Summary of Unitary HVAC ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Electric Unitary HVAC Measures		**1,299**	**0.8**	**0.0**	**$169.18**	**$1,633.14**	**$0.00**	**$1,633.14**	**9.65**	**1,308**
ECM 7	Install High Efficiency Electric AC	1,299	0.8	0.0	$169.18	$1,633.14	$0.00	$1,633.14	9.65	1,308

ECM 7: Install High Efficiency Electric AC

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,299	0.8	0.0	$169.18	$1,633.14	$0.00	$1,633.14	9.65	1,308

Measure Description

This measure evaluates replacing window air conditioner serving room 116 with a high efficiency window air conditioner. There have been significant improvements in both compressor and fan motor efficiencies in the past several years. Therefore, electricity savings can be achieved by replacing old units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the old and new unit, the cooling load, and the annual operating hours.

4.1.5 Domestic Water Heating Upgrade

Our recommendations for domestic water heating measures are summarized in Figure 21 below.

Figure 21 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**57.5**	**$431.17**	**$100.38**	**$0.00**	**$100.38**	**0.23**	**6,730**
ECM 8	Install Low-Flow Domestic Hot Water Devices	0	0.0	57.5	$431.17	$100.38	$0.00	$100.38	0.23	6,730

ECM 8: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	57.5	$431.17	$100.38	$0.00	$100.38	0.23	6,730

Measure Description

This measure evaluates the savings from installing low flow domestic water devices to reduce overall water flow in general and hot water flow in particular. Low flow faucet aerators reduce the water flow, relative to standard aerators, from the fixture.

All of the low flow devices reduce the overall water flow from the fixture which generally reduces the amount of hot water used resulting in energy and water savings.

4.1.6 Plug Load Equipment Control - Vending Machine

Our recommendations for plug load equipment control measures are summarized in Figure 22 below.

Figure 22 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**4,836**	**0.0**	**0.0**	**$629.90**	**$2,156.40**	**$0.00**	**$2,156.40**	**3.42**	**4,869**
ECM 9	Vending Machine Control	4,836	0.0	0.0	$629.90	$2,156.40	$0.00	$2,156.40	3.42	4,869

ECM 9: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,836	0.0	0.0	$629.90	$2,156.40	$0.00	$2,156.40	3.42	4,869

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor based controls to reduce the energy use. These controls power down the machine when the surrounding area is vacant, then monitor the surrounding temperature and power up the cooling system at regular intervals to keep the product cool. Savings are a function of the activity level around the vending machine.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost-effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

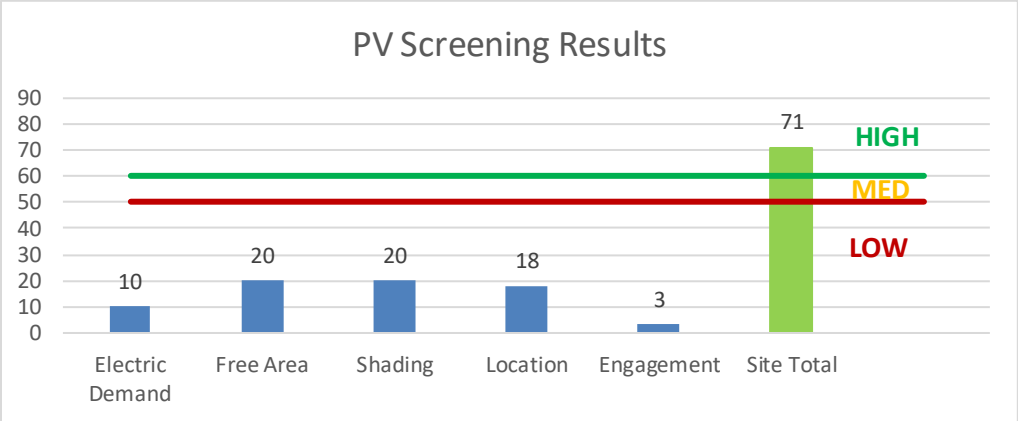
Refer to Section 4.1.5 for any low-flow ECM recommendations.

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear meet these minimum criteria for cost-effective PV installation.

Figure 23 - Photovoltaic Screening

Potential	High	
System Potential	200	kW DC STC
Electric Generation	238,274	kWh/yr
Displaced Cost	$20,730	/yr
Installed Cost	$520,000	

Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

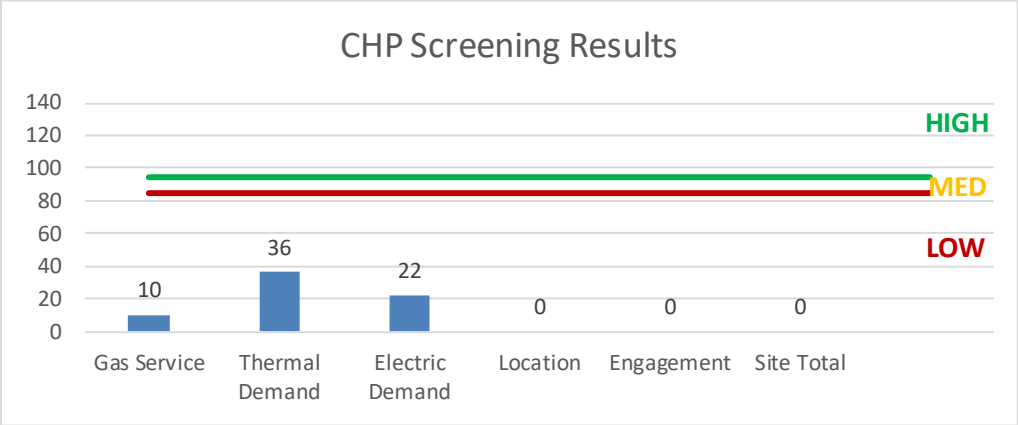
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 24 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facilities because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

In our opinion, the facility is not a good candidate for DR curtailment program.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 25 for a list of the eligible programs identified for each recommended ECM.

Figure 25 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x				
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	x				
ECM 3	Retrofit Fixtures with LED Lamps	x				
ECM 4	Install Occupancy Sensor Lighting Controls	x				
ECM 5	Install High/Low Lighitng Controls					
ECM 6	Premium Efficiency Motors					
ECM 7	Install High Efficiency Electric AC					
ECM 8	Install Low-Flow Domestic Hot Water Devices					
ECM 9	Vending Machine Control					

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one-year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Hillside School.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey local governments in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

Hillside School is a 125,799 square foot facility constructed in 1931. The building is a three-story educational facility including but not limited to classrooms, library areas, offices, hallways and an auditorium.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 17-Watt T8 and 59-Watt T8 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several incandescent, and compact fluorescent lamps. Exterior lighting is provided by a combination of 100-Watt metal halide fixtures, 100-Watt incandescent, and 250-Watt mercury vapor fixtures. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation is provided by window air conditioning (AC) units. Heating is provided by convectors that that are served by the Central Heating Plant.

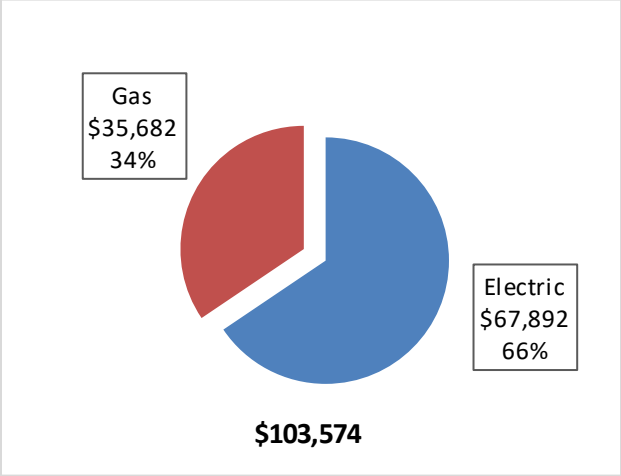
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated seven measures and recommends six measures which together represent an opportunity for the Hillside School to reduce annual energy costs by roughly $36,471 and annual greenhouse gas emissions by 240,907 lbs CO_2e. We estimate that if all measures were implemented as recommended, the project would pay for itself in 4.1 years. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce the Hillside School's annual energy use by 14%.

Figure 1 – Previous 12 Month Utility Costs



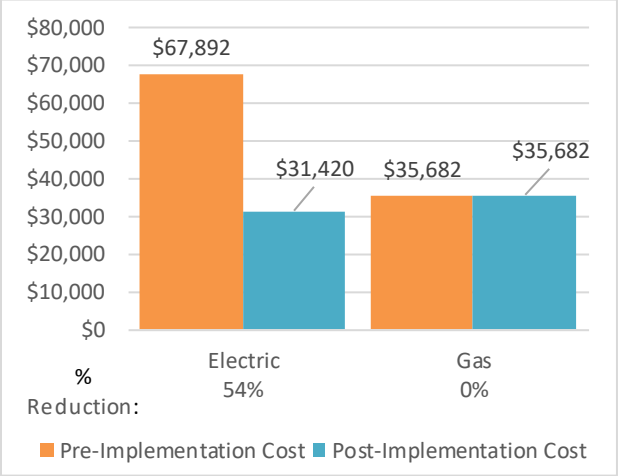


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Hillside School's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the proposed energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**209,371**	**46.9**	**0.0**	**$31,918.71**	**$146,006.71**	**$21,745.00**	**$124,261.71**	**3.9**	**210,835**

TOTALS (ALL EVALUATED MEASURES)			**241,031**	**54.2**	**0.0**	**$36,745.28**	**$192,106.65**	**$24,895.00**	**$167,211.65**	**4.6**	**242,716**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Electric Unitary HVAC measures generally involve replacing older inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide equivalent cooling to older air condition systems at a reduced energy cost. These measures save energy by reducing the power used by the air conditioning systems, due to improved electrical efficiency.

Plug Load Equipment control measures generally involve installing automated devices that limit the power usage or operation of equipment that is plugged into an electric outlet when not in use.

Energy Efficient Practices

TRC also identified seven low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at the Hillside School include:

- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Ensure Lighting Controls Are Operating Properly
- Clean Evaporator/Condenser Coils on AC Systems
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for the Hillside School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	135	kW DC STC
Electric Generation	160,835	kWh/yr
Displaced Cost	$13,990	/yr
Installed Cost	$351,000	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 03, 2016, TRC performed an energy audit at Hillside School located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Hillside School is a 125,799 square foot facility constructed in 1931. The building is a three-story educational facility including but not limited to classrooms, library areas, offices, hallways and an auditorium.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Hillside School	Weekday	5:30 AM - 3:30 PM
Hillside School	Weekend	unoccupied

2.4 Building Envelope

The Hillside School is a three-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with operable frames. The flat roof is constructed of built-up roofing material.

Figure 7 – Building Façade

2.5 On-Site Generation

Hillside School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at the Hillside School consists mainly of 32-Watt T8 fluorescent fixtures with a few 17-Watt T8 and 59-Watt T8 fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. The linear fluorescent fixtures are 2-foot, 4-foot, or 8-foot long, mainly troffers with diffusers having 1, 2, 3, or 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 27-Watt compact fluorescent lamps, 100-Watt incandescent lamps, and 250-Watt metal halide lamps. The exit signs are mostly LED fixtures, though some are incandescent fixtures.

Interior lighting control in the building is provided by a combination of manual switches and occupancy sensors.

Figure 8 - Building Lighting Systems

Linear Fluorescent Fixture	*Exterior Fixture*
	

Exterior lighting is provided by a combination of 100-Watt metal halide fixtures, 100-Watt incandescent, and 250-Watt mercury vapor fixtures.

Heating System

The Central Heating Plant has two natural gas fired Weil McLain steam boilers with an input rating of 7,938 MBh each and a nominal efficiency of 80%. These boilers provide space heating for the Hillside School, the Montclair Community Pre-K, and the district Administration Building.

Figure 9 – Heating System

Steam Boiler	*Baseboard Heater*
	

Direct Expansion Air Conditioning System (DX)

Air conditioning (AC) at the facility is primarily provided by window air conditioning units with capacities ranging between 0.42 ton and 1.5 tons and efficiency of around 10.9 EER.

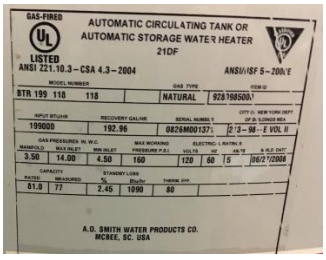

Figure 10 – DX Air Conditioning System

Window AC	*Window AC Arrangement*
	

Domestic Hot Water Heating System

The domestic hot water is supplied by one A.O. Smith 199 kBtu/hr input domestic hot water boiler. The boiler has an 81-gallon tank capacity and an efficiency of 80%.

Figure 11 – Domestic Hot Water Heating System

Domestic Hot Water Heater	*DHW Heater Nameplate*
	

Food Service Equipment

The facility has one full sized electric convection oven, insulated food holding cabinet, and an electric oven/steam cooker.

Refrigeration

The facility has two 19 cu. ft. stand up refrigerators with solid door and one ice making head producing around 400 pounds of ice per day.

Figure 12 – Refrigeration System

Solid Door Refrigerator

Building Plug Load

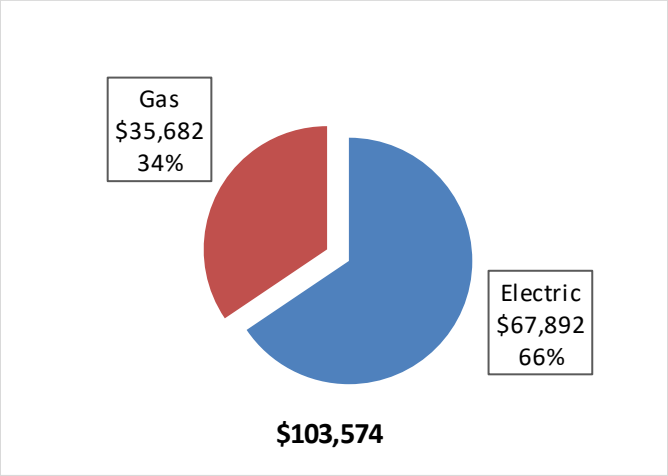
The facility contains several plug-load systems which contribute to plug load electric use including but not limited to printers, microwaves, and televisions. In addition to the typical plug load equipment, the facility also has a refrigerated vending machine.

Figure 13 – Vending Machines

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 14 - Utility Summary

Utility Summary for Hillside School		
Fuel	**Usage**	**Cost**
Electricity	445,334 kWh	$67,892
Natural Gas	44,496 Therms	$35,682
Total		**$103,574**

The current annual energy cost for this facility is $103,574 as shown in the chart below.

Figure 15 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.152/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Electric usage estimation and calibration methodology:

1. The Montclair BOE buildings Hillside, the Administration Building, Pre-K, and Central Heating Plant are served by three electric meters 65 795 083 02, 67 125 896 06, and 42 007 763 08. There is not a clear delineation of loads (or equipment kW) served by the meters, therefore, kW was not prorated.
2. Total energy use from all the meters combined is around 638,475 kWh for a 12-month period.
3. Monthly "calculated" energy use from the LGEA analysis tools were used to calculate the percentage contribution of each building. The percentages are:
    a. Hillside – 70%
    b. Administration Building – 11%
    c. Pre-K – 18%
    d. Central Heating Plant – 1%
4. The above percentages were applied to the "actual" total monthly energy use from bills to estimate monthly utility energy use to which all the tools were then calibrated.

Figure 16 - Electric Usage & Demand

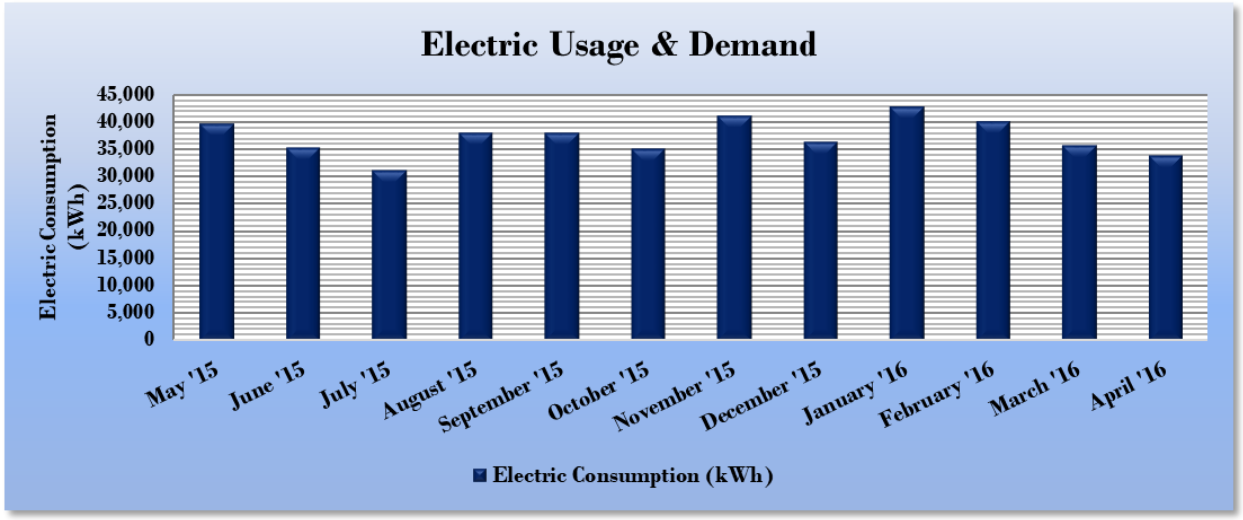


Figure 17 - Electric Usage & Demand

Electric Billing Data for Hillside School				
Period Ending	Days in Period	Electric Usage (kWh)	Total Electric Cost	TRC Estimated Usage?
6/15/15	33	39,547	$7,688	Yes
7/14/15	29	35,272	$6,781	Yes
8/17/15	34	31,193	$5,957	Yes
9/14/15	28	37,916	$6,959	Yes
10/13/15	29	37,851	$5,588	Yes
11/10/15	28	35,133	$4,939	Yes
12/11/15	31	40,989	$5,618	Yes
1/13/16	33	36,331	$4,744	Yes
2/11/16	29	42,800	$5,495	Yes
3/14/16	32	40,015	$5,139	Yes
4/13/16	30	35,638	$4,793	Yes
5/13/16	30	33,869	$4,375	Yes
Totals	**366**	**446,554**	**$68,078**	12
Annual	**365**	**445,334**	**$67,892**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.802/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Natural gas use was allocated to the sites served by the Central Heating Plant using the following method:

1. The Administration Building, Hillside School, Montclair Community Pre-K, and Central Heating Plant are served by two gas meters: 65 795 083 02 and 67 125 896 06. There is not a clear delineation of which buildings and equipment are served by each meter.
2. Total annual gas use for both of the meters combined is 59,235 therms.
3. The calculated gas use from the LGEA analysis for each building was used to determine the percentage of the total historical gas use to be assigned to each building. Total gas use was allocated to the three buildings served by the Central Heating Plant as follows:
    a. Hillside School - 75%
    b. Administration Building - 9%
    c. Montclair Community Pre-K - 16%
4. The above percentages were applied to the total monthly gas use from the utility bills to estimate the monthly gas use for the individual buildings. This estimated monthly gas use is what is provided in each of the reports.

Figure 18 - Natural Gas Usage

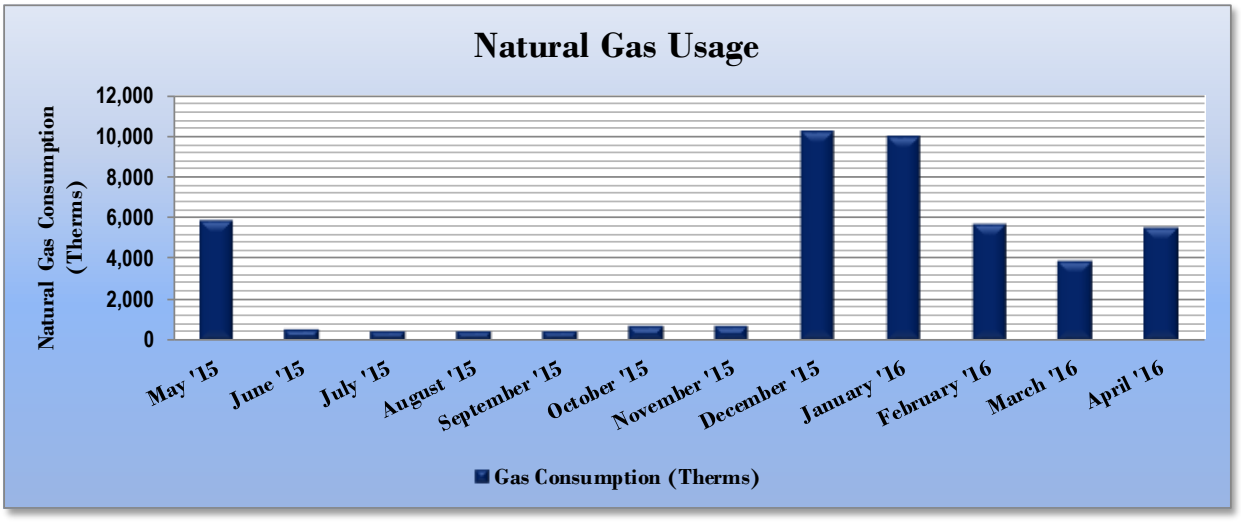

Figure 19 - Natural Gas Usage

Gas Billing Data for Hillside School				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/15/15	33	5,934	$3,201	Yes
7/14/15	29	500	$1,004	Yes
8/17/15	34	420	$417	Yes
9/14/15	28	419	$1,042	Yes
10/13/15	29	460	$642	Yes
11/10/15	28	677	$720	Yes
12/11/15	31	727	$938	Yes
1/13/16	33	10,293	$9,641	Yes
2/11/16	29	10,006	$9,178	Yes
3/14/16	32	5,693	$3,879	Yes
4/13/16	30	3,897	$2,119	Yes
5/13/16	30	5,591	$3,000	Yes
Totals	**366**	**44,618**	**$35,780**	12
Annual	**365**	**44,496**	**$35,682**	

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 20 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Hillside School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	75.1	141.4
Site Energy Use Intensity (kBtu/ft^2)	47.4	58.2

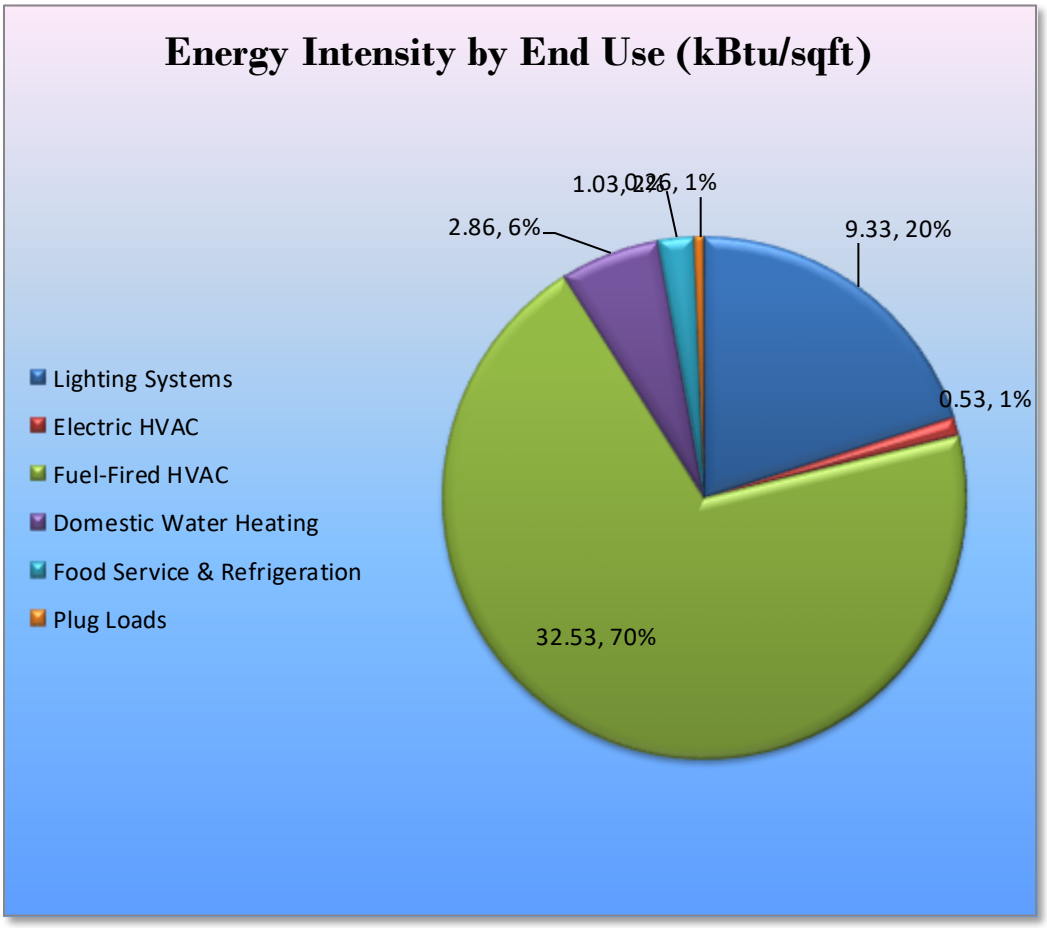
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 21 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Hillside School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	54.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	41.0	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. The Central Heating Plant and the three buildings served by it have a combined score of 74.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 22 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Hillside School regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 23 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**209,371**	**46.9**	**0.0**	**$31,918.71**	**$146,006.71**	**$21,745.00**	**$124,261.71**	**3.9**	**210,835**
ECM 1	Install LED Fixtures	18,278	3.8	0.0	$2,786.45	$43,765.28	$4,800.00	$38,965.28	14.0	18,406
ECM 2	Retrofit Fixtures with LED Lamps	187,817	42.8	0.0	$28,632.80	$101,058.32	$16,945.00	$84,113.32	2.9	189,130
ECM 3	Install LED Exit Signs	3,276	0.2	0.0	$499.47	$1,183.11	$0.00	$1,183.11	2.4	3,299
Lighting Control Measures		**28,655**	**6.3**	**0.0**	**$4,368.42**	**$29,720.00**	**$3,150.00**	**$26,570.00**	**6.1**	**28,855**
ECM 4	Install Occupancy Sensor Lighting Controls	24,564	5.4	0.0	$3,744.85	$25,920.00	$3,150.00	$22,770.00	6.1	24,736
ECM 5	Install High/Low Lighitng Controls	4,090	0.9	0.0	$623.57	$3,800.00	$0.00	$3,800.00	6.1	4,119
Plug Load Equipment Control - Vending Machine		**1,209**	**0.0**	**0.0**	**$184.29**	**$230.00**	**$0.00**	**$230.00**	**1.2**	**1,217**
ECM 6	Vending Machine Control	1,209	0.0	0.0	$184.29	$230.00	$0.00	$230.00	1.2	1,217
TOTALS		**239,234**	**53.2**	**0.0**	**$36,471.42**	**$175,956.71**	**$24,895.00**	**$151,061.71**	**4.1**	**240,907**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 24 below.

Figure 24 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**209,371**	**46.9**	**0.0**	**$31,918.71**	**$146,006.71**	**$21,745.00**	**$124,261.71**	**3.9**	**210,835**
ECM 1	Install LED Fixtures	18,278	3.8	0.0	$2,786.45	$43,765.28	$4,800.00	$38,965.28	14.0	18,406
ECM 2	Retrofit Fixtures with LED Lamps	187,817	42.8	0.0	$28,632.80	$101,058.32	$16,945.00	$84,113.32	2.9	189,130
ECM 3	Install LED Exit Signs	3,276	0.2	0.0	$499.47	$1,183.11	$0.00	$1,183.11	2.4	3,299

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	16,107	3.5	0.0	$2,455.52	$42,593.25	$4,500.00	$38,093.25	15.5	16,220
Exterior	2,171	0.3	0.0	$330.93	$1,172.03	$300.00	$872.03	2.6	2,186

Measure Description

We recommend replacing existing fixtures containing mercury vapor and metal halide lamps with new high-performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a HID lamp.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	184,094	42.4	0.0	$28,065.22	$100,618.79	$16,895.00	$83,723.79	3.0	185,381
Exterior	3,723	0.5	0.0	$567.57	$439.53	$50.00	$389.53	0.7	3,749

Measure Description

We recommend retrofitting existing incandescent, linear fluorescent, and compact fluorescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a fluorescent tube and more than 10 times longer than many incandescent lamps.

ECM 3: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	3,276	0.2	0.0	$499.47	$1,183.11	$0.00	$1,183.11	2.4	3,299

Measure Description

We recommend replacing all incandescent exit signs with LED exit signs. LED exit signs require virtually no maintenance and have a life expectancy of at least 20 years. This measure saves energy by installing LED fixtures, which use less power than other technologies with an equivalent lighting output.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 25 below.

Figure 25 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**28,655**	**6.3**	**0.0**	**$4,368.42**	**$29,720.00**	**$3,150.00**	**$26,570.00**	**6.1**	**28,855**
ECM 4	Install Occupancy Sensor Lighting Controls	24,564	5.4	0.0	$3,744.85	$25,920.00	$3,150.00	$22,770.00	6.1	24,736
ECM 5	Install High/Low Lighitng Controls	4,090	0.9	0.0	$623.57	$3,800.00	$0.00	$3,800.00	6.1	4,119

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
24,564	5.4	0.0	$3,744.85	$25,920.00	$3,150.00	$22,770.00	6.1	24,736

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in all offices, storage rooms, classrooms, kitchen areas, etc. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,090	0.9	0.0	$623.57	$3,800.00	$0.00	$3,800.00	6.1	4,119

Measure Description

We recommend installing occupancy sensors to provide dual level lighting control for lighting fixtures in spaces that are infrequently occupied but may require some level of continuous lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors, parking lots, and parking garages.

Lighting fixtures with these controls operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared sensors. The lighting systems are switched to full lighting levels whenever an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period of time. Energy savings results from only providing full lighting levels when it is required.

For this type of measure the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage needs to be provided to ensure that lights turn on in each area as an occupant approaches.

Additional savings from reduced lighting maintenance may also result from this measure, due to reduced lamp operation.

4.1.3 Plug Load Equipment Control - Vending Machines

Our recommendations for plug load equipment control measures can be summarized in Figure 26 below.

Figure 26 - Summary of Plug Load Equipment ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,209**	**0.0**	**0.0**	**$184.29**	**$230.00**	**$0.00**	**$230.00**	**1.2**	**1,217**
ECM 6	Vending Machine Control	1,209	0.0	0.0	$184.29	$230.00	$0.00	$230.00	1.2	1,217

ECM 6: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,209	0.0	0.0	$184.29	$230.00	$0.00	$230.00	1.2	1,217

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor controls to reduce the energy use. These controls power down vending machines when the vending machine area has been vacant for some time, then power up at regular intervals, as needed, to turn machine lights on or keep the product cool. Energy savings are a dependent on vending machine and activity level in the area surrounding the machines.

4.2 ECM Evaluated But Not Recommended

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 27 – Summary of Measure Evaluated, But Not Recommended

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Electric Unitary HVAC Measures	**1,796**	**1.0**	**0.0**	**$273.85**	**$16,149.94**	**$0.00**	**$16,149.94**	**59.0**	**1,809**
Install High Efficiency Electric AC	1,796	1.0	0.0	$273.85	$16,149.94	$0.00	$16,149.94	59.0	1,809
TOTALS	**1,796**	**1.0**	**0.0**	**$273.85**	**$16,149.94**	**$0.00**	**$16,149.94**	**59.0**	**1,809**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Air Conditioning Units

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,796	1.0	0.0	$273.85	$16,149.94	$0.00	$16,149.94	59.0	1,809

Measure Description

We evaluated replacing standard efficiency packaged air conditioning units with high efficiency packaged air conditioning units. There have been significant improvements in both compressor and fan motor efficiencies over the past several years. Therefore, electricity savings can be achieved by replacing older units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the older unit versus the new high efficiency unit, the average cooling load, and the estimated annual operating hours.

Reasons for not Recommending

This measure has a long payback, more than the rated useful life of the replacement equipment. The measure is not recommended for implementation on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

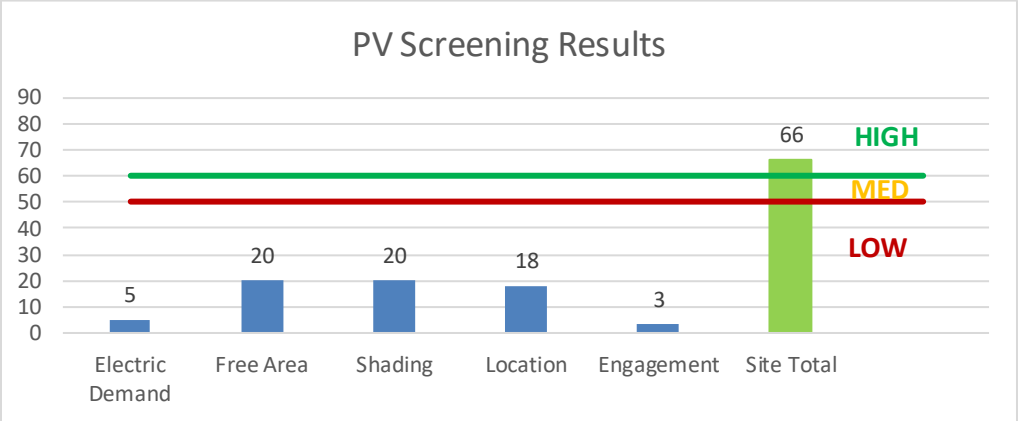
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the high potential for PV at the site. A PV array located on the roof of the building may be feasible. If Hillside School is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Figure 28 - Photovoltaic Screening

Potential	High	
System Potential	135	kW DC STC
Electric Generation	160,835	kWh/yr
Displaced Cost	$13,990	/yr
Installed Cost	$351,000	

Solar projects must register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.2 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a no potential for installing a cost-effective CHP system.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 29 for a list of the eligible programs identified for each recommended ECM.

Figure 29 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	X					
ECM 2	Retrofit Fixtures with LED Lamps	X					
ECM 3	Install LED Exit Signs						
ECM 4	Install Occupancy Sensor Lighting Controls	X					
ECM 5	Install High/Low Lighitng Controls						
ECM 6	Vending Machine Control						

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Montclair Community Pre-K.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey educational facilities in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

Montclair Community Pre-K is a 28,511 square foot facility constructed in 1900. The building is a three-story educational facility including but not limited to classrooms, offices, hallways and restrooms.

Lighting at the facility consists mainly of 32-Watt T8 linear fluorescent fixtures with 32-Watt T8 U-bend fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several 60-Watt incandescent lamps. Exterior lighting is provided by a combination of 70-Watt and 100-Watt metal halide fixtures and 150-Watt high pressure sodium fixtures. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation is provided by a combination of package units and window AC units. Heating is provided by the Central Heating Plant.

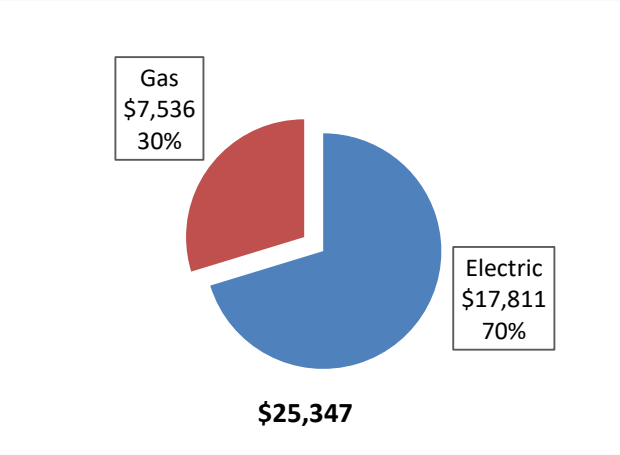
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated five measures and recommended four measures which together represent an opportunity for Montclair Community Pre-K to reduce annual energy costs by roughly $7,443 and annual greenhouse gas emissions by 49,167 lbs CO_2e. We estimate that if all high priority measures are implemented as recommended, the project will pay for itself in roughly 5.4 years. TRC has defined high priority measures as the evaluated measures that have a simple payback less than the typical equipment life of the proposed equipment. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce Montclair Community Pre-K's annual energy use by 12%.

Figure 1 – Previous 12 Month Utility Costs



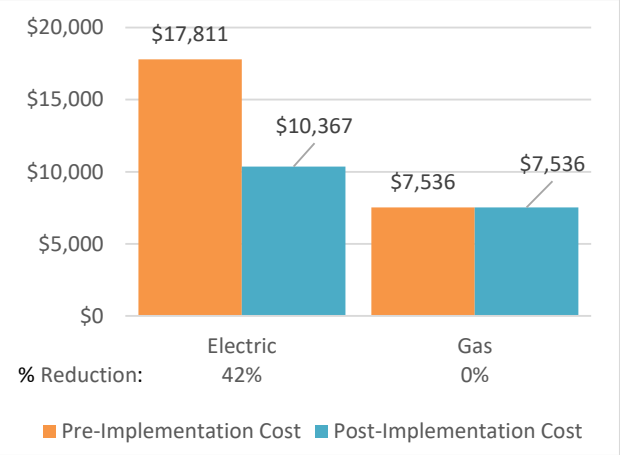


Figure 2 – Potential Post-Implementation Costs

A detailed description of Montclair Community Pre-K's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the evaluated energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		High Priority?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**41,993**	**11.1**	**0.0**	**$6,401.83**	**$33,919.29**	**$6,125.00**	**$27,794.29**	**4.3**	**42,286**
ECM 1	Install LED Fixtures	Yes	3,857	0.5	0.0	$588.01	$3,125.42	$800.00	$2,325.42	4.0	3,884
ECM 2	Retrofit Fixtures with LED Lamps	Yes	38,136	10.6	0.0	$5,813.83	$30,793.88	$5,325.00	$25,468.88	4.4	38,402
Lighting Control Measures			**6,833**	**1.9**	**0.0**	**$1,041.64**	**$13,830.00**	**$1,715.00**	**$12,115.00**	**11.6**	**6,880**
ECM 3	Install Occupancy Sensor Lighting Controls	Yes	6,525	1.8	0.0	$994.77	$13,230.00	$1,715.00	$11,515.00	11.6	6,571
ECM 4	Install High/Low Lighitng Controls	Yes	307	0.1	0.0	$46.87	$600.00	$0.00	$600.00	12.8	310
Electric Unitary HVAC Measures			**4,208**	**3.1**	**0.0**	**$641.58**	**$46,537.06**	**$996.67**	**$45,540.39**	**71.0**	**4,238**
	Install High Efficiency Electric AC	No	4,208	3.1	0.0	$641.58	$46,537.06	$996.67	$45,540.39	71.0	4,238
TOTALS FOR HIGH PRIORITY MEASURES			**48,825**	**12.9**	**0.0**	**$7,443.48**	**$47,749.29**	**$7,840.00**	**$39,909.29**	**5.4**	**49,167**
TOTALS FOR ALL EVALUATED MEASURES			**53,034**	**16.1**	**0.0**	**$8,085.06**	**$94,286.35**	**$8,836.67**	**$85,449.69**	**10.6**	**53,405**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Electric Unitary HVAC measures generally involve replacing older inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide equivalent cooling to older air condition systems at a reduced energy cost. These measures save energy by reducing the power used by the air conditioning systems, due to improved electrical efficiency.

Energy Efficient Practices

TRC also identified seven low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Montclair Community Pre-K include:

- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Clean Evaporator/Condenser Coils on AC Systems
- Clean and/or Replace HVAC Filters
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for Montclair Community Pre-K. Based on the configuration of the site and its loads there is a moderate potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	Medium	
System Potential	50	kW DC STC
Electric Generation	59,569	kWh/yr
Displaced Cost	$5,180	/yr
Installed Cost	$130,000	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.2 General Site Information

On November 09, 2016, TRC performed an energy audit at Montclair Community Pre-K located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Montclair Community Pre-K is a 28,511 square foot facility constructed in 1900. The building is a three-story educational facility including but not limited to classrooms, offices, hallways and restrooms.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Montclair Community Pre-K	Weekday	8:00 AM - 6:00 PM
Montclair Community Pre-K	Weekend	unoccupied

2.4 Building Envelope

The Pre-K facility is a three-story building. The construction is of concrete masonry block with painted exterior and double pane clear windows with operable frames. The slanted roof in the main building is constructed of tile roofing material.

Figure 7 – Building Façade

2.5 On-Site Generation

Montclair Community Pre-K does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at Montclair Community Pre-K consists mainly of 32-Watt T8 linear fluorescent fixtures with a few 32-Watt T8 U-bend fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. The linear fluorescent fixtures are 4-foot long or U-bend, mainly troffers with diffusers having 2, 3, or 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 60-Watt incandescent lamps. All the exit signs are LED fixtures.

Interior lighting control in the building is provided by a combination of manual switches and occupancy sensors.

Figure 8 - Building Lighting Systems

Linear Fluorescent Fixture	*Exterior Fixture*
	

Exterior lighting is provided by a combination of 70-Watt and 100-Watt metal halide fixtures and 150-Watt high pressure sodium fixtures.

Heating System

The Central Heating Plant has two natural gas fired Weil McLain steam boilers with an input rating of 7,938 MBh each and a nominal efficiency of 80%. These boilers provide space heating for Hillside School, the Montclair Community Pre-K, and the district Administration Building.

Figure 9 – Heating System

Direct Expansion Air Conditioning System (DX)

Air conditioning (AC) at the facility is primarily provided by a combination of package units and window AC units. Package/portable units have capacities between 1 ton and 2.67 tons and window AC units have capacities between 0.58 ton and 1.25 tons with efficiency ratings of around 10.9 EER.

Figure 10 – DX Air Conditioning System

Window AC

Portable Units

Domestic Hot Water Heating System

The domestic hot water heating system for the facility consists of one A.O. Smith gas fired hot water heater with an input rating of 199 kBtu/hr and a nominal efficiency of 80%. The water heater has a 100 gallon storage tank.

Figure 11 – Domestic Water Heater

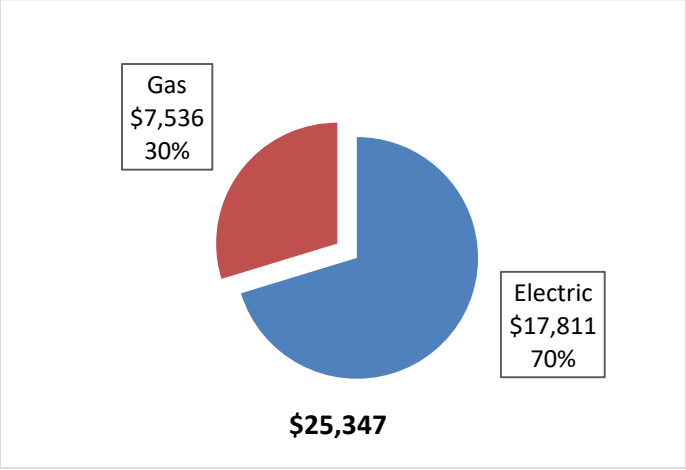
Building Plug Load

The facility contains several plug-load systems which contribute to plug load electric use including but not limited to copier, printers, microwaves, and refrigerators.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 12 - Utility Summary

Utility Summary for Montclair Community Pre-K		
Fuel	**Usage**	**Cost**
Electricity	116,830 kWh	$17,811
Natural Gas	9,397 Therms	$7,536
Total		**$25,347**

The current annual energy cost for this facility is $25,347 as shown in the chart below.

Figure 13 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.152/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Electric usage estimation and calibration methodology:

1. The Montclair BOE buildings Hillside School, Administration, Montclair Community Pre-K, and Central Heating Plant are served by three electric meters 65 795 083 02, 67 125 896 06, and 42 007 763 08. There is not a clear delineation of loads served by the meters. Based on this, demand (kW) data was not prorated.
2. Total energy use from all the meters combined is around 638,475 kWh for a 12-month period.
3. Monthly "calculated" energy use from the LGEA analysis tools were used to calculate the percentage contribution of each building. The percentages are:
    a. Hillside School – 70%
    b. Administration Building – 11%
    c. Montclair Community Pre-K – 18%
    d. Central Heating Plant – 1%
4. The above percentages were applied to the "actual" total monthly energy use from bills to estimate monthly utility energy use to which all the tools were then calibrated.

Figure 14 - Electric Usage & Demand

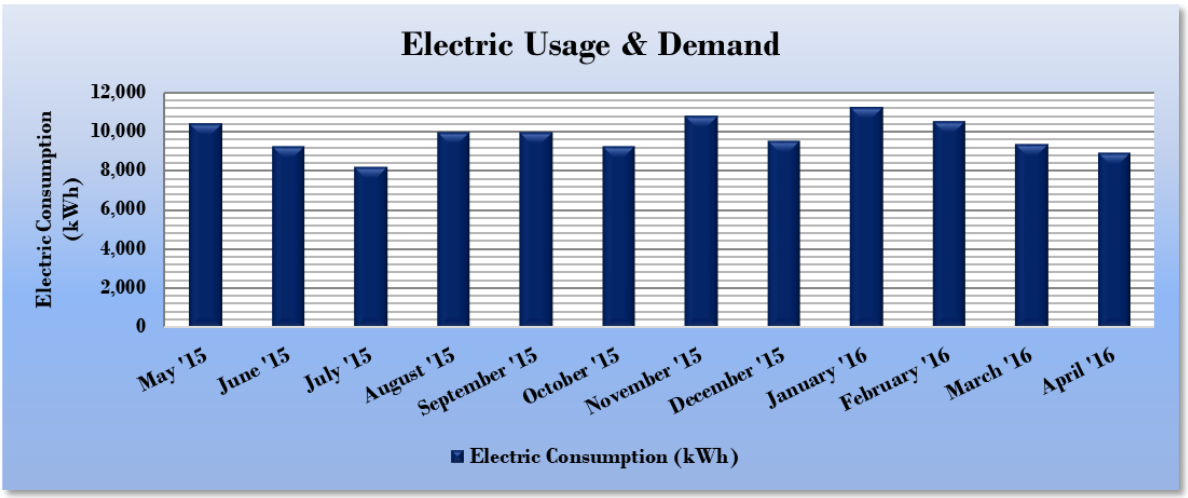


Figure 15 - Electric Usage & Demand

Electric Billing Data for Montclair Community Pre-K				
Period Ending	Days in Period	Electric Usage (kWh)	Total Electric Cost	TRC Estimated Usage?
6/15/15	33	10,375	$2,017	Yes
7/14/15	29	9,253	$1,779	Yes
8/12/15	29	8,183	$1,563	Yes
9/14/15	33	9,947	$1,826	Yes
10/13/15	29	9,930	$1,466	Yes
11/10/15	28	9,217	$1,296	Yes
12/11/15	31	10,753	$1,474	Yes
1/13/16	33	9,531	$1,245	Yes
2/11/16	29	11,228	$1,442	Yes
3/14/16	32	10,498	$1,348	Yes
4/13/16	30	9,349	$1,257	Yes
5/13/16	30	8,885	$1,148	Yes
Totals	**366**	**117,150**	**$17,860**	12
Annual	**365**	**116,830**	**$17,811**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.802/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Natural gas use was allocated to the sites served by the Central Heating Plant using the following method:

1. The Administration Building, Hillside School, Montclair Community Pre-K, and Central Heating Plant are served by two gas meters: 65 795 083 02 and 67 125 896 06. There is not a clear delineation of which buildings and equipment are served by each meter.
2. Total annual gas use for both of the meters combined is 59,235 therms.
3. The calculated gas use from the LGEA analysis for each building was used to determine the percentage of the total historical gas use to be assigned to each building. Total gas use was allocated to the three buildings served by the Central Heating Plant as follows:
    a. Hillside School - 75%
    b. Administration Building - 9%
    c. Montclair Community Pre-K - 16%
4. The above percentages were applied to the total monthly gas use from the utility bills to estimate the monthly gas use for the individual buildings. This estimated monthly gas use is what is provided in each of the reports.

Figure 16 - Natural Gas Usage

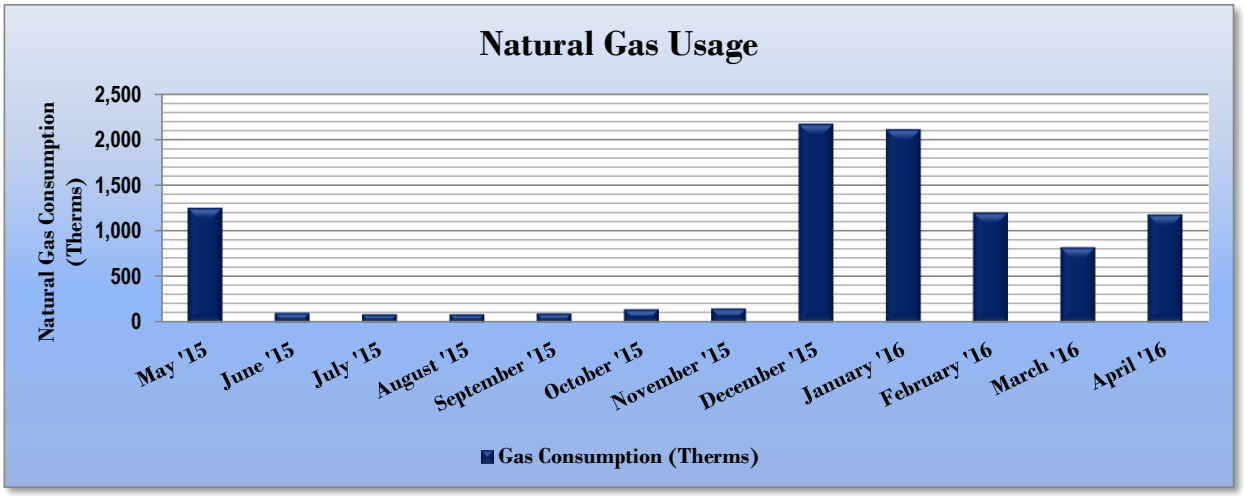

Figure 17 - Natural Gas Usage

Gas Billing Data for Montclair Community Pre-K				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/15/15	33	1,253	$676	Yes
7/14/15	29	106	$212	Yes
8/12/15	29	89	$88	Yes
9/14/15	33	89	$220	Yes
10/13/15	29	97	$136	Yes
11/10/15	28	143	$152	Yes
12/11/15	31	153	$198	Yes
1/13/16	33	2,174	$2,036	Yes
2/11/16	29	2,113	$1,938	Yes
3/14/16	32	1,202	$819	Yes
4/13/16	30	823	$447	Yes
5/13/16	30	1,181	$634	Yes
Totals	**366**	**9,423**	**$7,556**	12
Annual	**365**	**9,397**	**$7,536**	

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 18 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Montclair Community Pre-K	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	78.5	141.4
Site Energy Use Intensity (kBtu/ft^2)	46.9	58.2

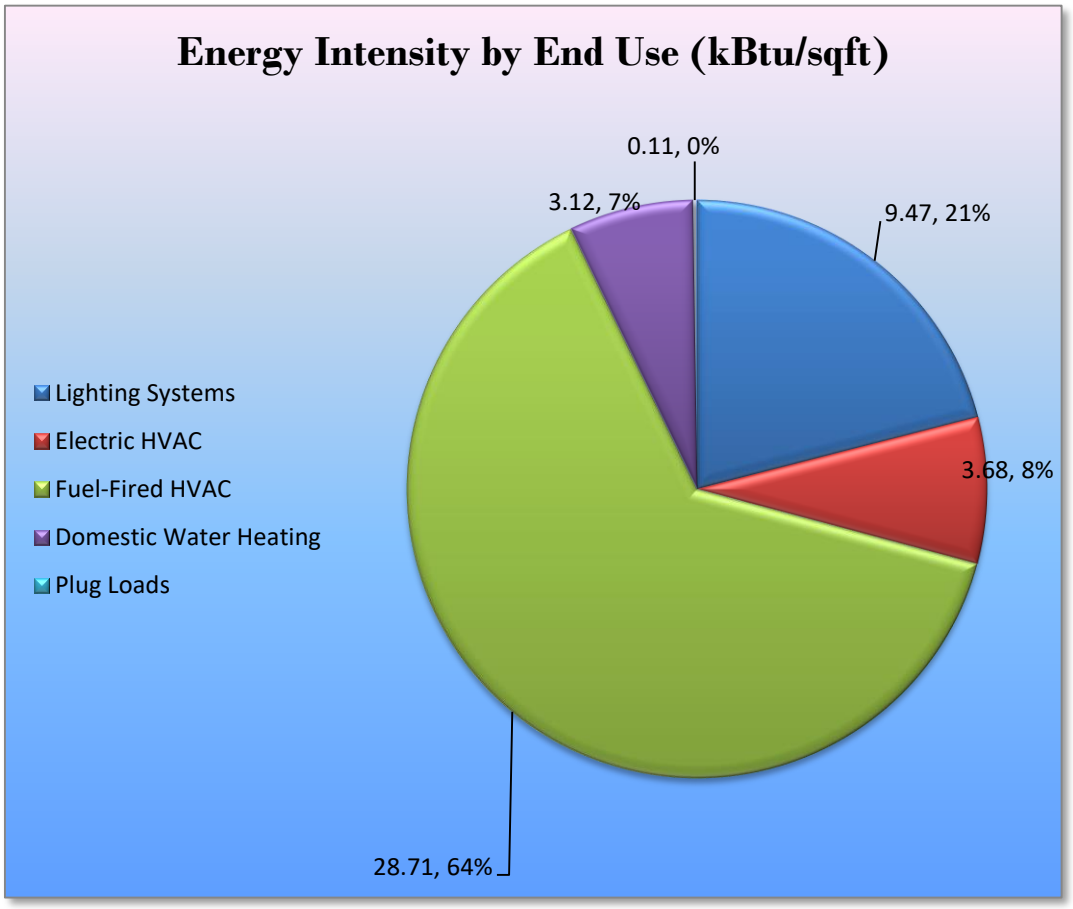
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 19 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Montclair Community Pre-K	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	60.2	141.4
Site Energy Use Intensity (kBtu/ft^2)	41.1	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. The Central Heating Plant and the three buildings served by it have a combined score of 74.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 20 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Montclair Community Pre-K regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 High Priority ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 21 – Summary of High Priority ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**41,993**	**11.1**	**0.0**	**$6,401.83**	**$33,919.29**	**$6,125.00**	**$27,794.29**	**4.3**	**42,286**
ECM 1	Install LED Fixtures	3,857	0.5	0.0	$588.01	$3,125.42	$800.00	$2,325.42	4.0	3,884
ECM 2	Retrofit Fixtures with LED Lamps	38,136	10.6	0.0	$5,813.83	$30,793.88	$5,325.00	$25,468.88	4.4	38,402
Lighting Control Measures		**6,833**	**1.9**	**0.0**	**$1,041.64**	**$13,830.00**	**$1,715.00**	**$12,115.00**	**11.6**	**6,880**
ECM 3	Install Occupancy Sensor Lighting Controls	6,525	1.8	0.0	$994.77	$13,230.00	$1,715.00	$11,515.00	11.6	6,571
ECM 4	Install High/Low Lighitng Controls	307	0.1	0.0	$46.87	$600.00	$0.00	$600.00	12.8	310
TOTALS		**48,825**	**12.9**	**0.0**	**$7,443.48**	**$47,749.29**	**$7,840.00**	**$39,909.29**	**5.4**	**49,167**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 22 below.

Figure 22 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**41,993**	**11.1**	**0.0**	**$6,401.83**	**$33,919.29**	**$6,125.00**	**$27,794.29**	**4.3**	**42,286**
ECM 1	Install LED Fixtures	3,857	0.5	0.0	$588.01	$3,125.42	$800.00	$2,325.42	4.0	3,884
ECM 2	Retrofit Fixtures with LED Lamps	38,136	10.6	0.0	$5,813.83	$30,793.88	$5,325.00	$25,468.88	4.4	38,402

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Annual Electric Savings (kWh)	Chilled Water Savings (Ton-Hr)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Exterior	3,857	3,857	0	0.5	0.0	$588.01	$3,125.42	$800.00	$2,325.42	4.0	3,884

Measure Description

We recommend replacing exterior fixtures containing metal halide and high-pressure sodium lamps with new high-performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a metal halide or high-pressure sodium lamp.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Annual Electric Savings (kWh)	Chilled Water Savings (Ton-Hr)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	38,136	38,136	0	10.6	0.0	$5,813.83	$30,793.88	$5,325.00	$25,468.88	4.4	38,402

Measure Description

We recommend retrofitting existing T8 linear fluorescent, T8 U-bend fluorescent, and incandescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 23 below.

Figure 23 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**6,833**	**1.9**	**0.0**	**$1,041.64**	**$13,830.00**	**$1,715.00**	**$12,115.00**	**11.6**	**6,880**
ECM 3	Install Occupancy Sensor Lighting Controls	6,525	1.8	0.0	$994.77	$13,230.00	$1,715.00	$11,515.00	11.6	6,571
ECM 4	Install High/Low Lighitng Controls	307	0.1	0.0	$46.87	$600.00	$0.00	$600.00	12.8	310

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 3: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
6,525	1.8	0.0	$994.77	$13,230.00	$1,715.00	$11,515.00	11.6	6,571

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in classrooms, restrooms, offices areas, etc. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

ECM 4: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
307	0.1	0.0	$46.87	$600.00	$0.00	$600.00	12.8	310

Measure Description

We recommend installing occupancy sensors to provide dual level lighting control for lighting fixtures in spaces that are infrequently occupied but may require some level of continuous lighting for safety or security reasons. Typical areas for such lighting control are stairwells, interior corridors, parking lots, and parking garages.

Lighting fixtures with these controls operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared sensors. The lighting systems are switched to full lighting levels whenever an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period of time. Energy savings results from only providing full lighting levels when it is required.

For this type of measure the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage needs to be provided to ensure that lights turn on in each area as an occupant approaches.

Additional savings from reduced lighting maintenance may also result from this measure, due to reduced lamp operation.

4.2 Other Evaluated ECM

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 24 – Summary of Other Evaluated ECM

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Electric Unitary HVAC Measures	**4,208**	**3.1**	**0.0**	**$641.58**	**$46,537.06**	**$996.67**	**$45,540.39**	**71.0**	**4,238**
Install High Efficiency Electric AC	4,208	3.1	0.0	$641.58	$46,537.06	$996.67	$45,540.39	71.0	4,238
TOTALS	**4,208**	**3.1**	**0.0**	**$641.58**	**$46,537.06**	**$996.67**	**$45,540.39**	**71.0**	**4,238**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Air Conditioning Units

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
4,208	3.1	0.0	$641.58	$46,537.06	$996.67	$45,540.39	71.0	4,238

Measure Description

We recommend replacing standard efficiency packaged air conditioning units with high efficiency packaged air conditioning units when cost effective. There have been significant improvements in both compressor and fan motor efficiencies over the past several years. Therefore, electricity savings can be achieved by replacing older units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the older unit versus the new high efficiency unit, the average cooling load, and the estimated annual operating hours.

Reasons for not Recommending

This measure has a long payback, more than the rated useful life of the replacement equipment. The measure is not recommended for implementation on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

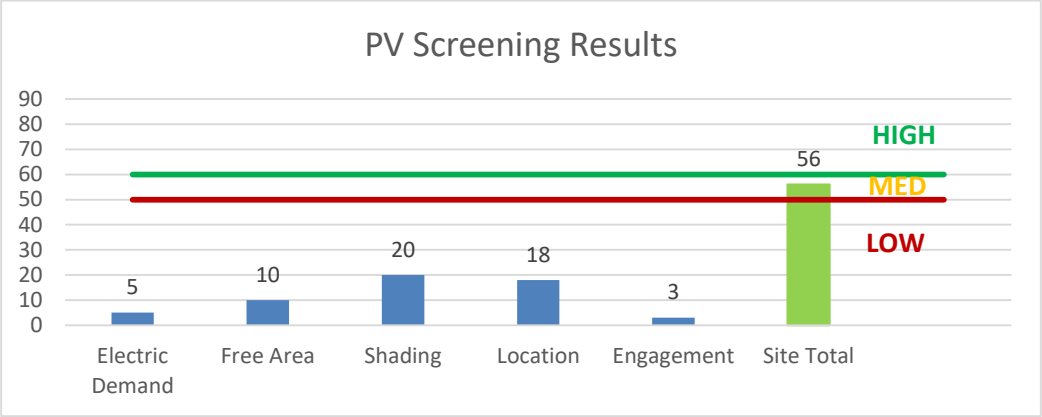
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **Medium** potential for installing a PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the potential for PV at the site. A PV array located on the roof of the building may be feasible. If Montclair Community Pre-K is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Figure 25 - Photovoltaic Screening

Solar projects must register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.2 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility does not have the potential for installing a cost-effective CHP system.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion this building is not is a good candidate for DR.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 26 for a list of the eligible programs identified for each recommended ECM.

Figure 26 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x					
ECM 2	Retrofit Fixtures with LED Lamps	x					
ECM 3	Install Occupancy Sensor Lighting Controls	x					
ECM 4	Install High/Low Lighitng Controls						

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

ENERGY STAR® Score[1]

Montclair Valley Road Campus (4 Buildings)

Primary Property Type: K-12 School
Gross Floor Area (ft²): 172,102
Built: 1879

For Year Ending: April 30, 2016
Date Generated: June 20, 2018

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Property & Contact Information

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for Montclair High School.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey local governments in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

Montclair High School is a 262,855 square foot facility constructed in 1914. The building is a four-story educational facility including but not limited to classrooms, library areas, offices, hallways and auditorium.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 40-Watt T12 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several circular T9 fluorescent, incandescent, as well as LED lamps. Exterior lighting is provided by a combination of 175-Watt and 400-Watt metal halide fixtures, 400-Watt high pressure sodium, incandescent, and linear fluorescent fixtures. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation is provided by rooftop packaged air conditioning (AC), window AC, and split system AC systems. Heating hot water is provided by three non-condensing hot water boilers.

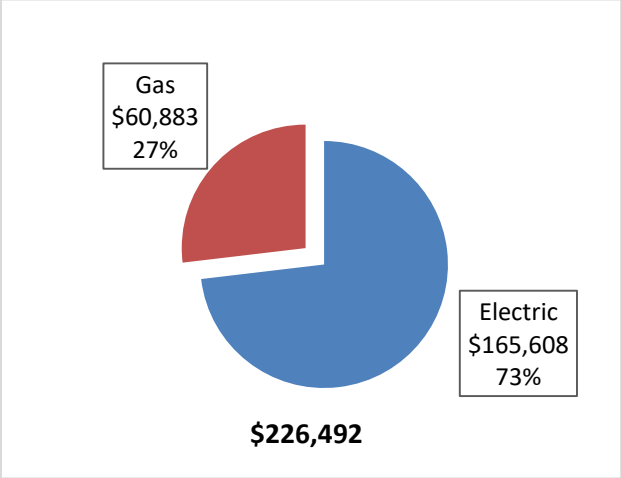
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated nine measures and recommended eight measures which together represent an opportunity for Montclair High School to reduce annual energy costs by roughly $53,673 and annual greenhouse gas emissions by 383,419 lbs CO_2e. We estimate that if all measures were implemented as recommended, the project would pay for itself in roughly 4.5 years. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce Montclair High School's annual energy use by 12%.

Figure 1 – Previous 12 Month Utility Costs



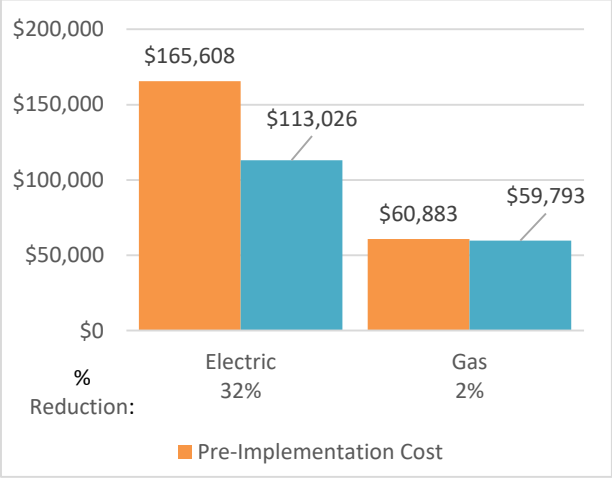


Figure 2 – Potential Post-Implementation Costs

A detailed description of Montclair High School's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the proposed energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

	Energy Conservation Measure	Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**297,995**	**62.4**	**0.0**	**$42,891.77**	**$206,332.89**	**$33,190.00**	**$173,142.89**	**4.0**	**300,078**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Variable Frequency Drives (VFDs) are motor control devices. These measures control the speed of a motor so that the motor spins at peak efficiency during partial load conditions. Sensors adapt the speed to flow, temperature, or pressure settings which is much more efficient that usage a valve or damper to control flow rates, or running the motor at full speed when only partial power is needed. These measures save energy by controlling motor usage more efficiently.

Gas Heating (HVAC/Process) measures generally involve replacing older inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide equivalent heating compared to older systems at a reduced energy cost. These measures save energy by reducing the fuel demands for heating, due to improved combustion and heat transfer efficiency.

Domestic Hot Water upgrade measures generally involve replacing older inefficient domestic water heating systems with modern energy efficient systems. New domestic hot water heating systems can provide equivalent, or greater, water heating capacity compared to older systems at a reduced energy cost. These measures save energy by reducing the fuel used for domestic hot water heating due to improved heating efficiency or reducing standby losses.

Plug Load Equipment control measures generally involve installing automated devices that limit the power usage or operation of equipment that is plugged into an electric outlet when not in use.

Energy Efficient Practices

TRC also identified seven low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Montclair High School include:

- Close Doors and Windows
- Perform Proper Lighting Maintenance
- Clean Evaporator/Condenser Coils on AC Systems
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for Montclair High School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	342	kW DC STC
Electric Generation	407,448	kWh/yr
Displaced Cost	$58,650	/yr
Installed Cost	$889,200	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Pay for Performance - Existing Building (P4P EB)
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

Larger facilities with an interest in a more comprehensive whole building approach to energy conservation should consider participating in the Pay for Performance (P4P) program. Projects eligible for this project program must meet minimum savings requirements. Final incentives are calculated based on actual measured performance achieved at the end of the project. The application process is more involved, and it requires working with a qualified P4P contractor, but the process may result in greater energy savings overall and more lucrative incentives, up to 50% of project's total cost.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.4 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 08, 2016, TRC performed an energy audit at Montclair High School located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Montclair High School is a 262,855 square foot facility constructed in 1914. The building is a four-story educational facility including but not limited to classrooms, library areas, offices, hallways and auditorium.

Lighting at the facility consists mainly of 32-Watt T8 fluorescent fixtures with a few 40-Watt T12 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to linear fluorescent technology, the facility also has several circular T9 fluorescent, incandescent, as well as LED lamps. Exterior lighting is provided by a combination of 175-Watt and 400-Watt metal halide fixtures, 400-Watt high pressure sodium, incandescent, and linear fluorescent fixtures. Interior lighting control is provided by a combination of manual switches and occupancy sensors.

Cooling and ventilation is provided by rooftop packaged AC, window AC, and split system AC systems. Heating hot water is provided by three non-condensing hot water boilers.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Montclair High School	Weekday	7:00 am - 3:30 pm
Montclair High School	Weekend	CLOSED

2.4 Building Envelope

Montclair High School is a four-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with operable frames. The flat roof is constructed of built-up roofing material.

Figure 7 – Building Façade

2.5 On-Site Generation

TRC evaluated the potential for installing on-site generation at Montclair High School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 8 – Photovoltaic Potential

Potential	High	
System Potential	342	kW DC STC
Electric Generation	407,448	kWh/yr
Displaced Cost	$58,650	/yr
Installed Cost	$889,200	

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at Montclair High School consists mainly of 32-Watt T8 fluorescent fixtures with a few 40-Watt T12 fluorescent fixtures. These sources are inefficient in performance when compared to the latest lighting technology available in the market. Linear fluorescent fixtures are 2-foot, 4-foot, or 8-foot long, mainly troffers with diffusers having 1, 2, 3, or 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 60-Watt, 75-Watt, 100-Watt, and 125-Watt incandescent lamps. In addition to linear fluorescent and incandescent lamps, the facility also has LED linear tubes and screw-in lamps. A majority of the exit signs are incandescent based fixtures.

Interior lighting control in the building is provided by a combination of manual switches and occupancy sensors.

Figure 9 - Building Lighting Systems

Fluorescent Fixture	*Exterior Fixtures*
	

Exterior lighting is provided by a combination of 175-Watt and 400-Watt metal halide fixtures, 400-Watt high pressure sodium, 60-Watt and 100-Watt incandescent, and 32-Watt T8 linear fluorescent fixtures.

Hot Water Heating System

The hot water system consists of three Cleaver-Brooks 3,348 kBtu/hr output, non-condensing hot water boilers. The boilers have a nominal combustion efficiency of 80%. The boilers are configured in a constant flow primary distribution with three hot water pumps. Each boiler is supplied by a dedicated 5 hp pump. Baseboard heaters provide heating to the zones. The boilers are in good condition and well maintained.

Figure 10 – Hot Water Systems

Hot Water Boilers	*Hot Water Pumps*
	

Direct Expansion Air Conditioning System (DX)

The facility also has several window AC units with capacities ranging between 0.42 ton and 1.71 tons. There are three rooftop package units having capacities between 1-ton and 15-tons. In addition to the window AC units and package units, facility also has several 2-ton and 5-ton split system AC units.

Figure 11 – DX Air Conditioning System

Window AC	*Split Systems*
	

Domestic Hot Water Heating System

The domestic hot water is supplied by the same three Cleaver-Brooks heating hot water boilers by way of a heat exchanger.

Food Service Equipment

The facility has two full sized gas convection ovens which uses approximately 126 MMBtu gas per year.

Refrigeration

The facility has four stand up refrigerators with glass door and eight stand up refrigerators with solid doors. Volume of the standard refrigerators range between 5 cu. ft. and 50 cu. ft.

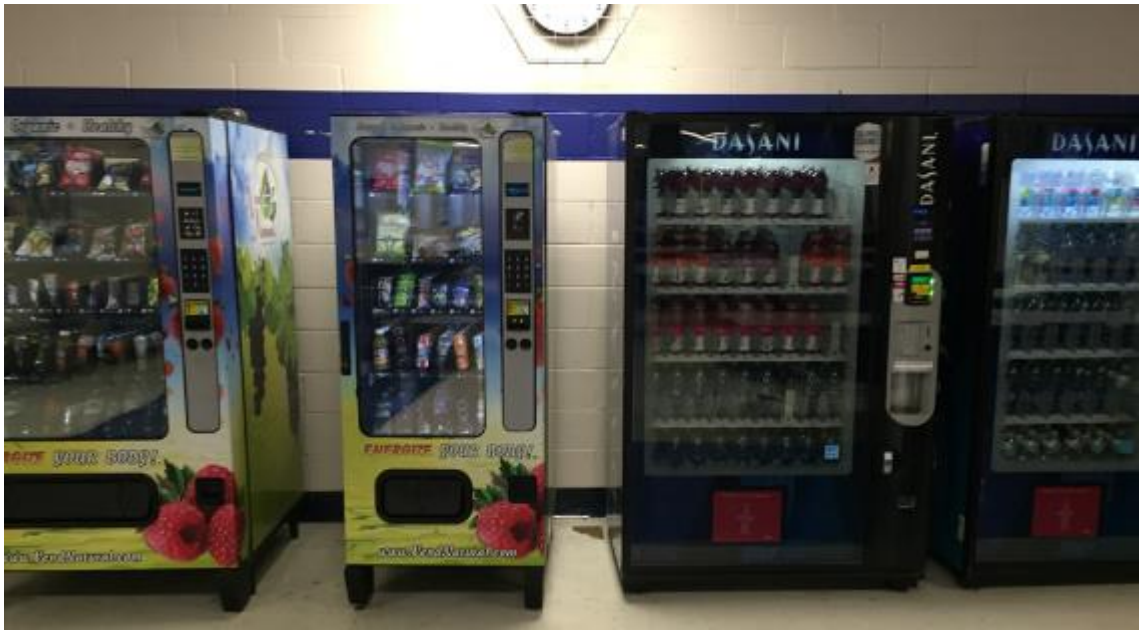

Figure 12 – Refrigeration System

Glass Door Refrigerator	*Solid Door Refrigerator*
	

Building Plug Load

There are roughly 310 computer work stations throughout the facility. All the computers are desktop units with LCD monitors. There is no centralized PC power management software installed.

Figure 13 – Vending Machines

The facility contains other systems which contribute to plug load including printers, microwaves, and televisions. In addition to the typical plug load equipment, the facility also has refrigerated and non-refrigerated vending machines.

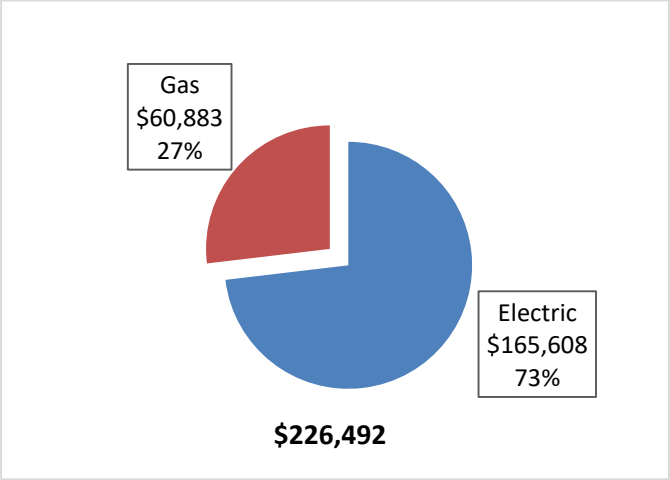
2.7 Water-Using Systems

Facility has several locker rooms with a total of 68 showerheads with flow rates of 3.8 gallons per minute (gpm).

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 14 - Utility Summary

Utility Summary for Montclair High School		
Fuel	**Usage**	**Cost**
Electricity	1,150,579 kWh	$165,608
Natural Gas	74,117 Therms	$60,883
Total		**$226,492**

The current annual energy cost for this facility is $226,492 as shown in the chart below.

Figure 15 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.144/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below.

Figure 16 - Electric Usage & Demand

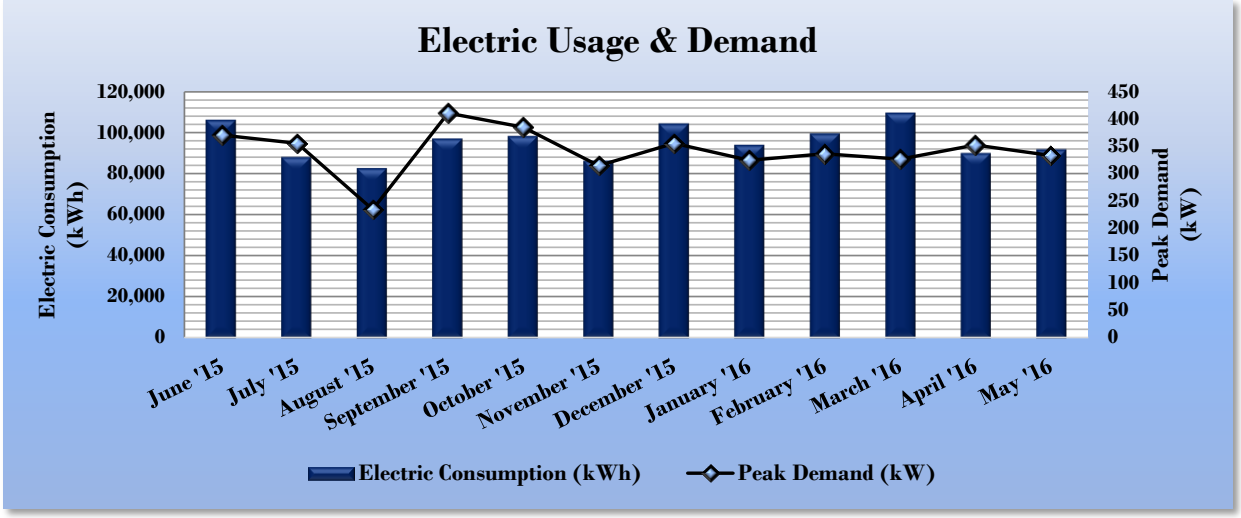


Figure 17 - Electric Usage & Demand

Electric Billing Data for Montclair High School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Total Electric Cost	TRC Estimated Usage?
6/16/15	32	106,128	371	$18,170	No
7/20/15	34	87,980	356	$15,676	No
8/17/15	28	82,671	234	$13,396	No
9/15/15	29	96,977	411	$17,107	No
10/14/15	29	98,211	385	$13,592	No
11/12/15	29	86,293	315	$11,847	No
12/15/15	33	104,378	356	$13,818	No
1/15/16	31	93,956	324	$12,039	No
2/16/16	32	99,546	337	$12,522	No
3/16/16	29	109,550	327	$13,660	No
4/14/16	29	90,007	353	$11,603	No
5/13/16	29	91,730	333	$11,725	No
Totals	**364**	**1,147,427**	**411.1**	**$165,155**	0
Annual	**365**	**1,150,579**	**411.1**	**$165,608**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.821/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below.

Figure 18 - Natural Gas Usage

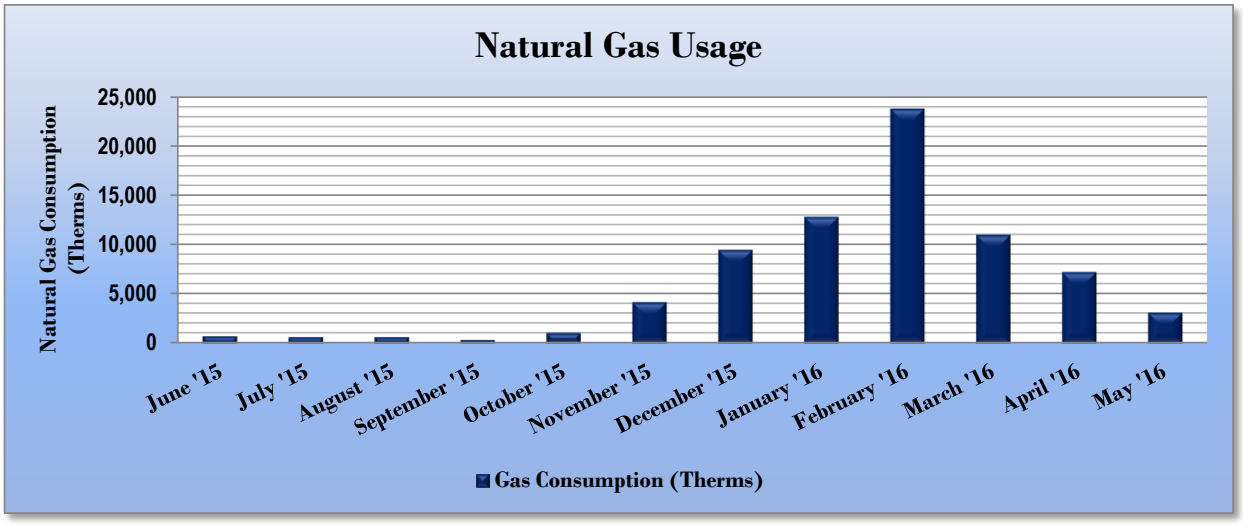

Figure 19 - Natural Gas Usage

Gas Billing Data for Montclair High School			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
6/16/15	32	694	$542
7/20/15	34	621	$495
8/17/15	28	608	$513
9/15/15	29	337	$1,292
10/14/15	29	1,048	$501
11/12/15	29	4,172	$5,080
12/15/15	33	9,448	$8,656
1/15/16	31	12,794	$10,342
2/16/16	32	23,718	$12,882
3/16/16	29	10,986	$15,079
4/15/16	30	7,216	$4,147
5/17/16	32	3,084	$1,855
Totals	**368**	**74,726**	**$61,384**
Annual	**365**	**74,117**	**$60,883**

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 20 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Montclair High School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	76.5	141.4
Site Energy Use Intensity (kBtu/ft^2)	43.1	58.2

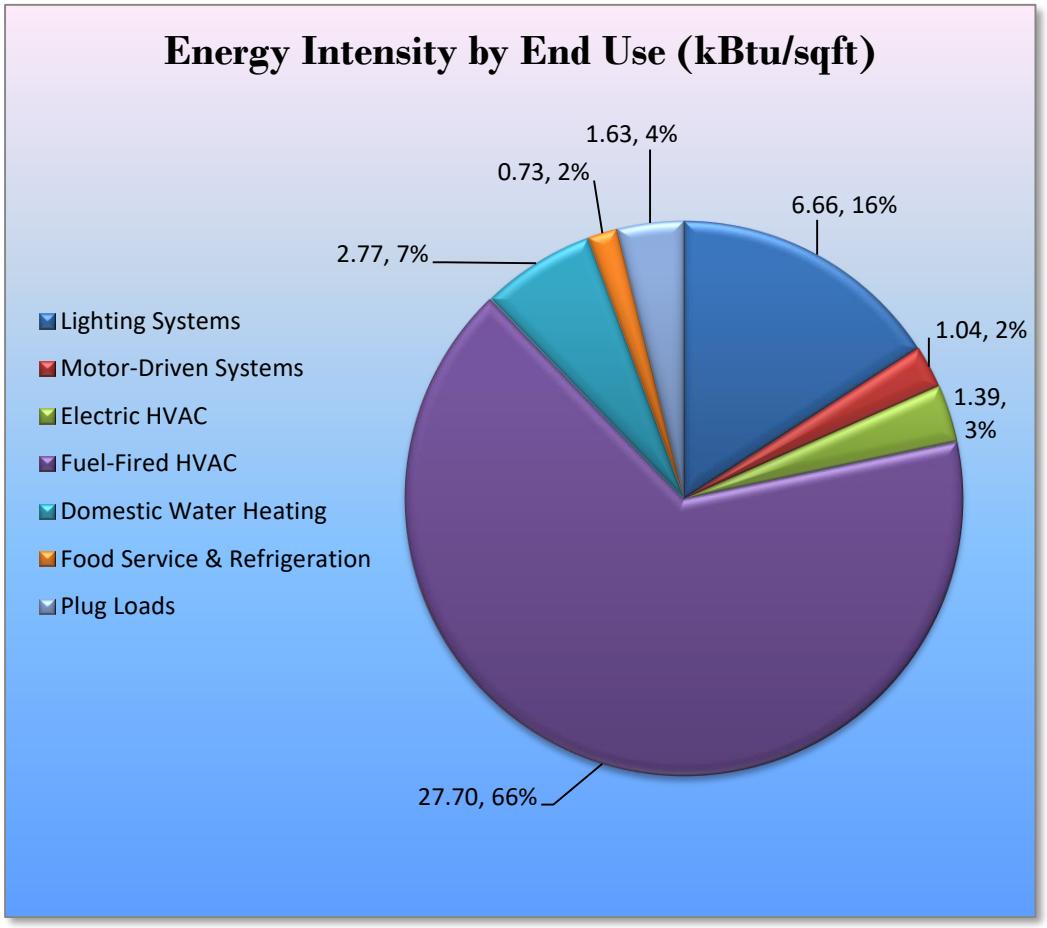
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 21 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Montclair High School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	61.1	141.4
Site Energy Use Intensity (kBtu/ft^2)	37.9	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. This facility has a current score of 93.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 22 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Montclair High School regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 23 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**297,995**	**62.4**	**0.0**	**$42,891.77**	**$206,332.89**	**$33,190.00**	**$173,142.89**	**4.0**	**300,078**
ECM 1	Install LED Fixtures	67,721	10.7	0.0	$9,747.39	$60,143.64	$8,360.00	$51,783.64	5.3	68,194
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,168	0.3	0.0	$168.04	$989.00	$50.00	$939.00	5.6	1,176

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 24 below.

Figure 24 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**297,995**	**62.4**	**0.0**	**$42,891.77**	**$206,332.89**	**$33,190.00**	**$173,142.89**	**4.0**	**300,078**
ECM 1	Install LED Fixtures	67,721	10.7	0.0	$9,747.39	$60,143.64	$8,360.00	$51,783.64	5.3	68,194
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,168	0.3	0.0	$168.04	$989.00	$50.00	$939.00	5.6	1,176
ECM 3	Retrofit Fixtures with LED Lamps	222,256	51.0	0.0	$31,990.33	$141,543.38	$24,780.00	$116,763.38	3.6	223,810
ECM 4	Install LED Exit Signs	6,850	0.4	0.0	$986.00	$3,656.87	$0.00	$3,656.87	3.7	6,898

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	19,265	4.4	0.0	$2,772.90	$45,969.38	$4,800.00	$41,169.38	14.8	19,400
Exterior	48,456	6.3	0.0	$6,974.49	$14,174.26	$3,560.00	$10,614.26	1.5	48,795

Measure Description

We recommend replacing existing fixtures containing HID lamps at this site, including metal halide and high-pressure sodium, with new high performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a HID lamp.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,168	0.3	0.0	$168.04	$989.00	$50.00	$939.00	5.6	1,176
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend retrofitting existing T12 fluorescent fixtures by removing fluorescent tubes and ballasts and replacing them with LEDs and LED drivers (if necessary), which are designed to be used retrofitted fluorescent fixtures. The measure uses the existing fixture housing but replaces the rest of the components with more efficient lighting technology. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	214,714	50.0	0.0	$30,904.73	$140,935.50	$24,620.00	$116,315.50	3.8	216,215
Exterior	7,542	1.0	0.0	$1,085.61	$607.88	$160.00	$447.88	0.4	7,595

Measure Description

We recommend retrofitting existing incandescent and fluorescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

ECM 4: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	6,850	0.4	0.0	$986.00	$3,656.87	$0.00	$3,656.87	3.7	6,898
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend replacing all incandescent or compact fluorescent exit signs with LED exit signs. LED exit signs require virtually no maintenance and have a life expectancy of at least 20 years. This measure saves energy by installing LED fixtures, which use less power than other technologies with an equivalent lighting output.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 25 below.

Figure 25 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**45,728**	**10.4**	**0.0**	**$6,581.77**	**$59,796.00**	**$7,470.00**	**$52,326.00**	**8.0**	**46,047**
ECM 5	Install Occupancy Sensor Lighting Controls	45,728	10.4	0.0	$6,581.77	$59,796.00	$7,470.00	$52,326.00	8.0	46,047

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 5: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
45,728	10.4	0.0	$6,581.77	$59,796.00	$7,470.00	$52,326.00	8.0	46,047

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in restrooms, storage rooms, classrooms, offices areas, etc. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

4.1.3 Variable Frequency Drive Measures

Our recommendations for variable frequency drive (VFD) measures are summarized in Figure 26 below.

Figure 26 – Summary of Variable Frequency Drive ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Variable Frequency Drive (VFD) Measures		**14,929**	**1.9**	**0.0**	**$2,148.84**	**$9,827.55**	**$0.00**	**$9,827.55**	**4.6**	**15,034**
ECM 6	Install VFDs on Hot Water Pumps	14,929	1.9	0.0	$2,148.84	$9,827.55	$0.00	$9,827.55	4.6	15,034

ECM 6: Install VFDs on Hot Water Pumps

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
14,929	1.9	0.0	$2,148.84	$9,827.55	$0.00	$9,827.55	4.6	15,034

Measure Description

We recommend installing a variable frequency drives (VFD) to control hot water pumps. This measure requires that a majority of the hot water coils be served by 2-way valves and that a differential pressure sensor is installed in the hot water loop. As the hot water valves close, the differential pressure increases. The VFD modulates pump speed to maintain a differential pressure setpoint. Energy savings results from reducing pump motor speed (and power) as hot water valves close. The magnitude of energy savings is based on the estimated amount of time that the system will operate at reduced load.

4.1.4 Domestic Hot Water Heating System Upgrades

Our recommendations for domestic water heating system improvements are summarized in Figure 27 below.

Figure 27 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**132.8**	**$1,090.55**	**$6,072.40**	**$0.00**	**$6,072.40**	**5.6**	**15,544**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	132.8	$1,090.55	$6,072.40	$0.00	$6,072.40	5.6	15,544

ECM 7: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	132.8	$1,090.55	$6,072.40	$0.00	$6,072.40	5.6	15,544

Measure Description

We recommend installing low-flow domestic hot water devices to reduce overall hot water demand. Energy demand from domestic hot water heating systems can be reduced by reducing water usage in general. Low-flow showerheads can reduce hot water usage, relative to standard showerheads, which saves energy.

Low-flow devices reduce the overall water flow from the fixture, while still adequate pressure for showers. This reduces the amount of water used per day resulting in energy and water savings.

4.1.5 Plug Load Equipment Control - Vending Machines

Our recommendations for plug load equipment control measures are summarized in Figure 28 below.

Figure 28 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**6,669**	**0.0**	**0.0**	**$959.90**	**$1,610.00**	**$0.00**	**$1,610.00**	**1.7**	**6,716**
ECM 8	Vending Machine Control	6,669	0.0	0.0	$959.90	$1,610.00	$0.00	$1,610.00	1.7	6,716

ECM 8: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
6,669	0.0	0.0	$959.90	$1,610.00	$0.00	$1,610.00	1.7	6,716

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor controls to reduce the energy use. These controls power down vending machines when the vending machine area has been vacant for some time, then power up at regular intervals, as needed, to turn machine lights on or keep the product cool. Energy savings are a dependent on vending machine and activity level in the area surrounding the machines.

4.2 ECM Evaluated but Not Recommended

The measure below have been evaluated by the auditor but is not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 29 – Summary of Measure Evaluated, but Not Recommended

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**812.9**	**$6,677.78**	**$186,907.92**	**$20,088.00**	**$166,819.92**	**25.0**	**95,184**
Install High Efficiency Hot Water Boilers	0	0.0	812.9	$6,677.78	$186,907.92	$20,088.00	$166,819.92	25.0	95,184
TOTALS	**0**	**0.0**	**812.9**	**$6,677.78**	**$186,907.92**	**$20,088.00**	**$166,819.92**	**25.0**	**95,184**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Hot Water Boilers

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	812.9	$6,677.78	$186,907.92	$20,088.00	$166,819.92	25.0	95,184

Measure Description

We generally evaluate replacing older inefficient hot water boilers with high efficiency hot water boilers. Significant improvements have been made in combustion technology resulting in increased overall boiler efficiency. Energy savings results from improved combustion efficiency and reduced standby losses at low loads.

The most notable efficiency improvement is condensing hydronic boilers that can achieve over 90% efficiency under the proper conditions. Condensing hydronic boilers typically operate at efficiencies between 85% and 87% (comparable to other high efficiency boilers) when the return water temperature is above 130°F. The boiler efficiency increases as the return water temperature drops below 130°F.

Reasons for not Recommending

This measure has a long payback, approximately equal to the rated useful life of the replacement equipment. The measure is not recommended for implementation on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

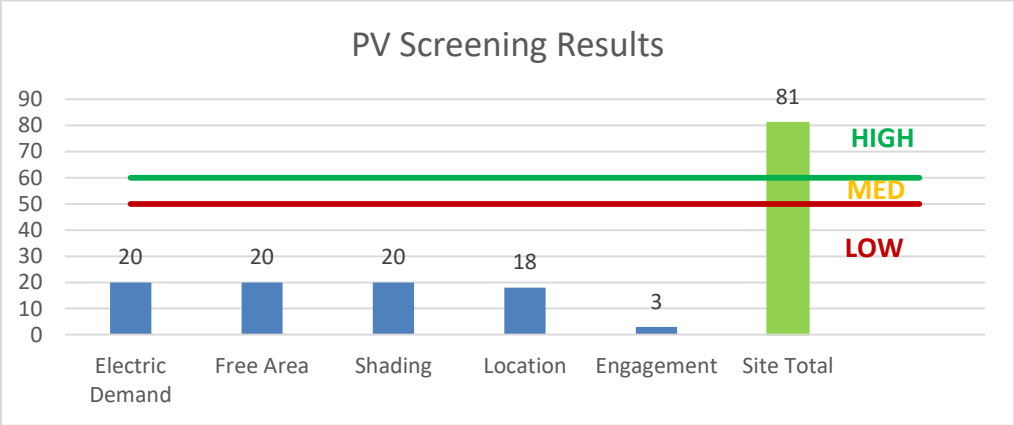
Refer to Section 4.1.4 for any low-flow ECM recommendations.

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the high potential for PV at the site. A PV array located on the roof of the building may be feasible. If Montclair High School is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Figure 30 - Photovoltaic Screening

Potential	High	
System Potential	342	kW DC STC
Electric Generation	407,448	kWh/yr
Displaced Cost	$58,650	/yr
Installed Cost	$889,200	

Solar projects must register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

A low or infrequent thermal load is the most significant factor contributing to the potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion this building is not is a good candidate for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 31 for a list of the eligible programs identified for each recommended ECM.

Figure 31 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings
ECM 1	Install LED Fixtures	X			X
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	X			X
ECM 3	Retrofit Fixtures with LED Lamps	X			X
ECM 4	Install LED Exit Signs				X
ECM 5	Install Occupancy Sensor Lighting Controls	X			X
ECM 6	Install VFDs on Hot Water Pumps		X		X
ECM 7	Install Low-Flow Domestic Hot Water Devices	X			X
ECM 8	Vending Machine Control				X

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Pay for Performance - Existing Buildings

Overview

The Pay for Performance – Existing Buildings (P4P EB) program is designed for larger customers with a peak demand over 200 kW in any of the preceding 12 months. Under this program the minimum installed scope of work must include at least two unique measures resulting in at least 15% energy savings, where lighting cannot make up the majority of the savings. P4P is a generally a good option for medium to large sized facilities looking to implement as many measures as possible under a single project in order to achieve deep energy savings. This program has an added benefit of evaluating a broad spectrum of measures that may not otherwise qualify under other programs. Many facilities pursuing an Energy Savings Improvement Program (ESIP) loan also utilize the P4P program.

Incentives

Incentives are calculated based on estimated and achieved energy savings ranging from $0.18-$0.22/kWh and $1.80-$2.50/therm, capped at the lesser of 50% total project cost, or $1 million per electric account and $1 million per natural gas account, per fiscal year, not to exceed $2 million per project. An incentive of $0.15/square foot is also available to offset the cost of developing the Energy Reduction Plan (see below) contingent on the project moving forward with measure installation.

How to Participate

To participate in the P4B EB program you will need to contact one of the pre-approved consultants and contractors ("Partners"). Under direct contract to you, the Partner will help further evaluate the measures identified in this report through development of the Energy Reduction Plan (ERP), assist you in implementing selected measures, and verify actual savings one year after the installation. At each of these three milestones your Partner will also facilitate securing program incentives.

Approval of the final scope of work is required by the program prior to installation completion. Although installation can be accomplished by a contractor of your choice (some P4P Partners are also contractors) or by internal personnel, the Partner must remain involved to ensure compliance with the program guidelines and requirements.

Detailed program descriptions, instructions for applying, applications and list of Partners can be found at: www.njcleanenergy.com/P4P.

8.3 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

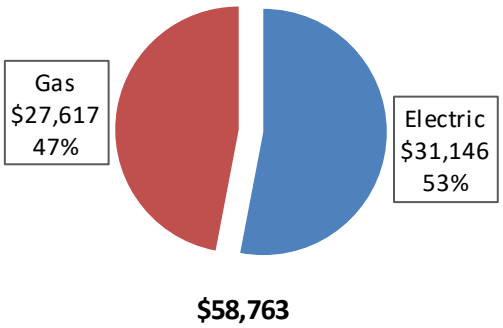
The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Nishuane School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey School Districts in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

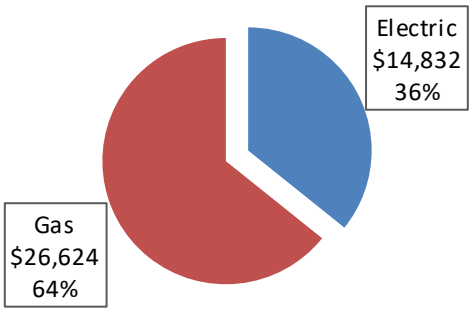
The Nishuane School is a three-story building totaling 87,440 square feet constructed in 1908. The building has a flat roof and exterior walls are finished with brick masonry. The windows throughout the facility are double pane. Interior lighting consists mainly of T8 linear fluorescent fixtures and lighting control is provided by manual wall switches. Heating is provided by two non-condensing gas fired steam boilers and cooling is provided by window air conditioning units.



A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures



TRC evaluated nine measures. Eight measures were recommended for implementation which together represent an opportunity for the Nishuane School to reduce annual energy costs by roughly $13,415 and annual greenhouse gas emissions by 105,904 lbs CO_2e. The measures would pay for themselves in roughly 7.0 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce the Nishuane School's annual energy use by 10.7%.

Figure 1 – Previous 12 Month Utility Costs

$58,763

Figure 2 – Potential Post-Implementation Costs

$41,455

A detailed description of the Nishuane School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4. Measure without an "ECM #" in the table below has been evaluated, but are not recommended for implementation.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Natural Gas Savings (MMBtu)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing old standard efficiency motors with motors of the current efficiency standard (EISA 2007). Motors will be replaced with the same size motors. This measure saves energy by reducing the power used by the motors due to improved electrical efficiency.

Gas Heating (HVAC/Process) measures generally involve replacing old inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide heating equivalent to older systems, but use less energy. These measures save energy by reducing the fuel used by the heating due to improved combustion and heat transfer efficiency.

Domestic Water Heating upgrade measures generally involve replacing old inefficient domestic water heating systems with modern energy efficient systems. New domestic water heating systems can provide equivalent or greater capacity as older systems, but use less energy. These measures save energy by reducing the fuel used by the domestic water heating systems due to improved efficiency or the removal of standby losses.

Plug Load Equipment control measures generally involve installing automation that limits the power use or operation of equipment plugged into an electrical receptacle based on occupancy.

Energy Efficient Practices

TRC also identified 10 low cost (or no-cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at the Nishuane School include:

- Reduce Air Leakage
- Close Doors and Windows
- Perform Proper Lighting Maintenance
- Develop a Lighting Maintenance Schedule
- Ensure Lighting Controls Are Operating Properly
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for the Nishuane School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	77	kW DC STC
Electric Generation	91,736	kWh/yr
Displaced Cost	$7,980	/yr
Installed Cost	$200,200	

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

This facility also qualifies for the Direct Install program which, through an authorized network of participating contractors, can assist with the implementation of a group of measures versus installing individual measures or phasing implementation. This program is designed to be turnkey and will provide an incentive up to 70% of the cost of the project identified by the designated contractor.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.4 for additional information on the ESIP Program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.1 Project Contacts

2.2 General Site Information

On November 08, 2016, TRC performed an energy audit at the Nishuane School located in Montclair, New Jersey. TRC's Auditor met with Kimberly Raison to review the facility operations and focus the investigation on specific energy-using systems.

Image 1 – Auditorium

The 87,440 square feet school building is a three-story facility comprised of classrooms, gymnasium, administration offices, nurse room, auditorium, technology room, dance rooms, kitchen, mechanical room, and storage areas. The original building was constructed in 1908 and expanded to accommodate additional classrooms and other spaces in 1917, 1923, and 2002.

2.3 Building Occupancy

The school operates on a 10-month schedule and is open Monday through Friday. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 395 students and staff.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Nishuane School	Weekday	8:00 AM - 3:30 PM
Nishuane School	Weekend	Closed

2.4 Building Envelope

The building has cast-in-place concrete perimeter wall footings with concrete foundation walls and a flat roof covered with a black synthetic rubber: EPDM roofing (ethylene propylene diene monomer). Exterior walls are finished with brick masonry. The windows throughout the facility are double pane glass with aluminum frames and are in acceptable condition with some units showing signs of outside air infiltration. Exterior doors are constructed of metal. Overall, the building envelope appears to be in acceptable condition.

Image 2 – Building Envelope

2.5 On-site Generation

The Nishuane School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Typical lighting throughout the school building is provided by recessed fluorescent fixtures with one or two 32-Watt T8 lamps and electronic ballasts. The auditorium is illuminated with 60-Watt screw-in incandescent lamps while the gymnasium is lit with 400-Watt metal halide lamps. Some of the storage rooms and closets are illuminated with a mixture of incandescent lamps and compact fluorescent lamps. Exit signs throughout the facility are incandescent. Lighting control is provided mainly by manual wall switches. The facility has minimal exterior lighting which consists of 150-Watt metal halide outdoor wall-mounted fixtures and 250-Watt metal halide parking lot fixtures. They are controlled with photocells.

Steam Heating System

The steam system consists of two H. B. Smith 3,959 MBh output steam boilers. The boilers are 30 years old and have an estimated combustion efficiency of 75%. They have passed their useful service life. The boilers operate in lead/lag operation with only one boiler operating at a time. Each boiler has 0.8 hp forced draft fan with discharge dampers to control the volume of combustion air. There are three constant speed 5 hp feed water pumps. The water level in the boilers is controlled by a valve. Steam is supplied to the radiators for heating at 15 psig. Space temperatures are controlled by local thermostats. The school should consider re-evaluating the building heating load and installing modular steam boilers when these boilers are replaced.

Image 3 – Steam Heating System (Boilers)

Air Conditioning (DX)

There are 26 window units and one split air conditioner (AC) are used to cool the building. Window units range in size from 0.5 to 1.25 tons and average four years of age. The unit serving room B11 is significantly less efficient than others and appears to be in poor condition. The 1.5-ton Mitsubishi split AC system is five years old and provides cooling to the server room. There is one air handler unit located in the fan room that provides constant fresh air to the hallways using a single constant speed 5 hp supply fan.

Domestic Hot Water

Domestic hot water for the school is provided by one Universal gas fired non-condensing hot water heater with an input rating of 156 MBh and a nominal efficiency of 80%. The water heater is seven years old and has 82-gallon storage tank. The water heater is in good condition.

Image 4 – Domestic Hot Water

Food Service & Refrigeration

The school houses a small non-commercial kitchen for light cooking. The kitchen appliances include gas cooking range, gas warmers, a stand-up refrigerator and freezer. The kitchen is well maintained.

Plug load & Vending Machines

There are approximately 68 computer work stations throughout the facility and they are mostly desktop units with LCD monitors. There is no centralized PC power management software installed.

There is one server closest in the facility that has cooling provided by a split AC. The facility has one refrigerated beverage vending machine located in the teacher room.

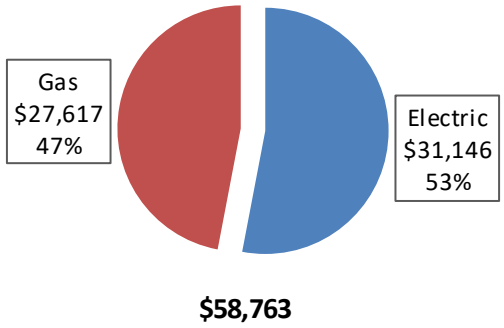
2.7 Water-Using Systems

There are several restrooms at this facility. A sampling of restrooms found that all the faucets are rated for 2.2 gallons per minute (gpm) or higher, the toilets are rated at 2.5 gallons per flush (gpf) and the urinals are rated at 2 gpf. There are no restrooms with showers.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are many factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 7 - Utility Summary

Utility Summary for Nishuane School		
Fuel	**Usage**	**Cost**
Electricity	197,890 kWh	$31,146
Natural Gas	33,552 Therms	$27,617
Total		**$58,763**

The current utility cost for this site is $58,763 as shown in the chart below.

Figure 8 - Energy Cost Breakdown

$58,763

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.136/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects lower occupancy in the summer months and confirms the school's 10-month operation.

Figure 9 - Electric Usage & Demand

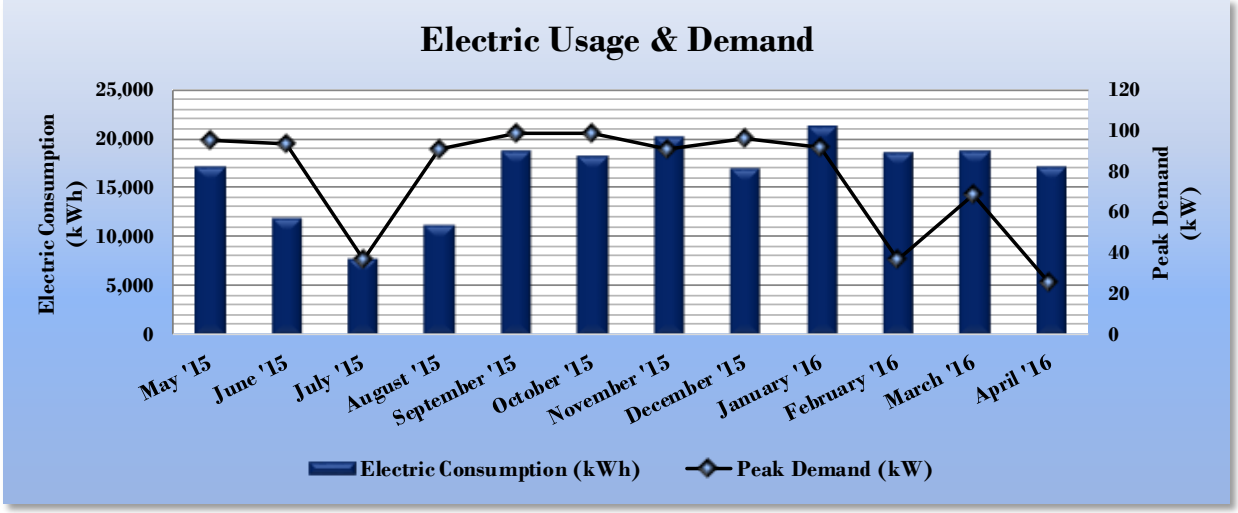


Figure 10 - Electric Usage & Demand

Electric Billing Data for Nishuane School						
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost	TRC Estimated Usage?
6/12/15	30	17,220	95	$413	$3,513	No
7/14/15	31	11,910	93	$405	$2,768	No
8/13/15	30	7,710	37	$160	$1,486	No
9/14/15	30	11,130	91	$432	$2,697	No
10/14/15	31	18,720	99	$431	$2,755	No
11/15/15	30	18,210	99	$431	$2,681	No
12/15/15	30	20,260	91	$398	$2,884	No
1/14/16	31	17,040	96	$418	$2,387	No
2/13/16	31	21,180	92	$402	$2,804	No
3/15/16	31	18,540	36	$159	$2,278	No
4/12/16	29	18,840	69	$414	$2,567	Yes
5/14/16	31	17,130	25	$111	$2,327	Yes
Totals	**365**	**197,890**	**98.7**	**$4,172**	**$31,146**	2
Annual	**365**	**197,890**	**98.7**	**$4,172**	**$31,146**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.823/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 11 - Natural Gas Usage

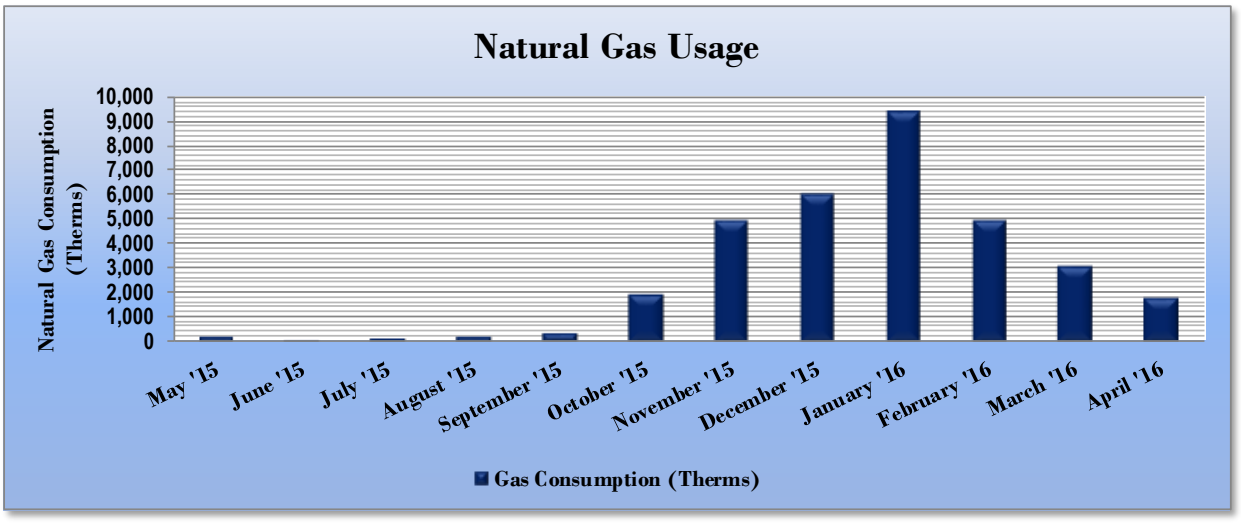

Figure 12 - Natural Gas Usage

Gas Billing Data for Nishuane School				
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost	TRC Estimated Usage?
6/12/15	30	218	$103	Yes
7/14/15	31	128	$104	Yes
8/13/15	30	190	$101	Yes
9/14/15	30	254	$136	Yes
10/14/15	31	388	$640	No

Annual	**365**	**33,552**	**$27,617**	

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the Energy Use Intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

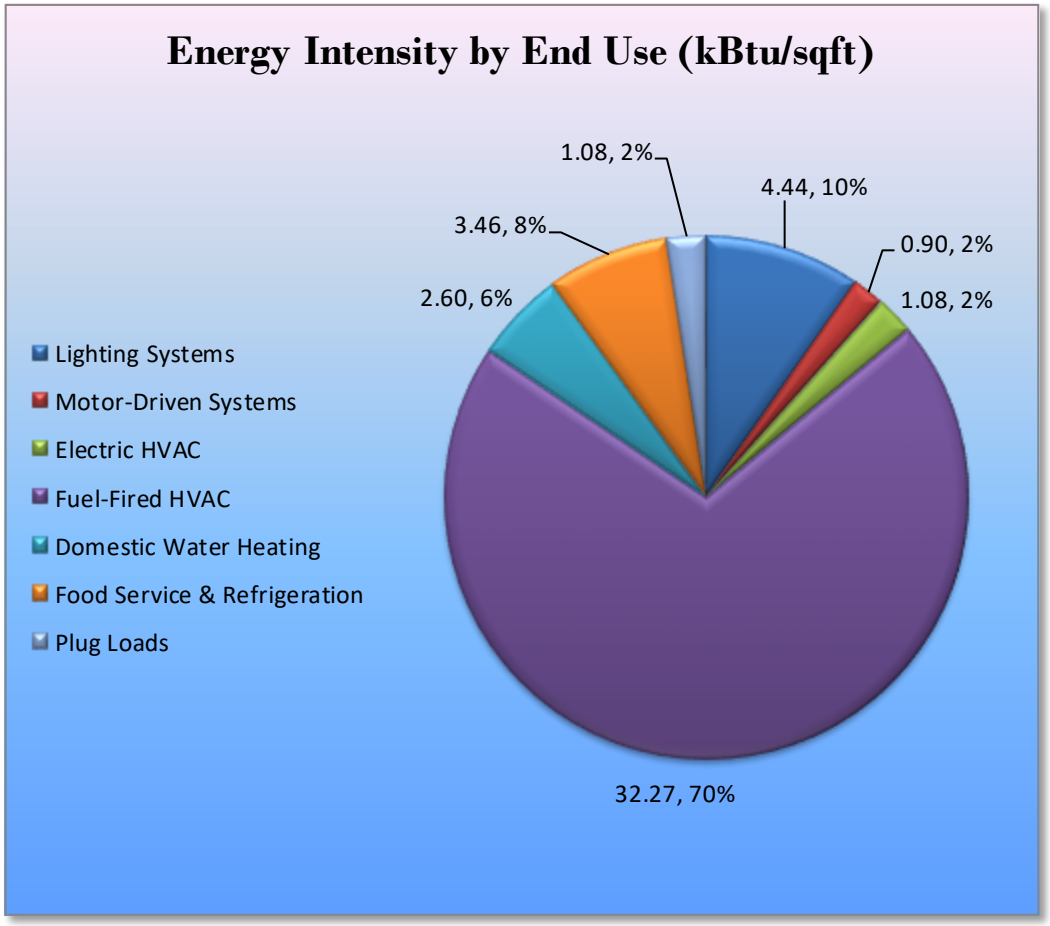
Figure 13 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Nishuane School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	64.5	141.4
Site Energy Use Intensity (kBtu/ft^2)	46.1	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 14 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Nishuane School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	51.9	141.4
Site Energy Use Intensity (kBtu/ft^2)	41.2	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 86.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 15 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the Nishuane School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based on the NJCEP prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 16 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	10,037	4.3	0.0	$1,368.09	$18,901.70	$340.00	$18,561.70	13.57	10,107
Exterior	8,815	1.1	0.0	$1,201.49	$3,906.77	$1,000.00	$2,906.77	2.42	8,876

Measure Description

This measure evaluates replacing existing fixtures containing metal halide lamps and halogen incandescent spot luminaire with new high-performance LED light fixtures. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	53,955	23.8	0.0	$7,354.32	$63,609.40	$10,890.00	$52,719.40	7.17	54,332
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent lamps with LED tube lamps and replacing incandescent and compact fluorescent lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in/plug-in LED lamps can be used as a direct replacement for most other screw-in/plug-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,934	0.1	0.0	$263.64	$2,581.32	$0.00	$2,581.32	9.79	1,948
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing incandescent lighting in exit signs with LEDs. LED sources require virtually no maintenance and LED exit signs have a life expectancy of at least 20 years. Many manufacturers can provide retrofit kits that meet fire and safety code requirements. Retrofit kits are less expensive and simpler to install than replacement signs, however, new fixtures would have a longer useful life and are therefore recommended.

A reduction in maintenance costs will be realized with the proposed retrofit because lamps will not have to be replaced as frequently.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 18 below.

Figure 18 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**12,879**	**5.6**	**0.0**	**$1,755.52**	**$14,110.00**	**$1,535.00**	**$12,575.00**	**7.16**	**12,969**
ECM 4	Install Occupancy Sensor Lighting Controls	10,575	4.6	0.0	$1,441.40	$9,910.00	$1,535.00	$8,375.00	5.81	10,649
ECM 5	Install High/Low Lighitng Controls	2,305	1.0	0.0	$314.12	$4,200.00	$0.00	$4,200.00	13.37	2,321

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
10,575	4.6	0.0	$1,441.40	$9,910.00	$1,535.00	$8,375.00	5.81	10,649

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in restrooms, storage rooms, classrooms and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,305	1.0	0.0	$314.12	$4,200.00	$0.00	$4,200.00	13.37	2,321

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are interior corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high-level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period.

For this application the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.1.3 Motor Upgrades

Our recommendations for motor upgrade measures are summarized in Figure 19 below.

Figure 19 - Summary of Motor Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades		**1,901**	**1.6**	**0.0**	**$259.16**	**$2,933.28**	**$0.00**	**$2,933.28**	**11.32**	**1,915**
ECM 6	Premium Efficiency Motors	1,901	1.6	0.0	$259.16	$2,933.28	$0.00	$2,933.28	11.32	1,915

ECM 6: Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,901	1.6	0.0	$259.16	$2,933.28	$0.00	$2,933.28	11.32	1,915

Measure Description

This measure evaluates replacing the 5 hp air handler supply fan and the three 5 hp boiler feed pump standard efficiency motors with EISA 2007 efficiency motors. The evaluation assumes existing motors will be replaced with the same size motors. It is important that the speed of each new motor match the speed of the motor it replaces as closely as possible. The base case motor efficiencies are obtained from nameplate information. Proposed case premium motor efficiencies are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016)*. Savings are based on the difference between baseline and proposed efficiencies and the annual operating hours.

4.1.4 Domestic Water Heating Upgrade

Our recommendations for domestic water heating measures are summarized in Figure 20 below.

Figure 20 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**120.7**	**$993.49**	**$207.93**	**$0.00**	**$207.93**	**0.21**	**14,133**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	120.7	$993.49	$207.93	$0.00	$207.93	0.21	14,133

ECM 7: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	120.7	$993.49	$207.93	$0.00	$207.93	0.21	14,133

Measure Description

This measure evaluates the savings from installing low flow domestic water devices to reduce overall water flow in general and hot water flow in particular. Low flow faucet aerators reduce the water flow, relative to standard aerators, from the fixture.

All of the low flow devices reduce the overall water flow from the fixture which generally reduces the amount of hot water used resulting in energy and water savings.

4.1.5 Plug Load Equipment Control - Vending Machine

Our recommendations for plug load equipment control measures are summarized in Figure 21 below.

Figure 21 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$219.70**	**$718.80**	**$0.00**	**$718.80**	**3.27**	**1,623**
ECM 8	Vending Machine Control	1,612	0.0	0.0	$219.70	$718.80	$0.00	$718.80	3.27	1,623

ECM 8: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,612	0.0	0.0	$219.70	$718.80	$0.00	$718.80	3.27	1,623

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor based controls to reduce the energy use. These controls power down the machine when the surrounding area is vacant, then monitor the surrounding temperature and power up the cooling system at regular intervals to keep the product cool. Savings are a function of the activity level around the vending machine.

4.2 ECM Evaluated but Not Recommended

The measure below has been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in the measure description section.

Figure 22 – Summary of Evaluated but Not Recommended ECM

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**44.9**	**$369.56**	**$122,929.93**	**$6,614.00**	**$116,315.93**	**314.74**	**5,257**
Install High Efficiency Steam Boilers	0	0.0	44.9	$369.56	$122,929.93	$6,614.00	$116,315.93	314.74	5,257
TOTALS	**0**	**0.0**	**44.9**	**$369.56**	**$122,929.93**	**$6,614.00**	**$116,315.93**	**314.74**	**5,257**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install High Efficiency Steam Boilers

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	44.9	$369.56	$122,929.93	$6,614.00	$116,315.93	314.74	5,257

Measure Description

This measure evaluates replacing old inefficient steam boilers with high efficiency steam boilers. Significant improvements have been made in combustion technology resulting in increases in overall boiler efficiency. Savings result from improved combustion efficiency and reduced standby losses at low loads. The school should consider re-evaluating the building heating load and installing modular steam boilers when these are replaced.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended based on energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost-effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Perform Routine Motor Maintenance

Motors consist of many moving parts whose collective degradation can contribute to a significant loss of motor efficiency. In order to prevent damage to motor components, routine maintenance should be performed. This maintenance consists of cleaning surfaces and ventilation openings on motors to prevent overheating, lubricating moving parts to reduce friction, inspecting belts and pulleys for wear and to ensure they are at proper alignment and tension, and cleaning and lubricating bearings. Consult a licensed technician to assess these and other motor maintenance strategies.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gpf and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

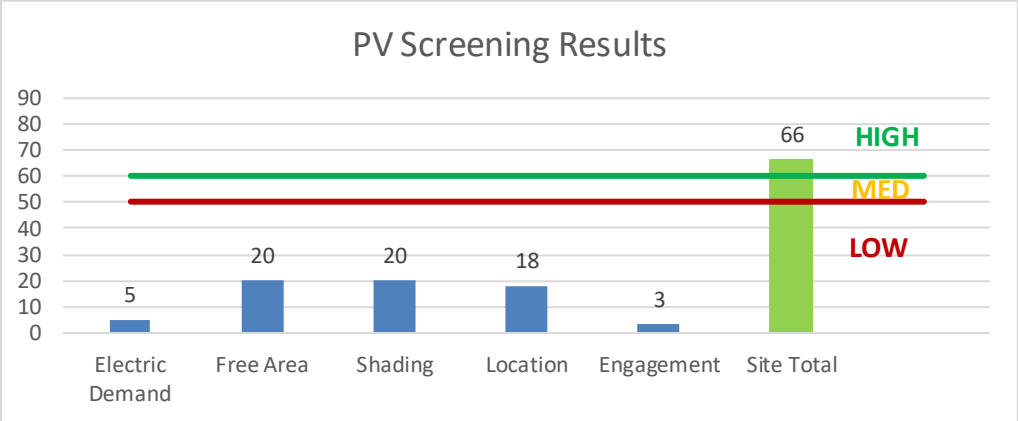
Refer to Section 4.1.4 for any low-flow ECM recommendations.

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear meet these minimum criteria for cost-effective PV installation.

Figure 23 - Photovoltaic Screening

Potential	High	
System Potential	77	kW DC STC
Electric Generation	91,736	kWh/yr
Displaced Cost	$7,980	/yr
Installed Cost	$200,200	

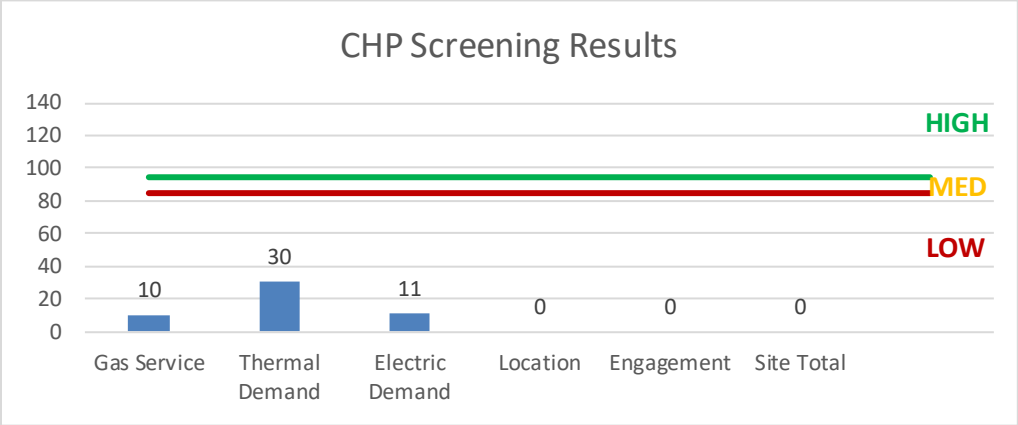
Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 24 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

In our opinion, the facility is not a good candidate for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 25 for a list of the eligible programs identified for each recommended ECM.

Figure 25 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x		x			
ECM 2	Retrofit Fixtures with LED Lamps	x		x			
ECM 3	Install LED Exit Signs			x			
ECM 4	Install Occupancy Sensor Lighting Controls	x		x			
ECM 5	Install High/Low Lighitng Controls			x			
ECM 6	Premium Efficiency Motors			x			
ECM 7	Install Low-Flow Domestic Hot Water Devices			x			
ECM 8	Vending Machine Control			x			

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to mid-sized facilities with a peak electric demand that did not exceed 200 kW in any of the preceding 12 months. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and install those measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor assigned to the county where your facility is located; a complete list is provided on the Direct Install website identified below. The contractor will be paid the program incentive directly which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps mentioned above, and the remaining 30% of the cost is your responsibility to the contractor.

Since Direct Install offers a free assessment, LGEA applicants that do not meet the audit program eligibility requirements, but do meet the Direct Install requirements, may be moved directly into this program.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Northeast School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey school districts in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

The Northeast School is a three-story building totaling 56,549 square feet, originally constructed in 1935. The building has a flat and pitched roof sections. Exterior walls are finished with stone blocks, masonry brick and concrete façade. Interior lighting is provided mainly by 32-Watt linear fluorescent T8 fixtures which are mostly controlled by manual wall switches. Heating is provided by two steam boilers and rooftop furnaces. The cooling system consists of window air conditioners (ACs), split system ACs and rooftop packaged units.

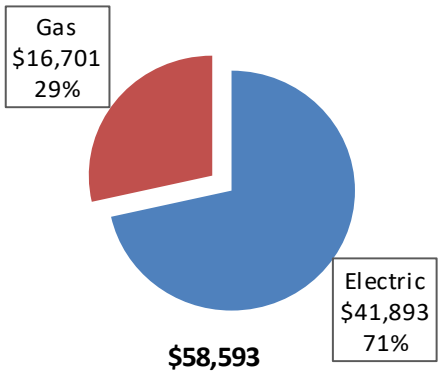
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated 13 measures. Eight measures were recommended for implementation which together represent an opportunity for Northeast School to reduce annual energy costs by roughly $15,213 and annual greenhouse gas emissions by 120,163 lbs CO_2e. The measures would pay for themselves in roughly 4.5 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce Northeast School's annual energy use by 23.9%.

Figure 1 – Previous 12 Month Utility Costs



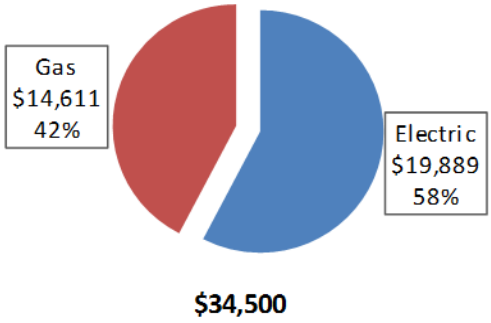


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Northeast School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4. Measures without an "ECM #" in the table below have been evaluated, but are not recommended for implementation.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**81,330**	**23.4**	**0.0**	**$10,792.69**	**$64,690.58**	**$9,450.00**	**$55,240.58**	**5.12**	**81,899**
ECM 1	Install LED Fixtures	Yes	14,553	3.5	0.0	$1,931.16	$14,906.34	$800.00	$14,106.34	7.30	14,654

Gas Heating (HVAC/Process) Replacement			**0**	**0.0**	**117.2**	**$1,062.45**	**$109,206.70**	**$6,832.00**	**$102,374.70**	**96.36**	**13,725**
	Install High Efficiency Steam Boilers	No	0	0.0	102.5	$929.18	$97,243.63	$5,232.00	$92,011.63	99.02	12,003
	Install High Efficiency Furnaces	No	0	0.0	14.7	$133.28	$11,963.07	$1,600.00	$10,363.07	77.76	1,722
HVAC System Improvements			**9,165**	**2.1**	**0.0**	**$1,216.23**	**$2,900.00**	**$1,000.00**	**$1,900.00**	**1.56**	**9,229**
ECM 6	Install Dual Enthalpy Outside Economizer Control	Yes	9,165	2.1	0.0	$1,216.23	$2,900.00	$1,000.00	$1,900.00	1.56	9,229
Domestic Water Heating Upgrade			**0**	**0.0**	**113.3**	**$1,027.01**	**$4,613.91**	**$150.00**	**$4,463.91**	**4.35**	**13,267**
	Install High Efficiency Gas Water Heater	No	0	0.0	15.6	$141.39	$4,449.00	$150.00	$4,299.00	30.40	1,827
ECM 7	Install Low-Flow Domestic Hot Water Devices	Yes	0	0.0	97.7	$885.62	$164.91	$0.00	$164.91	0.19	11,441
Plug Load Equipment Control - Vending Machine			**2,821**	**0.0**	**0.0**	**$374.32**	**$1,437.60**	**$0.00**	**$1,437.60**	**3.84**	**2,840**
ECM 8	Vending Machine Control	Yes	2,821	0.0	0.0	$374.32	$1,437.60	$0.00	$1,437.60	3.84	2,840
TOTALS FOR PROPOSED MEASURES			**107,967**	**29.9**	**97.7**	**$15,213.15**	**$80,527.09**	**$12,035.00**	**$68,492.09**	**4.50**	**120,163**
TOTALS FOR ALL MEASURES			**127,170**	**44.4**	**230.5**	**$18,965.32**	**$297,206.26**	**$24,097.50**	**$273,108.76**	**14.40**	**155,052**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Electric Unitary HVAC measures generally involve replacing old inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide cooling equivalent to older air condition systems, but use less energy. These measures save energy by reducing the power used by the air condition system due to improved electrical efficiency.

Gas Heating (HVAC/Process) measures generally involve replacing old inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide heating equivalent to older systems, but use less energy. These measures save energy by reducing the fuel used by the heating due to improved combustion and heat transfer efficiency.

HVAC System Improvements generally involve the installation of automated controls to reduce heating and cooling demand when conditions allow. These measures could encompass changing temperature setpoints, using outside air for free cooling, or limiting excessive outside air during extreme outdoor air temperatures. These measures save energy by reducing the demand on the systems and the amount of time systems operate.

Domestic Water Heating upgrade measures generally involve replacing old inefficient domestic water heating systems with modern energy efficient systems. New domestic water heating systems can provide equivalent or greater capacity as older systems, but use less energy. These measures save energy by reducing the fuel used by the domestic water heating systems due to improved efficiency or the removal of standby losses.

Plug Load Equipment control measures generally involve installing automation that limits the power use or operation of equipment plugged into an electrical receptacle based on occupancy.

Energy Efficient Practices

TRC also identified nine low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at Northeast School include:

- Reduce Air Leakage
- Close Doors and Windows
- Ensure Lighting Controls Are Operating Properly
- Practice Proper Use of Thermostat Schedules and Temperature Resets
- Clean Evaporator/Condenser Coils on AC Systems
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for the Northeast School. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	90	kW DC STC
Electric Generation	107,224	kWh/yr
Displaced Cost	$9,330	/yr
Installed Cost	$234,000	

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

This facility also qualifies for the Direct Install program which, through an authorized network of participating contractors, can assist with the implementation of a group of measures versus installing individual measures or phasing implementation. This program is designed to be turnkey and will provide an incentive up to 70% of the cost of the project identified by the designated contractor.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.4 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.1 Project Contacts

Figure 5 – Project Contacts

Customer			
Brian Fleischer	Business Administrator	bfleischer@montclair.k12.nj.us	(973) 509-4050
Designated Representative			
Steve Yekel	Custodian		(973) 509-4293
TRC Energy Services			
Moussa Traore	Auditor	mtraore@trcsolutions.com	(732) 855-0033

2.2 General Site Information

On November 09, 2016, TRC performed an energy audit at the Northeast School located in Montclair, New Jersey. TRC's auditor met with Steve Yekel to review the facility operations and focus the investigation on specific energy-using systems.

The 56,549-square foot building is a three-story facility comprised of classrooms, administrative offices, music room, multipurpose room, kitchen, media center, storage and mechanical spaces. The original building was built in 1935, the multipurpose room and additional classrooms were added in 1957. In 2000, a new section was built in the center to accommodate additional classrooms. The building is used primarily for elementary programs.

2.3 Building Occupancy

The school operates on a 10-month schedule and is open Monday through Friday. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 410 students and staff.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Notheast School	Weekday	7:00 AM - 5:30 PM
Notheast School	Weekend	Closed

2.4 Building Envelope

Image 1 – Building Envelope

The three-story building has a reinforced concrete foundation. The original building has a basement. The roofing system consists of a pitched concrete tile roof on the front facing section and perimeter, and a membrane type roof on the back of the building where the HVAC equipment resides. Exterior walls are finished with stone, concrete blocks, and masonry brick. The windows throughout the facility are double paned with aluminum frames which are in good condition and well maintained. Exterior doors are constructed of metal. The door seals were found to be in good condition. Overall, the building's envelope is in good condition.

2.5 On-site Generation

The Northeast School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Interior lighting at the facility is provided mainly by 32-Watt linear fluorescent T8 lamps with electronic ballasts. Most of the fixtures are 2-lamp or 4-lamp, 4-foot long troffers with diffusers. The main portion of the multipurpose room is illuminated with 250-Watt mercury vapor lamps while the stage area has halogen incandescent lamps. The front entrance hallway is lit with a combination of 32-Watt linear fluorescent T8 lamps and 40-Watt candelabra incandescent lamps while the media center is illuminated with compact fluorescent lamps (CFLs) in addition to 32-Watt linear fluorescent T8 lamps. A small number of 60-Watt incandescent screw-in lamps are found in spaces such as storage and closet rooms, Dean's office and some restrooms. Exit signs throughout the facility are primarily provided by incandescent sources. Lighting control is provided mostly by manual wall switches. The facility exterior lighting consists of 150-Watt metal halide and LED wall mounted area fixtures which are controlled with timers.

Steam and Heating Hot Water System

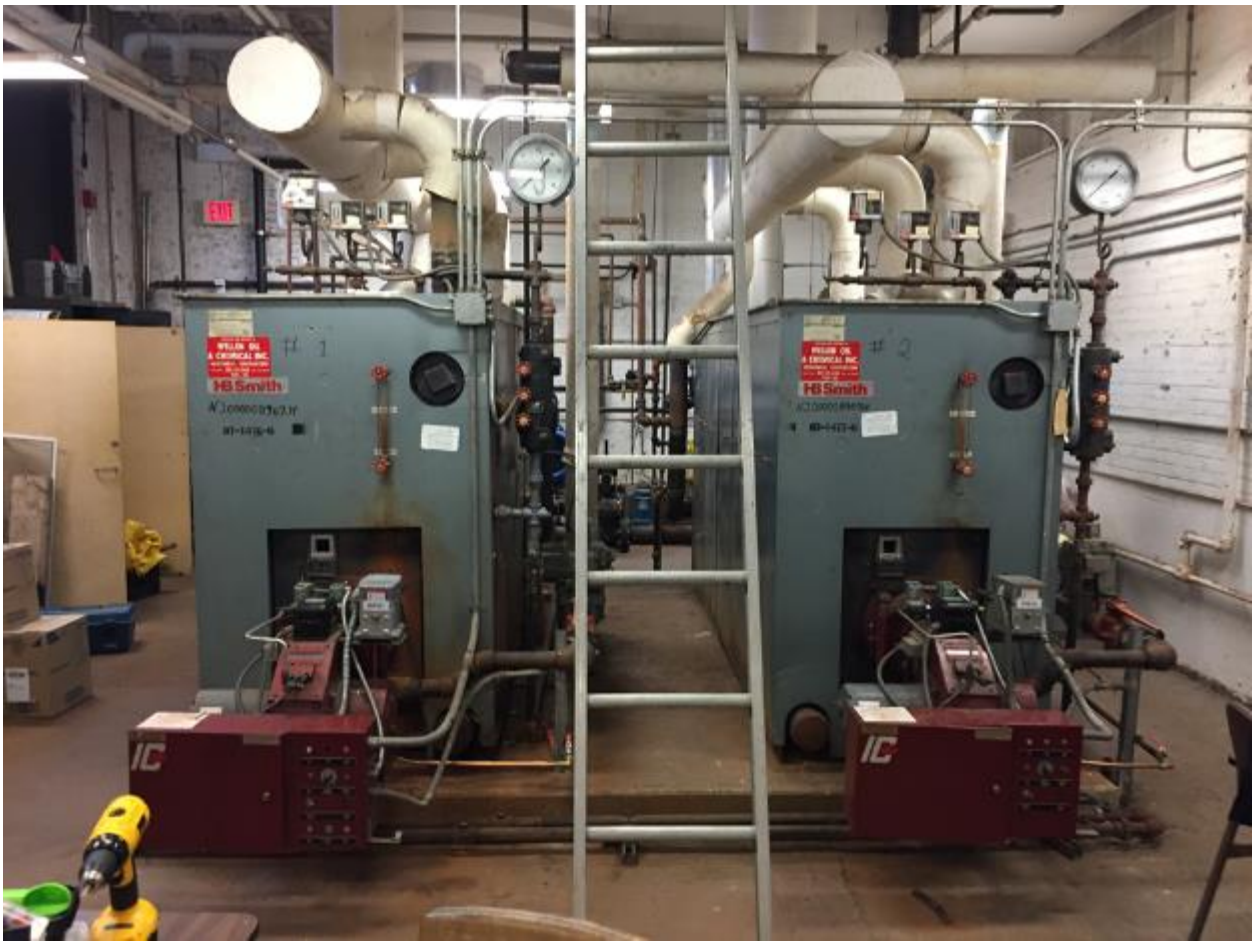

Image 2 – Steam Heating System

The steam system is comprised of two steam boilers and both steam and hot water distribution. Two 2,616 MBh output steam boilers, each with an estimated nominal combustion efficiency of 75%, operate in a lead/lag configuration. The boilers are 30 years old and have passed their useful service life. Each boiler has a 3 hp combustion air fan, a 0.75 hp feed water pump, and a control valve that maintains the boiler water level. Steam is supplied directly to the radiators and heating unit ventilators serving the old wing at 15 psi. Some unit ventilators serving the old section of the building appear in poor condition.

Heating hot water is supplied to unit ventilators located in the newer area through a heat exchanger. Two constant speed 3 hp pumps circulate the heating hot water.

The school should consider re-evaluating the building heating load and installing modular boilers when these are replaced. In addition to the steam system, four rooftop units equipped with gas-fired furnace sections are used to provide supplemental heating to the media center and other spaces. Local thermostats are used to control the temperature in the various zones.

Air Conditioning (DX)

Image 3 – Air Conditioning

Cooling is provided by a combination of window air conditioners (AC), split system ACs, and rooftop packaged units. There are 12 window ACs ranging from 0.8 to 1.5 tons. They are in relatively good condition except the unit serving the main office which appears in poor condition. There are ten Carrier split system ACs which are sized from 2 to 3.5 tons and serve various spaces of the facility. The units utilize a scroll compressor and a direct-expansion (DX) coil. They are all 18 years old, have passed their useful service live and appear in poor condition.

One 12.5-ton Carrier rooftop packaged unit (RTU1) is used to condition the media center. The unit provides constant air volume by utilizing a scroll compressor and a direct-expansion coil. The unit is also equipped with a gas fired furnace section that provides heating as needed. One 2-ton and two 8.5-ton Carrier packaged units (RTU2, RTU7, RTU8), also equipped with gas fired furnace sections, are used to provide cooling and heating to various spaces. The rooftop packaged units are 17 years old and appear in poor condition. Cooling and heating systems used to be controlled by an Automated Logic Corporation control system. The site contact stated that the system was out of service for long before the survey. Air is exhausted from the kitchen and restrooms through roof mounted exhaust fans. The multipurpose room has one exhaust fan located in the fan room.

Domestic Hot Water

Domestic hot water for the facility is provided by two natural gas fired water heaters. A Bradford White non-condensing water heater with an input rating of 76 MBh and a nominal efficiency of 82% has a 75-gallon storage tank and is located in boiler room. This water heater is seven years old and appear in good condition. It serves the old section of the building.

Domestic hot water for the new section consists of one A.O. Smith gas fired non-condensing water heater with an input rating of 75 MBh and an estimated combustion efficiency of 80%. It has a 75-gallon storage tank and is located in the storage room. The heater is 18 years old.

Image 4 – Domestic Hot Water System

Food Service & Refrigeration

The school houses one small kitchen. The kitchen includes gas convection ovens, insulated food holding cabinets, two standup refrigerators and one standup freezer. The kitchen is well maintained.

Plug load & Vending Machines

The building has approximately 48 computers with LCD monitors that are used daily, plus a server, four large photocopiers, and three printers. The computers, monitors, and printers seemed to be all recent models with power management software designed to reduce power when they sit idle for more than a few minutes. The building has two vending machines located in the teacher room.

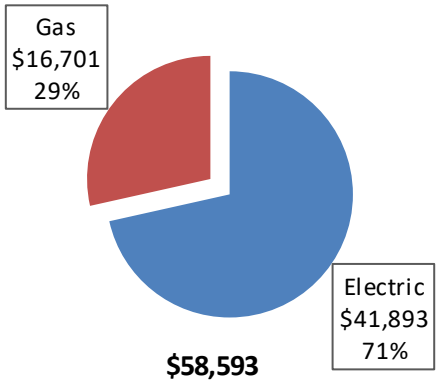
2.7 Water-Using Systems

There are several restrooms at this facility. A sampling of restrooms found that all of the faucets are rated for 2.2 gallons per minute (gpm) or higher, the toilets are rated at 2.5 gallons per flush (gpf) and the urinals are rated at 2 gpf. The kitchen has one faucet that is rated for 3 gpm.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 7 - Utility Summary

Utility Summary for Northeast School		
Fuel	**Usage**	**Cost**
Electricity	274,425 kWh	$41,893
Natural Gas	18,426 Therms	$16,701
Total		**$58,593**

The current utility cost for this site is $58,593 as shown in the chart below.

Figure 8 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.133/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects lower occupancy in the summer months, although the building is cooled.

Figure 9 - Electric Usage & Demand

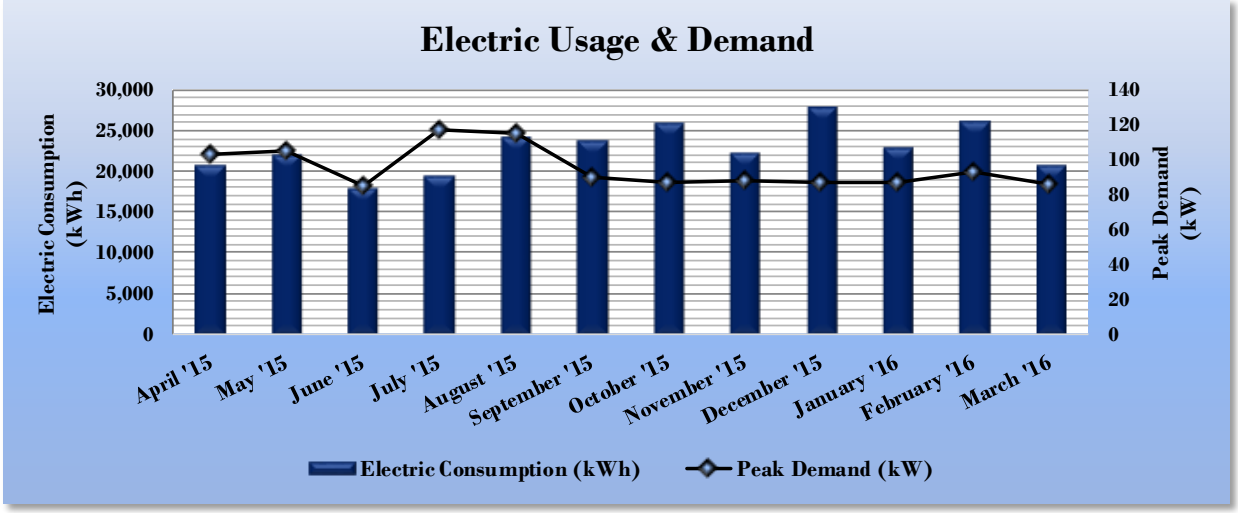


Figure 10 - Electric Usage & Demand

Electric Billing Data for Northeast School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
5/1/15	31	20,850	103	$404	$4,164
6/1/15	30	22,125	105	$850	$4,291
7/1/15	31	18,000	85	$469	$3,441
8/1/15	31	19,500	117	$456	$4,014
9/1/15	30	24,150	116	$368	$3,501
10/1/15	31	23,775	90	$509	$3,330
11/1/15	30	25,875	87	$504	$3,490
12/1/15	31	22,275	88	$393	$2,956
1/1/16	31	27,825	87	$380	$3,534
2/1/16	28	22,950	87	$383	$3,004
3/1/16	31	26,250	93	$380	$3,408
4/1/16	30	20,850	86	$382	$2,760
Totals	**365**	**274,425**	**117**	**$5,476**	**$41,893**
Annual	**365**	**274,425**	**117**	**$5,476**	**$41,893**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.906/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 11 - Natural Gas Usage

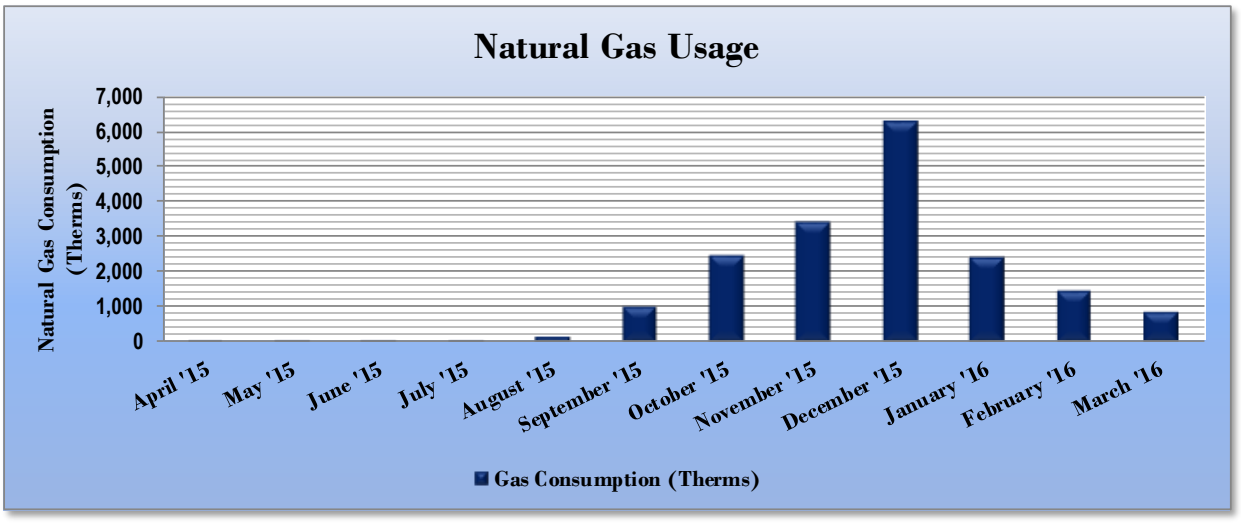

Figure 12 - Natural Gas Usage

Gas Billing Data for Northeast School			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
5/1/15	31	84	$150
6/1/15	30	66	$140
7/1/15	31	54	$133
8/1/15	31	43	$129
9/1/15	30	170	$199
10/1/15	31	1,030	$1,738
11/1/15	30	2,489	$2,624
12/1/15	31	3,442	$3,203
1/1/16	31	6,283	$4,622
2/1/16	28	2,415	$2,277
3/1/16	31	1,472	$903
4/1/16	30	878	$582
Totals	**365**	**18,426**	**$16,701**
Annual	**365**	**18,426**	**$16,701**

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the Energy Use Intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

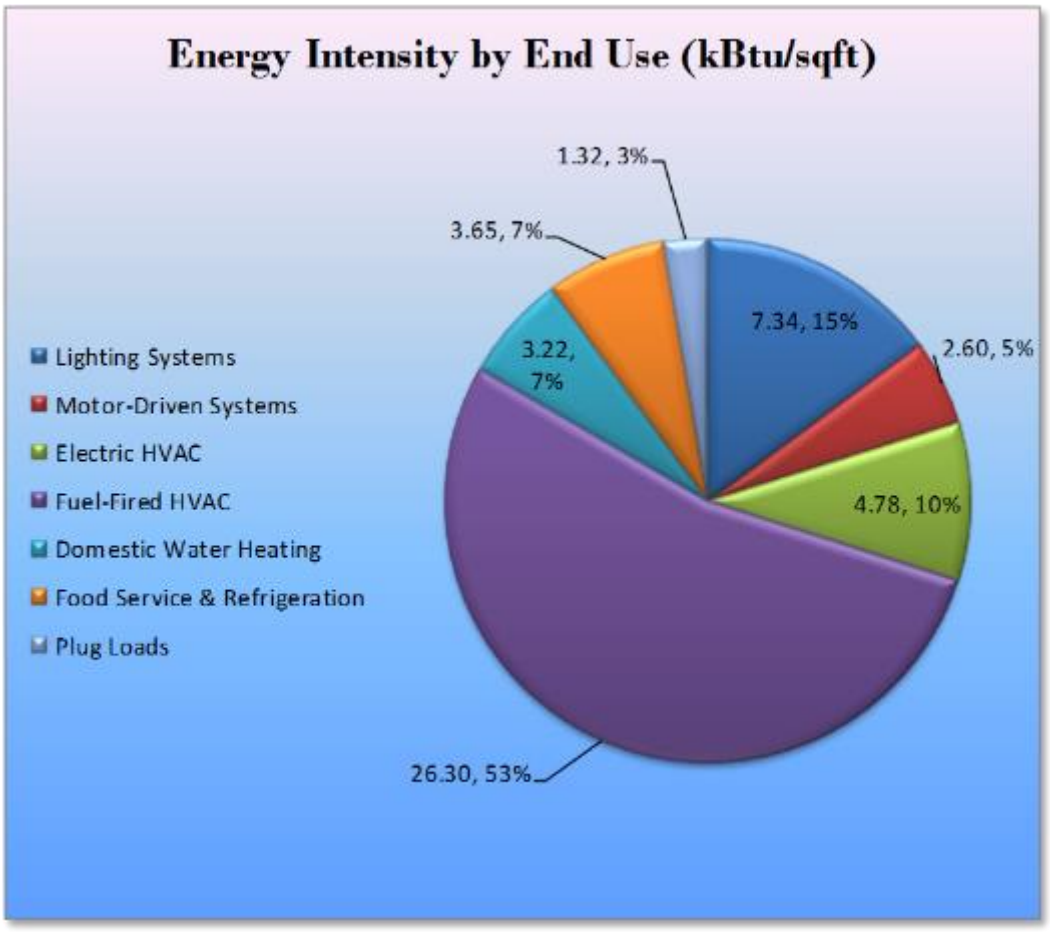
Figure 13 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Northeast School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	86.2	141.4
Site Energy Use Intensity (kBtu/ft^2)	49.1	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 14 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Northeast School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	63.9	141.4
Site Energy Use Intensity (kBtu/ft^2)	40.9	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 76.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 15 - Energy Balance (% and kBtu/SF)

4 Energy Conservation Measures

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the Northeast School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJ prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 16 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**81,330**	**23.4**	**0.0**	**$10,792.69**	**$64,690.58**	**$9,450.00**	**$55,240.58**	**5.12**	**81,899**
ECM 1	Install LED Fixtures	14,553	3.5	0.0	$1,931.16	$14,906.34	$800.00	$14,106.34	7.30	14,654
ECM 2	Retrofit Fixtures with LED Lamps	65,649	19.9	0.0	$8,711.80	$48,278.47	$8,650.00	$39,628.47	4.55	66,108
ECM 3	Install LED Exit Signs	1,128	0.1	0.0	$149.73	$1,505.77	$0.00	$1,505.77	10.06	1,136
Lighting Control Measures		**14,651**	**4.4**	**0.0**	**$1,944.29**	**$11,334.00**	**$1,585.00**	**$9,749.00**	**5.01**	**14,754**
ECM 4	Install Occupancy Sensor Lighting Controls	13,200	3.9	0.0	$1,751.66	$9,734.00	$1,585.00	$8,149.00	4.65	13,292
ECM 5	Install High/Low Lighting Controls	1,452	0.4	0.0	$192.63	$1,600.00	$0.00	$1,600.00	8.31	1,462
HVAC System Improvements		**9,165**	**2.1**	**0.0**	**$1,216.23**	**$2,900.00**	**$1,000.00**	**$1,900.00**	**1.56**	**9,229**
ECM 6	Install Dual Enthalpy Outside Economizer Control	9,165	2.1	0.0	$1,216.23	$2,900.00	$1,000.00	$1,900.00	1.56	9,229
Domestic Water Heating Upgrade		**0**	**0.0**	**97.7**	**$885.62**	**$164.91**	**$0.00**	**$164.91**	**0.19**	**11,441**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	97.7	$885.62	$164.91	$0.00	$164.91	0.19	11,441
Plug Load Equipment Control - Vending Machine		**2,821**	**0.0**	**0.0**	**$374.32**	**$1,437.60**	**$0.00**	**$1,437.60**	**3.84**	**2,840**
ECM 8	Vending Machine Control	2,821	0.0	0.0	$374.32	$1,437.60	$0.00	$1,437.60	3.84	2,840
TOTALS		**107,967**	**29.9**	**97.7**	**$15,213.15**	**$80,527.09**	**$12,035.00**	**$68,492.09**	**4.50**	**120,163**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendation for lighting upgrades are summarized in Figure 17 below.

Figure 17 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**81,330**	**23.4**	**0.0**	**$10,792.69**	**$64,690.58**	**$9,450.00**	**$55,240.58**	**5.12**	**81,899**
ECM 1	Install LED Fixtures	14,553	3.5	0.0	$1,931.16	$14,906.34	$800.00	$14,106.34	7.30	14,654
ECM 2	Retrofit Fixtures with LED Lamps	65,649	19.9	0.0	$8,711.80	$48,278.47	$8,650.00	$39,628.47	4.55	66,108
ECM 3	Install LED Exit Signs	1,128	0.1	0.0	$149.73	$1,505.77	$0.00	$1,505.77	10.06	1,136

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	9,440	2.8	0.0	$1,252.71	$12,171.60	$100.00	$12,071.60	9.64	9,506
Exterior	5,113	0.7	0.0	$678.45	$2,734.74	$700.00	$2,034.74	3.00	5,148

Measure Description

This measure evaluates replacing select interior and exterior fixtures. Consider replacing wall mounted fixtures containing 150-Watt metal halide lamps with new high-performance LED light fixtures on the building exterior. Additionally, consider replacing the mercury vapor fixtures located in the multipurpose room. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled. In many cases, replacement fixtures can be purchased with on-board switching controls.

ECM 2: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	65,649	19.9	0.0	$8,711.80	$48,278.47	$8,650.00	$39,628.47	4.55	66,108
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T8 lamps with LED tube lamps and replacing incandescent and compact fluorescent screw-in/plug-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in/plug-in LED lamps can be used as a direct replacement for most other screw-in/plug-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,128	0.1	0.0	$149.73	$1,505.77	$0.00	$1,505.77	10.06	1,136
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing incandescent lighting in exit signs with LEDs. LED sources require virtually no maintenance and LED exit signs have a life expectancy of at least 20 years. Many manufacturers can provide retrofit kits that meet fire and safety code requirements. Retrofit kits are less expensive and simpler to install than replacement signs, however, new fixtures would have a longer useful life and are therefore recommended.

A reduction in maintenance costs will be realized with the proposed retrofit because lamps will not have to be replaced as frequently.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 18 below.

Figure 18 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**14,651**	**4.4**	**0.0**	**$1,944.29**	**$11,334.00**	**$1,585.00**	**$9,749.00**	**5.01**	**14,754**
ECM 4	Install Occupancy Sensor Lighting Controls	13,200	3.9	0.0	$1,751.66	$9,734.00	$1,585.00	$8,149.00	4.65	13,292
ECM 5	Install High/Low Lighting Controls	1,452	0.4	0.0	$192.63	$1,600.00	$0.00	$1,600.00	8.31	1,462

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
13,200	3.9	0.0	$1,751.66	$9,734.00	$1,585.00	$8,149.00	4.65	13,292

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in many restrooms, storage rooms, classrooms and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

ECM 5: Install High/Low Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,452	0.4	0.0	$192.63	$1,600.00	$0.00	$1,600.00	8.31	1,462

Measure Description

This measure evaluates installing occupancy sensors to provide dual level lighting control for light fixtures in spaces that are infrequently occupied but require continuous or night lighting for safety or security reasons. Typical areas for such lighting control are interior corridors.

The light fixtures operate at default low levels when the area is not occupied to provide minimal lighting to meet security or safety requirements. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. The lighting systems are switched to the high-level setting when an occupant is detected. Fixtures are automatically switched back to low level after an area has been vacant for a preset period.

For this application the occupancy sensors will generally be ceiling or fixture mounted. Sufficient sensor coverage should be provided to turn lights on in an area as an occupant approaches the area.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.1.3 HVAC System Improvements

Our recommendations for HVAC system improvement measures are summarized in Figure 19 below.

Figure 19 - Summary of HVAC System Improvement ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
HVAC System Improvements		**9,165**	**2.1**	**0.0**	**$1,216.23**	**$2,900.00**	**$1,000.00**	**$1,900.00**	**1.56**	**9,229**
ECM 6	Install Dual Enthalpy Outside Economizer Control	9,165	2.1	0.0	$1,216.23	$2,900.00	$1,000.00	$1,900.00	1.56	9,229

ECM 6: Install Dual Enthalpy Outside Economizer Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
9,165	2.1	0.0	$1,216.23	$2,900.00	$1,000.00	$1,900.00	1.56	9,229

Measure Description

Dual enthalpy economizers are used to control a ventilation system's outside air intake in order to reduce a facility's total cooling load. A dual enthalpy economizer monitors the air temperature and humidity of both the outside and return air. The control supplies the lowest energy (temperature and humidity) air to the air handling system. When outside air conditions allow, outside air can be used for cooling in place of the air handling system's compressor. This reduces the demand on the cooling system, lowering its usage hours, saving energy.

Savings result from using outside air instead of mechanical cooling whenever possible.

4.1.4 Domestic Water Heating Upgrade

Our recommendations for domestic water heating measures are summarized in Figure 20 below.

Figure 20 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**97.7**	**$885.62**	**$164.91**	**$0.00**	**$164.91**	**0.19**	**11,441**
ECM 7	Install Low-Flow Domestic Hot Water Devices	0	0.0	97.7	$885.62	$164.91	$0.00	$164.91	0.19	11,441

ECM 7: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	97.7	$885.62	$164.91	$0.00	$164.91	0.19	11,441

Measure Description

This measure evaluates the savings from installing low flow domestic water devices to reduce overall water flow in general and hot water flow in particular. Low flow faucet aerators reduce the water flow, relative to standard aerators, from the fixture.

All of the low flow devices reduce the overall water flow from the fixture which generally reduces the amount of hot water used resulting in energy and water savings.

4.1.5 Plug Load Equipment Control - Vending Machine

Our recommendations for plug load equipment measures are summarized in Figure 21 below.

Figure 21 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**2,821**	**0.0**	**0.0**	**$374.32**	**$1,437.60**	**$0.00**	**$1,437.60**	**3.84**	**2,840**
ECM 8	Vending Machine Control	2,821	0.0	0.0	$374.32	$1,437.60	$0.00	$1,437.60	3.84	2,840

ECM 8: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,821	0.0	0.0	$374.32	$1,437.60	$0.00	$1,437.60	3.84	2,840

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor based controls to reduce the energy use. These controls power down the machine when the surrounding area is vacant, then monitor the surrounding temperature and power up the cooling system at regular intervals to keep the product cool. Savings are a function of the activity level around the vending machine.

4.2 ECMs Evaluated but Not Recommended

The measures below have been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in each measure description section.

Figure 22 – Summary of Evaluated but Not Recommended ECMs

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Variable Frequency Drive (VFD) Measures	**2,021**	**1.0**	**0.0**	**$268.21**	**$6,015.30**	**$0.00**	**$6,015.30**	**22.43**	**2,035**
Install VFDs on Hot Water Pumps	2,021	1.0	0.0	$268.21	$6,015.30	$0.00	$6,015.30	22.43	2,035
Electric Unitary HVAC Measures	**17,182**	**13.5**	**0.0**	**$2,280.11**	**$97,008.17**	**$5,080.50**	**$91,927.67**	**40.32**	**17,302**
Install High Efficiency Electric AC	17,182	13.5	0.0	$2,280.11	$97,008.17	$5,080.50	$91,927.67	40.32	17,302
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**117.2**	**$1,062.45**	**$109,206.70**	**$6,832.00**	**$102,374.70**	**96.36**	**13,725**
Install High Efficiency Steam Boilers	0	0.0	102.5	$929.18	$97,243.63	$5,232.00	$92,011.63	99.02	12,003
Install High Efficiency Furnaces	0	0.0	14.7	$133.28	$11,963.07	$1,600.00	$10,363.07	77.76	1,722
Domestic Water Heating Upgrade	**0**	**0.0**	**15.6**	**$141.39**	**$4,449.00**	**$150.00**	**$4,299.00**	**30.40**	**1,827**
Install High Efficiency Gas Water Heater	0	0.0	15.6	$141.39	$4,449.00	$150.00	$4,299.00	30.40	1,827
TOTALS	**19,203**	**14.6**	**132.8**	**$3,752.17**	**$216,679.18**	**$12,062.50**	**$204,616.68**	**54.53**	**34,889**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Install VFDs on Hot Water Pumps

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
2,021	1.0	0.0	$268.21	$6,015.30	$0.00	$6,015.30	22.43	2,035

Measure Description

This measure evaluates installing a variable frequency drive (VFD) to control the two 3 hp hot water pump. This measure requires that a majority of the hot water coils be served by 2-way valves and that a differential pressure sensor is installed in the hot water loop. As the hot water valves close, the differential pressure increases. The VFD modulates pump speed to maintain a differential pressure setpoint. Energy savings result from reducing pump motor speed (and power) as hot water valves close. The magnitude of energy savings is based on the amount of time at reduced loads.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Electric AC

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
17,182	13.5	0.0	$2,280.11	$97,008.17	$5,080.50	$91,927.67	40.32	17,302

Measure Description

This measure evaluates replacing rooftop packaged and split system air conditioners with high efficiency packaged and split system air conditioners. There have been significant improvements in both compressor and fan motor efficiencies in the past several years. Therefore, electricity savings can be achieved by replacing old units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the old and new unit, the cooling load, and the annual operating hours.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Boilers

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	102.5	$929.18	$97,243.63	$5,232.00	$92,011.63	99.02	12,003

Measure Description

This measure evaluates replacing the two old and inefficient steam boilers with high efficiency boilers. Significant improvements have been made in combustion technology resulting in increases in overall boiler efficiency. Savings result from improved combustion efficiency and reduced standby losses at low loads. The school should consider re-evaluating the building heating load and the entire distribution system and installing modular boilers when these are replaced.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Furnaces

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	14.7	$133.28	$11,963.07	$1,600.00	$10,363.07	77.76	1,722

Measure Description

This measure evaluates replacing existing gas fired standard furnaces section of the rooftop packaged units with condensing furnaces. Improved combustion technology and heat exchanger design optimize the heat recovery from the combustion gases which significantly improves the furnace efficiency. Savings result from improved system efficiency. Condensing furnaces do have acidic condensate that needs to be drained.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone. Typically, a furnace section of a packaged heating-cooling unit is replaced when the entire unit is replaced. When the package units are replaced, ensure that efficient heating sections are included as needed.

Install High Efficiency Gas Water Heater

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	15.6	$141.39	$4,449.00	$150.00	$4,299.00	30.40	1,827

Measure Description

This measure evaluates the savings from replacing the 18 year old tank water heater with a high efficiency tank water heater. Improvements in combustion efficiency and reductions in heat loss have improved the overall efficiency of water heaters. Savings result from less gas used during combustion and less time operating during standby to maintain the water tank temperature.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Reduce Air Leakage

Air leakage, or infiltration, occurs when outside air enters a building uncontrollably through cracks and openings. Properly sealing such cracks and openings can significantly reduce heating and cooling costs, improve building durability, and create a healthier indoor environment. This includes caulking or installing weather stripping around leaky doors and windows allowing for better control of indoor air quality through controlled ventilation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost-effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Practice Proper Use of Thermostat Schedules and Temperature Resets

Ensure thermostats are correctly set back. By employing proper set back temperatures and schedules, facility heating and cooling costs can be reduced dramatically during periods of low or no occupancy. As such, thermostats should be programmed for a setback of 5-10°F during low occupancy hours (reduce heating setpoints and increase cooling setpoints). Cooling load can be reduced further by increasing the facility's occupied setpoint temperature. In general, during the cooling season, thermostats should be set as high as possible without sacrificing occupant comfort.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

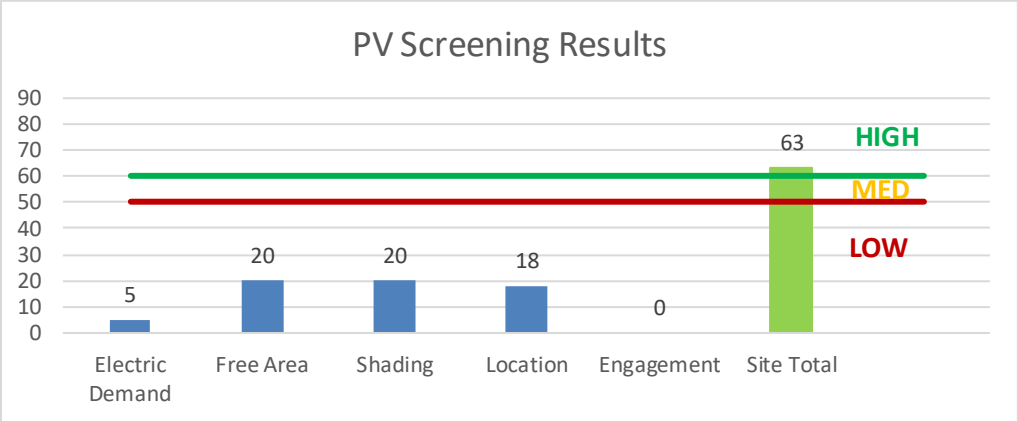
Refer to Section 4.1.4 for any low-flow ECM recommendations.

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before deciding to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear meet these minimum criteria for cost-effective PV installation.

Figure 23 - Photovoltaic Screening

Potential	High	
System Potential	90	kW DC STC
Electric Generation	107,224	kWh/yr
Displaced Cost	$9,330	/yr
Installed Cost	$234,000	

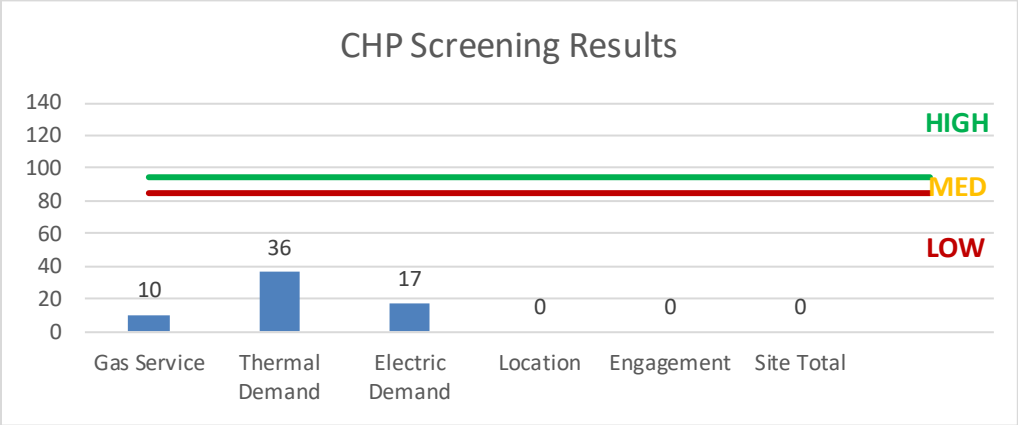
Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 24 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

In our opinion, this facility has a low penitential for DR curtailment.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 25 for a list of the eligible programs identified for each recommended ECM.

Figure 25 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings	Large Energy Users Program	Combined Heat & Power and Fuel Cell
ECM 1	Install LED Fixtures	x		x			
ECM 2	Retrofit Fixtures with LED Lamps	x		x			
ECM 3	Install LED Exit Signs			x			
ECM 4	Install Occupancy Sensor Lighting Controls	x		x			
ECM 5	Install High/Low Lighitng Controls			x			
ECM 6	Install Dual Enthalpy Outside Economizer Control	x		x			
ECM 7	Install Low-Flow Domestic Hot Water Devices			x			
ECM 8	Vending Machine Control			x			

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to mid-sized facilities with a peak electric demand that did not exceed 200 kW in any of the preceding 12 months. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and install those measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor assigned to the county where your facility is located; a complete list is provided on the Direct Install website identified below. The contractor will be paid the program incentive directly which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps mentioned above, and the remaining 30% of the cost is your responsibility to the contractor.

Since Direct Install offers a free assessment, LGEA applicants that do not meet the audit program eligibility requirements, but do meet the Direct Install requirements, may be moved directly into this program.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple year.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

Appendix A: Equipment Inventory & Recommendations

Reproduction or distribution of the whole, or any part of the contents of this document without written permission of TRC is prohibited. Neither TRC nor any of its employees makes any warranty, express or implied, or assumes any legal liability or responsibility for the accuracy, completeness, or usefulness of any data, information, method, product or process disclosed in this document, or represents that its use will not infringe upon any privately-owned rights, including but not limited to, patents, trademarks or copyrights.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Renaissance at Rand.

The goal of an LGEA report is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and provide information and assistance to help facilities implement ECMs. The LGEA report also contains valuable information on financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey higher education facilities in controlling energy costs and protecting our environment by offering a wide range of energy management options and advice.

1.1 Facility Summary

Renaissance at Rand is a 37,167 square foot facility constructed in 1924. The building is a three-story educational facility including classrooms, multipurpose rooms, offices, hallways, mechanical spaces, and other areas.

Lighting at the facility consists of a combination of 32-Watt T8 fluorescent fixtures and a few 40-Watt T12 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to the linear fluorescent, the facility also has inefficient circular fluorescent and incandescent lamps. Exterior lighting is provided by a combination of mercury vapor, metal halide, and incandescent fixtures. Interior lighting control is provided by manual switches.

Cooling and ventilation is provided by a combination of window air conditioners (AC) and split system AC systems. Heating hot water is distributed to the building's rooftop unit from natural draft steam boiler, via a heat exchanger.

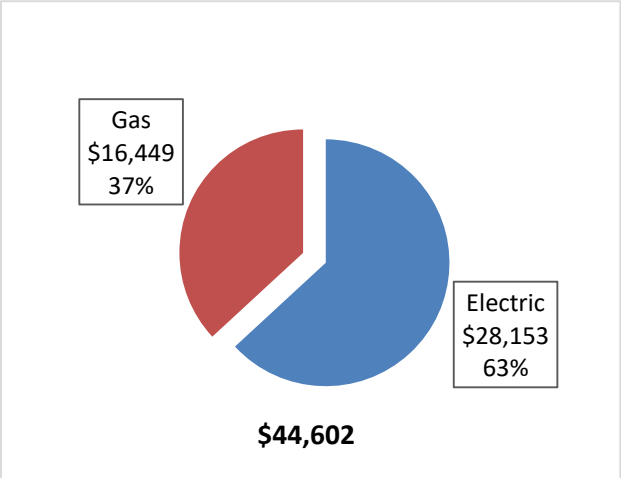
A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures

TRC evaluated and recommended five measures which together represent an opportunity for Renaissance at Rand to reduce annual energy costs by roughly $11,823 and annual greenhouse gas emissions by 75,372 lbs CO_2e. We estimate that if all high priority measures are implemented as recommended, the project will pay for itself in roughly 4.7 years. TRC has defined high priority measures as the evaluated measures that have a simple payback less than the typical equipment life of the proposed equipment. The breakdown of existing and potential utility costs after project implementation are illustrated in Figure 1 and Figure 2, respectively. Together these measures represent an opportunity to reduce Renaissance at Rand's annual energy use by 10%.

Figure 1 – Previous 12 Month Utility Costs



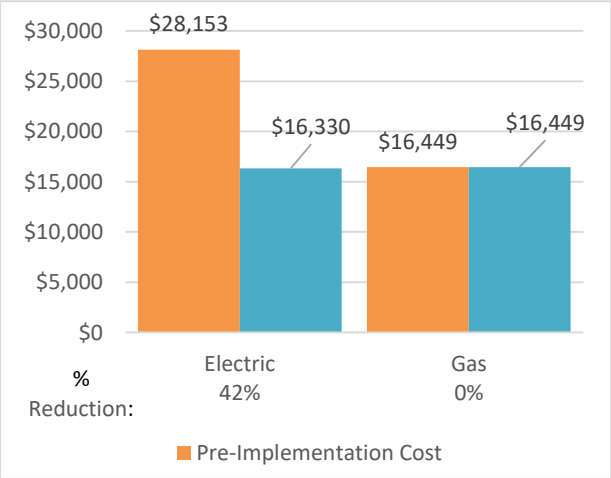


Figure 2 – Potential Post-Implementation Costs

A detailed description of the Renaissance at Rand's existing energy use can be found in Section 3.

Estimates of the total cost, energy savings, and financial incentives for the evaluated energy efficient upgrades are summarized below in Figure 3. A brief description of each category can be found below and a description of savings opportunities can be found in Section 4.

Figure 3 – Summary of Energy Reduction Opportunities

Energy Conservation Measure		Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**64,637**	**17.0**	**0.0**	**$10,209.81**	**$50,995.44**	**$8,305.00**	**$42,690.44**	**4.2**	**65,089**
ECM 1	Install LED Fixtures	Yes	27,030	4.7	0.0	$4,269.52	$18,883.42	$2,095.00	$16,788.42	3.9	27,219
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	Yes	308	0.2	0.0	$48.65	$585.00	$50.00	$535.00	11.0	310
ECM 3	Retrofit Fixtures with LED Lamps	Yes	37,299	12.2	0.0	$5,891.64	$31,527.01	$6,160.00	$25,367.01	4.3	37,560
Lighting Control Measures			**8,599**	**2.8**	**0.0**	**$1,358.33**	**$14,622.00**	**$1,835.00**	**$12,787.00**	**9.4**	**8,660**
ECM 4	Install Occupancy Sensor Lighting Controls	Yes	8,599	2.8	0.0	$1,358.33	$14,622.00	$1,835.00	$12,787.00	9.4	8,660
Plug Load Equipment Control - Vending Machine			**1,612**	**0.0**	**0.0**	**$254.60**	**$230.00**	**$0.00**	**$230.00**	**0.9**	**1,623**
ECM 5	Vending Machine Control	Yes	1,612	0.0	0.0	$254.60	$230.00	$0.00	$230.00	0.9	1,623
TOTALS			**74,848**	**19.8**	**0.0**	**$11,822.74**	**$65,847.44**	**$10,140.00**	**$55,707.44**	**4.7**	**75,372**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when not needed. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Plug Load Equipment control measures generally involve installing automated devices that limit the power usage or operation of equipment that is plugged into an electric outlet when not in use.

Energy Efficient Practices

TRC also identified seven low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral or operational adjustments and by performing better routine maintenance on building systems. These practices can extend equipment lifetime, improve occupant comfort, provide better health and safety, as well as reduce annual energy and O&M costs. Potential opportunities identified at Renaissance at Rand include:

- Close Doors and Windows
- Clean Evaporator/Condenser Coils on AC Systems
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

On-Site Generation Measures

TRC evaluated the potential for installing on-site generation for Renaissance at Rand. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 4 – Photovoltaic Potential

Potential	High	
System Potential	54	kW DC STC
Electric Generation	64,334	kWh/yr
Displaced Cost	$10,160	/yr
Installed Cost	$140,400	

For details on our evaluation and on-site generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, a project implementation plan must be developed. Available capital must be considered and decisions need to be made whether it is best to pursue individual ECMs separately, groups of ECMs, or a comprehensive approach where all ECMs are implemented together, possibly in conjunction with other facility upgrades or improvements.

Rebates, incentives, and financing are available from NJCEP, as well as other sources, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any measure, please review the relevant incentive program guidelines before proceeding. This is important because in most cases you will need to submit applications for the incentives prior to purchasing materials or commencing with installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- SREC (Solar Renewable Energy Certificate) Registration Program (SRP)
- Energy Savings Improvement Program (ESIP)

For facilities wanting to pursue only selected individual measures (or planning to phase implementation of selected measures over multiple years), incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to do the final design of the ECM(s) and do the installation. Program pre-approval is required for some SmartStart incentives, so only after receiving pre-approval should you proceed with ECM installation. The incentive estimates listed above in Figure 3 are based on the SmartStart program. More details on this program and others are available in Section 8.

This facility may also qualify for the Direct Install program which can provide turnkey installation of multiple measures, through an authorized network of participating contractors. This program can provide substantially higher incentives than SmartStart, up to 70% of the cost of selected measures, although measure eligibility will have to be assessed and be verified by the designated Direct Install contractor and, in most cases, they will perform the installation work.

For larger facilities with limited capital availability to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with project development, design, and implementation support services, as well as, attractive financing for implementing ECMs. An LGEA report (or other approved energy audit) is required for participation in ESIP. Please refer to Section 8.4 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a (non-NJCEP) program designed to reduce electric loads at commercial facilities, when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak power demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability. By enabling grid operators to call upon commercial facilities to reduce their electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and facilities receive payments whether or not they are called upon to curtail their load during times of peak demand. Refer to Section 7 for additional information on this program.

Additional information on relevant incentive programs is located in Section 8 or: www.njcleanenergy.com/ci.

2.2 General Site Information

On November 16, 2016, TRC performed an energy audit at the Renaissance at Rand located in Montclair, New Jersey. TRC's team met with John Eschmann to review the facility operations and help focus our investigation on specific energy-using systems.

Renaissance at Rand is a 37,167 square foot facility constructed in 1924. The building is a three-story educational facility including classrooms, multipurpose rooms, offices, hallways, mechanical spaces, and other areas.

Lighting at the facility consists of a combination of 32-Watt T8 fluorescent fixtures and a few 40-Watt T12 fluorescent fixtures; all of which are inefficient in performance when compared to the latest lighting technology available in the market. In addition to the linear fluorescent, the facility also has inefficient circular fluorescent and incandescent lamps. Exterior lighting is provided by a combination of mercury vapor, metal halide, and incandescent fixtures. Interior lighting control is provided by manual switches.

Cooling and ventilation is provided by a combination of window air conditioning (AC) and split system AC systems. Heating hot water is distributed to the building's rooftop unit from natural draft steam boiler, via a heat exchanger.

2.3 Building Occupancy

The typical schedule is presented in the table below.

Figure 6 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Renaissance at Rand	Weekday	7:00 am - 3:30 pm
Renaissance at Rand	Weekend	CLOSED

2.4 Building Envelope

Renaissance at Rand is a three-story building. The construction is of concrete masonry block with brick exterior and double pane clear windows with operable frames. The flat roof is constructed of built-up roofing material.

Figure 7 – Building Façade

2.5 On-Site Generation

TRC evaluated the potential for installing on-site generation for the Renaissance at Rand. Based on the configuration of the site and its loads there is a high potential for installing a photovoltaic (PV) array.

Figure 8 – Photovoltaic Potential

Potential	High	
System Potential	54	kW DC STC
Electric Generation	64,334	kWh/yr
Displaced Cost	$10,160	/yr
Installed Cost	$140,400	

2.6 Energy-Using Systems

Please see Appendix A: Equipment Inventory & Recommendations for an inventory of the facility's equipment.

Lighting System

Lighting at the Renaissance at Rand consists of a combination of 32-Watt T8 fluorescent fixtures and 40-Watt T12 fluorescent fixtures which are inefficient in performance when compared to the latest lighting technology available in the market. Most of the fixtures are 2-foot or 4-foot long troffers with diffusers having 1, 2, 3, and 4-lamp configurations. In addition to the fluorescent fixtures, the facility is also served by 60-Watt and 100-Watt incandescent lamps. All the exit signs are LED based fixtures.

Interior lighting control in the building is provided by manual switches.

Figure 9 - Building Lighting Systems

Fluorescent Fixture	*Exterior Security Light*
	

The building's exterior lighting consists primarily of 100-Watt and 175-Watt metal halide, 175-Watt and 400-Watt mercury vapor, and 100-Watt incandescent fixtures. Fixtures are a combination of pole and building mounted.

Steam to Hot Water Heating System

The hot water system consists of two H.B. Smith 3,576 kBtu/hr output, natural draft steam boilers. The boilers have a nominal combustion efficiency of 83% and are about eight years old. The boilers are connected to steam to water heat exchanger to convert the steam to heating hot water. The hot water is circulated by two hot water pumps. Each boiler is supplied by a dedicated 3 hp pump operating at constant speed.

Figure 10 – Hot Water System

Natural Gas Boiler	*Heating Hot Water Pumps*
	

The boilers are in good condition and well maintained.

Direct Expansion Air Conditioning System (DX)

The facility has several window AC units with capacities ranging between 0.42 ton and 2.0 tons. In addition to the window AC units, there is also a split system serving the computer lab.

Figure 11 – DX Air Conditioning System

Window AC	*Split System*
	

Domestic Hot Water Heating System

The domestic hot water heating system at the facility consists of one A.O. Smith gas fired hot water heater with an input rating of 75 kBtu/hr and nominal efficiency of 80%. Storage tank capacity is 74 gallons.

Figure 12 – Domestic Hot Water System

DHW Heater	*DHW Heater Nameplate*
	

Refrigeration

The facility has four stand-up refrigerators and a chest refrigerator. Capacities of the refrigerators are 6, 16, 20, 32, and 24 cubic feet.

Building Plug Load

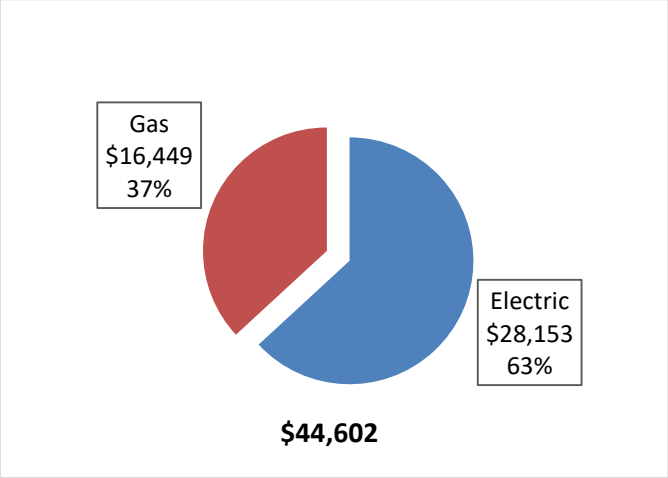
There are roughly 50 computer work stations throughout the facility. All the computers are desktop units with LCD monitors. There is no centralized PC power management software installed.

The facility contains other systems which contribute to plug load including printers, microwaves, and televisions. In addition to the typical plug load equipment, the facility also has a refrigerated vending machine at the teacher's room.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost per square foot and energy usage per square foot. These metrics are an estimate of the relative energy efficiency of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy usage profile for facilities with similar characteristics. Local weather conditions, building age and insulation levels, equipment efficiency, daily occupancy hours, changes in occupancy throughout the year, equipment operating hours, and energy efficient behavior of occupants all contribute to benchmarking scores. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12-month period of utility billing data that was provided for each utility. A profile of the annual energy consumption and energy cost of the facility was developed from this information.

Figure 13 - Utility Summary

Utility Summary for Renaissance at Rand		
Fuel	**Usage**	**Cost**
Electricity	178,232 kWh	$28,153
Natural Gas	18,492 Therms	$16,449
Total		**$44,602**

The current annual energy cost for this facility is $44,602 as shown in the chart below.

Figure 14 - Energy Cost Breakdown

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost over the past 12 months was $0.158/kWh, which is the blended rate that includes energy supply, distribution, and other charges. This rate is used throughout the analyses in this report to assess energy costs and savings. The monthly electricity consumption and peak demand are shown in the chart below. The usage profile is consistent with a facility which experiences a reduction of use in the summer months.

Figure 15 - Electric Usage & Demand

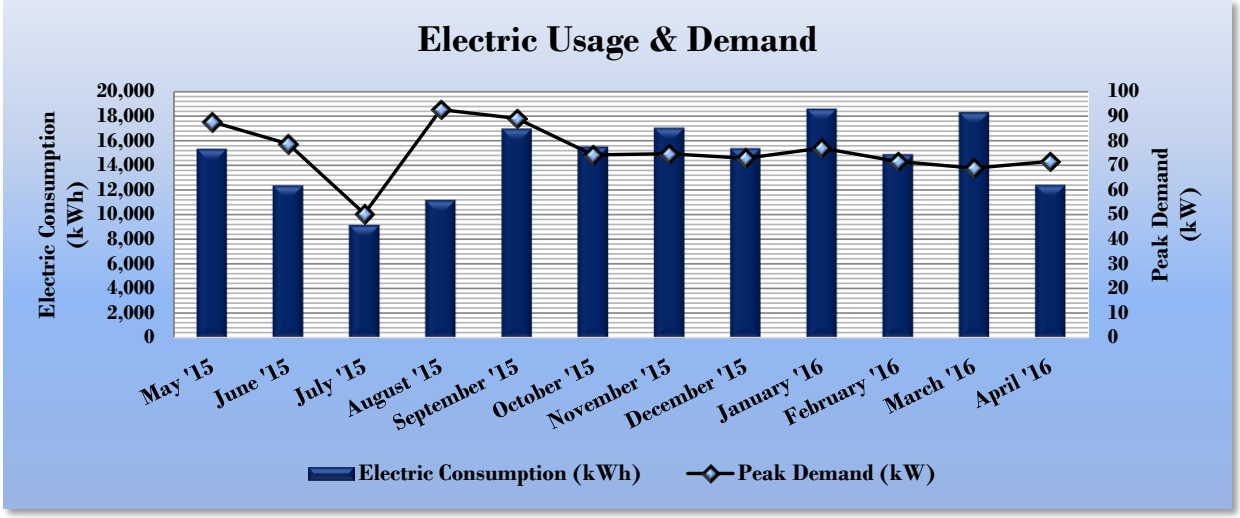


Figure 16 - Electric Usage & Demand

Electric Billing Data for Renaissance at Rand					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Total Electric Cost	TRC Estimated Usage?
6/15/15	26	15,345	88	$3,069	No
7/15/15	30	12,375	79	$2,651	No

Totals	**363**	**177,255**	**92.7**	**$27,998**	0
Annual	**365**	**178,232**	**92.7**	**$28,153**	

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.890/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is shown in the chart below. The usage profile is consistent with a facility dominated by winter heating.

Figure 17 - Natural Gas Usage

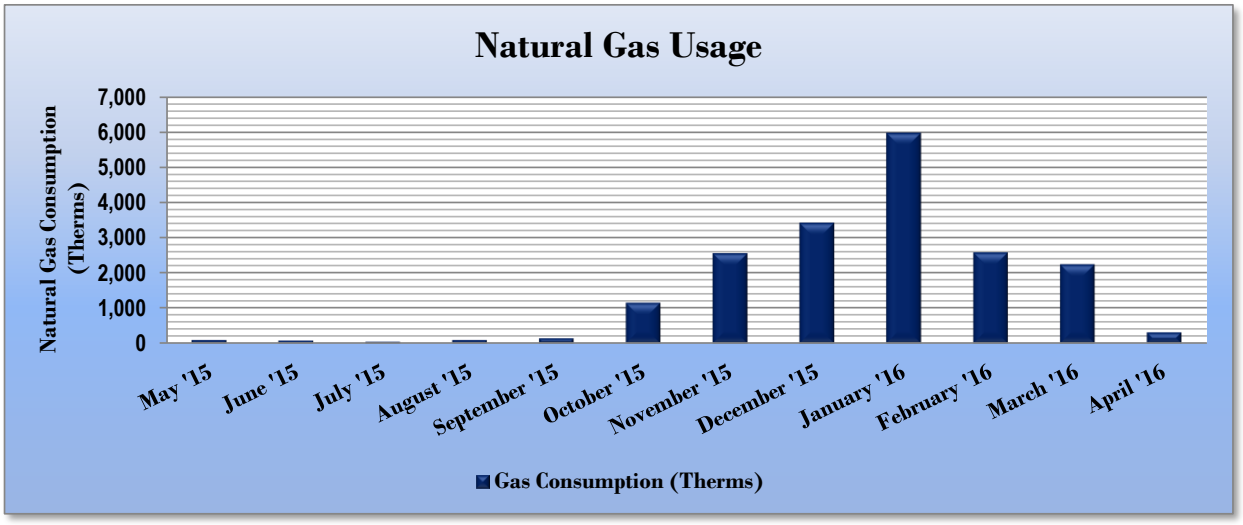

Figure 18 - Natural Gas Usage

Gas Billing Data for Renaissance at Rand			
Period Ending	Days in Period	Natural Gas Usage (Therms)	Natural Gas Cost
6/16/15	32	94	$156

10/14/15	29	138	$182
11/12/15	29	1,145	$1,676
12/15/15	33	2,554	$2,531
1/15/16	31	3,414	$3,054
2/18/16	34	5,960	$4,388
3/17/16	28	2,576	$2,336
4/15/16	29	2,232	$1,313
5/17/16	32	310	$275
Totals	**368**	**18,644**	**$16,584**
Annual	**365**	**18,492**	**$16,449**

3.4 Benchmarking

This facility was benchmarked using Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and then compares its performance against a national median for similar buildings of its type. Metrics provided by this analysis are Energy Use Intensity (EUI) and an ENERGY STAR® score for select building types.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more or less energy than similar buildings of its type on a square foot basis. EUI is presented in terms of "site energy" and "source energy." Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy includes fuel consumed to generate electricity consumed at the site, factoring in electric production and distribution losses for the region.

Figure 19 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Renaissance at Rand	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	103.6	141.4
Site Energy Use Intensity (kBtu/ft^2)	66.1	58.2

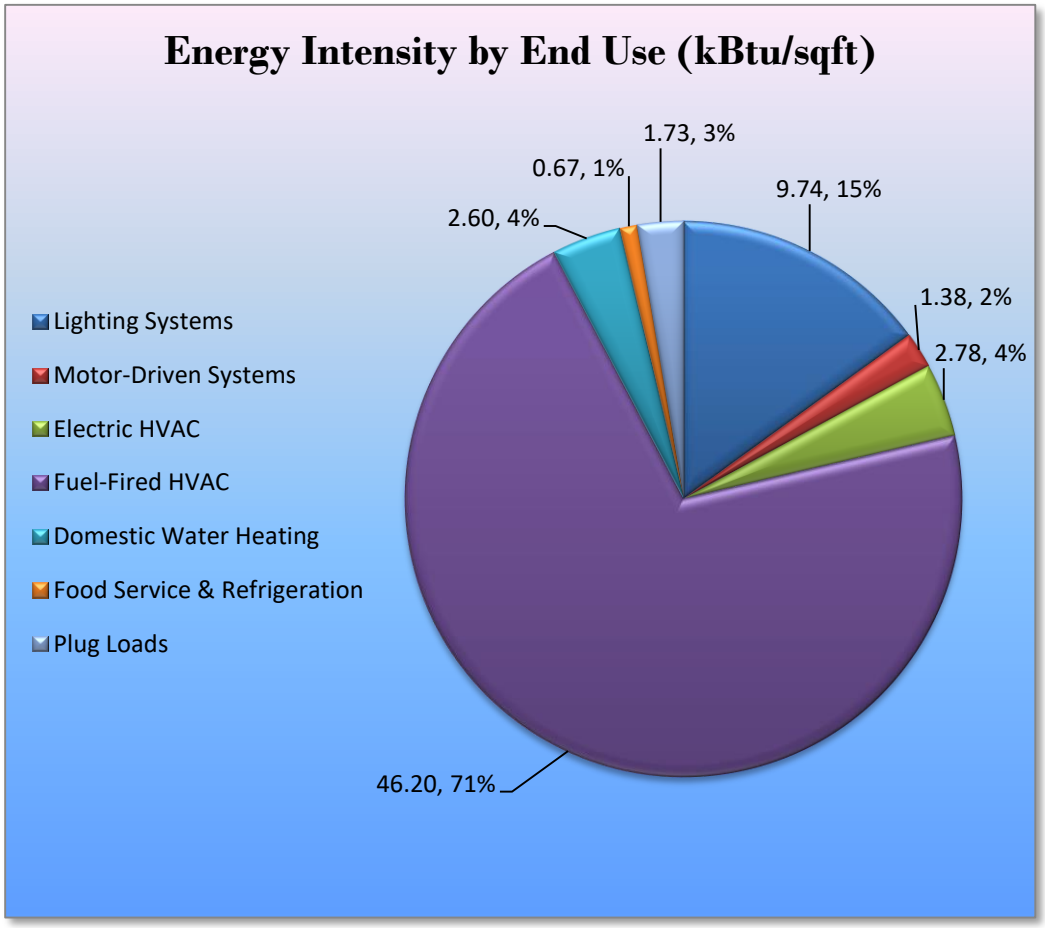
Implementation of all recommended measures in this report would improve the building's estimated EUI significantly, as shown in the table below:

Figure 20 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Renaissance at Rand	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	82.0	141.4
Site Energy Use Intensity (kBtu/ft^2)	59.2	58.2

Many types of commercial buildings are also eligible to receive an ENERGY STAR® score. This score is a percentile ranking from 1 to 100. It compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide and may be eligible for ENERGY STAR® certification. This facility has a current score of 65.

A Portfolio Manager® Statement of Energy Performance (SEP) was generated for this facility, see Appendix B: ENERGY STAR® Statement of Energy Performance.



For more information on ENERGY STAR® certification go to: https://www.energystar.gov/buildings/facility-owners-and-managers/existing-buildings/earn-recognition/energy-star-certification/how-app-1.

A Portfolio Manager® account has been created online for your facility and you will be provided with the login information for the account. We encourage you to update your utility information in Portfolio Manager® regularly, so that you can keep track of your building's performance. Free online training is available to help you use ENERGY STAR® Portfolio Manager® to track your building's performance at: https://www.energystar.gov/buildings/training.

3.5 Energy End-Use Breakdown

In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building to determine their proportional contribution to overall building energy usage. This chart of energy end uses highlights the relative contribution of each equipment category to total energy usage. This can help determine where the greatest benefits might be found from energy efficiency measures.

Figure 21 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy efficiency opportunities, help prioritize specific measures for implementation, and provide information to the Renaissance at Rand regarding financial incentives for which they may qualify to implement the recommended measures. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is usually considered sufficient to demonstrate project cost-effectiveness and help prioritize energy measures. Savings are based on the New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016, approved by the New Jersey Board of Public Utilities. Further analysis or investigation may be required to calculate more precise savings based on specific circumstances. A higher level of investigation may be necessary to support any custom SmartStart or Pay for Performance, or Direct Install incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Some measures and proposed upgrade projects may be eligible for higher incentives than those shown below through other NJCEP programs as described in Section 8.

The following sections describe the evaluated measures.

4.1 High Priority ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 22 – Summary of High Priority ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**64,637**	**17.0**	**0.0**	**$10,209.81**	**$50,995.44**	**$8,305.00**	**$42,690.44**	**4.2**	**65,089**
ECM 1	Install LED Fixtures	27,030	4.7	0.0	$4,269.52	$18,883.42	$2,095.00	$16,788.42	3.9	27,219
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	308	0.2	0.0	$48.65	$585.00	$50.00	$535.00	11.0	310
ECM 3	Retrofit Fixtures with LED Lamps	37,299	12.2	0.0	$5,891.64	$31,527.01	$6,160.00	$25,367.01	4.3	37,560
Lighting Control Measures		**8,599**	**2.8**	**0.0**	**$1,358.33**	**$14,622.00**	**$1,835.00**	**$12,787.00**	**9.4**	**8,660**
ECM 4	Install Occupancy Sensor Lighting Controls	8,599	2.8	0.0	$1,358.33	$14,622.00	$1,835.00	$12,787.00	9.4	8,660
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$254.60**	**$230.00**	**$0.00**	**$230.00**	**0.9**	**1,623**
ECM 5	Vending Machine Control	1,612	0.0	0.0	$254.60	$230.00	$0.00	$230.00	0.9	1,623
TOTALS		**74,848**	**19.8**	**0.0**	**$11,822.74**	**$65,847.44**	**$10,140.00**	**$55,707.44**	**4.7**	**75,372**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for upgrades to existing lighting fixtures are summarized in Figure 23 below.

Figure 23 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**64,637**	**17.0**	**0.0**	**$10,209.81**	**$50,995.44**	**$8,305.00**	**$42,690.44**	**4.2**	**65,089**
ECM 1	Install LED Fixtures	27,030	4.7	0.0	$4,269.52	$18,883.42	$2,095.00	$16,788.42	3.9	27,219
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	308	0.2	0.0	$48.65	$585.00	$50.00	$535.00	11.0	310
ECM 3	Retrofit Fixtures with LED Lamps	37,299	12.2	0.0	$5,891.64	$31,527.01	$6,160.00	$25,367.01	4.3	37,560

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	8,665	2.3	0.0	$1,368.61	$10,872.32	$1,170.00	$9,702.32	7.1	8,725
Exterior	18,365	2.4	0.0	$2,900.91	$8,011.11	$925.00	$7,086.11	2.4	18,494

Measure Description

We recommend replacing existing fixtures containing HID lamps with new high-performance LED light fixtures. This measure saves energy by installing LEDs which use less power than other technologies with a comparable light output.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of a HID lamp.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	308	0.2	0.0	$48.65	$585.00	$50.00	$535.00	11.0	310
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.0	0

Measure Description

We recommend retrofitting existing T12 fluorescent fixtures by removing fluorescent tubes and ballasts and replacing them with LEDs and LED drivers (if necessary), which are designed to be used retrofitted fluorescent fixtures. The measure uses the existing fixture housing but replaces the rest of the components with more efficient lighting technology. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	36,936	12.1	0.0	$5,834.22	$31,503.70	$6,155.00	$25,348.70	4.3	37,194
Exterior	364	0.0	0.0	$57.42	$23.31	$5.00	$18.31	0.3	366

Measure Description

We recommend retrofitting existing incandescent, linear fluorescent, and circular fluorescent lighting technologies with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed while leaving the fluorescent fixture ballast in place. LED bulbs can be used in existing fixtures as a direct replacement for most other lighting technologies. This measure saves energy by installing LEDs which use less power than other lighting technologies yet provide equivalent lighting output for the space.

Additional savings from lighting maintenance can be anticipated since LEDs have lifetimes which are more than twice that of fluorescent tubes and more than 10 times longer than many incandescent lamps.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures are summarized in Figure 24 below.

Figure 24 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**8,599**	**2.8**	**0.0**	**$1,358.33**	**$14,622.00**	**$1,835.00**	**$12,787.00**	**9.4**	**8,660**
ECM 4	Install Occupancy Sensor Lighting Controls	8,599	2.8	0.0	$1,358.33	$14,622.00	$1,835.00	$12,787.00	9.4	8,660

During lighting upgrade planning and design, we recommend a comprehensive approach that considers both the efficiency of the lighting fixtures and how they are controlled.

ECM 4: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
8,599	2.8	0.0	$1,358.33	$14,622.00	$1,835.00	$12,787.00	9.4	8,660

Measure Description

We recommend installing occupancy sensors to control lighting fixtures that are currently controlled by manual switches in selected restrooms, classrooms, and office areas. Lighting sensors detect occupancy using ultrasonic and/or infrared sensors. For most spaces, we recommend lighting controls use dual technology sensors, which can eliminate the possibility of any lights turning off unexpectedly. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Some controls also provide dimming options and all modern occupancy controls can be easily over-ridden by room occupants to allow them to manually turn fixtures on or off, as desired. Energy savings results from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. In general, wall switch replacement sensors are recommended for single occupant offices and other small rooms. Ceiling-mounted or remote mounted sensors are used in locations without local switching or where wall switches are not in the line-of-sight of the main work area and in large spaces. We recommend a comprehensive approach to lighting design that upgrades both the lighting fixtures and the controls together for maximum energy savings and improved lighting for occupants.

4.1.3 Plug Load Equipment Control - Vending Machines

Our recommendations for plug load equipment control measures are summarized in Figure 25 below.

Figure 25 - Summary of Plug Load Equipment Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Plug Load Equipment Control - Vending Machine		**1,612**	**0.0**	**0.0**	**$254.60**	**$230.00**	**$0.00**	**$230.00**	**0.9**	**1,623**
ECM 5	Vending Machine Control	1,612	0.0	0.0	$254.60	$230.00	$0.00	$230.00	0.9	1,623

ECM 5: Vending Machine Control

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,612	0.0	0.0	$254.60	$230.00	$0.00	$230.00	0.9	1,623

Measure Description

Vending machines operate continuously, even during non-business hours. It is recommended to install occupancy sensor controls to reduce the energy use. These controls power down vending machines when the vending machine area has been vacant for some time, then power up at regular intervals, as needed, to turn machine lights on or keep the product cool. Energy savings are a dependent on vending machine and activity level in the area surrounding the machines.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of many low cost or no-cost energy efficiency strategies. By employing certain behavioral and operational changes and performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and energy and O&M costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional.

For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low-flow faucets or faucet aerators, low-flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gallons per minute (gpm) for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

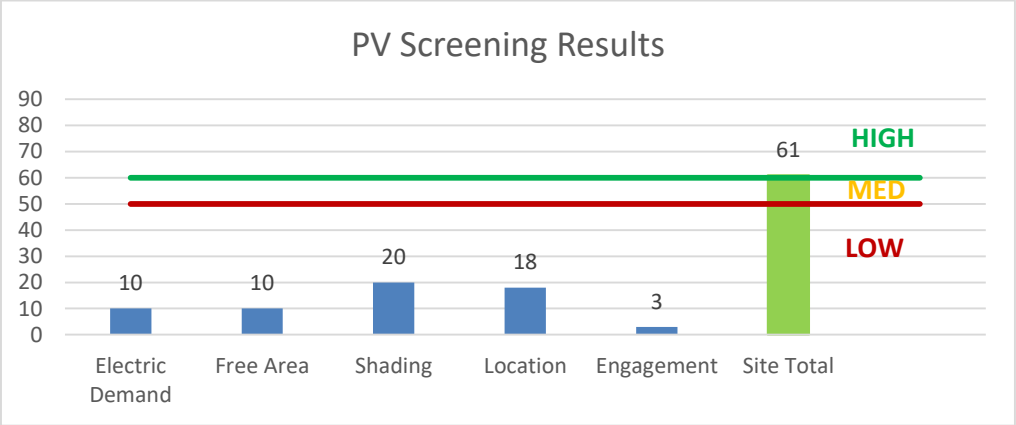
Installing dual flush or low-flow toilets and low-flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gallons per flush (gpf) and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

6 On-Site Generation Measures

On-site generation measure options include both renewable (e.g., solar, wind) and non-renewable (e.g., fuel cells) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **High** potential for installing a PV array.

The amount of free area, ease of installation (location), and the lack of shading elements contribute to the high potential for PV at the site. A PV array located on the roof of the building may be feasible. If Renaissance at Rand is interested in pursuing the installation of PV, we recommended a full feasibility study be conducted.

Figure 26 - Photovoltaic Screening

Potential	High	
System Potential	54	kW DC STC
Electric Generation	64,334	kWh/yr
Displaced Cost	$10,160	/yr
Installed Cost	$140,400	

Solar projects must register their projects in the SREC (Solar Renewable Energy Certificate) Registration Program (SRP) prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about developed new solar projects and insight into future SREC pricing. Refer to Section 8.3 for additional information.

For more information on solar PV technology and commercial solar markets in New Jersey, or to find a qualified solar installer, who can provide a more detailed assessment of the specific costs and benefits of solar develop of the site, please visit the following links below:

- **Basic Info on Solar PV in NJ**: http://www.njcleanenergy.com/whysolar
- **NJ Solar Market FAQs**: http://www.njcleanenergy.com/renewable-energy/program-updates-and-background-information/solar-transition/solar-market-faqs
- **Approved Solar Installers in the NJ Market**: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/?id=60&start=1

6.2 Combined Heat and Power

Combined heat and power (CHP) is the on-site generation of electricity along with the recovery of heat energy, which is put to beneficial use. Common technologies for CHP include reciprocating engines, microturbines, fuel cells, backpressure steam turbines, and (at large facilities) gas turbines. Electric generation from a CHP system is typically interconnected to local power distribution systems. Heat is recovered from exhaust and ancillary cooling systems and interconnected to the existing hot water (or steam) distribution systems.

CHP systems are typically used to produce a portion of the electric power used onsite by a facility, with the balance of electric power needs supplied by grid purchases. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load is the most significant factor contributing to the potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce the electric load of commercial facilities when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability.

By enabling grid operators to call upon Curtailment Service Providers and commercial facilities to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants receive payments whether or not their facility is called upon to curtail their electric usage.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR programs often find it to be a valuable source of revenue for their facility because the payments can significantly offset annual electric costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats, so that air conditioning units run less frequently, or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR curtailment event. DR program participants may need to install smart meters or may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding program rules and requirements for metering and controls, assess a facility's ability to temporarily reduce electric load, and provide details on payments to be expected for participation in the program. Providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment of their own to help ensure compliance with all terms and conditions of a DR contract.

In our opinion this building is not is a good candidate for DR.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and other benefits to ratepayers, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's Electricity Restructuring Law (1999), which requires all customers of investor-owned electric and gas utilities to pay a surcharge on their monthly energy bills. As a customer of a state-regulated electric or gas utility and therefore a contributor to the fund your organization is eligible to participate in the LGEA program and also eligible to receive incentive payment for qualifying energy efficiency measures. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 27 for a list of the eligible programs identified for each recommended ECM.

Figure 27 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install	Pay For Performance Existing Buildings
ECM 1	Install LED Fixtures	X		X	
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	X		X	
ECM 3	Retrofit Fixtures with LED Lamps	X		X	
ECM 4	Install Occupancy Sensor Lighting Controls	X		X	
ECM 5	Vending Machine Control			X	

SmartStart is generally well-suited for implementation of individual measures or small group of measures. It provides flexibility to install measures at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities that can bundle multiple ECMs together. This can greatly simplify participation and may lead to higher incentive amounts, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities. It requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. This facility does not meet all of the criteria for participating in the P4P program based on the measures identified in this study. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption. LEUP applicants can use in-house staff or a preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent basis for comparison of available incentives for various measures, though in many cases incentive amounts may be higher through participation in other programs.

Brief descriptions of all relevant financing and incentive programs are located in the sections below. Further information, including most current program availability, requirements, and incentive levels can be found at: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Equipment with Prescriptive Incentives Currently Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The SmartStart prescriptive incentive program provides fixed incentives for specific energy efficiency measures, whereas the custom SmartStart program provides incentives for more unique or specialized technologies or systems that are not addressed through prescriptive incentive offerings for specific devices.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at 50% of the total installed incremental project cost, or a project cost buy down to a one year payback (whichever is less). Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to medium-sized facilities with a peak electric demand that does not exceed 200 kW for any recent 12-month period. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and provide a clear scope of work for installation of selected measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor in the region of the state where your facility is located. A complete list of Direct Install program partners is provided on the Direct Install website linked below. The contractor will be paid the measure incentives directly by the program which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps and eligibility, while the remaining 30% of the cost is paid to the contractor by the customer.

Since Direct Install offers a free assessment of eligible measures, Direct Install is also available to small businesses and other commercial facilities too that may not be eligible for the more detailed facility audits provided by LGEA.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 SREC Registration Program

The SREC (Solar Renewable Energy Certificate) Registration Program (SRP) is used to register the intent to install solar projects in New Jersey. Rebates are not available for solar projects, but owners of solar projects MUST register their projects in the SRP prior to the start of construction in order to establish the project's eligibility to earn SRECs. Registration of the intent to participate in New Jersey's solar marketplace provides market participants with information about the pipeline of anticipated new solar capacity and insight into future SREC pricing.

After the registration is accepted, construction is complete, and final paperwork has been submitted and is deemed complete, the project is issued a New Jersey certification number which enables it to generate New Jersey SRECs. SREC's are generated once the solar project has been authorized to be energized by the Electric Distribution Company (EDC).

Each time a solar installation generates 1,000 kilowatt-hours (kWh) of electricity, an SREC is earned. Solar project owners report the energy production to the SREC Tracking System. This reporting allows SREC's to be placed in the customer's electronic account. SRECs can then be sold on the SREC Tracking System, providing revenue for the first 15 years of the project's life.

Electricity suppliers, the primary purchasers of SRECs, are required to pay a Solar Alternative Compliance Payment (SACP) if they do not meet the requirements of New Jersey's Solar RPS. One way they can meet the RPS requirements is by purchasing SRECs. As SRECs are traded in a competitive market, the price may vary significantly. The actual price of an SREC during a trading period can and will fluctuate depending on supply and demand.

Information about the SRP can be found at: www.njcleanenergy.com/srec.

8.4 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize NJCEP incentive programs to help further reduce costs when developing the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

ENERGY STAR® Score[1]

Renaissance at Rand Middle School

Primary Property Type: K-12 School
Gross Floor Area (ft²): 37,167
Built: 1924

For Year Ending: April 30, 2016
Date Generated: December 25, 2017

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Disclaimer

The intent of this energy analysis report is to identify energy savings opportunities and recommend upgrades to the facility's energy using equipment and systems. Approximate savings are included in this report to help make decisions about reducing energy use at the facility. This report, however, is not intended to serve as a detailed engineering design document. Further design and analysis may be necessary in order to implement some of the measures recommended in this report.

The energy conservation measures and estimates of energy savings have been reviewed for technical accuracy. However, estimates of final energy savings are not guaranteed, because final savings may depend on behavioral factors and other uncontrollable variables. TRC Energy Services (TRC) and New Jersey Board of Public Utilities (NJBPU) shall in no event be liable should the actual energy savings vary.

Estimated installation costs are based on TRC's experience at similar facilities, pricing from local contractors and vendors, and/or cost estimates from *RS Means*. The owner of the facility is encouraged to independently confirm these cost estimates and to obtain multiple estimates when considering measure installations. Since actual installed costs can vary widely for certain measures and conditions, TRC and NJBPU do not guarantee installed cost estimates and shall in no event be held liable should actual installed costs vary from estimates.

New Jersey's Clean Energy Program (NJCEP) incentive values provided in this report are estimates based on program information available at the time of the report. Incentive levels are not guaranteed. The NJBPU reserves the right to extend, modify, or terminate programs without prior notice. The owner of the facility should review available program incentives and eligibility requirements prior to selecting and installing any energy conservation measures.

1 EXECUTIVE SUMMARY

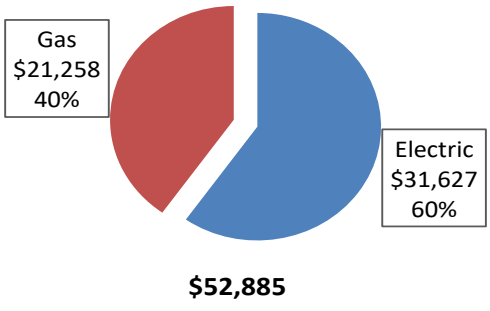
The New Jersey Board of Public Utilities (NJBPU) has sponsored this Local Government Energy Audit (LGEA) Report for the Watchung School.

The goal of a LGEA is to provide you with information on how your facility uses energy, identify energy conservation measures (ECMs) that can reduce your energy use, and put you in a position to implement the ECMs. The LGEA also sets you on the path to receive financial incentives from New Jersey's Clean Energy Program (NJCEP) for implementing the ECMs.

This study was conducted by TRC Energy Services (TRC), as part of a comprehensive effort to assist New Jersey school districts in controlling energy costs and protecting our environment by offering a full spectrum of energy management options.

1.1 Facility Summary

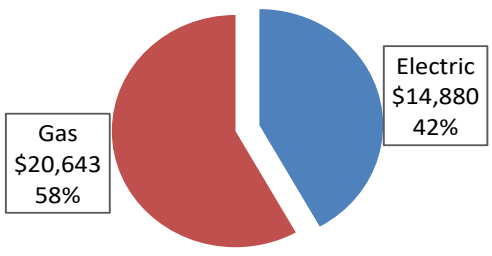
The Watchung School is a three-story building totaling 52,109 square feet constructed in 1900. The building has a flat roof and exterior walls are finished with brick masonry. The windows throughout the facility are double paned and the exterior doors are constructed of metal. Interior lighting consists predominantly of linear T8 fluorescent lamps and fixtures with electronic ballasts. Lighting control is provided by manual wall switches. Heating is provided by two steam boilers and cooling is provided by a combination of window and split system air conditioners (ACs).



A thorough description of the facility and our observations are located in Section 2.

1.2 Your Cost Reduction Opportunities

Energy Conservation Measures



TRC evaluated nine measures. Six measures were recommended for implementation which together represent an opportunity for the Watchung School to reduce annual energy costs by roughly $12,641 and annual greenhouse gas emissions by 103,370 lbs CO_2e. The measures would pay for themselves in roughly 4 years. The breakdown of existing and potential utility costs is illustrated in Figure 1 and Figure 2, respectively. These projects represent an opportunity to reduce Watchung School's annual energy use by 12.2%.

Figure 1 – Previous 12 Month Utility Costs

$52,885

Figure 2 – Potential Post-Implementation Costs

$35,523

A detailed description of the Watchung School's existing energy use can be found in Section 3.

The evaluated measures have been listed and grouped into major categories as shown in Figure 3. Brief descriptions of the categories can be found below and descriptions of the individual opportunities can be found in Section 4. Measures without an "ECM #" in the table below have been evaluated, but are not recommended for implementation.

Figure 3 – Summary of Energy Reduction Opportunities

	Energy Conservation Measure	Recommend?	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades			**87,875**	**21.3**	**0.0**	**$11,062.52**	**$54,625.36**	**$8,020.00**	**$46,605.36**	**4.21**	**88,489**
ECM 1	Install LED Fixtures	Yes	23,287	4.7	0.0	$2,931.59	$16,761.33	$2,310.00	$14,451.33	4.93	23,450

Gas Heating (HVAC/Process) Replacement			**0**	**0.0**	**36.2**	**$285.90**	**$52,933.84**	**$2,848.00**	**$50,085.84**	**175.19**	**4,244**
	Install High Efficiency Steam Boilers	No	0	0.0	36.2	$285.90	$52,933.84	$2,848.00	$50,085.84	175.19	4,244
Domestic Water Heating Upgrade			**0**	**0.0**	**41.7**	**$328.66**	**$93.21**	**$0.00**	**$93.21**	**0.28**	**4,879**
ECM 6	Install Low-Flow Domestic Hot Water Devices	Yes	0	0.0	41.7	$328.66	$93.21	$0.00	$93.21	0.28	4,879
TOTALS FOR ALL RECOMMENDED MEASURES			**97,807**	**23.92**	**41.7**	**$12,641.56**	**$60,478.57**	**$8,790.00**	**$51,688.57**	**4.09**	**103,370**
TOTALS FOR ALL MEASURES			**99,740**	**25.6**	**77.9**	**$13,170.82**	**$118,254.85**	**$11,638.00**	**$106,616.85**	**8.09**	**109,561**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Lighting Upgrades generally involve the replacement of existing lighting components such as lamps and ballasts (or the entire fixture) with higher efficiency lighting components. These measures save energy by reducing the power used by the lighting components due to improved electrical efficiency.

Lighting Controls measures generally involve the installation of automated controls to turn off lights or reduce light output when conditions allow. Automated control reduces reliance on occupant behavior for adjusting lights. These measures save energy by reducing the amount of time lights are on.

Motor Upgrades generally involve replacing old standard efficiency motors with motors of the current efficiency standard (EISA 2007). Motors will be replaced with the same size motors. This measure saves energy by reducing the power used by the motors due to improved electrical efficiency.

Electric Unitary HVAC measures generally involve replacing old inefficient air conditioning systems with modern energy efficient systems. New air conditioning systems can provide cooling equivalent to older air condition systems, but use less energy. These measures save energy by reducing the power used by the air condition system due to improved electrical efficiency.

Gas Heating (HVAC/Process) measures generally involve replacing old inefficient hydronic heating systems with modern energy efficient systems. Gas heating systems can provide heating equivalent to older systems, but use less energy. These measures save energy by reducing the fuel used by the heating due to improved combustion and heat transfer efficiency.

Domestic Water Heating upgrade measures generally involve replacing old inefficient domestic water heating systems with modern energy efficient systems. New domestic water heating systems can provide equivalent or greater capacity as older systems, but use less energy. These measures save energy by reducing the fuel used by the domestic water heating systems due to improved efficiency or the removal of standby losses.

Energy Efficient Practices

TRC also identified eight low cost (or no cost) energy efficient practices. A facility's energy performance can be significantly improved by employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems. Through these practices equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. Opportunities identified at the Watchung School include:

- Close Doors and Windows
- Ensure Lighting Controls Are Operating Properly
- Use Fans to Reduce Cooling Load
- Clean and/or Replace HVAC Filters
- Perform Proper Boiler Maintenance
- Perform Proper Water Heater Maintenance
- Install Plug Load Controls
- Water Conservation

For details on these energy efficient practices, please refer to Section 5.

Self-Generation Measures

TRC evaluated the potential for installing self-generation sources for the Watchung School. Based on the configuration of the site and its loads there is a low potential for installing any PV and combined heat and power self-generation measures.

For details on our evaluation and the self-generation potential, please refer to Section 6.

1.3 Implementation Planning

To realize the energy savings from the ECMs listed in this report, the equipment changes outlined for each ECM need to be selected and installed through project implementation. One of the first considerations is if there is capital available for project implementation. Another consideration is whether to pursue individual ECMs, a group of ECMs, or a comprehensive approach wherein all ECMs are pursued, potentially in conjunction with other facility projects or improvements.

Rebates, incentives, and financing are available from the NJBPU, NJCEP, as well as some of the state's investor-owned utilities, to help reduce the costs associated with the implementation of energy efficiency projects. Prior to implementing any project, please review the appropriate incentive program guidelines before proceeding. This is important because in most cases you will need to submit an application for the incentives before purchasing materials and beginning installation.

The ECMs outlined in this report may qualify under the following program(s):

- SmartStart
- Direct Install
- Energy Savings Improvement Program (ESIP)

For facilities with capital available for implementation of selected individual measures or phasing implementation of selected measures over multiple years, incentives are available through the SmartStart program. To participate in this program you may utilize internal resources, or an outside firm or contractor, to design the ECM(s), select the equipment and apply for the incentive(s). Program pre-approval is required for some SmartStart incentives, so only after receiving approval may the ECM(s) be installed. The incentive values listed above in Figure 3 represent the SmartStart program and will be explained further in Section 8, as well as the other programs as mentioned below.

This facility also qualifies for the Direct Install program which, through an authorized network of participating contractors, can assist with the implementation of a group of measures versus installing individual measures or phasing implementation. This program is designed to be turnkey and will provide an incentive up to 70% of the cost of the project identified by the designated contractor.

For facilities without capital available to implement ECMs, project financing may be available through the Energy Savings Improvement Program (ESIP). Supported directly by the NJBPU, ESIP provides government agencies with external project development, design, and implementation services as well as financing for implementing ECMs. This LGEA report is the first step for participating in ESIP and should help you determine next steps. Refer to Section 8.3 for additional information on the ESIP Program.

The Demand Response Energy Aggregator is a program (non-NJCEP) designed to reduce consumer electric load when wholesale electricity prices are high or when the reliability of the electric grid is threatened due to peak demand. Demand Response (DR) service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally. By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load. Refer to Section 7 for additional information on this program.

Additional descriptions of all relevant incentive programs are located in Section 8 or: www.njcleanenergy.com/ci.

To ensure projects are implemented such that maximum savings and incentives are achieved, bids and specifications should be reviewed by your procurement personnel and/or consultant(s) to ensure that selected equipment coincides with LGEA recommendations, as well as applicable incentive program guidelines and requirements.

2 FACILITY INFORMATION AND EXISTING CONDITIONS

2.1 Project Contacts

2.2 General Site Information

On November 14, 2016, TRC performed an energy audit at the Watchung School located in Montclair, New Jersey. TRC's auditor met with Clarren Vanperzee to review the facility operations and focus the investigation on specific energy-using systems.

The 52,109 square feet school facility is a three-story building comprised of classrooms, gymnasium, administration offices, auditorium, nurse's room, kitchen, mechanical room, and storage areas within two buildings connected by a hallway. The building was originally constructed in 1900 and expanded to accommodate additional classrooms and other spaces in 1908, 1917, 1924, and the greenhouse was added in 2002.

2.3 Building Occupancy

The school operates on a 10-month schedule and is open Monday through Friday. The typical schedule is presented in the table below. During a typical day, the school is occupied by approximately 440 students and 39 staff.

Figure 5 - Building Schedule

Building Name	Weekday/Weekend	Operating Schedule
Watchung School	Weekday	7:00 AM - 4:30 PM
Watchung School	Weekend	Closed

2.4 Building Envelope

The three-story buildings have a reinforced concrete foundation. They have flat roof areas covered with a white synthetic rubber: EPDM roofing (ethylene propylene diene monomer). They are in good condition with no signs of leakage. Exterior walls are finished with brick masonry, and the windows throughout the facility are double paned glass with aluminum frames and are in acceptable condition showing little sign of outside air infiltration. Exterior doors are constructed of metal.

Image 1 – Building Envelope

2.5 On-site Generation

The Watchung School does not have any on-site electric generation capacity.

2.6 Energy-Using Systems

Please refer to Appendix A: Equipment Inventory & Recommendations for an inventory of your equipment.

Lighting System

Lighting at the facility is provided predominately by 32-Watt linear fluorescent T8 lamps with electronic ballasts as well as compact fluorescent lamps (CFL) and incandescent lamps. Most of the building spaces use 1-lamp or 2-lamp, 4-foot long fixtures. The auditorium is illuminated with 100-Watt wall mounted incandescent lamps while the gymnasium is lit with 52-Watt CFL lamps. Several storage rooms and closets are illuminated with a mix of incandescent and compact fluorescent lamps. Exit signs throughout the facility are incandescent. Lighting control is provided mainly by manual wall switches. The school has minimal exterior lighting, consisting of 150-Watt metal halide and 175-Watt mercury vapor lamps. Exterior fixtures are controlled with photocells.

Steam System

The steam system consists of two Weil McLain 2,848 kBtu/hr output boilers. The boilers are two and 28 years old. The new unit has a combustion efficiency of 84% while the older unit is at 75%. The 28-year-old boiler has passed its useful service life. The two boilers operate in lead/lag operation with only one boiler operating at one time. Each boiler has a 3 hp forced draft fan with discharge dampers to control the volume of combustion air, and a 0.8 hp constant speed feed water pump. The boiler water levels are controlled by valves. Steam is supplied to radiators and fan coil units at 15 psi, and roughly 75% of the condensate is returned to the feed water system via the two 3 hp condenser water pumps. Space temperatures are controlled by local thermostats.

Image 2 – Steam System

Air Conditioning (DX)

Image 3 – Air Conditioning

The cooling system consists of 20 window units and eight split ACs. The split ACs range from 1.5 to 3 tons and are all two years old. The window units are four years old and appeared in good condition. Only the unit serving room 19 appears to be in poor condition. The split AC systems are controlled with programmable thermostats.

Domestic Hot Water

Domestic hot water for the school consists of one A.O. Smith gas fired non-condensing hot water heater with an input rating of 75,000 KBtu/hr and a nominal efficiency of 80%. The water heater is one year old and has a 74-gallon storage tank.

Food Service & Refrigeration

The school houses a small non-commercial kitchen for light cooking. The kitchen appliances include a gas cooking range, gas warmers, a stand-up refrigerator and freezer. The kitchen is well maintained.

Plug load & Vending Machines

There are approximately 52 computer work stations throughout the facility and they are mostly desktop units with LCD monitors. There is no centralized PC power management software installed. The facility has one refrigerated beverage vending machine located in the teacher room.

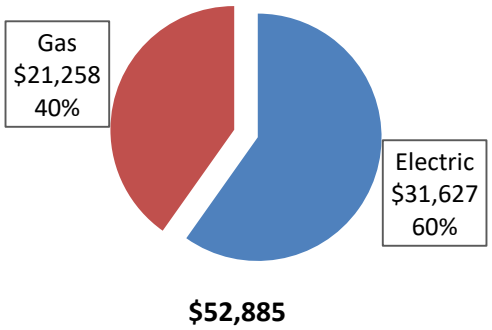
2.7 Water-Using Systems

There are several restrooms at this facility. A sampling of restrooms found that all of the faucets are rated for 2.0 gallons per minute (gpm) or higher, the toilets are rated at 2.5 gallons per flush (gpf) and the urinals are rated at 2 gpf. The kitchen has faucets that rated for 2.5 gpm or higher. There is no restroom with showers.

3 SITE ENERGY USE AND COSTS

Utility data for electricity and natural gas was analyzed to identify opportunities for savings. In addition, data for electricity and natural gas was evaluated to determine the annual energy performance metrics for the building in energy cost/ft^2 and energy use/ft^2. These energy use indices are indicative of the relative energy effectiveness of this building. There are a number of factors that could cause the energy use of this building to vary from the "typical" energy use for other facilities identified as: School (K-12). Specific local climate conditions, daily occupancy hours of the facility, seasonal fluctuations in occupancy, daily operating hours of energy use systems, and the behavior of the occupants with regard to operating systems that impact energy use such as turning off appliances and leaving windows open. Please refer to the Benchmarking section within Section 3.4 for additional information.

3.1 Total Cost of Energy



The following energy consumption and cost data is based on the last 12 month period of utility usage data that was provided for each utility. The annual consumption and cost was developed from this information.

Figure 6 - Utility Summary

Utility Summary for Watchung School		
Fuel	**Usage**	**Cost**
Electricity	215,729 kWh	$31,627
Natural Gas	26,953 Therms	$21,258
Total		**$52,885**

The current utility cost for this site is $52,885 as shown in the chart below.

Figure 7 - Energy Cost Breakdown

$52,885

3.2 Electricity Usage

Electricity is provided by PSE&G. The average electric cost (combined for commodity, transmission and distribution) for the past 12 months is $0.126/kWh, which is the blended rate used throughout the analyses in this report. The monthly electricity consumption and peak demand is represented graphically in the chart below. The electricity use profile reflects low occupancy in the summer months.

Figure 8 - Electric Usage & Demand

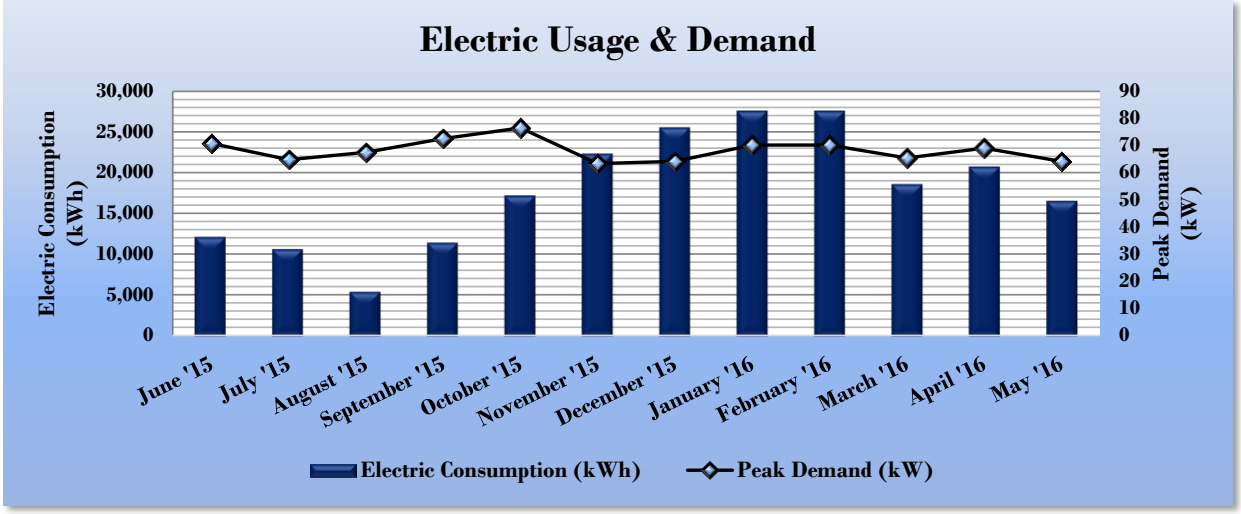


Figure 9 - Electric Usage & Demand

Electric Billing Data for Watchung School					
Period Ending	Days in Period	Electric Usage (kWh)	Demand (kW)	Demand Cost	Total Electric Cost
6/16/15	30	12,120	71	$316	$2,522
7/17/15	31	10,650	65	$599	$2,244
8/17/15	30	5,430	68	$307	$1,561
9/16/15	30	11,430	73	$281	$2,404
10/16/15	31	17,220	77	$293	$2,472
11/16/15	30	22,325	63	$316	$3,032
12/16/15	30	25,535	64	$334	$3,362
1/17/16	31	27,565	70	$276	$3,384
2/17/16	31	27,564	70	$280	$3,384
3/16/16	31	18,600	65	$873	$2,413
4/16/16	29	20,730	69	$306	$2,673
5/17/16	31	16,560	64	$287	$2,176
Totals	**365**	**215,729**	**76.5**	**$4,469**	**$31,627**
Annual	**365**	**215,729**	**76.5**	**$4,469**	**$31,627**

3.3 Natural Gas Usage

Natural gas is provided by PSE&G. The average gas cost for the past 12 months is $0.789/therm, which is the blended rate used throughout the analyses in this report. The monthly gas consumption is represented graphically in the chart below. The gas use profile is typical for a facility with a significant heating load relative to other end uses.

Figure 10 - Natural Gas Usage

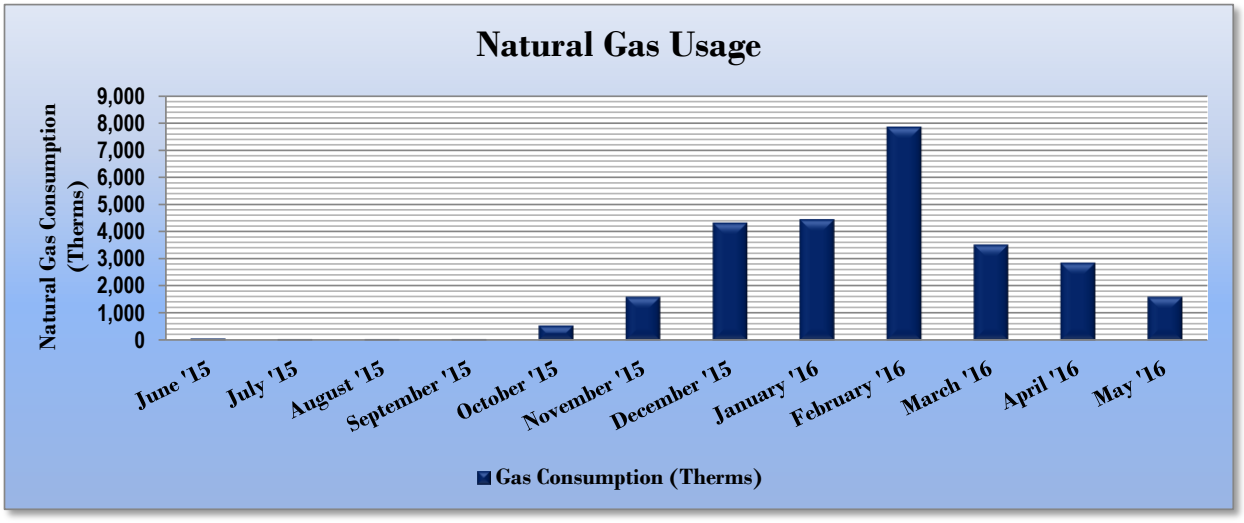

Figure 11 - Natural Gas Usage

Annual	**365**	**26,953**	**$21,258**	

3.4 Benchmarking

This facility was benchmarked through Portfolio Manager®, an online tool created and managed by the United States Environmental Protection Agency (EPA) through the ENERGY STAR® program. Portfolio Manager® analyzes your building's consumption data, cost information, and operational use details and compares its performance against a yearly baseline, national medians, or similar buildings in your portfolio. Metrics used in this comparison are the Energy Use Intensity (EUI) and ENERGY STAR® score.

The EUI is a measure of a facility's energy consumption per square foot, and it is the standard metric for comparing buildings' energy performance. Comparing the EUI of a building with the national median EUI for that building type illustrates whether that building uses more energy than similar buildings on a square foot basis or if that building performs better than the median. EUI is presented in both site energy and source energy. Site energy is the amount of fuel and electricity consumed by a building as reflected in utility bills. Source energy is the raw fuel consumed to generate the energy consumed at the site, factoring in energy production and distribution losses.

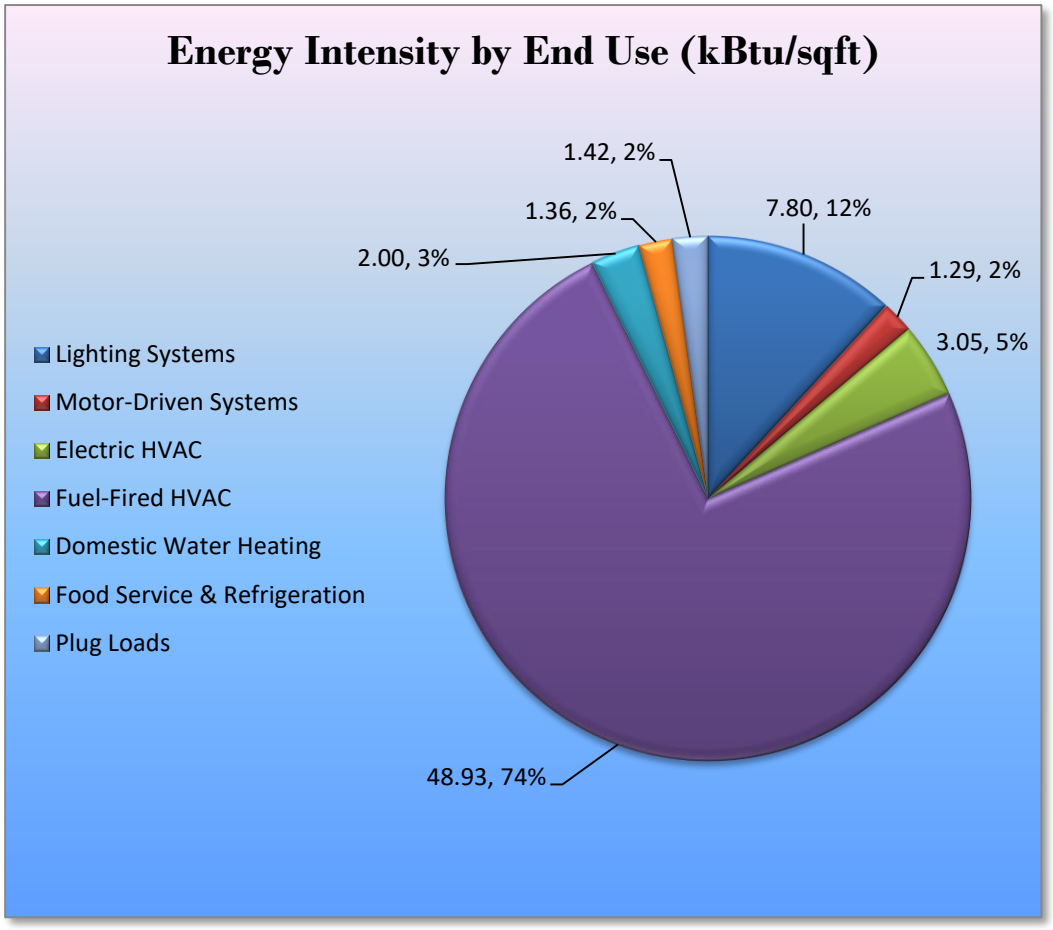
Figure 12 - Energy Use Intensity Comparison – Existing Conditions

Energy Use Intensity Comparison - Existing Conditions		
	Watchung School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	98.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	65.8	58.2

By implementing all recommended measures covered in this reporting, the project's estimated post-implementation EUI improves as shown in the table below:

Figure 13 - Energy Use Intensity Comparison – Following Installation of Recommended Measures

Energy Use Intensity Comparison - Following Installation of Recommended Measures		
	Watchung School	National Median Building Type: School (K-12)
Source Energy Use Intensity (kBtu/ft^2)	77.7	141.4
Site Energy Use Intensity (kBtu/ft^2)	58.6	58.2



Many buildings can also receive a 1 – 100 ENERGY STAR® score. This score compares your building's energy performance to similar buildings nationwide. A score of 50 represents median energy performance, while a score of 75 means your building performs better than 75 percent of all similar buildings nationwide — and may be eligible for ENERGY STAR® certification. This facility has a current score of 52.

The Portfolio Manager®, Statement of Energy Performance can be found in Appendix B: ENERGY STAR® Statement of Energy Performance.

3.5 Energy End-Use Breakdown
