In order to provide a complete overview of energy consumption across building systems, an energy balance was performed at this facility. An energy balance utilizes standard practice engineering methods to evaluate all components of the various electric and fuel-fired systems found in a building and determine their proportional contribution to overall building energy usage. This visual representation of energy end uses highlights systems that may benefit most from energy efficiency projects.

Figure 14 - Energy Balance (% and kBtu/SF)

4 ENERGY CONSERVATION MEASURES

Level of Analysis

The goal of this audit report is to identify potential energy projects, help prioritize specific measures for implementation, and set the Watchung School on the path to receive financial incentives. For this audit report, most measures have received only a preliminary analysis of feasibility which identifies expected ranges of savings and costs. This level of analysis is considered sufficient to make "Go/No-Go" decisions and to prioritize energy projects. Savings are based on the New Jersey Board of Public Utilities New Jersey Clean Energy Program Protocols to Measure Resource Savings dated June 29, 2016. Further analysis or investigation may be required to calculate more accurate savings to support any custom SmartStart, Pay for Performance, or Large Energy Users incentive applications. Financial incentives for the ECMs identified in this report have been calculated based the NJCEP prescriptive SmartStart program. Depending on your implementation strategy, the project may be eligible for more lucrative incentives through other programs as identified in Section 8.

The following sections describe the evaluated measures.

4.1 Recommended ECMs

The measures below have been evaluated by the auditor and are recommended for implementation at the facility.

Figure 15 – Summary of Recommended ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**87,875**	**21.3**	**0.0**	**$11,062.52**	**$54,625.36**	**$8,020.00**	**$46,605.36**	**4.21**	**88,489**
ECM 1	Install LED Fixtures	23,287	4.7	0.0	$2,931.59	$16,761.33	$2,310.00	$14,451.33	4.93	23,450
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,305	0.3	0.0	$164.33	$1,350.00	$85.00	$1,265.00	7.70	1,315
ECM 3	Retrofit Fixtures with LED Lamps	62,154	16.2	0.0	$7,824.55	$35,008.26	$5,625.00	$29,383.26	3.76	62,589
ECM 4	Install LED Exit Signs	1,128	0.1	0.0	$142.04	$1,505.77	$0.00	$1,505.77	10.60	1,136
Lighting Control Measures		**9,932**	**2.6**	**0.0**	**$1,250.38**	**$5,760.00**	**$770.00**	**$4,990.00**	**3.99**	**10,002**
ECM 5	Install Occupancy Sensor Lighting Controls	9,932	2.6	0.0	$1,250.38	$5,760.00	$770.00	$4,990.00	3.99	10,002
Domestic Water Heating Upgrade		**0**	**0.0**	**41.7**	**$328.66**	**$93.21**	**$0.00**	**$93.21**	**0.28**	**4,879**
ECM 6	Install Low-Flow Domestic Hot Water Devices	0	0.0	41.7	$328.66	$93.21	$0.00	$93.21	0.28	4,879
TOTALS		**97,807**	**23.9**	**41.7**	**$12,641.56**	**$60,478.57**	**$8,790.00**	**$51,688.57**	**4.09**	**103,370**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

4.1.1 Lighting Upgrades

Our recommendations for lighting upgrades are summarized Figure 16 below.

Figure 16 – Summary of Lighting Upgrade ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Upgrades		**87,875**	**21.3**	**0.0**	**$11,062.52**	**$54,625.36**	**$8,020.00**	**$46,605.36**	**4.21**	**88,489**
ECM 1	Install LED Fixtures	23,287	4.7	0.0	$2,931.59	$16,761.33	$2,310.00	$14,451.33	4.93	23,450
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	1,305	0.3	0.0	$164.33	$1,350.00	$85.00	$1,265.00	7.70	1,315
ECM 3	Retrofit Fixtures with LED Lamps	62,154	16.2	0.0	$7,824.55	$35,008.26	$5,625.00	$29,383.26	3.76	62,589
ECM 4	Install LED Exit Signs	1,128	0.1	0.0	$142.04	$1,505.77	$0.00	$1,505.77	10.60	1,136

ECM 1: Install LED Fixtures

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	12,785	3.3	0.0	$1,609.48	$10,901.18	$810.00	$10,091.18	6.27	12,874
Exterior	10,502	1.4	0.0	$1,322.11	$5,860.16	$1,500.00	$4,360.16	3.30	10,576

Measure Description

This measure evaluates replacing existing fixtures with new high-performance LED light fixtures at interior and exterior locations. In the auditorium, consider removing and replacing halogen and LED sources. The Green House is illuminated with HID fixtures which should be considered for LED. High Intensity Discharge (HID) lighting along the building perimeter should also be looked at for replacement at LED source lighting. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are generally more than twice that of a fluorescent source and more than 10 times incandescent sources. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During planning and design for the installation of new fixtures, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 2: Retrofit Fluorescent Fixtures with LED Lamps and Drivers

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,305	0.3	0.0	$164.33	$1,350.00	$85.00	$1,265.00	7.70	1,315
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T12 lamps, ballasts, and reflectors with LED tube lamps, reflectors, and drivers specifically designed for existing linear fluorescent fixtures. The retrofit uses the existing fixture housing but replaces the rest of the components with an efficient source and reflectors designed for LEDs. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output and efficiently projects the light into the space.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 3: Retrofit Fixtures with LED Lamps

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	62,154	16.2	0.0	$7,824.55	$35,008.26	$5,625.00	$29,383.26	3.76	62,589
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing linear fluorescent T8 lamps with LED tube lamps and replacing incandescent and compact fluorescent screw-in based lamps with LED lamps. Many LED tube lamps are direct replacements for existing fluorescent lamps and can be installed although there is a fluorescent fixture ballast in place. Other tube lamps require that fluorescent fixture ballasts be removed or replaced with LED drivers. Screw-in LED lamps can be used as a direct replacement for most other screw-in lamps. This measure saves energy by installing LED sources which use less power than other technologies with a comparable light output.

Maintenance savings are anticipated since LED sources have burn hours which are more than twice that of a fluorescent source and more than 10 times incandescent sources. LED lamps that use the existing fluorescent fixture ballast will be constrained by the remaining hours of the ballast. Maintenance savings may be partially offset by the higher material costs associated with LED sources.

During retrofit planning and design, we recommend a holistic approach that considers both the technology of the lighting sources and how they are controlled.

ECM 4: Install LED Exit Signs

Summary of Measure Economics

Interior/ Exterior	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Interior	1,128	0.1	0.0	$142.04	$1,505.77	$0.00	$1,505.77	10.60	1,136
Exterior	0	0.0	0.0	$0.00	$0.00	$0.00	$0.00	0.00	0

Measure Description

This measure evaluates replacing incandescent lighting in exit signs with LEDs. LED sources require virtually no maintenance and LED exit signs have a life expectancy of at least 20 years. Many manufacturers can provide retrofit kits that meet fire and safety code requirements. Retrofit kits are less expensive and simpler to install than replacement signs, however, new fixtures would have a longer useful life and are therefore recommended.

A reduction in maintenance costs will be realized with the proposed retrofit because lamps will not have to be replaced as frequently.

4.1.2 Lighting Control Measures

Our recommendations for lighting control measures summarized in Figure 17 below.

Figure 17 – Summary of Lighting Control ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Lighting Control Measures		**9,932**	**2.6**	**0.0**	**$1,250.38**	**$5,760.00**	**$770.00**	**$4,990.00**	**3.99**	**10,002**
ECM 5	Install Occupancy Sensor Lighting Controls	9,932	2.6	0.0	$1,250.38	$5,760.00	$770.00	$4,990.00	3.99	10,002

ECM 5: Install Occupancy Sensor Lighting Controls

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
9,932	2.6	0.0	$1,250.38	$5,760.00	$770.00	$4,990.00	3.99	10,002

Measure Description

This measure evaluates installing occupancy sensors to control light fixtures that are currently manually controlled in many restrooms, classrooms, storage rooms, and offices. Sensors detect occupancy using ultrasonic and/or infrared wave technologies. Lighting systems are enabled when an occupant is detected. Fixtures are automatically turned off after an area has been vacant for a preset period. Occupants will also be able to manually turn off fixtures. Energy savings result from only operating lighting systems when they are required.

Occupancy sensors may be mounted on the wall at existing switch locations, mounted on the ceiling, or in remote locations. Ceiling-mounted or remote-mounted sensors require the use of low voltage switching relays or a wireless signal to the switch. In general, use wall switch replacement sensors for single occupant offices and other small rooms. Install ceiling-mounted or remote mounted sensors in locations without local switching, in situations where the existing wall switches are not in the line-of-sight of the main work area, and in large spaces. We recommend a holistic design approach that considers both the technology of the lighting sources and how they are controlled.

Maintenance savings are anticipated due to reduced lamp operation, however, additional maintenance costs may be incurred because the occupancy sensors may require periodic adjustment; it is anticipated that the net effect on maintenance costs will be negligible.

4.1.3 Domestic Water Heating Upgrade

Our recommendations for domestic water heating improvements are summarized in Figure 18 below.

Figure 18 - Summary of Domestic Water Heating ECMs

Energy Conservation Measure		Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
Domestic Water Heating Upgrade		**0**	**0.0**	**41.7**	**$328.66**	**$93.21**	**$0.00**	**$93.21**	**0.28**	**4,879**
ECM 6	Install Low-Flow Domestic Hot Water Devices	0	0.0	41.7	$328.66	$93.21	$0.00	$93.21	0.28	4,879

ECM 6: Install Low-Flow DHW Devices

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	41.7	$328.66	$93.21	$0.00	$93.21	0.28	4,879

Measure Description

This measure evaluates the savings from installing low flow domestic water devices to reduce overall water flow in general and hot water flow in particular. Low flow faucet aerators reduce the water flow, relative to standard aerators, from the fixture.

All of the low flow devices reduce the overall water flow from the fixture which generally reduces the amount of hot water used resulting in energy and water savings.

4.2 ECMs Evaluated but Not Recommended

The measures below have been evaluated by the auditor but are not recommended for implementation at the facility. Reasons for exclusion can be found in each measure description section.

Figure 19 – Summary of Evaluated but Not Recommended ECMs

Energy Conservation Measure	Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)*	Estimated Net Cost ($)	Simple Payback Period (yrs)**	CO_2e Emissions Reduction (lbs)
Motor Upgrades	**1,441**	**1.4**	**0.0**	**$181.37**	**$3,481.49**	**$0.00**	**$3,481.49**	**19.20**	**1,451**
Premium Efficiency Motors	1,441	1.4	0.0	$181.37	$3,481.49	$0.00	$3,481.49	19.20	1,451
Electric Unitary HVAC Measures	**492**	**0.3**	**0.0**	**$61.99**	**$1,360.95**	**$0.00**	**$1,360.95**	**21.95**	**496**
Install High Efficiency Electric AC	492	0.3	0.0	$61.99	$1,360.95	$0.00	$1,360.95	21.95	496
Gas Heating (HVAC/Process) Replacement	**0**	**0.0**	**36.2**	**$285.90**	**$52,933.84**	**$2,848.00**	**$50,085.84**	**175.19**	**4,244**
Install High Efficiency Steam Boilers	0	0.0	36.2	$285.90	$52,933.84	$2,848.00	$50,085.84	175.19	4,244
TOTALS	**1,933**	**1.7**	**36.2**	**$529.26**	**$57,776.28**	**$2,848.00**	**$54,928.28**	**103.78**	**6,191**

* - All incentives presented in this table are based on NJ Smart Start Building equipment incentives and assume proposed equipment meets minimum performance criteria for that program.

** - Simple Payback Period is based on net measure costs (i.e. after incentives).

Premium Efficiency Motors

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
1,441	1.4	0.0	$181.37	$3,481.49	$0.00	$3,481.49	19.20	1,451

Measure Description

This measure evaluates replacing the two 0.8 hp boiler feed water and the two 3 hp condensate water pumps standard efficiency motors with EISA 2007 efficiency motors. The evaluation assumes existing motors will be replaced with the same size motors. It is important that the speed of each new motor match the speed of the motor it replaces as closely as possible. The base case motor efficiencies are obtained from nameplate information. Proposed case premium motor efficiencies are obtained from the *New Jersey's Clean Energy Program Protocols to Measure Resource Savings (2016*). Savings are based on the difference between baseline and proposed efficiencies and the annual operating hours.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone.

Install High Efficiency Electric AC

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
492	0.3	0.0	$61.99	$1,360.95	$0.00	$1,360.95	21.95	496

Measure Description

This measure evaluates replacing window air conditioner serving room 19 with high efficiency window air conditioner. There have been significant improvements in both compressor and fan motor efficiencies in the past several years. Therefore, electricity savings can be achieved by replacing old units with new high efficiency units. A higher EER or SEER rating indicates a more efficient cooling system. The magnitude of energy savings for this measure depends on the relative efficiency of the old and new unit, the cooling load, and the annual operating hours.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone. Replace this unit with a high efficiency unit when funds are available to do so, or upon failure.

Install High Efficiency Steam Boilers

Summary of Measure Economics

Annual Electric Savings (kWh)	Peak Demand Savings (kW)	Annual Fuel Savings (MMBtu)	Annual Energy Cost Savings ($)	Estimated Install Cost ($)	Estimated Incentive ($)	Estimated Net Cost ($)	Simple Payback Period (yrs)	CO_2e Emissions Reduction (lbs)
0	0.0	36.2	$285.90	$52,933.84	$2,848.00	$50,085.84	175.19	4,244

Measure Description

This measure evaluates replacing the older inefficient steam boiler with a high efficiency steam boiler. Significant improvements have been made in combustion technology resulting in increases in overall boiler efficiency. Savings result from improved combustion efficiency and reduced standby losses at low loads.

Reasons for not Recommending

The simple payback of this measure exceeds the expected useful life of the equipment and is therefore not recommended on the basis of energy savings alone. However, replacement of this boiler now would modernize the core of the heating system and help minimize deferred maintenance on the system.

5 ENERGY EFFICIENT PRACTICES

In addition to the quantifiable savings estimated in Section 4, a facility's energy performance can also be improved through application of low or no-cost efficiency strategies. By employing certain behavioral and operational adjustments as well as performing routine maintenance on building systems, equipment lifetime can be extended; occupant comfort, health and safety can be improved; and annual energy, operation, and maintenance costs can be reduced. The recommendations below are provided as a framework for developing a whole building maintenance plan that is customized to your facility. Consult with qualified equipment specialists for details on proper maintenance and system operation.

Close Doors and Windows

Ensure doors and windows are closed in conditioned spaces. Leaving doors and windows open leads to a significant increase in heat transfer between conditioned spaces and the outside air. Reducing a facility's air changes per hour (ACH) can lead to increased occupant comfort as well as significant heating and cooling savings, especially when combined with proper HVAC controls and adequate ventilation.

Perform Proper Lighting Maintenance

In order to sustain optimal lighting levels, lighting fixtures should undergo routine maintenance. Light levels decrease over time due to lamp aging, lamp and ballast failure, and buildup of dirt and dust on lamps, fixtures and reflective surfaces. Together, these factors can reduce total illumination by 20% - 60% or more, while operating fixtures continue drawing full power. To limit this reduction, lamps, reflectors and diffusers should be thoroughly cleaned of dirt, dust, oil, and smoke film buildup approximately every 6 – 12 months.

Develop a Lighting Maintenance Schedule

In addition to routine fixture cleaning, development of a maintenance schedule can both ensure maintenance is performed regularly and can reduce the overall cost of fixture re-lamping and re-ballasting. By re-lamping and re-ballasting fixtures in groups, lighting levels are better maintained and the number of site visits by a lighting technician or contractor can be minimized, decreasing the overall cost of maintenance.

Ensure Lighting Controls Are Operating Properly

Lighting controls are very cost effective energy efficient devices, when installed and operating correctly. As part of a lighting maintenance schedule, lighting controls should be tested annually to ensure proper functioning. For occupancy sensors, this requires triggering the sensor and verifying that the sensor's timer settings are correct. For daylight sensors, maintenance involves cleaning of sensor lenses and confirming setpoints and sensitivity are appropriately configured.

Use Fans to Reduce Cooling Load

Utilizing ceiling fans to supplement cooling is a low cost strategy to reduce cooling load considerably. Thermostat settings can be increased by 4°F with no change in overall occupant comfort when the wind chill effect of moving air is employed for cooling.

Clean Evaporator/Condenser Coils on AC Systems

Dirty evaporators and condensers coils cause a restriction to air flow and restrict heat transfer. This results in increased evaporator and condenser fan load and a decrease in cooling system performance. Keeping the coils clean allows the fans and cooling system to operate more efficiently.

Clean and/or Replace HVAC Filters

Air filters work to reduce the amount of indoor air pollution and increase occupant comfort. Over time, filters become less and less effective as particulate buildup increases. In addition to health concerns related to clogged filters, filters that have reached saturation also restrict air flow through the facility's air conditioning or heat pump system, increasing the load on the distribution fans and decreasing occupant comfort levels. Filters should be checked monthly and cleaned or replaced when appropriate.

Perform Proper Boiler Maintenance

Many boiler problems develop slowly over time, so regular inspection and maintenance is essential to retain proper functionality and efficiency of the heating system. Fuel burning equipment should undergo yearly tune-ups to ensure they are operating as safely and efficiently as possible from a combustion standpoint. A tune-up should include a combustion analysis to analyze the exhaust from the boilers and to ensure the boiler is operating safely. Buildup of dirt, dust, or deposits on the internal surfaces of a boiler can greatly affect its heat transfer efficiency. These deposits can accumulate on the water side or fire side of the boiler. Boilers should be cleaned regularly according to the manufacturer's instructions to remove this build up in order to sustain efficiency and equipment life.

Perform Proper Water Heater Maintenance

At least once a year, drain a few gallons out of the water heater using the drain valve. If there is a lot of sediment or debris, then a full flush is recommended. Turn the temperature down and then completely drain the tank. Once a year check for any leaks or heavy corrosion on the pipes and valves. For gas water heaters, check the draft hood and make sure it is placed properly, with a few inches of air space between the tank and where it connects to the vent. Look for any corrosion or wear on the gas line and on the piping. If you noticed any black residue, soot or charred metal, this is a sign you may be having combustion issues and you should have the unit serviced by a professional. For electric water heaters, look for any signs of leaking such as rust streaks or residue around the upper and lower panels covering the electrical components on the tank. For water heaters over three to four years old have a technician inspect the sacrificial anode annually.

Plug Load Controls

There are a variety of ways to limit the energy use of plug loads including increasing occupant awareness, removing under-utilized equipment, installing hardware controls, and using software controls. Some control steps to take are to enable the most aggressive power settings on existing devices or install load sensing or occupancy sensing (advanced) power strips. For additional information refer to "Plug Load Best Practices Guide" http://www.advancedbuildings.net/plug-load-best-practices-guide-offices.

Water Conservation

Installing low flow faucets or faucet aerators, low flow showerheads, and kitchen sink pre-rinse spray valves saves both energy and water. These devices save energy by reducing the overall amount of hot water used hence reducing the energy used to heat the water. The flow ratings for EPA WaterSense™ (http://www3.epa.gov/watersense/products) labeled devices are 1.5 gpm for bathroom faucets, 2.0 gpm for showerheads, and 1.28 gpm for pre-rinse spray valves.

Installing dual flush or low flow toilets and low flow or waterless urinals are additional ways to reduce the sites water use, however, these devices do not provide energy savings at the site level. Any reduction in water use does however ultimately reduce grid level electricity use since a significant amount of electricity is used to deliver water from reservoirs to end users. The EPA WaterSense™ ratings for urinals is 0.5 gpf and toilets that use as little as 1.28 gpf (this is lower than the current 1.6 gpf federal standard).

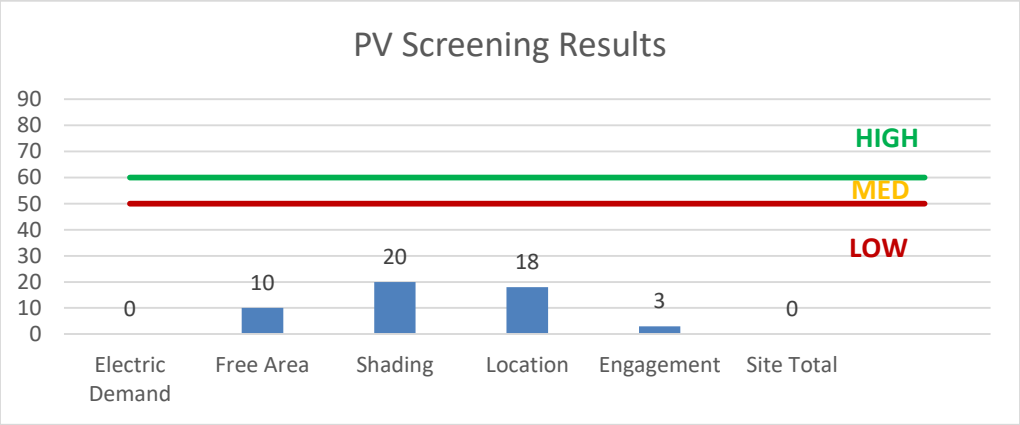
Refer to Section 4.1.3 for any low-flow ECM recommendations.

6 SELF-GENERATION MEASURES

Self-generation measures include both renewable (e.g., solar, wind) and non-renewable (e.g., microturbines) on-site technologies that generate power to meet all or a portion of the electric energy needs of a facility, often repurposing any waste heat where applicable. Also referred to as distributed generation, these systems contribute to Greenhouse Gas (GHG) emission reductions, demand reductions and reduced customer electricity purchases, resulting in the electric system reliability through improved transmission and distribution system utilization.

The State of New Jersey's Energy Master Plan (EMP) encourages new distributed generation of all forms and specifically focuses on expanding use of combined heat and power (CHP) by reducing financial, regulatory and technical barriers and identifying opportunities for new entries. The EMP also outlines a goal of 70% of the State's electrical needs to be met by renewable sources by 2050.

Preliminary screenings were performed to determine the potential that a generation project could provide a cost-effective solution for your facility. Before making a decision to implement, a feasibility study should be conducted that would take a detailed look at existing energy profiles, siting, interconnection, and the costs associated with the generation project including interconnection costs, departing load charges, and any additional special facilities charges.



6.1 Photovoltaic

Sunlight can be converted into electricity using photovoltaics (PV) modules. Modules are racked together into an array that produces direct current (DC) electricity. The DC current is converted to alternating current (AC) through an inverter. The inverter is interconnected to the facility's electrical distribution system. The amount of unobstructed area available determines how large of a solar array can be installed. The size of the array combined with the orientation, tilt, and shading elements determines the energy produced.

A preliminary screening based on the facility's electric demand, size and location of free area, and shading elements shows that the facility has a **Low** potential for installing a PV array.

In order to be cost-effective, a solar PV array generally needs a minimum of 4,000 square feet of flat or south-facing rooftop, or other unshaded space, on which to place the PV panels. In our opinion, the facility does appear not meet these minimum criteria for cost-effective PV installation.

Figure 20 - Photovoltaic Screening

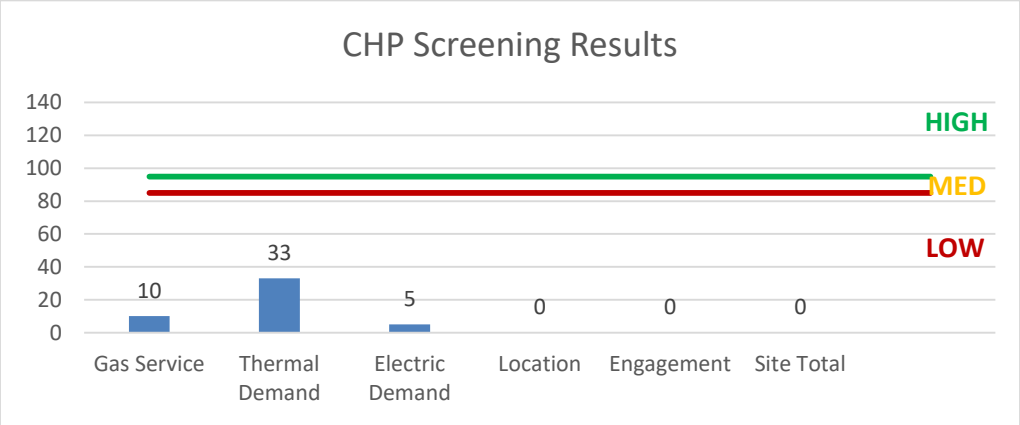
6.2 Combined Heat and Power

In non-industrial settings, combined heat and power (CHP) is the on-site generation of electricity and recovery of heat which is put to beneficial use. Common prime movers in CHP applications include reciprocating engines, microturbines, fuel cells, and (at large facilities) gas turbines. Electricity is typically interconnected to the sites local distribution system. Heat is recovered from the exhaust stream and the ancillary cooling system and interconnected to the existing hot water (or steam) distribution system.



CHP systems are typically used to produce a portion of the electricity needed by a facility, with the balance of electric needs satisfied by purchase from the grid. The heat is used to supplement (or supplant) existing boilers for the purpose of space heating and/or domestic hot water heating. Waste heat can also be routed through absorption chillers for the purpose of space cooling. The key criteria used for screening, however, is the amount of time the system operates at full load and the facility's ability to use the recovered heat. Facilities with continuous use for large quantities of waste heat are the best candidates for CHP.

A preliminary screening based on heating and electrical demand, siting, and interconnection shows that the facility has a **Low** potential for installing a cost-effective CHP system.

Low or infrequent thermal load, and lack of space near the existing thermal generation are the most significant factors contributing to the low potential for CHP at the site. In our opinion, the facility does not appear to meet the minimum requirements for a cost-effective CHP installation.

For a list of qualified firms in NJ specializing in commercial CHP cost assessment and installation, go to: http://www.njcleanenergy.com/commercial-industrial/programs/nj-smartstart-buildings/tools-and-resources/tradeally/approved_vendorsearch/.

Figure 21 - Combined Heat and Power Screening

7 DEMAND RESPONSE

Demand Response (DR) is a program designed to reduce consumer electric load when electric wholesale prices are high or when the reliability of the electric grid is threatened due to peak demand. DR service providers (a.k.a. Curtailment Service Providers) are registered with PJM, the independent system operator (ISO) for mid-Atlantic state region that is charged with maintaining electric grid reliability locally.

By enabling grid operators to call upon Curtailment Service Providers and energy consumers to reduce electric usage during times of peak demand, the grid is made more reliable and overall transmission costs are reduced for all ratepayers. Curtailment Service Providers provide regular payments to medium and large consumers of electric power for their participation in DR programs. Program participation is voluntary and participants will receive payments whether or not their facility is called upon to curtail their load.

Typically an electric customer needs to be capable of reducing their electric demand, within minutes, by at least 100 kW or more in order to participate in a DR program. Customers with a greater capability to quickly curtail their demand during peak hours will receive higher payments. Customers with back-up generators onsite may also receive additional DR payments for their generating capacity if they agree to run the generators for grid support when called upon. Eligible customers who have chosen to participate in a DR program often find it to be a valuable source of revenue for their facility(ies) because the payments can significantly offset annual utility costs.

Participating customers can often quickly reduce their peak load through simple measures, such as temporarily raising temperature set points on thermostats so that air conditioning units run less frequently or agreeing to dim or shut off less critical lighting. This usually requires some level of building automation and controls capability to ensure rapid load reduction during a DR event cycle. DR program participants often have to install smart meters and may need to also sub-meter larger energy-using equipment, such as chillers, in order to demonstrate compliance with DR program requirements.

DR does not include the reduction of electricity consumption based on normal operating practice or behavior. For example, if a company's normal schedule is to close for a holiday, the reduction of electricity due to this closure or scaled-back operation is not considered a demand response activity in most situations.

The first step toward participation in a DR program is to contact a Curtailment Service Provider. A list of these providers is available on PJM's website and it includes contact information for each company, as well as the states where they have active business (http://www.pjm.com/markets-and-operations/demand-response/csps.aspx). PJM also posts training materials that are developed for program members interested in specific rules and requirements regarding DR activity (http://www.pjm.com/training/training%20material.aspx), along with a variety of other DR program information.

Curtailment Service Providers typically offer free assessments to determine a facility's eligibility to participate in a DR program. They will provide details regarding the program rules and requirements for metering and controls, a facility's ability to temporarily reduce electric load, as well as the payments involved in participating in the program. Also, these providers usually offer multiple options for DR to larger facilities and may also install controls or remote monitoring equipment to help ensure compliance of all terms and conditions of a DR contract.

A preliminary screening based on the facility's electric demand and equipment configuration, shows that the facility has a low potential for participation in a DR program.

8 PROJECT FUNDING / INCENTIVES

The NJCEP is able to provide the incentive programs described below, and others, because of the Societal Benefits Charge (SBC) Fund. The SBC was created by the State of New Jersey's 1999 Electricity Restructuring Law which requires all customers of investor-owned electric and gas utilities to pay this charge on their monthly energy bills. As a contributor to the fund you were able to participate in the LGEA program and are also eligible to utilize the equipment incentive programs. Also available through the NJBPU are some alternative financing programs described later in this section. Please refer to Figure 22 for a list of the eligible programs identified for each recommended ECM.

Figure 22 - ECM Incentive Program Eligibility

Energy Conservation Measure		SmartStart Prescriptive	SmartStart Custom	Direct Install
ECM 1	Install LED Fixtures	x		x
ECM 2	Retrofit Fluorescent Fixtures with LED Lamps and Drivers	x		x
ECM 3	Retrofit Fixtures with LED Lamps	x		x
ECM 4	Install LED Exit Signs			x
ECM 5	Install Occupancy Sensor Lighting Controls	x		x
ECM 6	Install Low-Flow Domestic Hot Water Devices			x

SmartStart is generally well suited for implementation of individual or small sets of measures, with the flexibility to install projects at your own pace using in-house staff or a preferred contractor. Direct Install caters to small to mid-size facilities to bundle measures and simplify participation, but requires the use of pre-approved contractors. The Pay for Performance (P4P) program is a "whole-building" energy improvement program designed for larger facilities and requires implementation of multiple measures meeting minimum savings thresholds, as well as use of pre-approved consultants. The Large Energy Users Program (LEUP) is available to New Jersey's largest energy users giving them flexibility to install as little or as many measures, in a single facility or several facilities, with incentives capped based on the entity's annual energy consumption; applicants can use in-house staff or preferred contractor.

Generally, the incentive values provided throughout the report assume the SmartStart program is utilized because it provides a consistent comparison of available incentives.

Brief descriptions of all relevant alternative financing and incentive programs are located in the sections below. You may also check the following website for further information, including most current program availability, requirements, and incentive levels: www.njcleanenergy.com/ci.

8.1 SmartStart

Overview

The SmartStart program offers incentives for installing prescriptive and custom energy efficiency measures at your facility. Routinely the program adds, removes or modifies incentives from year to year for various energy efficiency equipment based on market trends and new technologies.

Prescriptive Equipment Incentives Available:

Electric Chillers
Electric Unitary HVAC
Gas Cooling
Gas Heating
Gas Water Heating
Ground Source Heat Pumps
Lighting
Lighting Controls
Refrigeration Doors
Refrigeration Controls
Refrigerator/Freezer Motors
Food Service Equipment
Variable Frequency Drives

Most equipment sizes and types are served by this program. This program provides an effective mechanism for securing incentives for energy efficiency measures installed individually or as part of a package of energy upgrades.

Incentives

The prescriptive path provides fixed incentives for specific energy efficiency measures whereas the custom measure path provides incentives for unique or specialized technologies that are not addressed through prescriptive offerings.

Since your facility is an existing building, only the retrofit incentives have been applied in this report. Custom measure incentives are calculated at $0.16/kWh and $1.60/therm based on estimated annual savings, capped at the lesser of 50% of the total installed incremental project cost, or a buy down to a one year payback. Program incentives are capped at $500,000 per electric account and $500,000 per natural gas account, per fiscal year.

How to Participate

To participate in the SmartStart program you will need to submit an application for the specific equipment to be installed. Many applications are designed as rebates, although others require application approval prior to installation. Applicants may work with a contractor of their choosing and can also utilize internal personnel, which provides added flexibility to the program. Using internal personnel also helps improve the economics of the ECM by reducing the labor cost that is included in the tables in this report.

Detailed program descriptions, instructions for applying and applications can be found at: www.njcleanenergy.com/SSB.

8.2 Direct Install

Overview

Direct Install is a turnkey program available to existing small to mid-sized facilities with a peak electric demand that did not exceed 200 kW in any of the preceding 12 months. You will work directly with a pre-approved contractor who will perform a free energy assessment at your facility, identify specific eligible measures, and install those measures. Energy efficiency measures may include lighting and lighting controls, refrigeration, HVAC, motors, variable speed drives and controls.

Incentives

The program pays up to 70% of the total installed cost of eligible measures, up to $125,000 per project. Direct Install participants will also be held to a fiscal year cap of $250,000 per entity.

How to Participate

To participate in the Direct Install program you will need to contact the participating contractor assigned to the county where your facility is located; a complete list is provided on the Direct Install website identified below. The contractor will be paid the program incentive directly which will pass on to you in the form of reduced material and implementation costs. This means up to 70% of eligible costs are covered by the program, subject to program caps mentioned above, and the remaining 30% of the cost is your responsibility to the contractor.

Since Direct Install offers a free assessment, LGEA applicants that do not meet the audit program eligibility requirements, but do meet the Direct Install requirements, may be moved directly into this program.

Detailed program descriptions and applications can be found at: www.njcleanenergy.com/DI.

8.3 Energy Savings Improvement Program

The Energy Savings Improvement Program (ESIP) is an alternate method for New Jersey's government agencies to finance the implementation of energy conservation measures. An ESIP is a type of "performance contract," whereby school districts, counties, municipalities, housing authorities and other public and state entities enter in to contracts to help finance building energy upgrades. This is done in a manner that ensures that annual payments are lower than the savings projected from the ECMs, ensuring that ESIP projects are cash flow positive in year one, and every year thereafter. ESIP provides government agencies in New Jersey with a flexible tool to improve and reduce energy usage with minimal expenditure of new financial resources. NJCEP incentive programs can be leveraged to help further reduce the total project cost of eligible measures.

This LGEA report is the first step to participating in ESIP. Next, you will need to select an approach for implementing the desired ECMs:

(1) Use an Energy Services Company or "ESCO."
(2) Use independent engineers and other specialists, or your own qualified staff, to provide and manage the requirements of the program through bonds or lease obligations.
(3) Use a hybrid approach of the two options described above where the ESCO is utilized for some services and independent engineers, or other specialists or qualified staff, are used to deliver other requirements of the program.

After adopting a resolution with a chosen implementation approach, the development of the Energy Savings Plan (ESP) can begin. The ESP demonstrates that the total project costs of the ECMs are offset by the energy savings over the financing term, not to exceed 15 years. The verified savings will then be used to pay for the financing.

The ESIP approach may not be appropriate for all energy conservation and energy efficiency improvements. Entities should carefully consider all alternatives to develop an approach that best meets their needs. A detailed program descriptions and application can be found at: www.njcleanenergy.com/ESIP.

Please note that ESIP is a program delivered directly by the NJBPU and is not an NJCEP incentive program. As mentioned above, you may utilize the incentive programs to help further reduce costs when compiling the ESP. You should refer to the ESIP guidelines at the link above for further information and guidance on next steps.

9 ENERGY PURCHASING AND PROCUREMENT STRATEGIES

9.1 Retail Electric Supply Options

In 1999, New Jersey State Legislature passed the Electric Discount & Energy Competition Act (EDECA) to restructure the electric power industry in New Jersey. This law deregulated the retail electric markets, allowing all consumers to shop for service from competitive electric suppliers. The intent was to create a more competitive market for electric power supply in New Jersey. As a result, utilities were allowed to charge Cost of Service and customers were given the ability to choose a third-party (i.e. non-utility) energy supplier.

Energy deregulation in New Jersey has increased energy buyers' options by separating the function of electricity distribution from that of electricity supply. So, though you may choose a different company from which to buy your electric power, responsibility for your facility's interconnection to the grid and repair to local power distribution will still reside with the traditional utility company serving your region.

If your facility is not purchasing electricity from a third-party supplier, consider shopping for a reduced rate from third-party electric suppliers. If your facility is purchasing electricity from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party electric suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

9.2 Retail Natural Gas Supply Options

The natural gas market in New Jersey has also been deregulated. Most customers that remain with the utility for natural gas service pay rates that are market-based and that fluctuate on a monthly basis. The utility provides basic gas supply service (BGSS) to customers who choose not to buy from a third-party supplier for natural gas commodity.

A customer's decision about whether to buy natural gas from a retail supplier is typically dependent upon whether a customer seeks budget certainty and/or longer-term rate stability. Customers can secure longer-term fixed prices by signing up for service through a third-party retail natural gas supplier. Many larger natural gas customers may seek the assistance of a professional consultant to assist in their procurement process.

If your facility is not purchasing natural gas from a third-party supplier, consider shopping for a reduced rate from third-party natural gas suppliers. If your facility is purchasing natural gas from a third-party supplier, review and compare prices at the end of the current contract or every couple years.

A list of third-party natural gas suppliers, who are licensed by the state to provide service in New Jersey, can be found online at: www.state.nj.us/bpu/commercial/shopping.html.

ENERGY STAR® Score[1]

Watchung Elementary School

Primary Property Type: K-12 School
Gross Floor Area (ft²): 52,109
Built: 1900

For Year Ending: April 30, 2016
Date Generated: December 21, 2017

1. The ENERGY STAR score is a 1-100 assessment of a building's energy efficiency as compared with similar buildings nationwide, adjusting for climate and business activity.

Property & Contact Information

Property Address	Property Owner	Primary Contact

APPENDIX 2 ECM CALCULATIONS

This Page Intentionally Left Blank

Montclair Board of Education
Exhibit D
ECM 1A LED Lighting
Lighting Upgrade and Heating Penalty

ECM DESCRIPTION

Retrofit existing lighting fixtures with new energy efficient lighting fixtures, install motion sensors and implement daylight harvesting in selected areas

DATA / ASSUMPTIONS

* Heating Season	20	Weeks
** Fraction of heat to be made-up	40.0%	
Heating Hours (Weather Data)	3,948	Hours

** Fraction of the Year Representing the Cooling Season Liberal estimate of the heating season, as there are times during the year when the building is neither heated nor cooled.
*** Fraction of the Lighting Reduction that Has to Be Made Up by Heating a portion of the lighting heat is released at night plus interior zones will have limited heating loads

MEASUREMENT AND VERIFICATION

Option A - The Engineering Calculations are based on 5% of the retrofitted lighting fixtures direct kW measurements and operating hours. The kW Measurements are taken for existing lighting fixtures before removal and for new installed lighting fixtures. Lighting operating hours are agreed by client basis from the audit, logging data, and operating personal input. The occupancy sensors savings are calculated as % of operating hours basebd on logging data and historical statistical data

COMMISSIONING

Confirm lighting operation and occupancy sensors functions

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Relatively high safety factor is used for this ECM because of direct measurements are proven over the time and savings are stipulated

Lighting Upgrade and Heating Penalty

Prescriptive Lighting

This is a fixture replacement program for existing commercial customers targeted for facilities performing efficiency upgrades to their lighting systems. New fixtures and technologies available after publication will be periodically updated. Baselines will be established based on the guidelines noted below.

Algorithms

$$\Delta kW = (\#\ of\ replaced\ fixtures) * (baseline\ fixture\ wattage\ from\ table) - (\#\ of\ fixtures\ installed) * (wattage\ of\ new\ fixture)$$

$$\text{Energy Savings } \left(\frac{\text{kWh}}{\text{yr}}\right) = (\Delta\text{kW}) * (Hrs) * (1 + HVAC_e)$$

$$\text{Peak Demand Savings (kW)} = (\Delta\text{kW}) * (CF) * (1 + HVAC_d)$$

$$\text{Fuel Savings } \left(\frac{\text{MMBtu}}{\text{yr}}\right) = (\Delta\text{kW}) * (\text{Hrs}) * (\text{HVAC}_g)$$

Definition of Variables

ΔkW	= Change in connected load from baseline to efficient lighting level.
CF	= Coincidence factor
Hrs	= Annual hours of operation
$HVAC_d$	= HVAC interactive factor for peak demand savings
$HVAC_e$	= HVAC interactive factor for annual energy savings
$HVAC_g$	= HVAC interactive factor for annual fuel savings

Summary of Inputs

Prescriptive Lighting for Commercial Customers

Component	Type	Value	Source

*** Fraction of the Lighting Reduction that Has to Be Made Up by Heating a portion of the lighting heat is released at night plus interior zones will have limited heating loads

MEASUREMENT AND VERIFICATION

Option A - The Engineering Calculations are based on 5% of the retrofitted lighting fixtures direct kW measurements and operating hours. The kW Measurements are taken for existing lighting fixtures before removal and for new installed lighting fixtures. Lighting operating hours are agreed by client basis from the audit, logging data, and operating personal input. The occupancy sensors savings are calculated as % of operating hours basebd on logging data and historical statistical data

COMMISSIONING

Confirm lighting operation and occupancy sensors functions

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Relatively high safety factor is used for this ECM because of direct measurements are proven over the time and savings are stipulated

Montclair Board of Education
Exhibit D
ECM 1C Vending Misers
Vending Misers

ECM DESCRIPTION

Install vending machines with vending misers, mounted on the respective vending machine.

DATA / ASSUMPTIONS

Cold Drink Run Hour Reduction	34%	
Snack Machine Run Hour Reduction	40%	
Typical Cold Drink Wattage	0.339	kW
Typical Snack Machine Wattage	0.041	kW

MEASUREMENT AND VERIFICATION

Option A -Pre M&V: Measurement of KW for 5% sample machines in each category Energy Savings scope with measured KW and compare to pre retrofit calculated savings.

COMMISSIONING

Confirm vending miser operation

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%

Relatively high safety factor is used for this ECM because of direct measurements are proven over the time and savings are stipulated

CALCULATIONS

Detailed energy savings calculations are in the line-by-line calculation sheet

*Inputs are blue

Montclair Board of Education
Exhibit D
ECM 1D De-Stratification Fans
De-stratifcation fans

ECM DESCRIPTION

Install de-stratification fans in large open ares. Fans will push and hold hot air down to reduce heating losses through the roof and upper section of the outside walls due to reducing the indoor temperature in these sections above the fan.

DATA / ASSUMPTIONS

Heating Hours	3,948	Hours
Roof - R Value (Assume between 1-2" insulation)	4.5	ft2-Deg F-hr/BTU
Wall - R Value (Assume 1/2" Wall Board, 8" LWCC, 4" Brick)	4.5	ft2-Deg F-hr/BTU
Window U Value Single Pane	1.20	Btu/ft2-Deg F-hr
Window U Value Double Pane	0.70	Btu/ft2-Deg F-hr

*Heating efficiency of de-stratification fans assumed at 60%

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Verify that the installed fans operate. Install clock meter on fans to verify that fans are running 24/7 during heating season

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Fuel savings recovery factor is conservatively set for 0 for the ECM due to the uncertainity in consistency of temperature difference between room and upper level temperatures, electric penalties recovery factor is at 0.

FORMULA

$$W_{TOTAL} = W_{FAN} \cdot q \cdot t_{FAN}$$

$$Q_{SAVINGS} = Q_{TOTAL} \cdot \mu$$

$$Q_{TOTAL} = Q_{WALL} + Q_{ROOF} + Q_{WIN}$$

$$Q_{WALL} = \sum_{-5}^{60} ((T_{STRAT} - T_{OCC}) \cdot A_{WALL} \cdot U_{WALL} \cdot t_{OCC}) + ((T_{STRAT} - T_{UNOCC}) \cdot A_{WALL} \cdot U_{WALL} \cdot t_{UNOCC})$$
$$Q_{WIN} = \sum_{-5}^{60} ((T_{STRAT} - T_{OCC}) \cdot A_{WIN} \cdot U_{WIN} \cdot t_{OCC}) + ((T_{STRAT} - T_{UNOCC}) \cdot A_{WIN} \cdot U_{WIN} \cdot t_{UNOCC})$$
$$Q_{ROOF} = \sum_{-5}^{60} ((T_{STRAT} - T_{OCC}) \cdot A_{ROOF} \cdot U_{ROOF} \cdot t_{OCC}) + ((T_{STRAT} - T_{UNOCC}) \cdot A_{ROOF} \cdot U_{ROOF} \cdot t_{UNOCC})$$

Variable	Units	Description
$Q_{SAVINGS}$	Therms	Annual thermal savings
$\sum_{-5}^{60}$	-	Summation of all bins from -5°F to 60°F
μ	%	Diversity factor of de-stratification fans (25% - 50%)
Q_{TOTAL}	btu	Total heat loss
Q_{WALL}	btu	Heat loss through wall (above de-stratification fan)
Q_{ROOF}	btu	Heat loss through roof
Q_{WIN}	btu	Heat loss through windows (above de-stratification fan)
T_{BIN}	°F	Temperature of respective bin
T_{OCC}	°F	Existing temperature of space during occupied hours
T_{UNOCC}	°F	Existing temperature of space during unoccupied hours
T_{STRAT}	°F	Existing stratified temperature above de-stratification fan) during all heating hours
t_{OCC}	Hrs	Occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Unoccupied Bin Hours in respective temperature bin
A_{WALL}	ft^2	Exposed wall area adove de-stratification fan
A_{ROOF}	ft^2	Exposed roof area adove de-stratification fan
A_{WINDOW}	ft^2	Exposed window area adove de-stratification fan
U_{WALL}	btu / ft^2 / °F	U-factor of wall
U_{ROOF}	btu / ft^2 / °F	U-factor of roof
U_{WIN}	btu / ft^2 / °F	U-factor of windows
W_{TOTAL}	kWh	Annual electrical consumption of fans
q	-	Quantity of fans
W_{FAN}	kW	Input kW of fan
t_{FAN}	Hrs	Annual run time of de-stratification fan (annual heating hours)

Montclair Board of Education
Exhibit D
ECM 1E Plug Load Management via WiFi
Smart Strips and Smart Board Projectors

ECM DESCRIPTION

Install BERT plug load management plug on the various plug loads throughout the district. Integrate equipment onto a central wifi network to schedule these pieces of equipment

DATA / ASSUMPTIONS

Electrical Power Draw When OFF

Cold Beverage Machines	384	W
Snack Machines	60	W
Large Copiers	30	W
Small Printers / Copiers	20	W
Monitor Combos (Printer)	30	W
Laptop Charging Carts	35	W
Projectors	21	W
Water Fountains	6	W
Coffee Machines	60	W
Hot / Cold Water Machines	60	W
Smart Boards	20	W
Window A/C Units	100	W
TVs	10	W
XXXs	0	W
XXXs	0	W

Annual Savings for smart strips and smart board projectors are based on logging results for the various pieces of equipment

MEASUREMENT AND VERIFICATION

Option A - The engineering calculations are based on direct kW measurements over a defined time period of the existing plug load and post BERT device. A population will be measured before the switch to the BERT devices to determine a baseline usage during a defined time period.

COMMISSIONING

Review installation and network integration with the IT department

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%

The safety factor for this ECM is taken at 0 due to conserative run hours based on data logging results.

ECM 2A Boiler Upgrade
Boiler Replacement Calculation

ECM DESCRIPTION

Replace boilers in respective buildings with new high efficiency condensing boilers

DATA / ASSUMPTIONS

Typical Condensing Boiler Seasonal Efficiency =	91.5%	
Heating Hours	3,948	Hours

* Utility baseline reduced by 10.5% to account for domestic hot water, science labs, and kitchen usage
* An adjusted baseline is used for the boiler baseline usage as to not double-dip on savings

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Verify all functions of the boiler control system, safety and operation. Verify air/fuel ratio is consistent through firing range. Provide training of the boiler operators

RECOVERY/SAFETY FACTOR

Safety Factor (Thermal) = 0%

A safety factor of 0 is used due to minimal variables and the proven results of this measure

FORMULAE

$Q_{savings} = ((\eta_{NEW} - \eta_{OLD}) / \eta OLD) \cdot Fuel_{ADJ}$

Variable	Units	Description
$Q_{savings}$	Therms	Thermal Savings
η_{NEW}	%	Efficiency of New Boiler
η_{OLD}	%	Efficiency of Old Boiler
$Fuel_{ADJ}$	Therms	Adjusted Boiler Fuel Usage

Montclair Board of Education
Exhibit D
ECM 2A Boiler Upgrade
Boiler Replacement Calculation

Notes:
Replacing the existing boiler with a new, high efficiency unit will reduce operating costs at this location.
Improving the air/fuel ratio will increase overall boiler combustion efficiency.
Note that the boiler efficiency discussed here is the overall boiler thermal efficiency, not just its combustion efficiency. The value of this number will be much lower than for combustion efficiency alone as it includes losses from radiation, blowdown, and other related losses. The value for annual boiler fuel has been adjusted for the effect of other ECMs.
New Non -Condensing Boilers will be Equiped with Control Links

Boiler Replacement Calculation

Prescriptive Boilers

This prescriptive measure targets the use of smaller-scale boilers (less than or equal to 4000 MBH) and furnaces (no size limitation) in all commercial facilities. Larger sized boilers are treated under the custom measure path.

This measure applies to new construction, replacement of failed equipment, or end of useful life. The baseline unit is a code compliant unit with an efficiency as required by ASHRAE Std. 90.1 – 2013, which is the current code adopted by the State of New Jersey.

Algorithms

Fuel Savings (MMBtu/yr) = Cap_{in} * $EFLH_h$ * ((Eff_q/Eff_b)-1) / 1000 kBtu/MMBtu

Definition of Variables

Cap_{in} = Input capacity of qualifying unit in kBtu/hr
$EFLH_h$ = The Equivalent Full Load Hours of operation for the average unit during the heating season in hours
Eff_b = Boiler Baseline Efficiency
Eff_q = Boiler Proposed Efficiency
1000 = Conversion from kBtu to MMBtu

Summary of Inputs

Prescriptive Boilers

Component	Type	Value	Source
Cap_{in}	Variable		Application
$EFLH_h$	Fixed	See Table Below	1
Eff_b	Variable	See Table Below	2
Eff_q	Variable		Application

ECM 2B Boiler Burner Replacement & Controls
Boiler Controlinks

ECM DESCRIPTION

Install burner controls on existing burners which optimize fuel to air ratio instantaneously

DATA / ASSUMPTIONS

Heating Hours	3,948	Hours
Controlinks improvement in boiler efficiency:	6.5%	
Delphi Combustion Controls	8.0%	
Intellidyne improvement in boiler efficiency:	4.0%	

* Utility baseline reduced by 10.5% to account for domestic hot water, science labs, and kitchen usage
* An adjusted baseline is used for the boiler baseline usage as to not double-dip on savings

Controlinks

# Projected Burner/Boiler Efficiency Savings	
Removal of Linkage Wear* (0 to 2.0)	2.0%
Improved Combustion** (.5 to 3.0)	3.0%
Increased Turndown*** (.5 to 1.5)	1.5%
Total Efficiency Savings	6.5%

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Verify all functions of the boiler control system, safety and operation. Verify air/fuel ratio is consistent through firing range. Provide training of the boiler operators

RECOVERY/SAFETY FACTOR

Safety Factor (Thermal) =	0%

There is no safety factor as improvement in efficiency is conservative

Annual Energy Savings	228	244	580	(5)	(8)	237	106

Notes:
Replacing the existing boiler with a new, high efficiency unit will reduce operating costs at this location.
Improving the air/fuel ratio will increase overall boiler combustion efficiency.
New Boiler will be Natural Gas
Note that the boiler efficiency discussed here is the overall boiler thermal efficiency, not just its combustion efficiency. The value of this number will be much lower than for combustion efficiency alone as it includes losses from radiation, blowdown, and other related losses. The value for annual boiler fuel has been adjusted for the effect of other ECMs.
New Non -Condensing Boilers will be Equiped with Control Links

ECM 2D Rooftop Unit Replacement (DI)
Rooftop Unit Replacement

ECM DESCRIPTION

Replace existing Rooftop Units with high efficiency units

DATA / ASSUMPTIONS

RTU Supply Air Temperature is assumed at, unless stated otherwise 85 °F
Full Load is estimated at 11°F for heating and 92.5°F for cooling unless stated otherwise

MEASUREMENT AND VERIFICATION

Option A (Electric) - Direct kW and savings measurements before and after installation conducted. A report is generated showing the reduction in kW

COMMISSIONING

Verify all functions of the rooftop system, safety and operation.

RECOVERY/SAFETY FACTOR

Safety Factor (Thermal) = 0%

A safety factor of 0 is used due to minimal variables and the proven results of this measure

FORMULAE

$W_{SAVINGS} = W_C - W_C$

$W_C = (W_{C\text{-}OCC} + W_{C\text{-}UNOCC})$
$W_C = (W_{C\text{-}OCC} + W_{C\text{-}UNOCC})$

$W_{C\text{-}OCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{OCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{OCC} \cdot \eta$
$W_{C\text{-}UNOCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{UNOCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{UNOCC} \cdot \eta$

$W_{C\text{-}OCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{OCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{OCC} \cdot \eta$
$W_{C\text{-}UNOCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{UNOCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{UNOCC} \cdot \eta$

$Q_{SAVINGS} = \sum_{-5}^{60} Q_{INPUT} - Q_{INPUT}$

$Q_{INPUT} = \sum_{-5}^{60} (t_{OCC} \cdot Q_{LOAD} \cdot L_{\%}) / \eta_{RTU}$
$Q_{INPUT} = \sum_{-5}^{60} (t_{OCC} \cdot Q_{LOAD} \cdot L_{\%}) / \eta_{RTU}$

$Q_{LOAD} = \sum_{-5}^{60} 1.08 \cdot CFM_{SUPPLY} \cdot (T_{SUPPLY} - T_{MIXED})$

$T_{RISE} = \sum_{-5}^{60} T_{SUPPLY} - T_{MIXED}$

$T_{MIXED} = \sum_{-5}^{60} ((CFM_{RETURN} \cdot T_{RETURN}) + (CFM_{OA} \cdot T_{BIN})) / (CFM_{RETURN} + CFM_{OA})$

Montclair Board of Education
Exhibit D
ECM 2D Rooftop Unit Replacement (DI)
Rooftop Unit Replacement

Variable	Units	Description
$W_{SAVINGS}$	kWh	Electrical Savings
W_C	kWh	Existing RTU Consumption
W_C	kWh	Proposed RTU Consumption
$\eta_{\%}$	%	Efficiency gain due to RTU optimization
$\sum_{60}^{105}$	-	Summation of all bins from 60°F to 105°F
C	Ton	Tonnage of RTU
η	-	Existing efficiency of RTU (EER)
η	-	Proposed efficiency of RTU (EER)
T_{DESIGN}	°F	Design Temperature of RTU (Usually 97.5°F)
T_{BIN}	°F	Bin Weather Temperature
T_{OCC}	°F	Temperature of building during occupied hours
T_{UNOCC}	°F	Temperature of building during unoccupied hours
t_{OCC}	Hrs	Existing occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Existing unoccupied Bin Hours in respective temperature bin
$Q_{SAVINGS}$	Therms	Thermal Savings
$\sum_{-5}^{60}$	-	Summation of all bins from -5°F to 60°F
T_{BIN}	°F	Temperature of respective bin
Q_{INPUT}	Therms	Existing Input heat provided by RTUs at respective bin temperature
Q_{INPUT}	Therms	Proposed Input heat provided by RTUs at respective bin temperature
Q_{LOAD}	Therms	Heat load on the unit vent
$L_{\%}$	%	Load % at respective bin
T_{RISE}	°F	Temperature rise across the coil (100% Design at 10°F)
T_{MIXED}	°F	Mixed air temperature
T_{SUPPLY}	Hrs	Temperature of supply air
T_{RETURN}	Hrs	Temperature of return air
CFM_{SUPPLY}	CFM	Total supply CFM of unit vent
CFM_{OA}	CFM	Total outside air CFM of unit vent
CFM_{RETURN}	CFM	Total return air CFM of unit vent
q	-	Quantity of replaced/refurbished RTUs
η_{REFURB}	%	Efficiency improvement of refurbished unit vent
$\eta_{REPLACE}$	%	Efficiency improvement of replaced unit vent
t_{OCC}	Hrs	Occupied Bin Hours in respective temperature bin

* Inputs are in blue
*Checks against baseline are in purple

Electric HVAC Systems

This measure provides energy and demand savings algorithms for C&I Electric HVAC systems. The type of systems included in this measure are: split systems, single package systems, air to air cooled heat pumps, packaged terminal systems (PTAC and PTHP), single package vertical systems (SPVAC and SPVHP), central DX AC systems, water source heat pumps, ground water source heat pumps, and/or ground source heat pumps.

This measure applies to new construction, replacement of failed equipment, or end of useful life. The baseline unit is a code compliant unit with an efficiency as required by ASHRAE Std. 90.1 – 2013, which is the current code adopted by the state of New Jersey.

Algorithms

Air Conditioning Algorithms:

Energy Savings (kWh/yr) = N * Tons * 12 kBtuh/Ton * (1/EER_b-1/EER_q) * $EFLH_c$

Peak Demand Savings (kW) = N * Tons * 12 kBtuh/Ton * (1/EER_b-1/EER_q) * CF

Heat Pump Algorithms:

Cooling Energy Savings (kWh/yr) = N * Tons * 12 kBtuh/Ton * (1/EER_b-1/EER_q) * $EFLH_c$

Heating Energy Savings (Btu/yr) = N * Tons * 12 kBtuh/Ton * ((1/ (COP_b * 3.412))-(1/ (COP_q * 3.412)) * $EFLH_h$

Where *c* is for cooling and *h* is for heating.

Definition of Variables

N = Number of units

Tons = Rated cooling capacity of unit.This value comes from ARI/AHRI or AHAM rating or manufacturer data.

EER_b = Energy Efficiency Ratio of the baseline unit. This data is found in the HVAC and Heat Pumps table below. For units < 65,000 BtuH (5.4 tons), SEER should be used in place of EER.

COP_b = Coefficient of Performance of the baseline unit. This data is found in the HVAC and Heat Pumps table below. For units < 65,000 BtuH (5.4 tons), SEER and HSPF/3.412 should be used in place of COP * 3.412 for cooling and heating savings, respectively.

EER_q = Energy Efficiency Ratio of the high efficiency unit. This value comes from the ARI/AHRI or AHAM directories or manufacturer data. For units < 65,000 (5.4 tons) BtuH, SEER should be used in place of EER.

COP_q = Coefficient of Performance of the high efficiency unit. This value comes from the ARI/AHRI or AHAM directories or manufacturer data. For units < 65,000 BtuH (5.4 tons), SEER and HSPF/3.412 should be used in place of COP * 3.412 for cooling and heating savings, respectively.

CF = Coincidence Factor – This value represents the percentage of the total load which is on during electric system's Peak Window. This value is based on existing measured usage and determined as the average number of operating hours during the peak window period.

$EFLH_{c\ or\ h}$ = Equivalent Full Load Hours – This represents a measure of energy use by season during the on-peak and off-peak periods.

Summary of Inputs

HVAC and Heat Pumps

Component	Type	Value	Source
Tons	Variable	Rated Capacity, Tons	Application
EER_b	Variable	See Table below	1
EER_q	Variable	ARI/AHRI or AHAM Values	Application
CF	Fixed	50%	2
EFLH	Variable	See Tables below	3

$EFLH_{(c\ or\ h)}$	Variable	See Tables below	5

HVAC Baseline Efficiencies Table – New Construction/EUL/RoF

Equipment Type	Baseline = ASHRAE Std. 90.1 – 2013
Unitary HVAC/Split Systems and Single Package, Air Cooled	
<=5.4 tons, split	13 SEER
<=5.4 tons, single	14 SEER
>5.4 to 11.25 tons	11.0 EER, 12.7 IEER
>11.25 to 20 tons	10.8 EER, 12.2 IEER
> 21 to 63 tons	9.8 EER, 11.4 IEER
>63 Tons	9.5 EER, 11.0 IEER
Air Cooled Heat Pump Systems, Split System and Single Package	
<=5.4 tons, split	14 SEER, 8.2 HSPF
<=5.4 tons, single	14 SEER, 8.0 HSPF
>5.4 to 11.25 tons	10.8 EER, 11.0 IEER, 3.3 heating COP
>11.25 to 20 tons	10.4 EER, 11.4 IEER, 3.2 heating COP
>= 21	9.3 EER, 10.4 IEER, 3.2 heating COP

Equipment Type	Baseline = ASHRAE Std. 90.1 – 2013
Water Source Heat Pumps (water to air, water loop)	
<=1.4 tons	12.2 EER, 4.3 heating COP
>1.4 to 5.4 tons	13.0 EER, 4.3 heating COP
>5.4 to 11.25 tons	13.0 EER, 4.3 heating COP
Ground Water Source Heat Pumps <=11.25 tons	18.0 EER, 3.7 heating COP
Ground Source Heat Pumps (brine to air, ground loop) <=11.25 tons	14.1 EER, 3.2 heating COP
Package Terminal Air Conditioners[37]	14.0 – (0.300 * Cap/1,000), EER
Package Terminal Heat Pumps	14.0 – (0.300 * Cap/1,000), EER 3.7 – (0.052 * Cap/1,000), heating COP
Single Package Vertical Air Conditioners	
<=5.4 tons	10.0 EER
>5.4 to 11.25 tons	10.0 EER
>11.25 to 20 tons	10.0 EER
Single Package Vertical Heat Pumps	
<=5.4 tons	10.0 EER, 3.0 heating COP
>5.4 to 11.25 tons	10.0 EER, 3.0 heating COP
>11.25 to 20 tons	10.0 EER, 3.0 heating COP

Kitchen Hood Replacement

ECM DESCRIPTION

Kitchen hoods in the district's kitchens are ventilated by exhaust fans. Fans are running most of the time at full speed when kitchen is in operation even if there are no activities under the hoods. e new ventilaton control systems will control exhaust fans based on hood exhaust temperatures. The exhaust fan will be equipped with VFDs will control air flows. If the exhaust fan is combined with a make up air unit, then variable air flow will be controlled on both exhaust and make up air fans.

DATA / ASSUMPTIONS

Existing equipment schedule was given by personnel operating the kitchen equipment and with interviews with facility staff

MEASUREMENT AND VERIFICATION

Option A (Both Electric and Fuel) - Measure kW, logging fan operation and calculate energy savings, both electric and fuel, from collected data with fan and make up air information from manufacturer.

COMMISSIONING

Test exhaust fans and make up air units that they operate per design intent, which include simulation of the exhaust temperature driving fan motor speeds. Verify all safety interlocks.

RECOVERY/SAFETY FACTOR

Recovery/Safety Factor (Electric) =	0%
Recovery/Safety Factor (Thermal) =	0%

Savings calculations are based on weather bin data, make up air flow and operating schedules. A more conservative is used for heating losses due to the uncertainty of the basic operating information in terms of the volume of air being exhausted and other operating perimeters. The heating fuel saving calculations are based upon information provided by the equipment vendor. The exhaust fan electric savings are based on existing fan schedules and proposed fan schedules. Recovery factor of the electric savings is less conservative due to knowledge of technical data and agreed operating schedule.

FORMULAE

$W_{SAVINGS} = (W_{FAN} - W_{FAN})$

$Q_{SAVINGS} = (Q_{HOOD} - Q_{HOOD}) / \eta_{Boiler}$

$W_{FAN} = \sum_{0\%}^{100\%} HP \cdot Lf \cdot .746 \cdot t_{HOOD}$

$W_{FAN} = \sum_{0\%}^{100\%} (HP \cdot Lf \cdot .746) \cdot RPM_{\%}^{3} \cdot t_{HOOD}$

$Q_{HOOD} = (1.08 \cdot V_{EX} \cdot HD_{OCC} \cdot (t_{HOOD} / t_{HOOD} + t_{OCC})) / (\eta_{sys} \cdot 100{,}000)$

$Q_{HOOD} = (1.08 \cdot V_{EX} \cdot HD_{OCC} \cdot (t_{HOOD} / t_{HOOD} + t_{OCC})) / (\eta_{sys} \cdot 100{,}000)$

$V_{EX} = V_{EX} \cdot RPM_{W}$

New and Retrofit Kitchen Hoods with Variable Frequency Drives

Kitchen Hoods with Variable Frequency Control utilize optical and temperature sensors at the hood inlet to monitor cooking activity. Kitchen hood exhaust fans are throttled in response to real time ventilation requirements. Energy savings result from fan power reduction during part load operation as well as a decrease in heating and cooling requirement of make-up air.

Algorithms

Electric Fan Savings (kWh/yr) = N * (HP * *LF * 0.746/FEFF) * RH * PR

Heating Savings (MMBtu/yr) = SF * CFM/SF * OF * FR * HDD * 24 * 1.08 / (HEFF * 1,000,000)

Cooling Savings (kWh/yr) = SF * CFM/SF * OF * FR * CDD * 24 * 1.08 / (CEFF * 3,412)

Definition of Variables

N = Number of Kitchen Hood Fan Motors
HP = Kitchen Hood Fan Motor HP
LF = Existing Motor Loading Factor
0.746 = Conversion factor = HP to kW
F_{EFF} = Efficiency of Kitchen Hood Fan Motors (%)
RH = Kitchen Hood Fan Run Hours
PR = Fan Motor Power Reduction resultant from VFD/Control Installation
SF = Kitchen Square Footage
CFM/SF = Code required ventilation rate per square foot for Commercial Kitchen spaces
OF = Ventilation rate oversize factor (compared to code requirement)
FR = Flow Reduction resultant from VFD/Control Installation
HDD_{mod} = Modified Heating Degree Days based on location and facility type
CDD_{mod} = Modified Cooling Degree Days based on location and facility type
24 = Hours per Day
1.08 = Sensible heat factor for air ((Btu/hr) / (CFM * Deg F))
H_{EFF} = Efficiency of Heating System (AFUE %)
C_{EFF} = Efficiency of Cooling System (COP)
3,412 = Conversion factor from Btu to kWh (3,412 Btu = 1 kWh)
1,000,000 = Btu/MMBtu

ECM 2F Walk In Compressor Controls
Walk-In Freezer/Cooler Controllers

ECM DESCRIPTION

Installation of a refrigeration controller made by intellidyne on walk-in freezers and refrigerators. This will reduce cycling and improve operating efficiency of the compressor.

DATA / ASSUMPTIONS

Assumed compressor and controller savings	15%	
Assumed Run Hours	4,200	Hours

MEASUREMENT AND VERIFICATION

Option A - Measure kW of selected freezer compressors. Logging compressor operation before and after the controller installations. Calculate savings based on measured results.

COMMISSIONING

Test compressors after installation.

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) = 0%

Recovery factor taken at 0 due to few installations and not proven savings record.

FORMULAE

$W_{SAVINGS} = (\ kW_{REFRIG} + kW_{FREEZER}\ ) \cdot t \cdot \delta_{\%SAVINGS}$

Variable	Units	Description

Exhibit D
ECM 2G Premium Efficiency Motors and VFDs
Variable Frequency Drives and Motor Replacements

ECM DESCRIPTION

There are standard efficiency motors and motors that need to be replaced due to poor condition throughout the district. These motors will be replaced with premium high efficiency motors to save electrical energy. In addition some new motors will be equipped with variable frequency drives (VFDs) for additional savings.

DATA / ASSUMPTIONS

Load Factor	**50%**

*VFD run speed percentages are based on typical VFD curves for hot water / chilled water loops
*Run hours are based on the audit, data logging, and through interviews with facility staff

MEASUREMENT AND VERIFICATION

Option A - The engineering calculations are based on direct kW measurements of the existing and installed motors and operating hours. All existing motors will be measured before removal and new motors after the installation. VFD kW will be measured through the load range and selected motors with VFDs will be monitored for the time period using kW loggers. Equipment operating hours are based on the audit, logging and operating personnel input.

COMMISSIONING

Review installation documents for alignments and vibrations. Start up equipment and measure vibration through the load range along with motor kW. Verify that VFDs are capable of operating in full design range upon the control signal demand.

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	**0%**

The safety factor for this ECM is taken at 0 due to some unknown data such as actual existing motor kW loads and operation hours.

Montclair Board of Education
Exhibit D

Variable Frequency Drives and Motor Replacements

FORMULAE

VFD

$W_{SAVINGSVFD} = W_{PROPOSED} - W_{VFD}$

$W_{VFD} = \sum_{0}^{60} Hp \cdot Lf \cdot \eta \cdot f^{\wedge 2.8} \cdot t_f$

MOTOR

$W_{SAVINGS} = W_{EXISTING} - W_{PROPOSED}$

$W_{EXISTING} = Hp \cdot Lf \cdot \eta \cdot t$
$W_{PROPOSED} = Hp \cdot Lf \cdot \eta \cdot t$

Variable	Units	Description
$W_{savingsVFD}$	kWh	Electrical Savings associated with VFD
$W_{savings}$	kWh	Electrical Savings for Motor Replacement
Hp	HP	Horsepower of motor
t	Hrs	Existing Run Hours
t	Hrs	Proposed Run Hours
Lf	-	Load Factor of motor
η	-	Existing efficiency of motor
η	-	Proposed efficiency of motor
$\sum_{0}^{60}$	-	Summation of all frequences (0 Hz to 60 Hz)
f	-	Frequency of drive, as a percentage of full frequency (60 Hz)
t_f	Hrs	Percentage of time motor will run at a particular frequency
W_{VFD}	kWh	Electrical consumption with VFD
$W_{EXISTING}$	kWh	Existing electrical consumption of motor
$W_{PROPOSED}$	kWh	Proposed electrical consumption of motor

Variable Frequency Drives

This section provides algorithms and assumptions for reporting of energy and demand savings for C/I Variable Frequency Drive (VFD) installations for HVAC systems including: supply air fans, return air fans, chilled water and condenser water pumps, hot water circulation pumps, water source heat pump circulation pumps, cooling tower fans, and boiler feed water pumps. VFD applications for other end uses should follow the custom path.

Algorithms

Energy Savings (kWh/yr) = N * HP * ESF

Peak Demand Savings (kW) = N * HP * DSF

Definitions of Variables

N = Number of motors controlled by VFD(s) per application
HP = Nameplate motor horsepower or manufacturer specification sheet per application
ESF = Energy Savings Factor (kWh/year per HP)
DSF = Demand Savings Factor (kW per HP)

Summary of Inputs

Variable Frequency Drives

Component	Type	Value	Source
HP	Variable	Nameplate/Manufacturer Spec. Sheet	Application
ESF	Variable	See Table Below	Derived value based on the following sources: 1, 2, 3
DSF	Variable	See Table Below	Derived value based on the following sources: 1, 2, 3

The ESF for the supply and return fans and circulating pumps are derived from a 2014 NEEP-funded study of 400 VFD installations in eight northeast states. The derived values are based on actual logged input power data and reflect average operating hours, load factors, and motor efficiencies for the sample. Savings factors representing cooling tower fans and boiler feed water pumps are not reflected in the NEEP report. Values representing these applications are taken from April 2018 New York TRM, Appendix K, and represent average values derived from DOE2.2 simulation of various building types

and climate zones, supplemented with results from an earlier analysis of actual program data completed by NSTAR in 2010.

The DSF are derived from the same sources. The NEEP values reflect the actual average impact for the category occurring in the PJM defined peak demand period. The NY values are based on a similar but not identically defined peak period. In all cases the values are expressed in kW/HP rating of the controlled motor and reflect average load factors during the peak period and motor efficiencies for the sample.

VFD Savings Factors

Application	ESF (kWh/Year-HP)	DSF (kW/HP)	Source
Supply Air Fan	2,033	0.286	1
Return Air Fan	1,788	0.297	1
CHW or CW Pump	1,633	0.185	1
HHW Pump	1,548	0.096	1
WSHP Pump	2,562	0.234	1
CT Fan	290	-0.025	2, 3
Boiler Feedwater Pump	1,588	0.498	2, 3

Motors

For premium efficiency motors 1-200 HP.
Algorithms

Montclair Board of Education
Exhibit D
ECM 2G Premium Efficiency Motors and VFDs
Variable Frequency Drives and Motor Replacements

From application form calculate ΔkW where:

$$\Delta kW = 0.746 * HP * IF_{VFD} * (1/\eta_{base} - 1/\eta_{prem})$$

Demand Savings = (ΔkW) * CF

Energy Savings = (ΔkW)*HRS * LF

Definition of Variables
ΔkW = kW Savings at full load

HP = Rated horsepower of qualifying motor, from nameplate/manufacturer specs.

LF = Load Factor, percent of full load at typical operating condition

IF_{VFD} = VFD Interaction Factor, 1.0 without VFD, 0.9 with VFD

η_{base} = Efficiency of the baseline motor

η_{prem} = Efficiency of the energy-efficient motor

HRS = Annual operating hours

CF = Coincidence Factor

ECM 2H Piping Insulation
Piping Insulation

ECM DESCRIPTION

Insulate bare hot water, steam and condensate piping located in boiler rooms and in transition areas. Repair damaged insulation on piping.
Insulate condensate storage tanks where applicable. Insulate steam heat exchangers where applicable.

DATA / ASSUMPTIONS

Run Hours	Varies by building
* Insulation "k" Factor of New Piping Insulation	0.270 Btu / ft^2 / °F / hr. / inch

*Respective boiler efficiencies are used

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Visual inspection per scope of work from subcontractor.

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

The safety factor for this ECM is taken at 0 due to uncertainty of on going steam and hot water piping temperatures incorporated in the savings calculation.

FORMULAE

Detailed energy savings calculations are in the Piping Insulation calculation sheet

* Inputs are in blue

Subcontractor Calculations N * If Yes - Please Refer to tab 'Sub Pipe Insulation' for details

This spreadsheet calculates insulation performance and bare pipe thermal losses for schedule 40 steel horizontal pipes. The calculation computes natural convective and radiant losses based on actual conditions using the Stephan-Boltzmann, radial heat flow and Nusselt equations. This calculation does not depend on insulation "k" factors but rather actual measured temperature data.

To use this spreadsheet, simply fill in all the blue cells. The tan cells contain fixed data or calculations and should not normally require change. All temperatures are in degrees F. If the nominal pipe size (NPS) for an application is greater than 10 inches, or other than listed, use the "OTHER" column. Other parameters will then be calculated automatically. If the insulation temp is known, insert the figures in row 20, (this color) otherwise the program will calculate an estimated value for you.

Montclair Board of Education
Exhibit D
ECM 2I Split System Replacement
Condensing Unit Replacement

ECM DESCRIPTION

Replace existing low efficiency condensing units in respective buildings with new high efficiency condensing units with an EER of 12+

CLARIFICATIONS, DELETIONS

*Run Hours based on occupancy schedule
*Full Load is estimated at (unless stated otherwise) : 97.5 °F
*Run hours are based on chiller cutoff temperature and bin weather data

MEASUREMENT AND VERIFICATION

Option A - The engineering calculations are based on direct kW measurements of the existing and installed condensing unit and operating hours.

COMMISSIONING

Start up equipment ensure proper operation

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) = 0%

The safety factor for this ECM is taken at 0 due to some variances on the run hours and the estimated part load efficiencies of the existing chiller.

FORMULAE

OPTIMIZATION

$W_{SAVINGS} = W_C \cdot \eta_{\%}$

REPLACEMENT

$W_{SAVINGS} = W_C - W_C$

$W_C = (W_{C\text{-}OCC} + W_{C\text{-}UNOCC})$
$W_C = (W_{C\text{-}OCC} + W_{C\text{-}UNOCC})$

$W_{C\text{-}OCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{OCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{OCC} \cdot \eta$
$W_{C\text{-}UNOCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{UNOCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{UNOCC} \cdot \eta$

$W_{C\text{-}OCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{OCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{OCC} \cdot \eta$
$W_{C\text{-}UNOCC} = \sum_{60}^{105} C \cdot (T_{BIN} - T_{UNOCC}) / (T_{BIN} - T_{DESIGN}) \cdot t_{UNOCC} \cdot \eta$

Variable	Units	Description
$W_{SAVINGS}$	kWh	Electrical Savings
W_C	kWh	Existing condensing unit Consumption
W_C	kWh	Proposed condensing unit Consumption
$\eta_{\%}$	%	Efficiency gain due to condensing unit optimization
$\sum_{60}^{105}$	-	Summation of all bins from 60°F to 105°F
C	Ton	Tonnage of condensing unit
η	-	Existing efficiency of condensing unit (EER)
η	-	Proposed efficiency of condensing unit (EER)
T_{DESIGN}	°F	Design Temperature of condensing unit (Usually 97.5°F)
T_{BIN}	°F	Bin Weather Temperature
T_{OCC}	°F	Temperature of building during occupied hours
T_{UNOCC}	°F	Temperature of building during unoccupied hours
t_{OCC}	Hrs	Existing occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Existing unoccupied Bin Hours in respective temperature bin

Electric HVAC Systems

This measure provides energy and demand savings algorithms for C&I Electric HVAC systems. The type of systems included in this measure are: split systems, single package systems, air to air cooled heat pumps, packaged terminal systems (PTAC and PTHP), single package vertical systems (SPVAC and SPVHP), central DX AC systems, water source heat pumps, ground water source heat pumps, and/or ground source heat pumps.

This measure applies to new construction, replacement of failed equipment, or end of useful life. The baseline unit is a code compliant unit with an efficiency as required by ASHRAE Std. 90.1 – 2013, which is the current code adopted by the state of New Jersey.

Algorithms

Air Conditioning Algorithms:

Energy Savings (kWh/yr) = N * Tons * 12 kBtuh/Ton * $(1/EER_b - 1/EER_q) * EFLH_c$

Peak Demand Savings (kW) = N * Tons * 12 kBtuh/Ton * $(1/EER_b - 1/EER_q) * CF$

Heat Pump Algorithms:

Cooling Energy Savings (kWh/yr) = N * Tons * 12 kBtuh/Ton * $(1/EER_b - 1/EER_q) * EFLH_c$

Heating Energy Savings (Btu/yr) = N * Tons * 12 kBtuh/Ton * $((1/(COP_b * 3.412)) - (1/(COP_q * 3.412)) * EFLH_h$

Where $_c$ is for cooling and $_h$ is for heating.

Definition of Variables

N = Number of units

Tons = Rated cooling capacity of unit.This value comes from ARI/AHRI or AHAM rating or manufacturer data.

EER_b = Energy Efficiency Ratio of the baseline unit. This data is found in the HVAC and Heat Pumps table below. For units < 65,000 BtuH (5.4 tons), SEER should be used in place of EER.

COP_b = Coefficient of Performance of the baseline unit. This data is found in the HVAC and Heat Pumps table below. For units < 65,000 BtuH (5.4 tons), SEER and HSPF/3.412 should be used in place of COP * 3.412 for cooling and heating savings, respectively.

EER_q = Energy Efficiency Ratio of the high efficiency unit. This value comes from the ARI/AHRI or AHAM directories or manufacturer data. For units < 65,000 (5.4 tons) BtuH, SEER should be used in place of EER.

COP_q = Coefficient of Performance of the high efficiency unit. This value comes from the ARI/AHRI or AHAM directories or manufacturer data. For units < 65,000 BtuH (5.4 tons), SEER and HSPF/3.412 should be used in place of COP * 3.412 for cooling and heating savings, respectively.

CF = Coincidence Factor – This value represents the percentage of the total load which is on during electric system's Peak Window. This value is based on existing measured usage and determined as the average number of operating hours during the peak window period.

$EFLH_{c\ or\ h}$ = Equivalent Full Load Hours – This represents a measure of energy use by season during the on-peak and off-peak periods.

Summary of Inputs

HVAC and Heat Pumps

Montclair Board of Education

Condensing Unit Replacement

Component	Type	Value	Source
Tons	Variable	Rated Capacity, Tons	Application
EER_b	Variable	See Table below	1
EER_q	Variable	ARI/AHRI or AHAM Values	Application
CF	Fixed	50%	2
$EFLH_{(c\ or\ h)}$	Variable	See Tables below	3

HVAC Baseline Efficiencies Table – New Construction/EUL/RoF

Equipment Type	Baseline = ASHRAE Std. 90.1 – 2013
Unitary HVAC/Split Systems and Single Package, Air Cooled	
<=5.4 tons, split	13 SEER
<=5.4 tons, single	14 SEER
>5.4 to 11.25 tons	11.0 EER, 12.7 IEER
>11.25 to 20 tons	10.8 EER, 12.2 IEER
> 21 to 63 tons	9.8 EER, 11.4 IEER
>63 Tons	9.5 EER, 11.0 IEER
Air Cooled Heat Pump Systems, Split System and Single Package	
<=5.4 tons, split	14 SEER, 8.2 HSPF
<=5.4 tons, single	14 SEER, 8.0 HSPF
>5.4 to 11.25 tons	10.8 EER, 11.0 IEER, 3.3 heating COP
>11.25 to 20 tons	10.4 EER, 11.4 IEER, 3.2 heating COP
>= 21	9.3 EER, 10.4 IEER, 3.2 heating COP
Water Source Heat Pumps (water to air, water loop)	
<=1.4 tons	12.2 EER, 4.3 heating COP
>1.4 to 5.4 tons	13.0 EER, 4.3 heating COP
>5.4 to 11.25 tons	13.0 EER, 4.3 heating COP
Ground Water Source Heat Pumps <=11.25 tons	18.0 EER, 3.7 heating COP
Ground Source Heat Pumps (brine to air, ground loop) <=11.25 tons	14.1 EER, 3.2 heating COP
Package Terminal Air Conditioners[37]	14.0 – (0.300 * Cap/1,000), EER
Package Terminal Heat Pumps	14.0 – (0.300 * Cap/1,000), EER 3.7 – (0.052 * Cap/1,000), heating COP
Single Package Vertical Air Conditioners	
<=5.4 tons	10.0 EER
>5.4 to 11.25 tons	10.0 EER
>11.25 to 20 tons	10.0 EER
Single Package Vertical Heat Pumps	
<=5.4 tons	10.0 EER, 3.0 heating COP
>5.4 to 11.25 tons	10.0 EER, 3.0 heating COP
>11.25 to 20 tons	10.0 EER, 3.0 heating COP

ECM 2J Steam Trap Replacement

Steam Trap Retrofit

ECM DESCRIPTION

Steam trap audit identified that there are steam traps that are not currently working or are partially working. Faulty steam traps will be either replaced or repaired.

DATA / ASSUMPTIONS

* Percentage of failed steam traps based on audit	0.270	Btu / ft^2 / °F / hr. / inch
*Respective boiler efficiencies are used		
Heating Hours	3,948	Hours
* # of traps/SF	0.0022	
Steam Enthalpy (5 psi, 230F)	961	

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Verify function of all steam traps per scope of work

RECOVERY/SAFETY FACTOR

Diversity Factor =	75%	Percentage of "lost" steam from orifice size from a failed trap (i.e. Not all all
Safety Factor (Thermal) =	0%	steam will flow through open orifice)

The safety factor for this ECM is taken at 0 due to exactness of the existing trap losses

FORMULAE

$Q_{savings} = (q_{loss} \cdot 1{,}194/100{,}000) / \eta$

$q_{loss} = \sum^{TRAPS} q_{trap} \cdot st_{fail\%} \cdot t$

$q_{trap} = 10.1 \cdot d^2 \cdot (p + 14.7)$

Variable	Units	Description
$Q_{savings}$	Therms	Thermal Savings
$\sum^{TRAPS}$	-	Summation of all steam traps
q_{loss}	lb / yr	Annual steam loss through failed office
q_{trap}	lb / hr	Steam loss through failed office
$st_{fail\%}$	%	Percentage of failed steam traps
t	hrs	Annual heating system run hours
p	psig	Pressure of steam through respective system
d	inches	Orifice Diameter
η	%	Boiler Efficiency

* Inputs are in blue

ECM 2K Air Handling Unit Refurbishment
Replace/Refurbished Air Handling Units

ECM DESCRIPTION

Replace and/or refurbish existing air handlers with new units.

DATA / ASSUMPTIONS

Efficiency Gain with refurbishment	2.5%	
Efficiency Gain with replacement	5.0%	
Supply Air Temperature	85.0	°F

*Air Handler Supply CFM and OA CFM is obtained by drawings and equipment manuals
*Air Handler load is assumed to occur at 7.5 degrees F bin average temperature

MEASUREMENT AND VERIFICATION

Option A - Engineering calculations based on comparison of existing operations and post installation operation

COMMISSIONING

Review installation documents for wiring and vibrations. Start up equipment, test thermostat/building management system response, and inspect perimeter of new units for any air infiltration.

RECOVERY/SAFETY FACTOR

Safety Factor (Thermal) =	0%

The safety factor for this ECM is taken at 0 due to some variability in schedule and load changes.

FORMULAE

$Q_{SAVINGS} = \sum_{-5}^{60} Q_{INPUT} \cdot \eta_{REFURB/REPLACE}$

$Q_{INPUT} = \sum_{-5}^{60} (t_{OCC} \cdot Q_{LOAD} \cdot L_{\%}) / \eta_{BOILER}$

$Q_{LOAD} = \sum_{-5}^{60} 1.08 \cdot CFM_{SUPPLY} \cdot (T_{SUPPLY} - T_{MIXED})$

$T_{RISE} = \sum_{-5}^{60} T_{SUPPLY} - T_{MIXED}$

$T_{MIXED} = \sum_{-5}^{60} ((CFM_{RETURN} \cdot T_{RETURN}) + (CFM_{OA} \cdot T_{BIN})) / (CFM_{RETURN} + CFM_{OA})$

Montclair Board of Education
Exhibit D
ECM 2K Air Handling Unit Refurbishment
Replace/Refurbished Air Handling Units

Variable	Units	Description
$Q_{SAVINGS}$	Therms	Thermal Savings
$\sum_{-5}^{60}$	-	Summation of all bins from -5°F to 60°F
η_{BOILER}	%	Efficiency of boiler
T_{BIN}	°F	Temperature of respective bin
Q_{INPUT}	Therms	Input heat provided by air handlers at respective bin temperature
Q_{LOAD}	Therms	Heat load on the air handler
$L_{\%}$	%	Load % at respective bin
T_{RISE}	°F	Temperature rise across the coil (100% Design at 10°F)
T_{MIXED}	°F	Mixed air temperature
T_{SUPPLY}	Hrs	Temperature of supply air
T_{RETURN}	Hrs	Temperature of return air
CFM_{SUPPLY}	CFM	Total supply CFM of air handler
CFM_{OA}	CFM	Total outside air CFM of air handler
CFM_{RETURN}	CFM	Total return air CFM of air handler
q	-	Quantity of replaced/refurbished air handlers
η_{REFURB}	**%**	Efficiency improvement of refurbished air handler
$\eta_{REPLACE}$	**%**	Efficiency improvement of replaced air handler
t_{OCC}	Hrs	Occupied Bin Hours in respective temperature bin

*Inputs are blue

Montclair Board of Education
Exhibit D
ECM 3A Building Management Control System
BMS Upgrades

ECM DESCRIPTION

The building managament system for the school district will be upgraded. Where the DDC system exists it will be incorporated into a web-based system. The pnaumatic control system in some buildings will be replaced with new DDC controls. The new DDC system will be a web based type that allows remote access to a personnel from any computer using a security password.

DATA / ASSUMPTIONS

Heating Hours	3,948 Hours
Cooling electrical use	5%

*Schedules and temperatures are based on data logging trends performed throughout the building

MEASUREMENT AND VERIFICATION

Option A (Electric) - Direct kW and savings measurements before and after installation conducted. A report is generated showing the reduction in kW
Option C (Fuel) - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Verify functions of all installed controllers. Verify that control loops work properly. Verify function of all alarms installed in the system. Verify that all installed control variables and set points can be set and managed remotely

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Savings calculations are based on weather bin data, fresh air flows and temperature setpoints. A more conservative of percent is used for this ECM due to the uncertainty of variables. The heating fuel savings calculations are based upon information provided by the equipment vendor.

FORMULAE

$$Q_{SAVINGS} = (HD_{EXISTING} - HD_{PROPOSED} / HD_{EXISTING}) \cdot Fuel_{ADJUSTED}$$

$$HD_{EXISTING} = \sum_{-5}^{60} (T_{OCC} - T_{BIN}) \cdot t_{OCC} + (T_{UNOCC} - T_{BIN}) \cdot t_{UNOCC}$$

$$HD_{PROPOSED} = \sum_{-5}^{60} (T_{OCC} - T_{BIN}) \cdot t_{OCC} + (T_{UNOCC} - T_{BIN}) \cdot t_{UNOCC}$$

Variable	Units	Description
$Q_{savings}$	Therms	Thermal Savings
$\sum_{-5}^{60}$	-	Summation of all bins from -5°F to 60°F
T_{BIN}	°F	Temperature of respective bin
t_{OCC}	Hrs	Existing occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Existing unoccupied Bin Hours in respective temperature bin
t_{OCC}	Hrs	Proposed occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Proposed unoccupied Bin Hours in respective temperature bin
T_{OCC}	°F	Existing temperature of space during occupied hours
T_{UNOCC}	°F	Existing temperature of space during unoccupied hours
T_{OCC}	°F	Proposed temperature of space during occupied hours
T_{UNOCC}	°F	Proposed temperature of space during unoccupied hours
$HD_{EXISTING}$	Hrs	Existing heating degree hours in space
$HD_{PROPOSED}$	Hrs	Proposed heating degree hours in space
$Fuel_{ADJUSTED}$	Therms	Adjusted Boiler Fuel Usage

Occupancy Controlled Thermostats

The program has received a large amount of custom electric applications for the installation of Occupancy Controlled Thermostats in hotels, motels, and, most recently, university dormitories.

Standard practice today is thermostats which are manually controlled by occupants to regulate temperature within a facility. An occupancy controlled thermostat is a thermostat paired with a sensor and/or door detector to identify movement and determine if a room is occupied or unoccupied. If occupancy is sensed by the sensor, the thermostat goes into an occupied mode (i.e., programmed setpoint). If a pre-programmed time frame elapses (i.e., 30 minutes) and no occupancy is sensed during that time, the thermostat goes into an unoccupied mode (e.g., setback setpoint or off) until occupancy is sensed again. This type of thermostat is often used in hotels to conserve energy.

The occupancy controlled thermostat reduces the consumption of electricity and/or gas by requiring less heating and/or cooling when a room or a facility is vacant or unoccupied.

Algorithms

Cooling Energy Savings (kWh/yr) = $(((T_c * (H+5) + S_c * (168 - (H+5)))/168) - T_c) * (P_c * Cap_{hp} * 12 * EFLH_c/EER_{hp})$

Heating Energy Savings (kWh/yr) = $(T_h - ((T_h * (H+5) + S_h * (168 - (H+5)))/168)) * (P_h * Cap_{hp} * 12 * EFLH_h/EER_{hp})$

Heating Energy Savings (Therms/yr) = $(T_h - ((T_h * (H+5) + S_h * (168 - (H+5)))/168) * (P_h * Cap_h * EFLH_h/AFUE_h/100{,}000)$

Definition of Variables

T_h = Heating Season Facility Temp. (°F)
T_c = Cooling Season Facility Temp. (°F)
S_h = Heating Season Setback Temp. (°F)
S_c = Cooling Season Setup Temp. (°F)
H = Weekly Occupied Hours
Cap_{hp} = Connected load capacity of heat pump/AC (Tons) – Provided on Application.
Cap_h = Connected heating load capacity (Btu/hr) – Provided on Application.
$EFLH_c$ = Equivalent full load cooling hours
$EFLH_h$ = Equivalent full load heating hours
P_h = Heating season percent savings per degree setback
P_c = Cooling season percent savings per degree setup
$AFUE_h$ = Heating equipment efficiency – Provided on Application.
EER_{hp} = Heat pump/AC equipment efficiency – Provided on Application

12 = Conversion factor from Tons to kBtu/hr to acquire consumption in kWh.
168 = Hours per week.
7 = Assumed weekly hours for setback/setup adjustment period (based on 1 setback/setup per day, 7 days per week).

Summary of Inputs

Occupancy Controlled Thermostats

Montclair Board of Education
Exhibit D
ECM 3B Demand Control Ventilation (in BMS scope)
Demand Control Ventilation

ECM DESCRIPTION

Install CO2 sensors in large areas to control fresh air intake

DATA / ASSUMPTIONS

Heating Hours 3,948 Hours

*Schedules and temperatures are based on data logging trends performed throughout the building
* Proposed setpoints are used as to not capture thermal savings twice

MEASUREMENT AND VERIFICATION

Option A (Electric) -
Option C (Thermal) - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Simulate function of CO2 control signal. Test all equipment involved in DCV, which will include but not limited to testing function of fresh air damper response to the CO2 sensor signal and sequence of operation per design (Override CO2 signal during the building warm up, etc.).

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Savings calculations are based on weather bin data, fresh air flows and temperature setpoints. A more conservative of 0 percent is used for this ECM due to the uncertainty of variables.

FORMULAE

$$W_{SAVINGS} = \sum_{-5}^{60} [(kW_{FAN} \cdot t_{OCC}) - (kW_{FAN} \cdot (1 - RPM_{-\%})^{2.8}) \cdot t_{OCC}]$$

$$Q_{SAVINGS} = \sum_{-5}^{60} \{ [Q_{LOAD} \cdot t_{OCC} \cdot (1 - OA_{\%OCC})] + [Q_{LOAD} \cdot t_{UNOCC} \cdot (1 - OA_{\%UNOCC})] \} / \eta_{BOILER}$$

$$Q_{LOAD} = 1.08 \cdot CFM_{OA} \cdot (T_{OCC} - T_{BIN}) / 1000$$

Variable	Units	Description
$W_{SAVINGS}$	kWh	Annual kWh Savings
$Q_{SAVINGS}$	Therms	Annual Thermal Savings
Q_{LOAD}	Mmbtu	Thermal Load of unit at respective temperature bin
kW_{FAN}	kW	Total kW of Fan
$\sum_{-5}^{60}$	-	Summation of all bins from -5°F to 60°F
T_{BIN}	°F	Temperature of respective bin
t_{OCC}	Hrs	Proposed occupied Bin Hours in respective temperature bin
t_{UNOCC}	Hrs	Proposed unoccupied Bin Hours in respective temperature bin
$RPM_{-\%}$	%	Percentage of RPM fan will be reduced due to VFD
$OA_{\%OCC}$	%	Percentage Fresh Air Reduction during occupied hours
$OA_{\%UNOCC}$	%	Percentage Fresh Air Reduction during unoccupied hours
CFM_{SUPPLY}	CFM	Total supply CFM of units
CFM_{OA}	CFM	Total outside air CFM of units
T_{OCC}	°F	Proposed occupied Temperature
T_{UNOCC}	°F	Proposed unoccupied Temperature
$T_{OCC/UNOCC}$	°F	Proposed occupied/unoccupied Mode Temperature for controlled unit
η_{BOILER}	%	Boiler Efficiency

Exhibit D
ECM 3C Exhaust Fan Controls (in BMS scope)
Exhaust Fan Replacement

ECM DESCRIPTION

Replacement of exhaust fans. New exhaust fans will be integrated into the existing / proposed building management syste. The tie in will allow control of the fans to run only when spaces or occupied or needed. Code exhaust requirements will be met.

DATA / ASSUMPTIONS

* Current run hours are based upon interview with staff and site survey observations
* Proposed run hours are based upon either on occupancy of the spaces or to meet code requirements
* Some motor efficiencies have been verified and an average motor efficiency is used

MEASUREMENT AND VERIFICATION

Option A - The engineering calculations are based on direct kW measurements of the existing and installed motors and operating hours. All existing motors will be measured before removal and new motors after the installation. Equipment operating hours are based on the audit, logging and operating personnel input.

COMMISSIONING

Review installation documents for alignments and vibrations. Verify functional control of fans and their response to the control signals issued by the building management system.

SAFETY FACTOR

Safety Factor (Electric) = **0%**

FORMULAE

$W_{SAVINGS} = W_{EXISTING} - W_{PROPOSED}$

$W_{EXISTING} = Hp \cdot Lf \cdot \eta \cdot t$
$W_{PROPOSED} = Hp \cdot Lf \cdot \eta \cdot t$

ECM DESCRIPTION

Reduce building infiltration by weather stripping doors, sealing roof & wall joints, duct & piping penetrations, skylight perimeters and window corners.

DATA / ASSUMPTIONS

*Crack area determined by survey team

MEASUREMENT AND VERIFICATION

Option C - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Visual inspection per scope of work from subcontractor. Inspection might include smoke test.

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	0%
Safety Factor (Thermal) =	0%

Recovery factor taken at 10% due to the uncertainty of variables incorporated in the savings calculations

FORMULAE

$H = (K * Q_{INF} * (dp)^n * HDD * 10) / 28,900$ where 28,900 = Heating efficiency factor = (1,000,000 Btu per MMBtu / (1.08 * 24 hr/day)) * 75% std htg efficiency

$C = T * C2 * CDD$ where $T = C1 * Q_{INF} * h$

$Q_{INF} = K * dp^n * A_{CRACK}$

$dp^n = 5.16$

$A_{CRACK} = A_{VENTS} + A_{WIN} + A_{RTU} + A_{DOORS} + A_{BULK} + A_{ROOF/WALL}$

Variable	Units	Description
H	therms	Thermal Savings associated with air infiltration reduction
C	kWh	Electrical Savings associated with air infiltration reduction
Q_{INF}	cfm	Infiltration air flow savings
A_{CRACK}	ft^2	Total square feet of infiltration area
K	(ft^3 / min) / (Pa * ft^2)	Flow Factor
dp^n	Pa	Pressure difference across building envelope raised to nth power
CDD	(^oF-Day)/Yr	Cooling degree days
T	tons	Cooling load
h	Btu/lb	Avg. enthalpy of air
HDD	(°F-Day)/Yr	Annual heating degree days
C1	lb/ft^3 * min/hr	Cooling Constant = std air density 0.075 lb/ft^3 * 60 min/hr
C2	kW/ton	Cooling system characteristic power consumption
A_{VENTS}	ft^2	Total square feet of infiltration spaces with regards to vents
A_{WIN}	ft^2	Total square feet of infiltration spaces with regards to windows
A_{RTU}	ft^2	Total square feet of infiltration spaces with regards to RTU's
A_{DOORS}	ft^2	Total square feet of infiltration spaces with regards to doors
A_{BULK}	ft^2	Total square feet of infiltration spaces with regards to bulkheads
$A_{ROOF/WALL}$	ft^2	Total square feet of infiltration spaces with regards to the wall roof joint

Montclair Board of Education
Exhibit D
ECM 5A Computer Power Management
Computer Power Management

ECM DESCRIPTION

Install a centralized personal computer power management system to control computers and monitors.

DATA / ASSUMPTIONS

* Annual Savings for Student Computers	120	kWh/Yr
* Annual Savings for Administrative Computers	110	kWh/Yr

	On		Sleep Mode	
* CRT wattage (Average)	70	W	15	W
* LCD wattage	18	W	5	W

Annual Savings for Administrative Computers and Student Computers are based on previous logging results for computers with similar usage types

MEASUREMENT AND VERIFICATION

Option A - The engineering calculations are based on direct kW measurements of the existing and post software installation computers. All existing computers will be measured before the installation of the computer management software.

COMMISSIONING

Review installation documents for alignments and vibrations. Start up equipment and measure vibration through the load range along with motor kW. Verify that VFDs are capable of operating in full design range upon the control signal demand.

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) = 0%

The safety factor for this ECM is taken at 0 due to some variability in schedule and load changes.

FORMULAE

$$W_{TOTAL} = (W_{CPU} \cdot CPU_{\#}) + (W_{LCD} \cdot CRT_{\#})$$

$$W_{LCD} = (CRT_{\#} \cdot Monitor_{hrs\text{-}SLEEP} \cdot (W_{CRT\text{-}SLEEP} - W_{LCD\text{-}SLEEP}) \cdot Monitor_{\%OFF}) + (CRT_{\#} \cdot Monitor_{hrs\text{-}ON} \cdot (W_{CRT\text{-}ON} - W_{LCD\text{-}ON}))$$

Variable	Units	Description
W_{TOTAL}	kWh	Total Electrical Savings associated with this measure
W_{CPU}	kWh	Electrical Savings associated with computer control
W_{LCD}	kWh	Electrical Savings associated with Monitor Replacement
$CPU_{\#}$	-	Numbers of Computers
$CRT_{\#}$	-	Numbers of CRTs
$W_{CRT\text{-}ON}$	kWh	Wattage of CRT Monitor when ON
$W_{CRT\text{-}SLEEP}$	kWh	Wattage of CRT Monitor when in sleep mode
$W_{LCD\text{-}ON}$	kWh	Wattage of LCD Monitor when ON
$W_{LCD\text{-}SLEEP}$	kWh	Wattage of LCD Monitor when in sleep mode
$Monitor_{hrs\text{-}ON}$	hrs	Annual hours monitor is ON
$Monitor_{hrs\text{-}SLEEP}$	hrs	Annual hours monitor is in sleep mode
$Monitor_{\%OFF}$	%	Percentage that monitor is off during sleep mode hours

Montclair Board of Education
Exhibit D
ECM 7A Transformer Replacement
Transformer Replacement

ECM DESCRIPTION

Replace dry transformers with new custom designed high efficiency transformers. New transformers will save electricity and avoid the future replacements due to failure.

DATA / ASSUMPTIONS
*Input Measured kW losses (If kW losses are not none calculation will calculate efficiency using past results)
* Existing loads were obtained by data logging
* Existing efficiencies were obtained by data logging or manufacturer specifications

MEASUREMENT AND VERIFICATION

Option A - Direct kW and savings measurements before and after installation conducted. A report is generated showing the reduction in kW

COMMISSIONING

Test all transformers after installation

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) = 0%

Recovery factor is set at 10% due to unknown flucuations in transformer loads

FORMULAE

$W_{SAVINGS} = \varepsilon_T - \varepsilon_T$

$\varepsilon_T = \varepsilon_{OCC} \cdot t_{OCC} + \varepsilon_{UNOCC} \cdot t_{UNOCC}$
$\varepsilon_T = \varepsilon_{OCC} \cdot t_{OCC} + \varepsilon_{UNOCC} \cdot t_{UNOCC}$

$\varepsilon_{OCC} = [(Lf_{OCC} \cdot KVA) / \eta_L^{OCC}] - (KVA \cdot Lf_{OCC})$
$\varepsilon_{OCC} = [(Lf_{OCC} \cdot KVA) / \eta_L^{OCC}] - (KVA \cdot Lf_{OCC})$

$\varepsilon_{UNOCC} = [(Lf_{OCC} \cdot KVA) / \eta_L^{UNOCC}] - (KVA \cdot Lf_{OCC})$
$\varepsilon_{UNOCC} = [(Lf_{OCC} \cdot KVA) / \eta_L^{UNOCC}] - (KVA \cdot Lf_{OCC})$

$\eta_L^{OCC} = Lf_{OCC} \cdot kVA \cdot \eta_T$
$\eta_L^{OCC} = Lf_{OCC} \cdot kVA \cdot \eta_T$

$\eta_L^{UNOCC} = Lf_{UNOCC} \cdot kVA \cdot \eta_T$
$\eta_L^{UNOCC} = Lf_{UNOCC} \cdot kVA \cdot \eta_T$

ECM 8A Cogeneration
Combined Heat and Power Plant

ECM DESCRIPTION

Installation of a Combined Heat and Power Plant (CHP). Recoverable heat from the CHP will be used to subsidize heating requirements.

DATA / ASSUMPTIONS

*Annual run hours are agreed upon by facility staff
*Annual waste dump hours are taken at 10% of run time
*CHP Natural Gas Consumption and Recoverable Heat Rate provided by the CHP Manufacturer.
* Parasitic load during normal operation 1%

MEASUREMENT AND VERIFICATION

Option A (Electric) - The engineering calculations are based on direct kW measurements of the electrical output feed.
Option C (Thermal) - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Verify electrical and natural gas interconnects, as well as, electrical production by multimeter spot measurements. Verify proper exhaust ventilation.

A safety factor of 0.5 is conservative

RECOVERY/SAFETY FACTOR

Safety Factor (Electric) =	50%
Safety Factor (Thermal) =	0%

Montclair Board of Education
Exhibit D
ECM 8A Cogeneration
Combined Heat and Power Plant

FORMULAE

$W_{PRODUCTION} = (kW_{CHP} - KW_{PARA}) \cdot t_{CHP}$

$Q_{NET} = (Q_{CHP} - Q_{DISPLACED})$

$Q_{CHP} = Q_D$

$Q_{DISPLACED} = CHP_{NG\text{-}RATE} \cdot (t_{CHP} + t_{DUMP})$

$Q_D = CHP_{NG\text{-}USEABLE} \cdot (CHP_{RECOVERY} \ / \ CHP_{NG\text{-}RATE}) \cdot HEATEXG$

$CHP_{NG\text{-}USEABLE} = CHP_{NG\text{-}RATE} \cdot t_{CHP}$

Variable	Units	Description
$W_{PRODUCTION}$	kWh/yr	Annual Electrical Production of CHP
Q_{NET}	Therms/yr	Net Annual Natural Gas Consumption of CHP
$Q_{DISPLACED}$	Therms/yr	Avoided Boiler Natural Gas Consumption due to CHP Recoverable Heat
Q_D	Therms/yr	Annual CHP Recoverable Heat
kW_{CHP}	kW	CHP kW
kW_{PARA}	kW	CHP Parasitic Load
t_{CHP}	hrs	Annual CHP run time
t_{DUMP}	hrs	Annual CHP waste heat dump
Q_{CHP}	therms/yr	Annual Natural Gas Consumption of CHP
$CHP_{NG\text{-}USEABLE}$	therms/yr	Annual useable Natural Gas available for heating purposes
$CHP_{NG\text{-}RATE}$	therms/hr	Natural Gas Consumption rate for the CHP
$CHP_{RECOVERY}$	therms/hr	Recoverable heat from CHP
HEATEXG	%	Heat Exchanger Efficiency
η_{BOILER}	%	Boiler Efficiency

*Parastic Load, Natural Gas Consumption Rate, and Recoverable Heat Rate based off of Tecogen Literature. If using another manufacturer input fields manually

CHP	Building	CHP Plant Electric Output (kW)	Annual Run Hours of Plant	Heat Recovery Efficiency through Heat Exchanger	Parasitic Load* (kW)	Natural Gas Consumption Rate* (therm/hr)	Recoverable Heat Rate* (therm/hr)

Annual Net Thermal Consumption	(25,666)

Montclair Board of Education
Exhibit D
ECM 9A Roof Re-sealing
Roof Replacement

ECM DESCRIPTION

Furnish and install a PVC roofing system as manufactured by Sika Samafil or equal.

DATA / ASSUMPTIONS

Heating Hours 3,948 Hours

Building Existing Roof is in satisfactory condition and can be overlayed with little or no repairs
-15%+ loss in thermal resistance due to thermal shorts of steel fasteners
-10% increase in thermal transmittance when using single layer of insulation board
-R-value & Air permeability of a deck, insulation & membrane has a major impact on System R-value

*U Factors for the new roof was obtained by manufacturer and product data. U Factors for the existing roof is based on construction type and material

MEASUREMENT AND VERIFICATION

Option A - Electrical Savings based on Engineering Calculations
Option C - Thermal Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Verify area of new roof installed.

RECOVERY/SAFETY FACTOR

Recovery/Safety Factor (Electric) =	0%
Recovery/Safety Factor (Thermal) =	0%

Savings calculations are based on weather bin data, fresh air flows and temperature setpoints. A more conservative of 0 percent is used for this ECM due to the uncertainty of variables. The heating fuel savings calculations are based upon information provided by the equipment vendor.

FORMULAE

$$Q_{SAVINGS} = (Q_C - Q_C) + Q_{INF}$$

$$Q_{INF} = \sum_{-5}^{100} (1.08 \cdot (i_{ROOF} - i_{ROOF}) \cdot (T_{W/S} - T_{BIN}) \cdot I_R \cdot t_{BIN}) / 100{,}000$$

$$Q_C = \sum_{-5}^{100} ((T_{W/S} - T_{BIN}) \cdot A_{ROOF} \cdot U_{ROOF} \cdot t_{BIN}) / 100{,}000$$
$$Q_C = \sum_{-5}^{100} ((T_{W/S} - T_{BIN}) \cdot A_{ROOF} \cdot U_{ROOF} \cdot t_{BIN}) / 100{,}000$$

*Note W/S designates use of either winter building setpoint or summer building setpoint with the appropiate bin

Variable	Units	Description
$Q_{savings}$	Therms	Thermal Savings
Q_C	Therms	Conductive/convective cooling gain and heating loss with existing windows
Q_C	Therms	Conductive/convective cooling gain and heating loss with proposed windows
Q_{INF}	Therms	Infiltration savings with proposed windows
$\sum_{-5}^{100}$	-	Summation of all bins from -5°F to 100°F
T_W	°F	Winter building setpoint
T_S	°F	Summer building setpoint
T_{BIN}	°F	Temperature of respective bin
t_{BIN}	Hrs	Hrs in respective bin
A_{ROOF}	ft^2	Existing unoccupied Bin Hours in respective temperature bin
U_{ROOF}	btu / ft^2 / °F	Existing U-factor of roof
U_{ROOF}	btu / ft^2 / °F	Proposed U-factor of roof
i_{ROOF}	Cfm/ft	Infiltration constant for existing windows
i_{ROOF}	Cfm/ft	Infiltration constant for proposed windows
I_R	ft	Linear feet of curtain wall

Kitchen Equipment Upgrades

ECM DESCRIPTION

Convert Kitchen Appliances from Electric to Gas

DATA / ASSUMPTIONS

Savings achieved by converting electric kitchen appliances to gas appliances

Demand Load Factor	25%
Consumption Load Factor	25%
Relative Appliance Efficiency	90%

MEASUREMENT AND VERIFICATION

OPTION A - Stipulated Savings - Electric
OPTION C - Utility Bill Analysis. - Thermal

COMMISSIONING

Ensure all equipment is installed and working properly

RECOVERY/SAFETY FACTOR

Safety Factor (Electrical) =	0%
Safety Factor (Thermal) =	0%

FORMULAE

UsageFUEL = (EkWh · 3,412 / 100,000) / APP
EkWh = EkW · LFCons
EkW = APPkW · LFDemand

Variable	Units	Description
EkWh	kWh	Electric consumption savings
EkW	kW	Electric demand savings
UsageFUEL	Therms	Proposed fuel consumption
LFCons	%	Consumption load factor
LFDemand	%	Demand load factor
APP	%	Appliance thermal efficiency
APPkW	kW	Electrical appliance kW load

Montclair Board of Education
Exhibit D
ECM 11A Solar PPA
Solar PPA Photovoltaic System

ECM DESCRIPTION

Installation of a photovoltaic array utilizing Solar Power Purchase Agreement (PPA) - reducing grid electricity with a reduction of greenhouse gas emissions.

DATA / ASSUMPTIONS

PPA Cost per kWH	**$0.020**	typically around $0.05, Carlisle roof membrane adds another $0.04
*1-Axis Tracking System Collection Improvement:	**18.6%**	

*Emperical studies show an that annual output increases 18.6% with use of one-axis sun tracking
**Assume two weeks of downtime for PV maintenance

Solar radiation at ground level was obtained using the data collected by the National Renewable Energy Laboratory (NREL) via the software Pvwatts.
Proposed technology is only able to convert 77% of the direct current produced at the panel to a usable alternative current for building consumption

MEASUREMENT AND VERIFICATION

Option C - Verification by dedicated electric meter.

COMMISSIONING

Test installed system - measuring the output and verify with calculations for weather conditions. Verify all electrical connections and tie-ins to the grid and the building power.

RECOVERY/SAFETY FACTOR

Safety Factor (Electrical) =	**0%**

FORMULAE

$$W_{PV} = \sum_{Jan}^{Dec} (Q_{RAD} \cdot A_{PV} \cdot t_{MONTH}) \cdot t_{\%}$$

Variable	Units	Description
W_{PV}	kWh	Electrical energy produced by PV array
$\sum_{Jan}^{Dec}$	-	Summation of months
Q_{RAD}	$kWh/m^2/day$	Solar radiation (averaged by month) capable of being collected with the proposed PV technology
A_{PV}	ft^2	Area of proposed system
t_{MONTH}	Days	Days in the month
$t_{\%}$	%	Percentage of operational time

ECM 12A Water Conservation (DI)
Water Conservation

ECM DESCRIPTION

Reduce water consumption by replacing older less-efficient toilets, urinals, faucets, sinks and showerheads with more water efficient fixtures.

DATA / ASSUMPTIONS

* Existing flow rates were determined by flushometers during walk-throughs
*Proposed flow rates were determined by manufacturer data

MEASUREMENT AND VERIFICATION

Option C (Thermal)- Savings Calculations are based on regression analysis of utility billing meter data
Option C (Water) - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Ensure installation by testing for leaks and proper functionality.

RECOVERY/SAFETY FACTOR

Safety Factor (Thermal) =	0%
Safety Factor (Water) =	0%

Recovery factor taken at 10% due to the variability of fixture usage

FORMULAE

$$Q_{SAVINGS} = [(h_{SAVINGS} \cdot 8.34) \cdot (1000 / 100000)] / \eta_{BOILER}$$

ECM 13A Window Film
Window Film

ECM DESCRIPTION

Replacement of windows with double-pane, low-e, metal frame windows.

DATA / ASSUMPTIONS

Recovery/Safety Factor (Electric) =	0%	
Recovery/Safety Factor (Thermal) =	0%	
Heating Hours	3,948	Hours

*U Factors for the new windows are obtained by manufacturer data. U Factors for the existing windows are based on type, material, and thickness

MEASUREMENT AND VERIFICATION

Option C - Savings Calculations are based on regression analysis of utility billing meter data

COMMISSIONING

Verify quantities installed and total square feet.

RECOVERY/SAFETY FACTOR

Savings calculations are based on weather bin data, fresh air flows and temperature setpoints. A more conservative of 0 percent is used for this ECM due to the uncertainty of variables. The heating fuel savings calculations are based upon information provided by the equipment vendor.

FORMULAE

$$Q_{SAVINGS} = (Q_C - Q_C) + Q_{INF}$$

$$Q_{INF} = \sum_{-5}^{100} (1.08 \cdot (I_{WIN} - i_{WIN}) \cdot (T_{W/S} - T_{BIN}) \cdot I_W \cdot t_{BIN}) / 100{,}000$$

$$Q_C = \sum_{-5}^{100} ((T_{W/S} - T_{BIN}) \cdot A_{WIN} \cdot U_{WIN} \cdot t_{BIN}) / 100{,}000$$
$$Q_C = \sum_{-5}^{100} ((T_{W/S} - T_{BIN}) \cdot A_{WIN} \cdot U_{WIN} \cdot t_{BIN}) / 100{,}000$$

*Note W/S designates use of either winter building setpoint or summer building setpoint with the appropiate bin

Variable	Units	Description
$Q_{savings}$	Therms	Thermal Savings
Q_C	Therms	Conductive/convective cooling gain and heating loss with existing windows
Q_C	Therms	Conductive/convective cooling gain and heating loss with proposed windows
Q_{INF}	Therms	Infiltration savings with proposed windows
$\sum_{-5}^{100}$	-	Summation of all bins from -5°F to 100°F
T_W	°F	Winter building setpoint
T_S	°F	Summer building setpoint
T_{BIN}	°F	Temperature of respective bin
t_{BIN}	Hrs	Hrs in respective bin
A_{WIN}	ft^2	Existing unoccupied Bin Hours in respective temperature bin
U_{WIN}	btu / ft^2 / °F	Existing U-factor of roof
U_{WIN}	btu / ft^2 / °F	Proposed U-factor of roof
i_{WIN}	Cfm/ft	Infiltration constant for existing windows
i_{WIN}	Cfm/ft	Infiltration constant for proposed windows
I_W	ft	Linear feet of curtain wall

VT8000 Room Controllers

VT8650 Data Sheet
Roof Top Unit (RTU), Heat Pump and Indoor Air Quality (IAQ)
Firmware release version 2.4

Programmable and application specific room controller with customizable covers and screen colors. The VT8650 is a rooftop, heat pump and indoor air quality room controller suitable for commercial and high end hospitality markets.

Product at a glance

The perfect balance between simplicity and sophistication. Select from a wide variety of configurable screen colors to match decor. Display your own logo and custom messages on screen to reinforce your brand and provide a more enjoyable occupant experience.

- **Interface:** touch screen interface.
- **Aesthetics:** up to ten selectable screen colors.
- **Flexible:** configurable economizer/scheduler, support for custom standby screen and Lua scripts uploads.
- **Conformity:** conforms to ASHRAE specifications for Green Building Standards and applicable safety, EMC and radio standards.
- **Customize**: supports the display of custom messages when integrated to a BACnet MS/TP system.
- **Protocols:** wired BACnet MS/TP, Modbus RTU and wireless ZigBee Pro.
- **Peripherals:** easy to install ZigBee Pro plug-in module or CO_2 sensor plug-in module.
- **Sensors**: CO_2 sensor, occupancy, motion, light, temperature, RH and water leak sensors.
- **Automatic Demand Response:** load shedding application for demand response.

Benefits

All models can be equipped with a discrete optional Passive Infrared (PIR) motion sensor. With this sensor installed, the VT8650 uses advanced occupancy routines to generate automatic energy savings during occupied and unoccupied periods without sacrificing comfort.

- Generate automatic energy savings
- Display custom logo
- Interchange between °C/°F
- Suitable for commercial/hospitality markets
- 20 selectable languages

Note: This specification applies to units with date code 1838 or later.

The VT8000 family is both application-specific AND programmable.

VICONICS Beyond Comfort

VT8650 Overview

Introduction

Smart energy management has never been easier than with the VT8650 room controllers for Rooftop Units, Heat Pump applications and Indoor air Quality applications.

Designed for new construction and retrofit projects, the room controllers dramatically decrease project delivery costs by reducing installation, configuration and commissioning time. No complex software or tools are required to customize functionality to meet your applications requirements. The room controllers provide all the advanced features and monitoring functions required by modern building automation systems in a simple compact enclosure.

Application Specific and Programmable

The VT8650 room controllers, part of the VT8000 family, are both application-specific AND programmable. This enables the modification of pre-configured control sequences, or the creation of entirely new control sequences for HVAC, lighting and other applications. The VT8650 room controllers provide exceptional control of staged heating and cooling equipment such as packaged roof-top units. Their configurable control sequences, economizer, and scheduler functionalities deliver all the flexibility necessary for optimal indoor air quality applications.

Touch Screen with Customizable User Experience

The touch screen of the VT8650 room controller offers a customizable user experience with selection of languages, temperature scales, buttons, and screen colors. Using the Uploader Tool, it also supports the upload of an image or logo that becomes the default standby screen of the device. Custom messages can also be displayed on-screen using BACnet® objects when the VT8650 room controller is integrated via a BACnet MS/TP or Modbus system.

Optional Passive Infrared Motion Sensor

All models are available with a discrete optional passive infrared (PIR) motion sensor. With this sensor, the VT8650 room controller uses advanced occupancy routines and optional additional Lua scripts to generate automatic energy savings during occupied and unoccupied periods without sacrificing comfort.

Automatic Demand Response

The Automatic Demand Respond (ADR) implements the Load Shedding application compatible with regulations for Occupant Controlled Smart Thermostats. The application requires a BACnet command from interfacing equipment to turn-on and turn-off the Load Shedding feature. Messaging and confirmations are performed by adjoining equipment having Internet connectivity and then providing the Room Controller the BACnet or Modbus command message.

ZigBee Wireless Sensors

The VT8650 room controllers support pairing of a number of ZigBee wireless sensors. Facility managers benefit from being able to monitor critical areas and be informed of events of concern in a timely manner which facilitates the maintenance of a safe and efficient operation.

VT8650 Features

Product highlights

The VT8650 Room Controller has the following high level functionality:

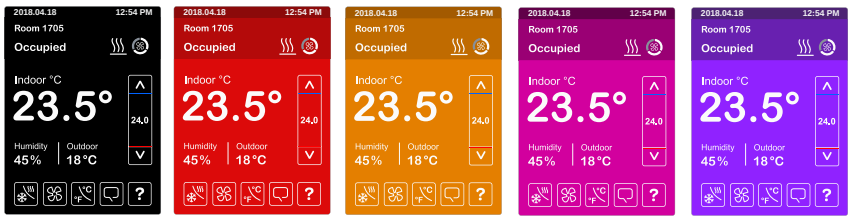
- Suitable for both commercial and hospitality markets and systems
- Customizable color digital touch screen interface with multi-language support
- Fully programmable control sequences using scripting
- On board configuration interface utility
- Configurable sequence of operations
- Configurable Economizer and Scheduler
- Change of Value (COV) function for BMS integration
- Universal inputs and outputs including a CO_2 sensor input, and a fresh air station input
- Humidity sensor with on-board dehumidification strategy
- Optional PIR occupancy sensor
- Optional wireless door and window switches (with optional ZigBee Pro® card) available
- Optional or embedded on-board ZigBee Pro module

Network Protocols

The VT8650 Room Controller natively supports BACnet MS/TP and Modbus RTU as well as optional ZigBee Pro protocols.

Integration to Schneider Electric Systems

The VT8650 Room Controller can be seamlessly integrated with the following:

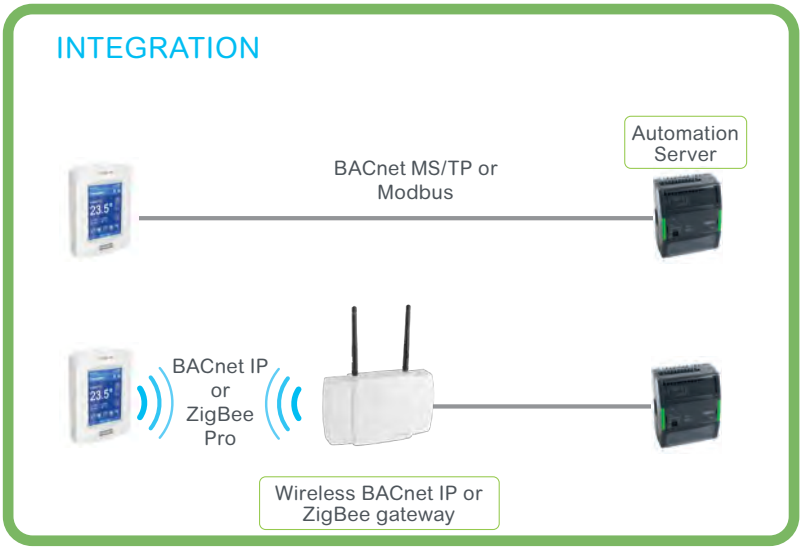


- EcoStruxure™ Building Expert™, EcoStruxure Building Operation and other Schneider Electric systems.
- Wireless integration to MPM devices
- Wireless integration to BACnet IP, oBIX and EWS via MPM devices
- Direct wired integration to BACnet MS/TP and Modbus

Custom Match Styling to Decor

The VT8650 Room Controller is available in ten screen colors.

10 selectable screen colors



VT8650 Programming

Programming with Lua

The VT8650 room controllers are programmable using the open source programming language Lua. Although building management systems often use open protocols and standards, their Program BACnet objects and scripting features remain proprietary and incompatible with third party devices. The VT8650 room controllers use of an open language enables operability with all systems.

Programming with BMS Integration

When integrated into a BACnet MS/TP building management system, the VT8650 offers 10 Program BACnet objects able to contain 480 characters each. No special software, license or tool is required.

Programming without Integration

When there is no BACnet MS/TP or Modbus integration, a Lua script can be uploaded directly into the VT8650 unit using the VT8000 Uploader Tool. Unlike the 10 PG objects used when the unit is integrated via BACnet MS/TP or Modbus, there is only one script, which can contain up to 80kBytes. In addition to Lua scripts, standby screen images and firmware upgrades can also be loaded into the VT8650 using the VT8000 Uploader Tool.

HVAC Applications and Beyond

Programming can be used to go beyond the pre-configured control sequences of the VT8650 to create customized HVAC applications. It can also be used to comply with specific project requirements and manage other applications, such as lighting and other equipment. Using Lua scripts also enables you to take advantage of the extra inputs and outputs of the VT8650 to manage other devices, such as sensors and relays.

Integration and Custom Screens

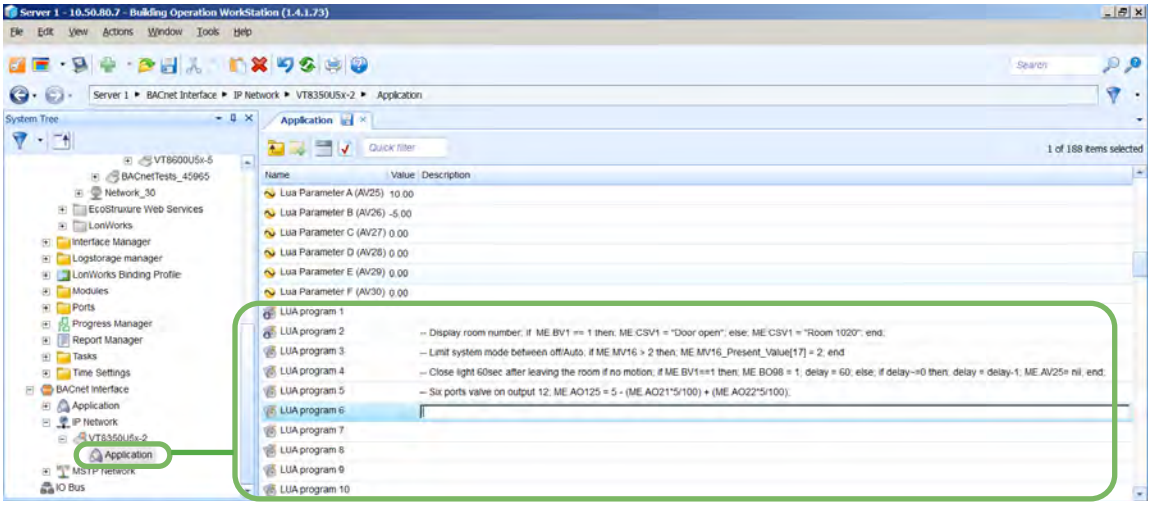
The VT8650 is flexible and adapts to wired and wireless applications. Custom screen and display messages can be uploaded using the Uploader Tool.

Uploader Tool

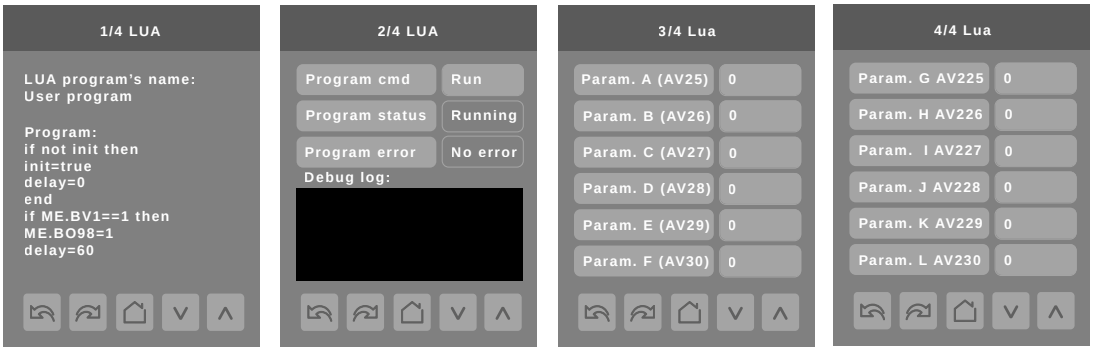
The VT8000 Uploader Tool now enables Lua scripts, standby screen images and firmware upgrades to be loaded via a Micro-USB cable into and from the VT8650 room controller. This allows an existing VT8650 configuration to be copied from an existing device and loaded into another VT8650 room controller.

CUSTOM STANDBY SCREEN & MESSAGES

> Custom standby screen



> Custom BACnet MS/TP or Modbus messages



Viewing Objects in EcoStruxure Building Operation

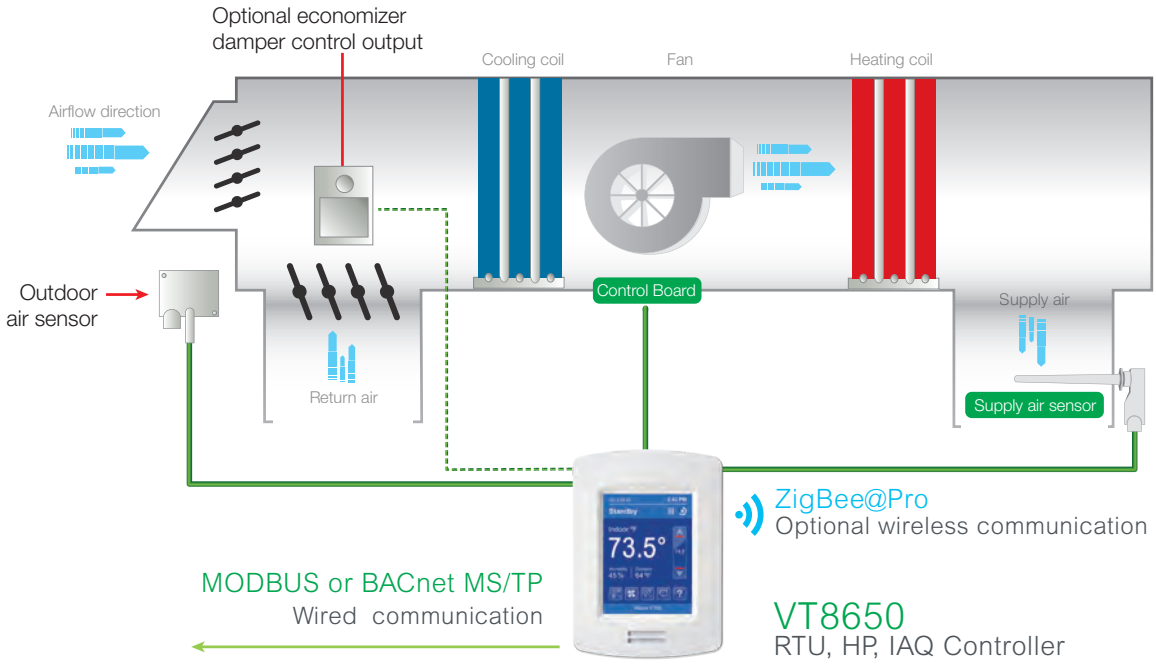
All PG Objects of the VT8650 Room Controller can easily be viewed through a Building Management System.

Viewing Objects in Lua Touch Screens

All PG Objects of the VT8650 Room Controller can easily be viewed through the touch screen display.

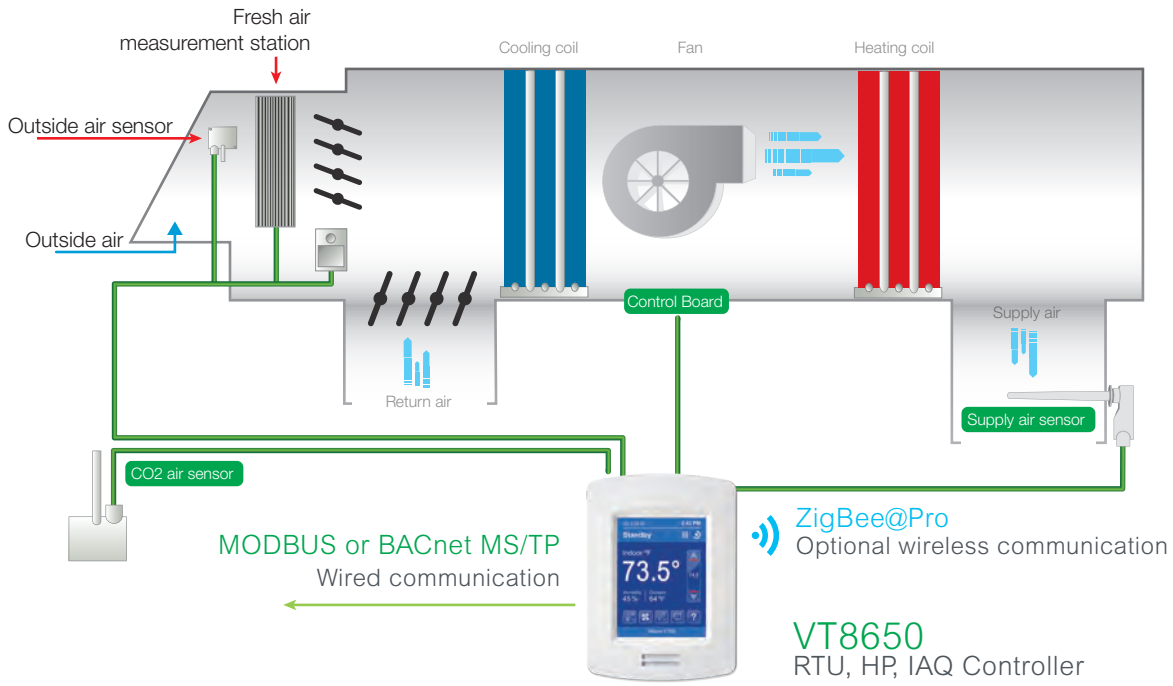
VT8650 Applications

Indoor Air Quality



Indoor air quality is increasingly becoming a major concern to businesses, building managers, tenants, and employees because of its direct impact on the comfort, well-being, and productivity of the building's occupants. The VT8650 room controller, along with a CO_2 sensor, is a cost-effective solution capable of controlling economizer free cooling, and demand-based ventilation strategies, while providing a fresh air measurement input. When integrated to a building management system, the room controller can monitor and verify the CO_2 and fresh air levels, ensuring optimal air quality and energy efficiency.

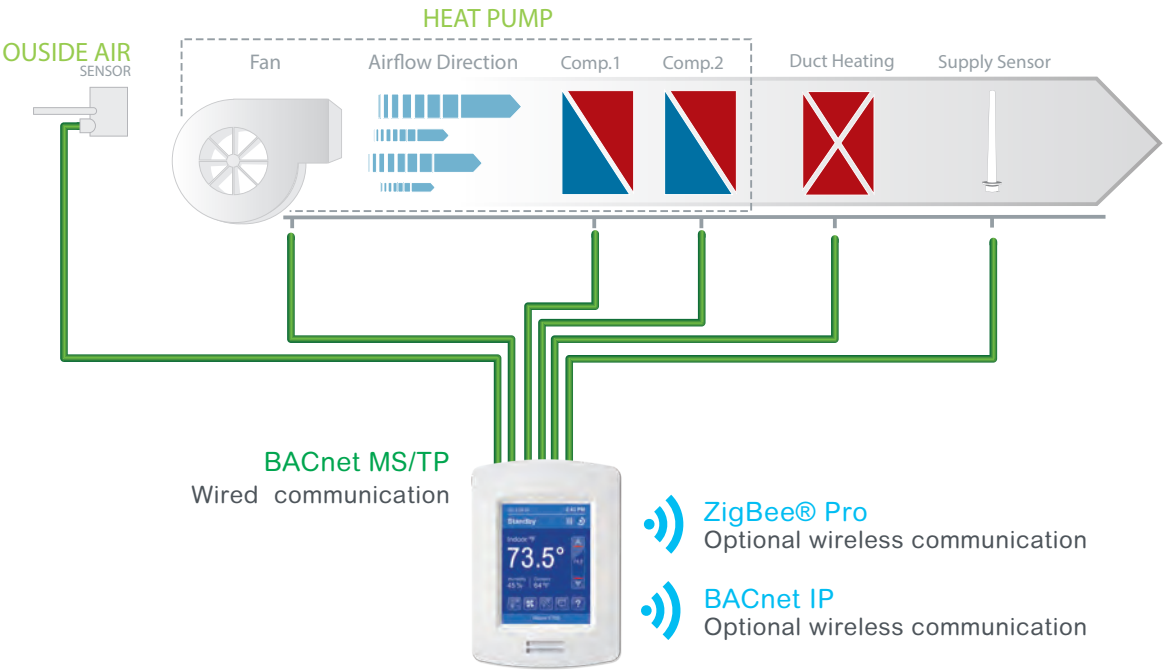
Rooftop Units



The VT8650 room controller can be configured to manage different types of staged equipment, such as the following:

- 1 Heating stage / 1 Cooling stage
- 2 Heating stages / 2 Cooling stages
- 3 Heating stages / 2 Cooling stages
- Modulating heat / 2 Cooling stages

Typical Room Application



Typical Indoor Air Quality Application

Heat Pump

- Selectable single or dual stage compressor stages
- High balance point: Locks out auxiliary heating when outside air temperature is above this value
- Low balance point: Locks out heat pump compressor operation when outside air temperature is below this value
- Comfort/economy mode: In economy mode, heat pump use is maximized before turning on auxiliary heating
- Compressor/auxiliary interlock: Adds flexibility by locking out heat pump operation during auxiliary heating to prevent high pressure trip when the coil is downstream of the auxiliary heat source

Typical Heat Pump Application

Specifications

Main Specifications

Note: This specification applies to units with date code 1838 or later.

Item	Description
Dimensions	12cm/4.72in (H) x 8.6cm/3.38in (W) x 2.5cm/1in (D)
Power Requirements	Input: 24VAC ±15%, 50/60Hz Peak device consumption: up to 12VA with CO2 sensor module Transformer maximum rating: 100VA, 4.17 A
Output Ratings	**Nine Electronic Relays**: 28Vac 50/60Hz, 1.0 Amp., in-rush = 3.0 Amps; **Four Analog Outputs**: 0 - 10 Vdc, 5mA maximum, (2 kilo-ohm resistance) Configurable Output Analog/Electronic Relay
Operating Conditions	0 °C to 50 °C (32 °F to 122 °F) 0% to 75% R.H. non-condensing
Storage Conditions	-30 °C to 50 °C (-22 °F to 122 °F) 0% to 75% R.H. non-condensing
Temperature Sensor	Local 10 K NTC type 2 thermistor
Temperature Sensor Resolution	± 0.1 °C (± 0.2 °F)
Temperature Control Accuracy	±0.5 ° C (± 0.9 °F) @ 21 °C (70 °F) typical calibrated
Humidity Sensor Precision	Reading range from 10-90 % R.H. non-condensing 10 to 20% precision: 10% 20% to 70% precision: 5% 70% to 90% precision: 10%
Humidity Sensor Stability	Less than 0.25 % yearly (typical drift)
Dehumidification Setpoint Range	30% to 95% R.H.
Occ, Unocc and Standby Cooling Setpoint Range	12.0 to 37.5 °C (54 to 100 °F)
Occ, Unocc and Standby Heating Setpoint Range	4.5 °C to 32 °C (40 °F to 90 °F)
Room and Outdoor Air Temperature Display Range	-40 °C to 50 °C (-40 °F to 122 °F)
Proportional Band for Room Temperature Control	Cooling and Heating: Default: 1.8°C (3.2°F)
Analog Inputs	Modulating 0-10 VDC across UI19, UI24 to Common
Binary Inputs	Dry contact across terminals UI16, UI17 to Common
Remote Temperature Sensor	10 K NTC type 2 thermistor UI20, UI22, UI23
Wire Gauge	Power supply: 18 gauge or larger, Communications: 24 gauge or larger
Shipping Weight	0.34 kg (0.75 lb)

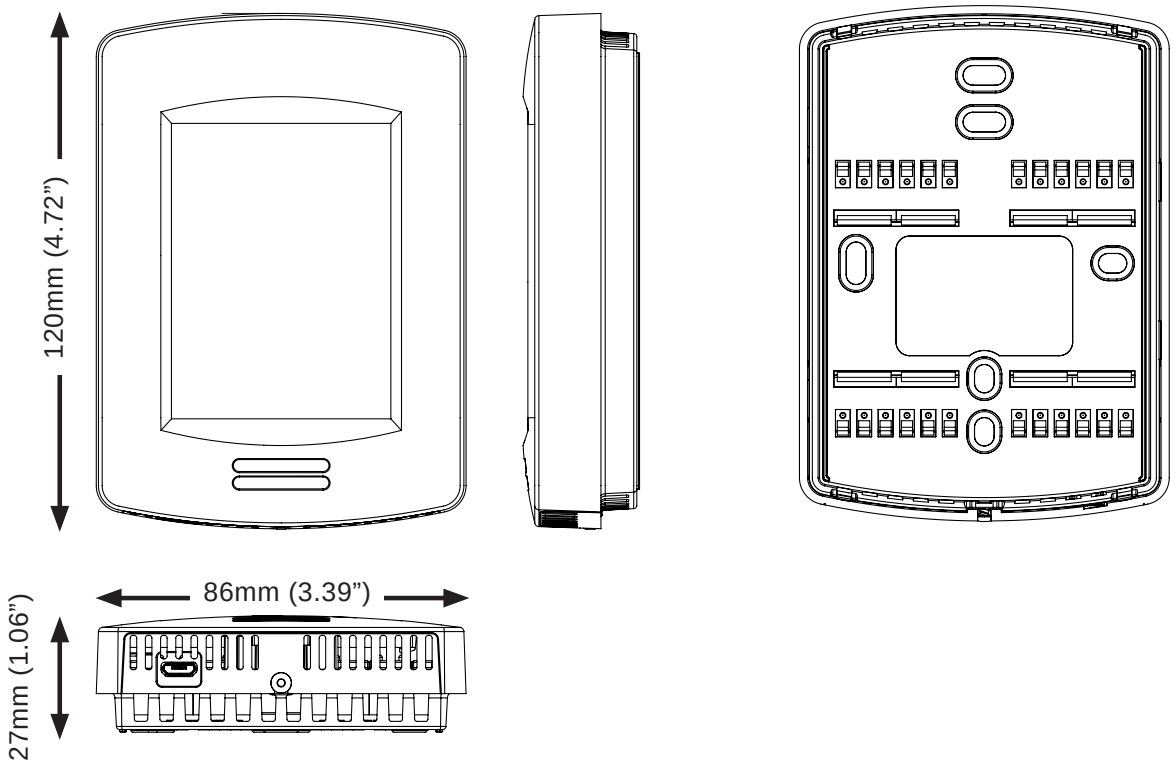
THIS DEVICE COMPLIES WITH PART 15 OF THE FCC RULES. OPERATION IS SUBJECT TO THE FOLLOWING TWO CONDITIONS: (1) THIS DEVICE MAY NOT CAUSE HARMFUL INTERFERENCE , AND (2) THIS DEVICE MUST ACCEPT ANY INTERFERENCE RECEIVED, INCLUDING INTERFERENCE THAT MAY CAUSE UNDESIRED OPERATION.

THE GRANTEE IS NOT RESPONSIBLE FOR ANY CHANGES OR MODIFICATIONS NOT EXPRESSLY APPROVED BY THE PARTY RESPONSIBLE FOR COMPLIANCE. SUCH MODIFICATIONS COULD VOID THE USER'S AUTHORITY TO OPERATE THE EQUIPMENT.

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one of the following measures:

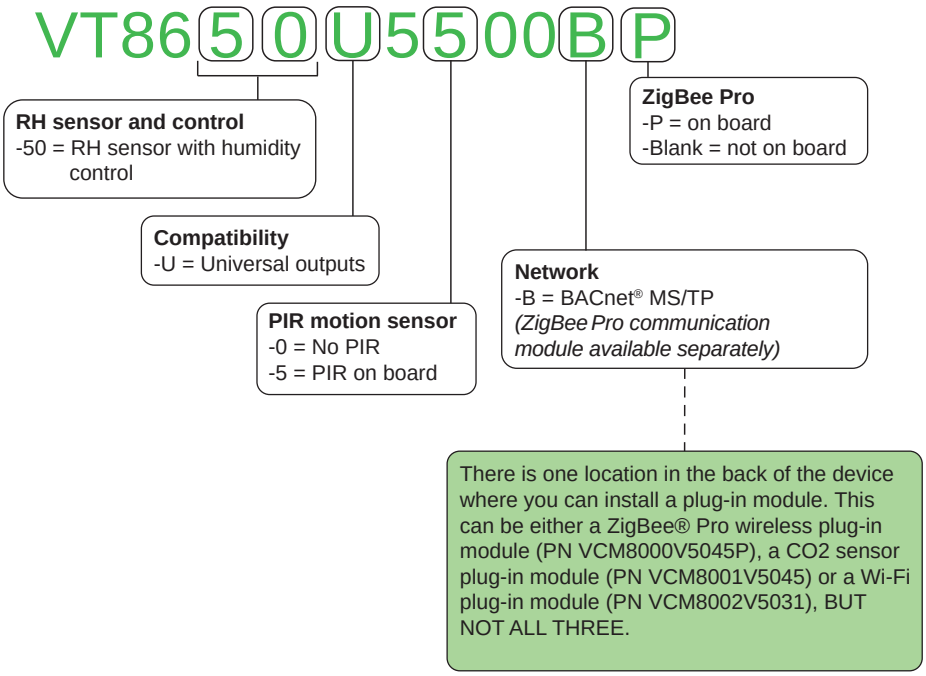
Reorient or relocate the receiving antenna.
Increase the separation between the equipment and receiver.
Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
Consult the dealer or an experienced radio/TV technician for help.

This device complies with Industry Canada's licence-exempt RSSs. Operation is subject to the following two conditions:
(1) This device may not cause interference; and
(2) This device must accept any interference, including interference that may cause undesired operation of the device.
In order to comply with FCC/ISED RF Exposure requirements, this device must be installed to provide at least 20 cm separation from the human body at all times.



Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes :
1) l'appareil ne doit pas produire de brouillage;
2) l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

Afin de se conformer aux exigences d'exposition RF FCC/ISED, cet appareil doit être installé pour fournir au moins 20 cm de séparation du corps humain en tout temps.



Check with your local government for instruction on disposal of this product.

Communication Module for VT8000 Room Controller

Technical Cut Sheet

Accessory communication module that allows the upgrade of all network-ready VT8000 Series Room Controllers to support networking communication using the ZigBee® Pro wireless protocol.

VICONICS
Beyond Comfort

VCM8000V5000P Communication Module Features

AT A GLANCE

Communication options

- ZigBee Pro extended profile (P)

Overview

Accessory communication modules allow the upgrade of all network-ready VT8000 Series Room Controllers to support wireless communication.

All current network-ready VT8000 Series Room Controllers are capable of being retrofitted in the field with an accessory communication module. This enables the controllers to be integrated into a 2.4 GHz ZigBee Pro wireless network.

This approach provides the flexibility to add network communication strategies as budgets allow, or as building management needs change.

Wireless Option

- Current generation of ZigBee Pro
- Makes VT8000 Series products compatible with SmartStruxure™ Lite solution's StruxureWare™ Building Expert
- Building Expert versions 2.5 and 2.6 offer a fixed Home Automation profile view of the Room Controller and its objects
- Building Expert 2.7 and subsequent versions offer an extended object profile view of the Room Controller and its objects
- Building Expert 2.7 and subsequent versions can be integrated into SmartStruxure solution and other Schneider Electric building management systems

VCM8000V5000P Communication Module Features

Easy Installation

VCM8000V5000P communication modules are easy to install. Network-ready VT8000 Series Room Controllers are specifically designed to enable upgrades to their communication capabilities.

Adding a communication module only takes a few minutes but provides a big advantage to existing installations that require new networking and integration functionality.

Operating Conditions
0 °C to 50 °C (32 °F to 122 °F)
0% to 95% R.H. non-condensing
Storage Conditions
-30 °C to 50 °C (-22 °F to 122 °F)
0% to 95% R.H. non-condensing
Approximate shipping weight
0.34kg (0.75lb)
Module Profile
ZigBee Pro (HA Profile)
Frequency Range: 2405 - 2475 MHz for (channels 11 - 25)
Agency approvals wireless models
FCC: Compliant to: Part 15, Subpart C
EN 300 328 V1.8.1
EN 301 489-1 V1.9.2
EN 301 489-1M V2.2.1

THIS DEVICE COMPLIES WITH PART 15 OF THE FCC RULES. OPERATION IS SUBJECT TO THE FOLLOWING TWO CONDITIONS: (1) THIS DEVICE MAY NOT CAUSE HARMFUL INTERFERENCE, AND (2) THIS DEVICE MUST ACCEPT ANY INTERFERENCE RECEIVED, INCLUDING INTERFERENCE THAT MAY CAUSE UNDESIRED OPERATION.

NOTE: THE MANUFACTURER IS NOT RESPONSIBLE FOR ANY RADIO OR TV INTERFERENCE CAUSED BY UNAUTHORIZED MODIFICATIONS TO THIS EQUIPMENT. SUCH MODIFICATIONS COULD VOID THE USER'S AUTHORITY TO OPERATE THE EQUIPMENT.

Check with your local government for instruction on disposal of these products.

Module Versions

All modules shipped after December 15, 2016 are Version 9 (V9) modules. The V9 module is required for the VT8000 Series Room Controllers to communicate wirelessly with the SEC-TE Smart Controller (VTR8300 only)

NOTE: All VTR8300 Room Controllers must be running Firmware version 1.5.1 to activate CO_2 Sensor Module functionality as well as communicate with the SED-TE Smart Controller. The Smart Controller must be version 16 (v16) or later.

NOTE: All VT8000 Series Room Controller require Version 10 (V10) modules and later to enable features available with Firmware Version 1.7 and later.

CO_2 + TRH Sensor

Wireless CO_2 Temperature and Humidity Sensor

Monitor indoor air quality, review data on interfacing devices, and control fresh air inside customizable zones.

Product at a glance

Comfort is more than just a serene, pleasant ambiance. It's also about clean, fresh air, and ensuring a healthy environment inside a building.

Whether you're in a school, restaurant, office or other small building, the CO_2 + TRH Sensor will help ensure the well-being of your customers, students, or personnel.

Putting you on the fast track to Building LEED, BREEAM and Green Star Certification, the CO_2 +TRH Sensor delivers:

- **Performance:** maintains high performance in varying air type environments
- **Reliability:** provides accurate and reliable carbon dioxide, temperature and humidity measurement
- **Conformity:** conforms to ASHRAE specifications for Green Building Standards
- **Improved air quality**: achieves optimal ventilation and reduces stagnant air
- **Durability:** adapts to a multitude of environments
- **Affordable:** easily convince customers to invest in improved Indoor Air Quality (IAQ)
- **Features:** choose between the TRH and CO_2 + TRH model to fit your needs

Benefits

All CO_2 sensors are maintenance-free in normal environments thanks to the built-in Automatic Baseline Correction (ABCLogic™) algorithm function.

The sensors have a life expectancy of 10 years.

- Miniature size
- Requires no calibration
- Maintenance free
- Long term stability
- Low power consumption

The convenience of an out-of-the-box module allows full implementation in minutes.

Version 1

Specifications

Main Specifications

Function	Description
Operating Principle	Non-dispersive infrared (NDIR)
Dimensions	3.26in x 2.85in x 0.72in 82.9 mm x 72.4 mm x 18.4 mm
Operating temperature	0°C to 50°C (32°F to 122°F)
Temperature accuracy	±0.3°C (0.54 °F) typical within operating range
Humidity range	0% to 100%
Humidity accuracy	± 3% RH (typical within 0% to 80% RH)
Measurement range	0 to 5000 ppm
Measurement/ Transmission intervals	2.5 minutes (day), 10 minutes (evening) Note: Battery life will be reduced should interval be shortened (i.e. using remote temperature/humidity functions)
CO_2 accuracy at NTP	±60ppm +3% of reading (400 - 2,000ppm range)
CO_2 calibration	Automatic calibration
CO_2 measurement pressure dependency	0.13% of reading per mm Hg (normal atmospheric conditions of ~100Kpa)
CO_2 resolution at NTP	+/- 20ppm at 800ppm
Transmission protocol	Zigbee 3.0 Green Power (encrypted, bi-directional)
Transmission range	Up to 100m (328 ft) free field 20 to 30m (66 - 98ft) indoor
Battery lifetime	10+ years (non-replaceable) Note: Battery life can be reduced when sensor is operated at temperatures approaching the operating limits.
HMI	Push button & LED (for commissioning)
Power supply / Battery cell	3.6 V AA Lithium ion
Enclosure	Polycarbonate, white (front) and black (back)
Protection	IP 20
Environment & health	Halogen free, RoHS, WEEE
Storage temperature	-30°C to 70°C

SED-TRH-G-5045	Wireless Sensor with Room Temperature and Humidity

Firmware Version

The VT8000 Series Room Controller must be running Firmware version 1.7 or greater to integrate with the wireless CO_2 and TRH sensors. The sensors will not function with any Firmware version below 1.7. Make sure to download the latest Firmware before attempting to integrate the sensors with any VT8000 Series Room Controller. Also, version 10 or greater of the wireless communication module is required to bind the sensors to the Room Controller.

Note: Only one sensor can be commissioned per VT8000 Room Controller.

Note: Contact technical support for MPM compatibility using LUA.

8000 Room Controllers

Frequently Asked Questions

Q1: Using the uploader software, can I convert my 8350 to an 8650 and vice-versa?

A1: It is not possible anymore since the new hardware version (firmware v2.0+).

Q2: Why are the 8350 Cool and Heat outputs simultaneously activated?

A1: The Dehumidification is activated. If dehumidification is not required, set the "Dehum lockout" parameter to "Disable".

Q3: Why does the 8350 fan stay in low speed instead of shutting down when there is no demand?

A1: The "Fan mode" is set to "Low" instead of "Auto".

A2: The "Auto Fan func." is set to "AS". Change the setting to "AS / AD".

A3: The Dehumidification is activated. If dehumidification is not required, set the "Dehum lockout" parameter to "Disable".

Q4: Why does the 8650 fan stay ON even when there is no demand?

A1: The "Fan mode" is set to "On" or "Smart". Change the setting to "Auto".

A2: The Dehumidification is activated. If dehumidification is not required, set the "Dehum lockout" parameter to "Disable".

Q5: Why is the 8650 Modulating output UO11 not modulating?

A1: The "Heat stages" parameter must be set to 0 (zero) to activate 0-10 Vdc heat on UO11.

A2: The output will stay at 0 Vdc if there is a demand for Cooling or if there is no demand for Heating from the Room nor Supply.

Note: You can use the "Test outputs" page to force a voltage on UO11 (anywhere between 0 and 10 Vdc).

Q6: Why are the 8650 Heat stages turning ON, but the Fan remaining Off?

A1: The "Fan cont. heat" parameter is set to "Off". Change the setting to "On".

Q7: Why is the configuration parameter highlighted in red and not editable?

A1: The configuration parameter has been overwritten at a higher BACnet priority. This may have been done by a Building Automation System (via BACnet MS/TP or IP), or by a LUA script running on the room controller.

Q8: After setting temperature setpoints over BACnet, why can they not be changed at the thermostat?

A1: The point has been added to the BAS as "Present Value". Change it to "Relinquish Default".

Q9: Why are parameters configured via BACnet lost after a power-cycle?

A1: BACnet points written between priorities 4 to 16 are lost after a power-cycle. Use priority 1, 2 or 3 or "Relinquish Default".

Q10: Why do heating outputs W1 and W2 indicate ON but there is no voltage output?

A1: W1 and W2 outputs are isolated. They do not switch "RC" 24 Vac. They are switching "RH" terminal. Install a jumper across "RC" and "RH".

Q11: What type of temperature sensors are compatible?

A1: NTC 10,000 Ohm type 2.

Q12: Can a remote sensor average with an internal sensor?

A1: The remote room sensor (UI20) can take over the internal sensor but not average with it.

A2: A custom LUA program can be loaded in the 8000 to average, or to get the highest and lowest temperatures from one or multiple remote sensors.

Q13: Can an 8650 Outside Air Temperature (OAT) sensor input (UI23) be used for another sensor like Mixed Air?

A1: No, the input will automatically display "Outdoor: XX°X" on the display and the related OAT lockouts may block thermostat operations.

A2: Use another free input such as UI19, UI20, UI22 or UI24.

Q14: Can the outdoor temperature be sent over BACnet instead of using a wired 8650 OAT sensor? If yes, will the lockouts still work?

A1: Yes, the outside air temperature can be sent to all 8000 room controllers over BACnet. All OAT-related features and lockouts will work.

Q15: Can a remote humidity sensor be used?

A1: Not natively, a custom LUA program can be loaded in the 8000 to use a 0-10 Vdc humidity sensor and take over the 8000 internal sensor.

Q16: Do analog inputs accept a 4-20 mA signal?

A1: The 8000 does not accept a 4-20 mA signal, however, a 500 Ohm resistor across the input transforms 4-20 mA to 2-10 Vdc.

Q17: Can 0-10 Vdc input and outputs be set to 2-10 Vdc?

A1: Most inputs and outputs are operating on the full range of 0 to 10 Vdc. There is no parameter to re-scale to 2-10 Vdc, except for the damper actuator and duct fan on the VAV 8250.

A2: A custom LUA program can be loaded in the 8000 to re-scale the inputs and outputs to 2-10 Vdc or anything else.

Q18: Why does the 8650 dehumidification status indicate ON but the Y1 and Y2 compressors are Off?

A1: The 8650 dehumidification does NOT activate Cooling nor Heating outputs. It only activates Fan and UO12 (for units with a built-in dehumidification sequence).

A2: A custom LUA program can be loaded in the 8650 to activate Y1, Y2, and W1 with sub-cool and over-heat protections.

Q19: Can configuration parameters and the occupancy schedule be saved from one 8000 then loaded in others?

A1: Use the Uploader8000 Software to download configuration points, schedule, date and time, etc. from one 8000 then upload into all others.

Q20: Can the 8000 communicate with 3rd-party ZigBee devices?

A1: No, it is not possible.

Q21: What can I do when the 8000 is password protected and I do not have it?

A1: Call your Technical Support agent, who will guide you through the password recovery process..

Q22: Is there or will there be an SEZ8650 for the corresponding RTU/AHU?

A1: There is currently no plan to create a VVT system with an 8650 controlling the RTU/AHU for zones controlled by the 8250.

Q23: Can we rename the objects?

A1: The 8000 series does not support renaming of objects.

Q24: Is there a suggested list of actuators and flow control?

A1: Recommended damper:
Schneider Electric MS41-6043 or equivalent

A2: Recommended air flow sensor:
Schneider Electric (Veris) PX3PXX01 or equivalent

Q25: Can you explain how CFM is measured in this application?

A1: Refer to the documentation for details. Flow measurement requires a Differential Pressure Sensor with a 0-10V analog output.

Q26: On the Bacnet IP product announcement, it mentioned a future wired Bacnet IP solution. Is that still planned?

A1: Wired ethernet is on our priority list, but support from the 8000 family is not currently scheduled due to complexities of mechanical design and installation.

Q27: Can you install the CO_2 plugin module?

A1: Yes, you can use the VCM8001 CO_2 module with the 8250. As there is only one expansion connector you can only install one VCM (ZigBee, CO_2 or Wi-Fi).

Note: SKUs are available with internal ZigBee, leaving the expansion connector available for CO_2 or Wi-Fi.

Q28: Is the duct heating only controlled via Room Temperature via its Demand, or can it be configured to do Discharge Air Control thru Configuration - or would that require LUA Script ATM?

A1: Duct heating is currently only controlled via Room Temperature, and hence Heating Demand.

ComfortPoint Open

CPO-PC-6A PLANT CONTROLLER

DATA SHEET

GENERAL

The ComfortPoint™ Open Plant Controller CPO-PC-6A is an Ethernet-based, freely programmable native BACnet® building Controller (B-BC), which is designed for a wide variety of complex applications.

The CPO-PC-6A features a large complement of different analog inputs, analog outputs, binary inputs, binary outputs, and relays.

The CPO-PC-6A also features numerous communication interfaces, chief among them four different RS485 interfaces (three of which are screw-type terminals located in the terminal block at the upper left-hand corner; the fourth consists of push-in terminals at the upper right-hand corner). It also possesses two standard Ethernet interfaces.

The CPO-PC-6A is thus compatible with a wide range of other electronic devices (see also Fig. 1. ComfortPointTM Open System architecture on pg. 3).

Clearly visible LED control lamps convey important status and alarm information.

The CPO-PC-6A has a durable, anthracite-colored plastic housing conforming with DIN 43880, with a max. slot height of 45 mm. It is thus suitable for mounting in fuse boxes, but can also be mounted on 35 mm standard panel rails (both vertical and horizontal mounting possible).

FEATURES

- **BACnet 2010 certified**
- **24 Vac/dc power supply (from external transformer).**
- **Three separate RS485 interfaces consisting of screw-type terminals.**
- **One additional RS485 interface consisting of push-in terminals.**
- **Three pairs of LEDs indicating the transmission and reception (respectively) of data via the three screw-type RS485 interfaces.**
- **Quick and convenient connection to neighboring modules using the XS816 Bridge Connector (regular cabling also possible).**
- **Alarm LED, power LED.**
- **Three DIP switches for manually switching internal biasing resistors to the three screw-type RS485 interfaces.**
- **Two Ethernet connectors and corresponding status LEDs.**
- **Watchdog for connection to optical or acoustical signaling devices.**
- **Communication using the Panel Bus communication protocol (all four RS485 interfaces), the BACnet MS/TP protocol (RS485 interfaces 1, 2, and 3), the Field Bus protocol (RS485 interfaces 1, 2, and 3), the Modbus protocol (RS485 interfaces 1, 2, and 3), and the CP-IO protocol (RS485 interface 4, only).**
- **Built-in advanced diagnostics software facilitating troubleshooting.**
- **RAM (incl. online data and real-time clock time) are buffered by a super capacitor for 72 hours.**
- **UTF-8 and UCS-2 character encoding formats are supported.**
- **Maximum number of Trend objects permitted: 100**
- **Maximum number of samples per Trend: 200**
  NOTE: Trend samples are based on COV.
- **Supports Peer-to-Peer communication.**

NOTICE

Equipment damage!

- ► Make sure that the CPO-PC-6A is not connected to earth ground.
- ► If nonetheless earth grounding is required, make sure that only terminal 2 is connected to earth ground. Terminal 1 must not be connected to earth ground.

Tx LED and Rx LED

The CPO-PC-6A is equipped with three Tx LEDs (status: yellow/OFF) and three corresponding Rx LEDs (status: yellow/OFF).

These LEDs indicate (by flickering) the transmission / reception of data by the CPO-PC-6A via its three RS485 interfaces.

Specifically:

- Tx1 and Rx1 indicate the transmission/reception (respectively) of data by the CPO-PC-6A via its RS485 interfaces 1 (Bus 1: terminals 3, 4, and 5).
- Tx2 and Rx2 indicate the transmission/reception (respectively) of data by the CPO-PC-6A via its RS485 interfaces 2 (Bus 2: terminals 11, 12, and 13).
- Tx3 and Rx3 indicate the transmission/reception (respectively) of data by the CPO-PC-6A via its RS485 interfaces 3 (Bus 3: terminals 14, 15, and 16).

Table 2. Behavior and meaning of RS485 LEDs

LED behavior	meaning
OFF	No communication over the given RS485 interface.
ON steadily	Fault.
ON/OFF randomly	Communication occurring over the given RS485 interface.

RS232 Interface

The CPO-PC-6A is equipped with an RS232 Interface for the connection of a terminal via a standard XW885 cable.

Ethernet 1 Interface

RJ45 female interface for permanent connection to the ETHERNET network.

Ethernet 2 Interface

For connection of a laptop or PC (onto which ComfortPoint Open Studio has been installed) via a standard Ethernet cross-over cable for application download/upload, or application de-bugging, or Internet Browser access, while the CPO-PC-6A can remain connected in the Ethernet network without interruption. This allows parallel access, e.g., without creating alarm showers at the front-end.

USB Interfaces

USB-A and USB-B interfaces are currently not supported.

Power LED (Green)

The CPO-PC-6A is equipped with a power LED.

Table 3. Power LED

behavior	meaning
ON	Normal operation. CPO-PC-6A is in Boot loader mode. Either Boot loader 1 or Boot loader 2 is running.
OFF	No power to processor, LED damaged, low voltage to board, first second of power up, or boot loader damaged or NAND flash formatting is in process.
very slow blink	CPO-PC-6A is operating normally and the firmware is executing the application.
slow blink	Firmware is not executing application.

Alarm LED (red) and Watchdog

The alarm LED indicates the status of the watchdog relay (terminals 9 and 10). The watchdog relay is for connection to optical or acoustical signals, and allows 24 V, 500 mA dry contacts. These contacts are closed when the power is OFF, when no application is loaded, or when the firmware or application is not working properly. The watchdog resets the CPO-PC-6A if the delay since the previous trigger exceeds 20 sec. Further, the watchdog locks the CPO-PC-6A if the trigger between two restarts is not set.

NOTE: In the event of software problems, the CPO-PC-6A should be restarted by switching the power OFF and then back ON.

Table 4. Alarm LED

behavior	meaning
OFF	Watchdog alarm relay contacts are open = normal operation (or unpowered).
ON	Watchdog alarm relay contacts are closed = failure (alarm) status. • CPO-PC-6A has encountered a hardware problem. • The application has a fault. • CPO-PC-6A powered up without application or operator has manually stopped application, e.g., using the ComfortPoint Open Online Tool. The LED will then light up 13 min. after power-up without application.

Table 5. Permissible load of terminals 9, 10

	max. load	min. current
per normally closed contact (terminals 9, 10)	**19…29 Vac** current at cos φ ≥ 0.6: 0.5A **19…29 Vdc** 0.5 A resistive or inductive	10 mA

DIP Switches

The CPO-PC-6A features three DIP switches (equipped with 510 Ω bias resistors) located to the right of the two blocks of non-removable screw-type terminals. Each DIP switch can be used to switch the 510 Ω bias resistors of the corresponding RS485 interface ON and OFF.

- The bias resistors of RS485 interface 1 (terminals 3, 4, and 5) is switched ON/OFF using DIP switch 1.
- The bias resistors of RS485 interface 2 (terminals 11, 12, and 13) is switched ON/OFF using DIP switch 2.
- The bias resistors of RS485 interface 3 (terminals 14, 15, and 16) is switched ON/OFF using DIP switch 3.

The resultant communication rate over RS485 interfaces 1, 2, and 3 depends upon the given communication protocol selected during engineering using ComfortPoint Open Studio.

HARDWARE SPECIFICATIONS

Table 6. CPO-PC-6A

Feature	Description
SRAM	512 KB
NOR-Flash	4 MB
NAND-Flash	512 MB
CPU	Freescale Coldfire MCF5485, 200 MHz, 32-bit
Operating System	MQX (Message Queue eXecutive)

NOTE: The CPO-PC-6A does not contain a battery. The contents of RAM (incl. online data [out-of-service flag and runtime datapoint properties] and real-time clock time) are buffered by a super capacitor for (typically) 72 hours.

Serial number, date code, part number, and manufacturing location are stored in the CPO-PC-6A non-volatile memory and are thus protected against deleting or overwriting.

GENERAL SAFETY INFORMATION

- ► When performing any work (installation, mounting, start-up), all manufacturer instructions and in particular the Installation and Commissioning Instructions (EN1B-0462GE51) are to be observed.
- ► The ComfortPoint™ Open System (including the CPO-PC-6A Plant Controller, Panel Bus I/O modules, manual disconnect modules, and the auxiliary terminal packages) may be installed and mounted only by authorized and trained personnel.
- ► Rules regarding electrostatic discharge should be followed.
- ► If the ComfortPoint™ Open System is modified in any way, except by the manufacturer, all warranties concerning operation and safety are invalidated.
- ► FCC-CERTIFIED: This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) This device may not cause harmful interference, and (2) this device must accept any interference received, including interference that may cause undesired operation.
- ► Make sure that the local standards and regulations are observed at all times. Examples of such regulations are VDE 0800 and VDE 0100 or EN 60204-1 for earth grounding.
- ► Use only accessory equipment which comes from or has been approved by Honeywell.
- ► It is recommended that devices be kept at room temperature for at least 24 hours before applying power. This is to allow any condensation resulting from low shipping/storage temperatures to evaporate.
- ► The ComfortPoint Open System must be installed in a manner (e.g., in a lockable cabinet) ensuring that uncertified persons have no access to the terminals.
- ► Investigated according to United States Standard UL-60730 and UL-916.
- ► Investigated according to Canadian National Standard(s) C22.2, No. 205-M1983 (CNL-listed).
- ► Do not open the CPO-PC-6A, as it contains no user-serviceable parts inside!
- ► CE declarations according to LVD Directive 2006/95/EC and EMC Directive 2004/108/EC.
- ► Product standards are EN 60730-1 and EN 60730-2-9.

Safety Information as per EN60730-1

The ComfortPoint Open System is intended for home (residential, commercial, and light-industrial) environments.

The ComfortPoint Open System is an independently mounted electronic control system with fixed wiring.

The CPO-PC-6A is suitable for mounting in fuse boxes conforming with standard DIN43880, and having a slot height of max. 45 mm.

It is suitable for panel rail mounting on 35 mm standard panel rail (both horizontal and vertical rail mounting possible).

The CPO-PC-6A is used for the purpose of building HVAC control and is suitable for use only in non-safety controls for installation on or in appliances.

Table 7. Safety information as per EN60730-1

Shock protection	24 V-powered controls: Class III mains-powered controls: Class II
Pollution degree	Pollution Degree 2, suitable for use in home and industrial environments.
Installation	Class 3
Overvoltage category	24 V-powered controls: Category I mains-powered controls: Category II
Rated impulse voltage	330 Vac for Category I 2500 Vac for Category II
Automatic action	Type 1.C (micro-interruption for the relay outputs)
Software class	Class A
Enclosure	IP20 according to EN-60529
Ball-pressure test temperature	75 °C for all housing and plastic parts 125 °C in the case of devices applied with voltage-carrying parts and connectors
Electromagnetic interference	Tested at 230 Vac, with the modules in normal condition.
System transformer	Europe: safety isolating transformers according to IEC61558-2-6 U.S.A. and Canada: NEC Class-2 transformers

testing electrical components	IEC68
certification	CE, cUL60730, UL916, BACnet 2010
system transformer	The system transformer(s) must be safety isolating transformers according to IEC 61558-2-6. In the U.S.A. and Canada, NEC Class 2 transformers must be used.

Operational Environment

Table 10. Operational environment

ambient operating temperature	0 … 50 °C (32 … 122 °F)
ambient operating humidity	5 … 95% relative humidity (non-condensing)
vibration under operation	0.024” double amplitude (2 … 30 Hz), 0.6 g (30 … 300 Hz)
dust, vibration	According to EN60730-1
RFI, EMI	home (residential, commercial, and light-industrial) environments
MTBF (Mean Time Between Failure)	11.7 years

Interfaces and Bus Connections

Via its various interfaces and bus connections, the CPO-PC-6A can be connected to a variety of devices and systems.

Hardware Interfaces

Table 11. Hardware interfaces

Ethernet	10/100 Mbit/s, RJ45
MSTP Port	Supports 9.6, 38.4, and 76.8 Kbps
Modbus	0.6 to 115.2 Kbps
Panel bus	115.2 Kbps

Supported Communication Protocols

The following communication protocols are supported. (There are no limitations pertaining to the parallel / concurrent use of communication protocols.) See Table 12.

Table 12. Protocols supported by communication interfaces

communication interface	supported protocol(s)
Panel Bus (terminals 75, 76)	Panel Bus; CP-IO
RS485 interface 1 (term. 3, 4, 5)	Panel Bus, BACnet MS/TP, Mod-Bus, Field Bus
RS485 interface 2 (term. 11, 12, 13)	
RS485 interface 3 (term. 14, 15, 16)	
watchdog (terminals 9, 10)	--
RS232 interface	--
Ethernet 1 interface	BACnet/IP, Telnet
Ethernet 2 interface	BACnet/IP, Telnet
USB-A, USB-B interfaces	not used

The communication rate across each communication interface is dependent upon the given communication protocol.

CPO-Rxx ROOM CONTROLLERS

DATA SHEET

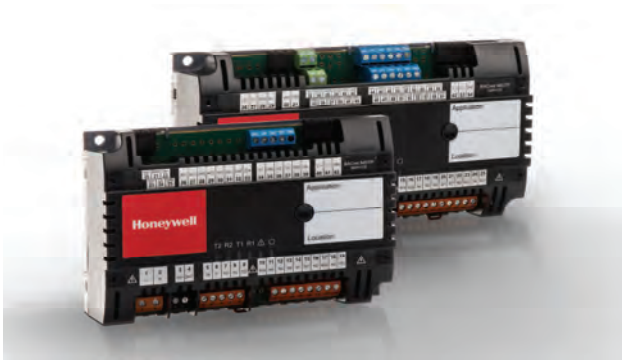

Fig. 1. CPO-Rxx (without optional covers)

GENERAL

The CPO-Rxx family of room controllers provide flexible, configurable, demand-led control that delivers tangible benefits to reduce energy spends and drives new levels of functionality and efficiency in today's buildings. With scalable and freely programmable BACnet MS/TP-based room controllers, smart engineering & commissioning tools, and SYLK technology, multiple and flexible configurations can be achieved to address specific applications.

FEATURES

- Designed to control terminal units such as 2- and 4-pipe fan coil units, chilled ceilings, hydronic, air quality control, and a mix of these applications.
- For complex applications requiring high I/O count.
- Both configurable and freely programmable, covering enhanced applications.
- Support for 1-3 stage fans, variable fan speed drives (VSDs), thermal, floating, and proportional actuators.
- Dual-loop support allows for 2-room application.
- Auto Mac-addressing.
- Fast commissioning using plug-and-play solutions, pre-defined applications and state-of-the-art commissioning via the RoomUp mobile application – eliminating the need for two people when commissioning.
- Reduced number of sensors because sensors are shared across different applications.
- BACnet BTL®-Listed as Advanced Application Controllers (B-AAC) rev 1.12.
- Two housing dimensions and several different I/O versions to match your individual needs.
- 24 VAC and 230 VAC versions.
- Universal mounting options, including terminal covers and color-coded terminals.
- The 230 VAC models feature 24 VAC aux. output voltage, allowing direct connection and powering of field devices.
- Two-wire polarity-insensitive bus interface to connect to Honeywell Sylk wall modules.
- All models with real-time clock. RL4, RL5, RL6, and RL7U with super capacitor for 72-hr data retention.

SYSTEM OVERVIEW

Table 1. Overview of models

	OS no.: CPO-…	power supply	AOs	UIs	relays (N.O.)	triacs (24 / 230 VAC)	total no. of I/Os	max. 24 VAC output	remarks
large housing (198 x 110 x 57.5 mm)	RL1	230 VAC	2	6	1	2	11	300 mA	--
	RL2	230 VAC	2	6	4	4	16	300 mA	--
	RL3	24 VAC	2	6	4	4	16	600 mA	--
	RL4	230 VAC	6	10	4	4	24	300 mA	72-hr data retention
	RL5	24 VAC	6	10	4	4	24	600 mA	72-hr data retention; with removable terminals
	RL6	24 VAC	6	10	4	4	24	600 mA	72-hr data retention
	RL7U	24 VAC	6	10	4*	4	23	600 mA	72-hr data retention; with watchdog relay
	RL8	230 VAC	6	10**	4	4	24	300 mA	With lighting support
small housing (162 x 110 x 57.5 mm)	RS1	230 VAC	3	3	0	0	6	300 mA	--
	RS2	230 VAC	1	3	0	2	6	300 mA	Configurable, only
	RS3	230 VAC	0	3	3	2	8	300 mA	Configurable, only
	RS4	230 VAC	4	4	4	2	14	300 mA	--
	RS5	24 VAC	4	4	4	2	14	600 mA	--
	RS6	24 VAC	1	3	0	2	6	600 mA	Configurable, only

*Including relay 4 (the watchdog), which is not available for use by the application.

**UI1-UI4 are binary-only inputs.

CPU: 32-bit MK24FN Freescale Kinetis Cortex M4

DIMENSIONS AND MOUNTING

Housings

The controller is available in two housing sizes, both conforming to IP20:

- RLxx (large housing):
  W x L x H = 110 x 198 x 59 mm and
- RSxx (small housing):
  W x L x H = 110 x 162 x 59 mm

See also Fig. 3 and Fig. 4.

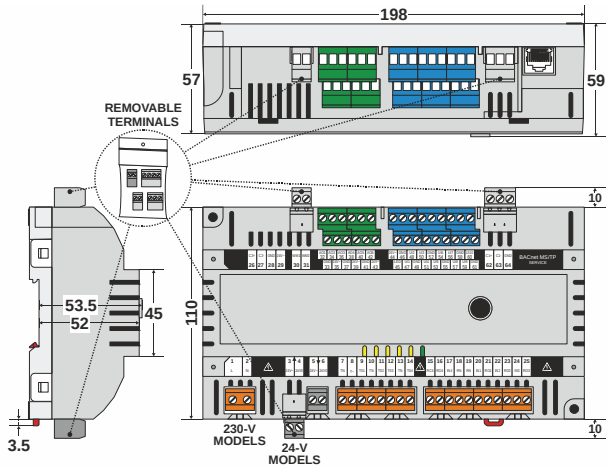

Fig. 3. RLxx dimensions (in mm)

NOTE: In the case of the RL5, all of the terminal blocks are removable.

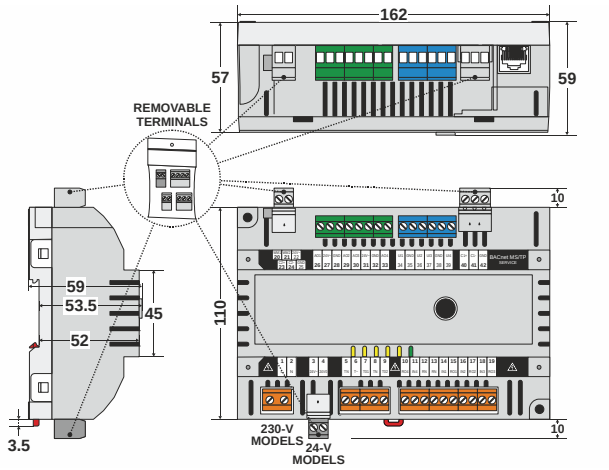

Fig. 4. RSxx dimensions (in mm)

The unit is suitable for mounting on a standard rail, on walls, as well as in wiring cabinets or fuse boxes.

Terminal Protection Covers for IP30

In the case of controllers mounted outside of a cabinet, before applying power to the device, Terminal Protection Covers (10-pc. bulk packs, order no.: IRM-RLC for large housings and IRM-RSC for small housings) must be mounted so as to provide IP30.

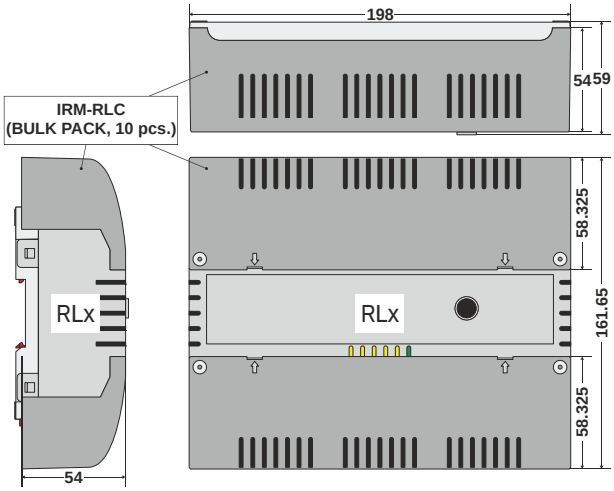

Fig. 5. Large housing, with terminal protection covers, dimensions (in mm)

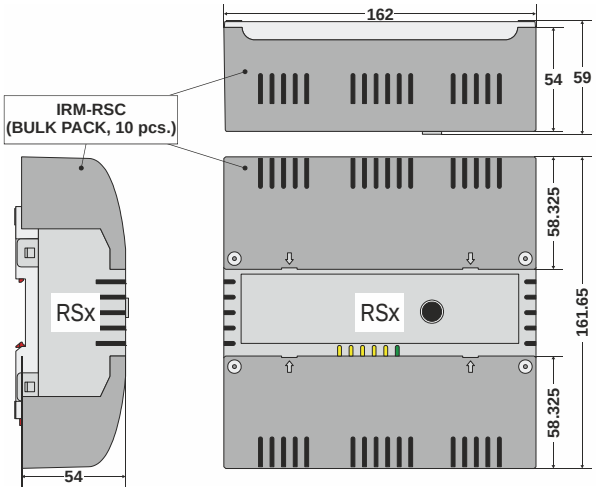

Fig. 6. Small housing, with terminal protection covers, dimensions (in mm)

TERMINAL ASSIGNMENT

General

For a complete list of all terminals and a description of their functions, see Table 2 and Table 6.

Communication Interfaces

All models of the controller features the following communication interfaces:

- A Sylk Bus interface for connection to TR40x/42x Wall Modules;
- A BACnet MS/TP interface;
- An RJ45 connector for connection of the BACnet WiFi Adapter.

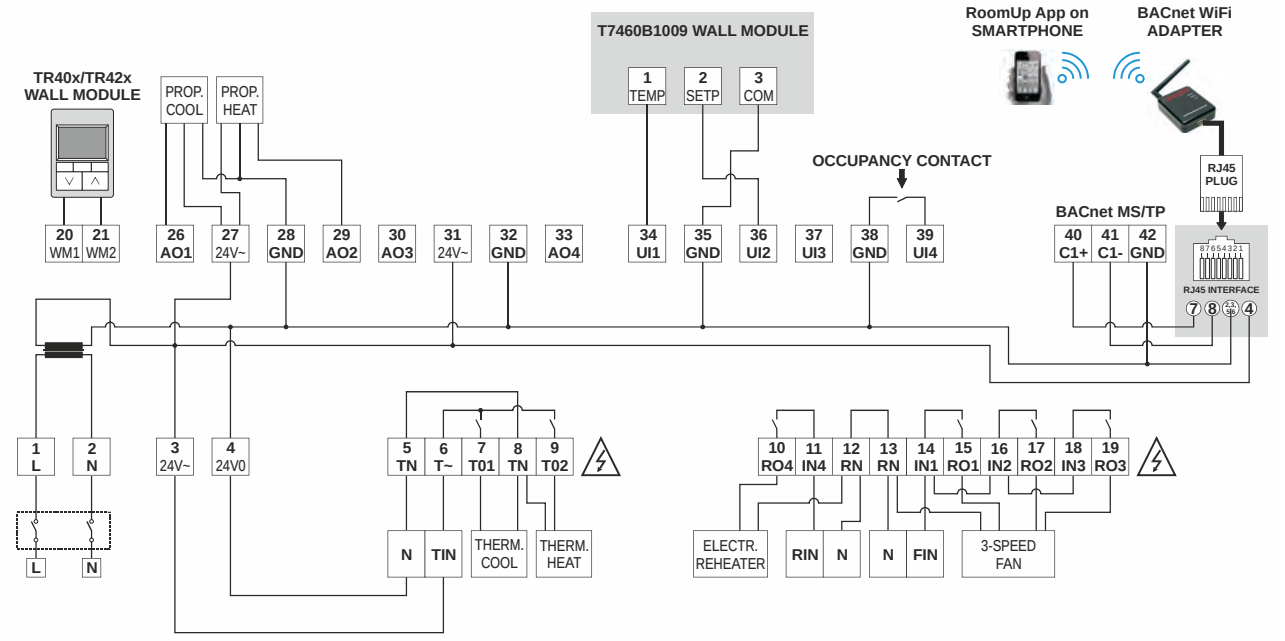

Fig. 7. RS2, RS3, and RS4 (230-V models) and example wiring

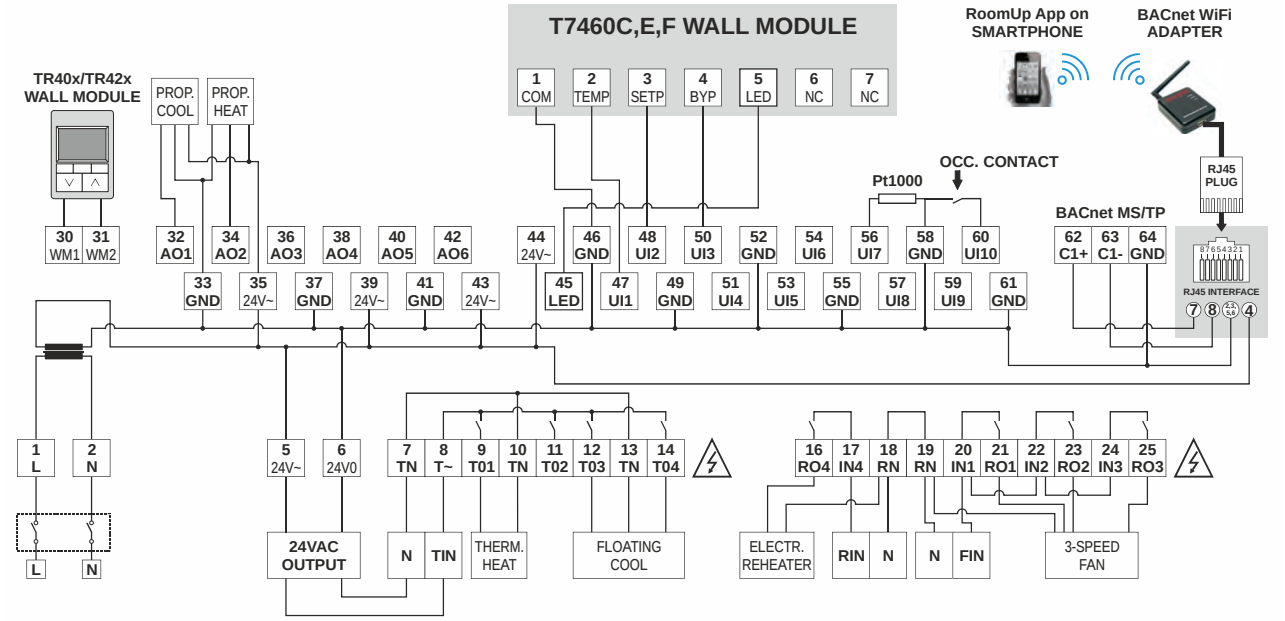

Fig. 8. RL2 and RL4 (230-V models) and example wiring

ELECTRICAL DATA

RL1, RL2, RL4, RL8, RS1, RS2, RS3, RS4 (230 VAC)

Power via terminals 1 + 2: 230 VAC +10% / -15%, 50/60 Hz.

Max. power consumption (when unloaded): 8 W.

Max. power consumption (when loaded): 18 W.

The controller is "unloaded" when it has no external load. Thus, the only load on the controller is the inherent load (8 W) of the electronics, themselves. The heat dissipation then amounts to 8 W. The controller is "loaded" when – besides the inherent load – an additional sum load of max. **300 mA** is applied to the 24 VAC output terminals. The max. unloaded output voltage at terminals 3 and 4 is 33 VAC (typically: 29.5 VAC).

RL3, RL5, RL6, RL7U, RS5, RS6 (24 VAC)

Power via terminals 3+4: 24 VAC ±20%, 50/60 Hz.

Max. current consumption (when unloaded): 300 mA.

Max. current consumption (when loaded): 900 mA.

The controller is "unloaded" when it has no external load. The heat dissipation then amounts to 7 W. The controller is "loaded" when – besides the inherent load (300 mA) – an additional sum load of max. **600 mA** is applied to the 24 VAC output terminals.

COMMISSIONING

The controller can be used with freely programmable applications or with a configurable application.

Freely Programmable Applications

Of the 14 models of the controller, eleven (see Table 1) can be used with applications which the application engineer can freely program for each controller. This process is performed on a PC on which the CPO Studio software program has been installed (see also Table 9 on pg. 12).

Configurable Application

All 14 models can be used with the configurable application already included in the controller. Three models (RS2, RS3, and RS6) can be used only with the configurable application (i.e., they are not freely programmable).

The configurable application has the advantage that it is proven and quickly commissioned using the RoomUp commissioning tool running on an Android Smart device.

Configuration and commissioning can be performed using the RoomUp commissioning tool available in the Google Playstore (URL: https://play.google.com/store).

NOTE: Before configuring, if as yet no WLAN is present, the commissioning engineer will require a BACnet WiFi Adapter (order no.: BACA-A) to establish wireless communication between his Android Smart device and the controller.

Example Application Types

The configurable application supports the following application types:

- The **FCU application type** supports 1-, 2-, and 3-stage or variable-speed fan. It also supports water cooling, water heating (2-pipe or 4-pipe), electric re-heating, and dx-cooling (incl. fan interlock). It supports PID and, optionally, cascade control as well as min. temperature limitation. This application type may be used in combination with other types (see following).
- The **chilled/heated ceiling application type** uses PID with dewpoint protection (2-pipe or 4-pipe). It also supports 6-way valve on AO. It may be used in combination with other applications (e.g., min. temperature).
- The **radiator heating** application type.
- The **underfloor heating application type** uses PID and, optionally, max. temperature limitation. It may be used in combination with other applications.
- The **intake air / air quality control application type** for cooling and air quality control uses PID and, optionally, min. temperature limitation. It may be used in combination with other applications.

The use of different application types is limited by the number of I/Os supported by the given model.

Supported Actuators

The application supports open/close, PWM (thermal), floating, and proportional (0[2]…10 V) actuators. Proportional actuators may be used with 6-way valves for heating and cooling, in chilled/heated ceilings.

Supported Sensors

A variety of sensors (e.g., room temperature sensors, supply temperature sensors, condensation switch, window sensors, occupancy sensors, and card readers) may be used to optimize control quality.

Supported Operating Modes

The application supports a variety of different operating modes (e.g., occupied, standby, unoccupied, building protection, fan automatic/manual/fan, only [FCU application type, only], night purge [intake air application type, only]).

I/Os not used by the configurable application may be used by a plant controller for monitoring or to switch an actuator (e.g., window actuator).

Automatic MAC Addressing

In contrast to many other MS/TP controllers, the CPO-R Controller features automatic MAC addressing. There is thus no need to manually set the MAC address.

BACnet MS/TP Master/Slave Functionality

During configuration, the commissioning engineer can identify (e.g., using the RoomUp configuration tool) which of the controllers located on a given BACnet MS/TP bus are so-called "Masters," and which are so-called "Slaves." The commissioning engineer is not allowed to assign more than a single Master to each Slave; this is the only action which the commissioning engineer is required to perform. The Slave controller will inform its Master that it has been assigned to be

its Slave. Once this is done, Master/Slave communication is as shown in Fig. 9.

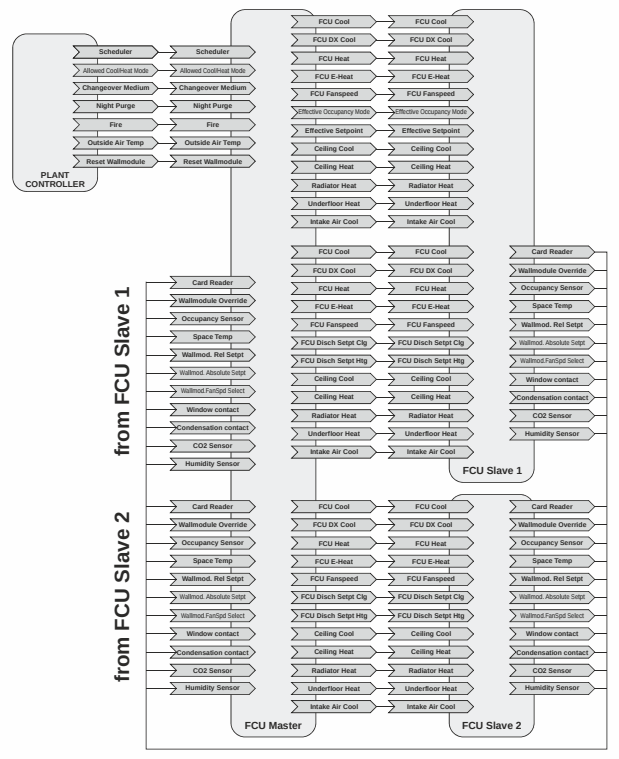

Fig. 9. Master/Slave communication

The given application in the Master controller defines how this group (consisting of the Master controller and its Slave controllers) reacts to sensor inputs.

Examples:

- Activation of a window contact (indicating an opened window) will cause the application to stop heating/cooling.
- Receipt of a condensation signal will stop cooling.
- Occupancy will be detected if one of the occupancy sensors detects occupancy.
- A key card will be detected if one of the key card sensors detects a key card.
- Occupancy override from one of the connected wall modules will trigger an occupancy override.
- The last setpoint change (temperature setpoint or fan speed setpoint) on one of the wall modules (T7460x or TR40x/TR42x) will define the setpoint (NOTE: All TR42x wall modules will show the actual settings used by the controllers. The T7460x and TR40x do not feature a display and are thus unable to provide the actual setting, nor does their setpoint wheel reflect setpoint changes enacted using another wall module in the same group).
- For such sensor values as temperature, CO_2, and humidity, the commissioning engineer can configure the use of the average, min., or max. value (thus improving system robustness against failures of a single sensor.)
- A changeover signal from one of the controllers will set the group to the corresponding mode.
- The Master shares schedule, heat/cool mode, night purge, emergency, and actuator positions with its Slave(s).

OPERATOR INTERFACES

LEDs

The controller features the following LEDs:

Fig. 10. Controller LEDs

Table 7. Description of LED behaviors

symbol	color	function, description
T2	yellow	Not used
R2	yellow	Not used
T1	yellow	LED indicating transmission of communication signals via the BACnet MS/TP interface
R1	yellow	LED indicating reception of communication signals via the BACnet MS/TP interface.
⚠	yellow	Status LED indicating firmware problems, hardware problems, etc.
⏻	green	Power LED indicating firmware problems, hardware problems, etc.
	red	Watchdog (RL7U, only) has locked controller.

Watchdog Functionality (RL7U, only)

The RL7U features a watchdog (relay 4) which enhances the system's reliability.

The watchdog indicates whether or not the controller's software and processor are functioning properly. In the event that either the software or the processor is not functioning properly, the watchdog will reboot the controller.

If, after this reboot, the watchdog again detects a problem, the watchdog will then lock the controller (i.e., permanent reset). The following will then occur: The watchdog will operate (i.e., terminal 15 will be connected with terminal 17), the power LED will light up RED, and the status LED will remain OFF (see Table 7).

Optionally, the user can connect an alarm (e.g., beeper) to terminals 15 and 17.

The watchdog relay is not available for use by the application.

See also Table 3 for technical details on the watchdog relay.

Service Button

The controller's Service Button is used to trigger dedicated events.

COMMUNICATION INTERFACES

BACnet MS/TP Interface

The controller features an RS485 interface (RLx: terminals 62, 63, and 64; RSx: terminals 40, 41, and 42) suitable for BACnet MS/TP communication. The terminal block containing it is black. The cable length affects the baud rate. See Table 8.

Table 8. Baud rate vs. max. cable length

baud rate	max. cable length (L)
9.6, 19.2, 38.4, 57.6, and 76.8 kbps	1200 m
115.2 kbps	800 m

For information on wire gauge, max. permissible cable length, possible shielding and grounding requirements, and the max. number of devices which can be connected to a bus, refer to standard EIA-485.

RJ45 Connector for BACnet WiFi Adapter

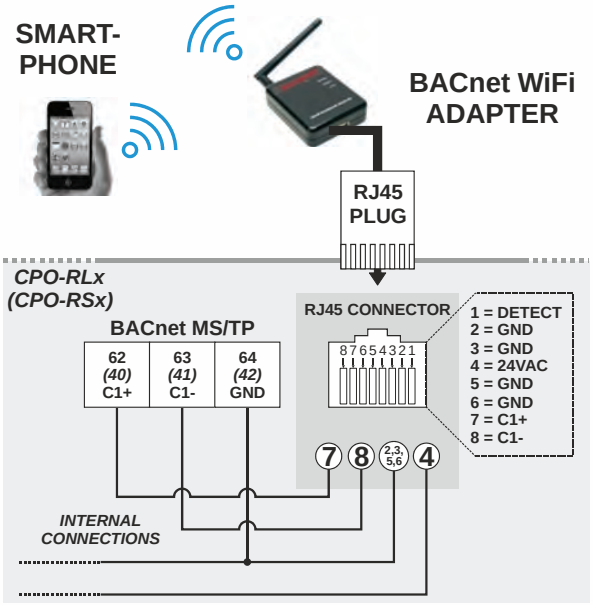

Fig. 11. RJ45 interface and BACnet WiFi Adapter

⚠ CAUTION

It is permitted to connect ***only*** the BACnet WiFi Adapter to this RJ45 connector. Do ***not*** connect IP!

A BACnet WiFi Adapter can be connected to the controller's RJ45 connector in order to establish wireless communication with an Android Smart device so that the application engineer can configure the controller (using the RoomUp configuration tool).

NOTE: When the BACnet WiFi Adapter is connected to the controller's RJ45 connection, it is powered by the controller. It is then prohibited to simultaneously power the BACnet WiFi Adapter via a wall adapter. When, on the other hand, the BACnet WiFi Adapter is instead connected to the controller's BACnet MS/TP interface, it is prohibited to simultaneously use an RJ45 plug; instead, the BACnet WiFi Adapter must then be powered by a wall adapter (standard 5-V USB wall adapter with micro USB connector).

See also corresponding Technical Literature listed in Table 9 on pg. 12.

Wall Modules

The T7460x and TR40x/TR42x Wall Modules can be used in conjunction with the controller to perform room temperature sensing, setpoint adjustment, fan speed manual override, and occupancy override.

I/O TERMINALS

Relay Outputs

⚠ CAUTION

Mixing of different voltages (e.g., 24 V and 230 V) within the relay block is not allowed.

The terminal blocks containing the controller's relay outputs are orange. Relay output types: See Table 3.

NOTE: If inductive components are to be connected to the relays and if these relays switch more often than once every two minutes, these components must be prevented from causing harmful interference to radio or television reception (conformance with EN 45014).

Triac Outputs

The terminal blocks containing the controller's triac outputs are orange.

These triac outputs can be configured (using, e.g., the RoomUp configuration tool) for a variety of different functions, e.g., for connection to either a floating drive or to a thermal actuator. Once the triac outputs have been configured, the corresponding devices can then be connected to them directly.

NOTE: The VC6983 actuator is intended for use at relay outputs, only and must not be used at the controller's triac outputs.

Triac Current Limitations

In the case of the 230-VAC versions of the controller, when the triacs are to be supplied with 24-VAC power from the controller's internal transformer, then the following applies:

- 300 mA max., i.e., a max. of one thermal actuator for heating and one thermal actuator for cooling can be operated (provided that heating and cooling are not operated at the same time).

⚠ CAUTION

The max. permissible power output of all 24 VAC terminals combined is 300 mA! If the triacs, alone, are loaded with 300 mA, then it is not permitted to connect a load at any other 24 VAC output terminal.

In all other cases, when the triacs are to be supplied with power (24 VAC or 230 VAC) from an external source, then the following applies:

- 700 mA (peak) and 600 mA (max.), i.e., two to three thermal actuators can be operated in parallel (depending upon the current consumption of the given actuator).

Universal Inputs

The terminal blocks containing the controller's universal outputs are blue. Universal input types: See Table 4.

The universal inputs are protected against voltages of max. 29 VAC and 30 VDC (due to, e.g., miswiring).

Bias Resistors

Each universal input is equipped with one bias resistor.

Analog Outputs

The terminal blocks containing the controller's analog outputs are green. Analog output types: See Table 5.

The analog outputs of the RLxx controllers (large housing) are protected against voltages of max. 29 VAC and 30 VDC (due to, e.g., miswiring).

NOTE: Connecting 24 VAC to any analog output of the RSxx controllers (small housing) will damage the hardware.

TROUBLESHOOTING

All units feature a Service LED, Power LED, and Service Button for commissioning and troubleshooting. See also sections "LEDs", "Watchdog Functionality (RL7U, only)", and "Service Button".

Check if the Service LED's behavior is changed if you switch the power OFF/ON. Please contact Honeywell if this does not solve the problem.

ACCESSORIES

Terminal Protection Cover

Required for wall mounting. Bulk pack, set of ten covers.

- For LARGE controllers, order no.: **IRM-RLC**
- For SMALL controllers, order no.: **IRM-RSC**

APPROVALS, CERTIFICATIONS, AND STANDARDS

Approvals and Certifications

- 24-V models and 230-V models: UL 60730-1, Standard for Automatic Electric Controls for Household and Similar Use, Part 1: General Requirements;
- 24-V models and 230-V models: CAN/CSA-E60730-1:02, Standard for Automatic Electrical Controls for Household and Similar Use, Part 1: General Requirements;
- 24-V models and 230-V models: Complementary listing for UL916, CSA C22.2 No. 205;
- BACnet AAC profile;
- CE-approved;
- SASO and EAC-approved;
- FCC part 15B-compliant.

Classification according to EN 60730-1

EN 60730 sub part:	EN 60730-2-9
Environmental conditions:	For use in home (residential, commercial, and light-industrial) environments
Construction:	Independently mounted electronic control unit with fixed wiring; panel-mounted on DIN rail
Action:	type 1.C
Rated impulse voltage:	230 V circuits: 2500 V 24 V circuits: 500 V
Pollution degree:	2
Protection against shock:	Class 0 (without terminal cover) Class II (with terminal cover)
Software class:	A

Classification according to EN 60529

(Degree of protection provided by enclosures)

IP20. In the case of controllers mounted outside of a cabinet, before applying power to the device, Terminal Protection Covers (10-pc. bulk packs, order no.: IRM-RLC for large housings and IRM-RSC for small housings) must be mounted so as to provide IP30.

Ambient Environmental Limits

24-V Models (5...95% r.H., non-condensing)

Operating temperature:	0 … +50 °C (RL7U: -40 … +65 °C)
Storage temperature:	-20 … +70 °C

230-V Models (5...95% r.H., non-condensing)

Operating temperature (floor/ceiling mounting):	0 … +40 °C
Operating temperature (wall/rail mounting):	0 … +50 °C
Storage temperature:	-20 … +70 °C

JACE® 8000 controller

PRODUCT DEFINITION

The JACE 8000 is a compact, embedded IoT (Internet of Things) controller and server platform for connecting multiple and diverse devices and sub-systems. With Internet connectivity and Web-serving capability, the JACE 8000 controller provides integrated control, supervision, data logging, alarming, scheduling and network management. It streams data and rich graphical displays to a standard Web browser via an Ethernet or wireless LAN, or remotely over the Internet.

The licensing model for the JACE 8000 controller is simplified and features standard drivers along with optional IO and field bus expansion modules for ultimate flexibility and expandability. The JACE 8000 controller operates with Niagara 4, the latest version of the Niagara Framework®, for optimum performance. In larger facilities, multi-building applications and large-scale control system integrations, Niagara 4 Supervisors can be used with JACE 8000 controllers to aggregate information, including real-time data, history and alarms, to create a single, unified application.

HARDWARE SPECIFICATIONS

TI AM3352: 1000MHz ARM® Cortex™-A8
1GB DDR3 SDRAM
Removable micro-SD card with 4GB flash total storage/2GB user storage
Wi-Fi (Client or WAP) *IEEE802.11a/b/g/n* *IEEE802.11n HT20 @ 2.4GHz* *IEEE802.11n HT20/HT40 @ 5GHz* *Configurable radio (Off, WAP, or Client)* *WPAPSK/WPA2PSK supported*
USB type A connector *Back-up and restore support*
(2) isolated RS-485 with selectable bias and termination
(2) 10/100MB Ethernet ports
Secure boot
24VAC/DC power supply
Runs Niagara 4.1 and later
Real time clock
Batteryless

28HE Series High Efficiency Steam Boilers

THE HEATING Pros

Smith
CAST IRON BOILERS

High Efficiency

Smith Boilers is the only manufacturer offering a high-efficiency steam boiler; replace an aging or failed system and still attain fuel cost savings.

Efficiency [makes replacement the smart choice]

When you can get extensive savings from a high efficiency steam boiler, extensive costs of system conversion are no longer justified. When plans require an eye on value over time, and call for less hands-on operation and maintenance, Smith Boilers will get you there. Proven in decades past, proving it for decades to come.

Simple Install & Maintenance

Smith Boilers designs products with the needs of the contractor and end-user in mind. Our sectional design installs easily within existing mechanical rooms. Easy access for service and maintenance provides a longer service life.

Optimal Operation

Larger heat transfer surface and cast-in heat transfer pins allow for maximum thermal efficiency—during the course of its lifetime, the boiler pays for itself several times over. Additionally, our integral flue gas collector enables quieter operation.

Engineered [to be your long-term answer]

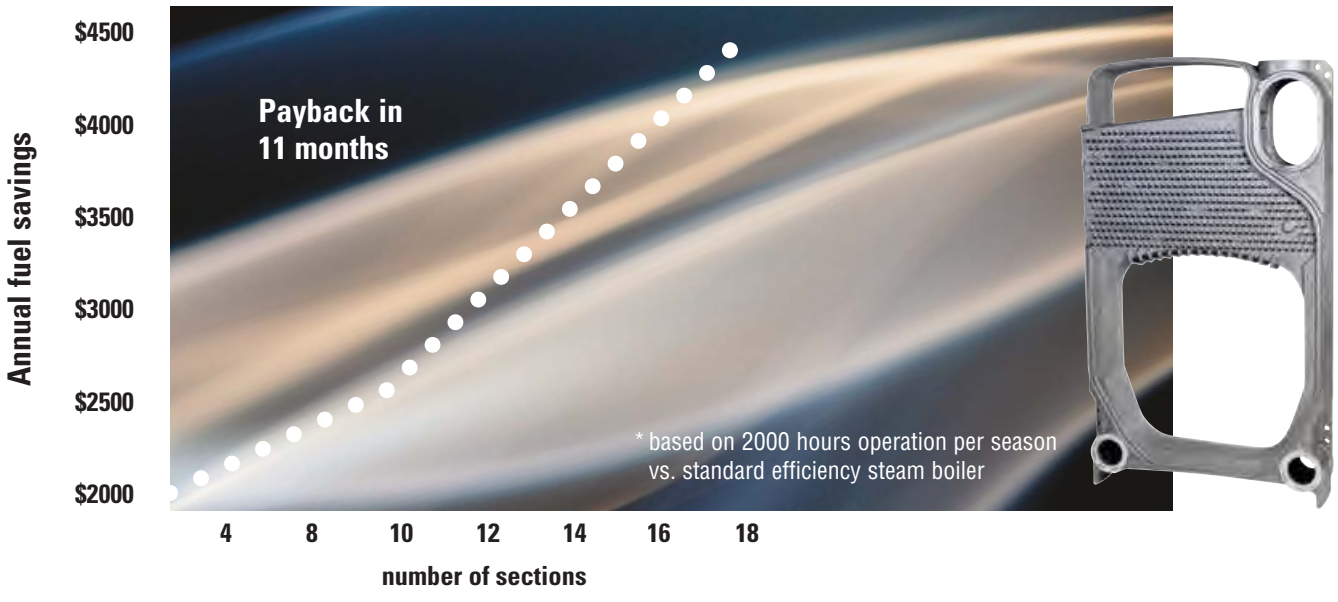
When you choose a replacement boiler, you want one that won't itself need replacement or extensive service. Smith Boilers's specialized machining and components ensure your decision stands up over time.

1. Machined Feet

Smith Boilers ship with their own steel floor rails that match section feet assembly; no need for shims or field adjustments. Sections are drawn together pair-by-pair to reduce stress for simplified, no-jack connection

2. Indestructible Port Connectors

Precise sectional alignment accommodates graphite port connectors that permanently withstand exposure to flue gases and steam pressure up to 15 psi, and any water pH factor



3. Large Steam Chest

The obround design of the upper port provides improved internal circulation and a drier steam, enhancing performance

4. Continuous Seal/ Integral Smokehood

The exact alignment of the sections allows for a convenient continuous ceramic rope seal, as well as a cast-in smokehood in order to reduce the operational noise

28HE Series

HIGH EFFICIENCY STEAM BOILERS

Steam Standard Equipment

- Cast iron wet-base sections
- Insulated metal jacket
- Cast iron smokehood with integral damper
- Burner mounting plate with insulation block
- Front and rear flame observation ports
- Stack thermometer
- Steel angle floor rails
- Ceramic fiber rope seal between sections
- Graphite port connectors
- Low NOx available
- 15 psi working pressure sections
- ASME relief valve, 15 psi
- Steam gauge
- Manual reset, Hi-Limit pressuretrol (Boiler/Burner units only)
- Operating pressuretrol (Boiler/Burner units only)
- Gauge glass and fittings

I B R Ratings, Burner Capacities and Dimensions (inches)

94™ BOILER

- PACKAGED FOR KNOCK DOWN
- EASY TO INSTALL AND SERVICE
- GAS, OIL, GAS/OIL
- WATER OR STEAM
- MADE WITH WEIL-McLAIN QUALITY

WEIL-McLAIN®
weil-mclain.com

WEIL-McLAIN®

Presenting... the Weil-McLain No. 94 heavy-duty cast iron boiler is designed for heating apartments, schools, churches, offices, and other commercial and institutional buildings. The boiler is available for hot water or steam in 18 sizes with net I-B-R ratings from 1,763.5 to 6,060.9 MBH.

The 94 is available as a complete boiler-burner unit furnished with a light oil burner (BL Unit), power gas burner (BG Unit), or combination gas light oil burner (BGL Unit). It is also available as a boiler only (H Unit) for use with heavy oil burners approved by Weil-McLain.

In addition to total fuel flexibility, the 94 also features total installation flexibility: It is available in individual sections, with factory-assembled sections, or as a completely assembled and factory fire-tested package boiler.

The 94 features forced draft firing at over 80% operating efficiency. Outstanding design and construction features include provision for multiple tankless water heaters, patented section sealing method, Hydro-Wall wet-base design, insulated steel jacket, provision for easy cleaning, built-in air eliminator in water boilers, simplified piping no refractory combustion course, Weil-McLain cast iron construction.

Forced Draft Firing

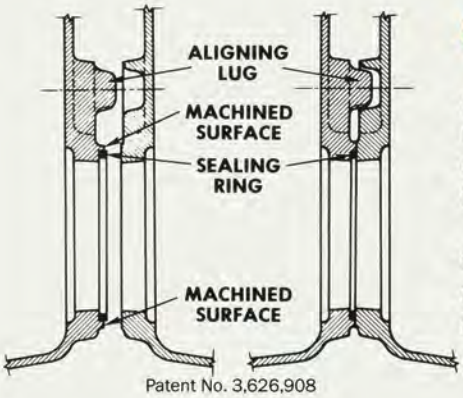
The No. 94 boiler is pressurized for forced draft firing and therefore does not require a chimney for draft... only a 3-foot vent above the roof is necessary. This feature is particularly valuable in replacement installations, since an existing chimney with insufficient draft because of low height or poor construction is not a problem. Other advantages of a forced draft boiler: No mechanical draft equipment is required, boiler room space requirements are reduced, and a pressurized boiler is more energy efficient.

Design Features

1. Forced draft firing with light oil, gas combination gas-light oil, or heavy oil. Burner mounting plate furnished as standard equipment (additional equipment for heavy oil boilers).
2. Hydro-Wall design with water circulating completely around the combustion area... no refractory combustion chamber, no separate base.
3. Cast iron sections for corrosion resistance and extra long life... special sealing rope assures a gastight seal.
4. Short draw rods permit faster, easier assembly of boiler sections.
5. Patented section sealing method assures a watertight seal and reduces installation time.
6. Simplified piping reduces installation time. No return header necessary.
7. Multiple tankless heaters. Up to eight heaters can be installed in larger boilers.
8. Supply outlets with built-in air eliminator simplify piping.
9. Extra-large top port opening forms internal header for better water circulation... large steam area assures rapid production of dry steam.
10. Steel jacket finished in attractive blue hammerloid, completely insulated, designed for fast installation.
11. Designed for easy cleaning through front cleanout doors and openings.
12. Stronger boiler construction. H and T-shaped cross sections provide maximum design strength, 80 lbs. working pressure available.

Hydro Wall Design

The No. 94 boiler has a water-backed combustion area with water circulating completely around the firebox. The crown sheet and sidewalls maximize heat-transfer surface.

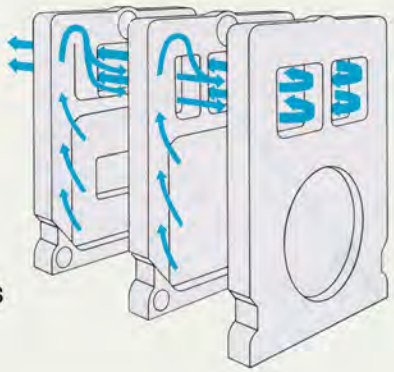


Hydro-Wall section design also permits lower height, reduces heat loss through the bottom of the boiler, and permits installation on any floor.

The cast iron sections are not face-ground; the tough outer skin is retained to protect against rust and corrosion.

No Refractory Combustion Chamber

A refractory combustion chamber is not required for the 94 boiler because the combustion area is entirely surrounded by water, and flame retention burners do not require hot refractory for combustion. This feature of the boiler saves the cost of combustion chamber material, the labor to install it, and there is no future replacement cost.



Patent No. 3,626,908

Section Sealing Method

A flexible elastomer sealing ring is used in each port opening of the 94 boiler to assure a permanent, water-tight seal between sections. This sealing method, combined with the use of short draw rods to tie sections together, also permits faster section assembly.

As shown in the illustrations, the machined surface of the port opening controls the compression ratio of the sealing ring for a watertight seal. The aligning lugs assure proper section alignment during assembly and positive locking of the sections.

Flue Gas Traveler

Multiple uptakes, combined with "3-pass" design, force hot gases to wipe the entire flue area, assure balanced flue gas travel, and prevent shortcuts to the chimney. Extra-long flue gas travel and higher velocities increases heat absorption of the secondary heating surfaces.

Assembled with short draw rods

Multiple short draw rods, instead of a single long rod and expansion washers, are used to tie the sections of the 94 boiler together. This is a standard feature of Weil-McLain boilers and is recognized by leading insurance companies. Short draw rods permit faster, easier assembly of boiler sections.

Tappings (1 ½") may be provided in front, back and intermediate sections for access to waterway areas and for inspection above the crown sheet and at the bottom of the boiler.

Front Cleanout Openings

The No. 94 boiler has two large cleanout doors that give complete access to center flueways for easy cleaning. These frameless doors are hinged to a center plate, sealed with rope, and made airtight by tightening the wing nuts. There are also six rope-sealed cleanout plates at the front of the boiler for cleaning the side flues.

No Return Header... Flanged flue collar

No separate return header is necessary for the 94 boiler, saving valuable installation time and material costs. Return water or condensate enters the center opening and is directed to the left and right port openings by internal vanes in the section.

For water boilers 894 through 1294 and all steam boilers, the center opening is covered with a plate with a 6" tapping. For water boilers 1394 through 2094, the opening accepts a standard 8" counter flange; for water boilers 2194 through 2594, the opening accepts a 10" counter flange.

The flanged flue collar has a steel counter flange so the breeching may be welded to the collar of the gastight seal required for forced draft firing. (Note: 2294 through 2594 boilers are furnished with a counter flange with a 12-inch-long male adapter.) Rope seal between the flange and counter flange eliminates air leakage. The flue collar has a built-in breeching damper that can be locked in position to maintain positive pressure over fire.

The large access panel gives easy access tot the firebox for servicing. The panel has a refractory liner; an additional refractory heat shield provides further cooling of the panel. An observation port on the access panel permits close study of the flame.

Supply Outlets

The 94 boiler requires only one or tow supply outlets, which reduces installation time. All water boilers and the 894 steam boiler use one supply outlet; remaining steam boilers use two. Three types of supply outlets are furnished as standard equipment depending on boiler size: (1) supply elbow with 6" tapping, (2) supply elbow with 8" flanged opening, and (3) top outlet with 10" flanged opening (see table). The outlets feature a built-in trap, which separates the air from the water.

Multiple Tankless Water Heaters

Up to eight tankless water heaters can be installed in the 94 boiler. Storage heaters are also available.

Multiple tankless heaters offer these advantages: (1) increased volume of hot water, (2) hot water at different temperatures, or (3) one heater for snow melting.

Domestic Water Heater Capacities

Tankless Heaters*

Heater Number	**Intermittent Draw GPM 100º Average Temperature Rise	***Continous Draw GPM 100º Temperature Rise	Inlet and Outlet Tappings

2494	6	8	2, 9, 11, 13, 17, 23	6, 9, 11, 13, 17, 19, 21, 23
2594	7	8	2, 9, 11, 13, 15, 18, 24	6, 9, 11, 13, 17, 19, 21, 23

Note: If TI sections are ordered (see boiler rating table footnote), it is important to position them in the boiler section assembly in the exact location shown in the table above so that heater openings will match the jacket knockouts. If one or two TI sections are ordered with boiler, they MUST be located in one jacket panel because only ONE jacket side panel will have knockouts for tankless heaters. If more than two TI sections are ordered, additional jacket side panels with knockouts will be provided according to the table. The location of TI sections in other positions in the section assembly is possible, but jacket openings must then be cut by the installer.

No Return Header... Flanged flue collar

No separate return header is necessary for the 94 boiler, saving valuable installation time and material costs. Return water or condensate enters the center opening and is directed to the left and right port openings by internal vanes in the section.

For water boilers 894 through 1294 and all steam boilers, the center opening is covered with a plate with a 6" tapping. For water boilers 1394 through 2094, the opening accepts a standard 8" counter flange; for water boilers 2194 through 2594, the opening accepts a 10" counter flange.

The flanged flue collar has a steel counter flange so the breeching may be welded to the collar of the gastight seal required for forced draft firing. (Note: 2294 through 2594 boilers are furnished with a counter flange with a 12-inch-long male adapter.) Rope seal between the flange and counter flange eliminates air leakage. The flue collar has a built-in breeching damper that can be locked in position to maintain positive pressure over fire.

The large access panel gives easy access tot the firebox for servicing. The panel has a refractory liner; an additional refractory heat shield provides further cooling of the panel. An observation port on the access panel permits close study of the flame.

Supply Outlets

The 94 boiler requires only one or tow supply outlets, which reduces installation time. All water boilers and the 894 steam boiler use one supply outlet; remaining steam boilers use two. Three types of supply outlets are furnished as standard equipment depending on boiler size: (1) supply elbow with 6" tapping, (2) supply elbow with 8" flanged opening, and (3) top outlet with 10" flanged opening (see table). The outlets feature a built-in trap, which separates the air from the water.

1994	8	2, 4, 6, 9, 11, 14, 16, 18
2094	8	2, 4, 6, 9, 11, 15, 17, 19

	Steam	Water	Steam	Water
2194	5	7	2, 9, 11, 13, 20	6, 9, 11, 13, 16, 18, 20
2294	5	7	2, 9, 11, 13, 21	6, 9, 11, 13, 17, 19, 21
2394	6	8	2, 9, 11, 13, 15, 22	6, 9, 11, 13, 15, 18, 20, 22
2494	6	8	2, 9, 11, 13, 17, 23	6, 9, 11, 13, 17, 19, 21, 23
2594	7	8	2, 9, 11, 13, 15, 18, 24	6, 9, 11, 13, 17, 19, 21, 23

Note: If TI sections are ordered (see boiler rating table footnote), it is important to position them in the boiler section assembly in the exact location shown in the table above so that heater openings will match the jacket knockouts. If one or two TI sections are ordered with boiler, they MUST be located in one jacket panel because only ONE jacket side panel will have knockouts for tankless heaters. If more than two TI sections are ordered, additional jacket side panels with knockouts will be provided according to the table. The location of TI sections in other positions in the section assembly is possible, but jacket openings must then be cut by the installer.

No Return Header... Flanged flue collar

No separate return header is necessary for the 94 boiler, saving valuable installation time and material costs. Return water or condensate enters the center opening and is directed to the left and right port openings by internal vanes in the section.

For water boilers 894 through 1294 and all steam boilers, the center opening is covered with a plate with a 6" tapping. For water boilers 1394 through 2094, the opening accepts a standard 8" counter flange; for water boilers 2194 through 2594, the opening accepts a 10" counter flange.

The flanged flue collar has a steel counter flange so the breeching may be welded to the collar of the gastight seal required for forced draft firing. (Note: 2294 through 2594 boilers are furnished with a counter flange with a 12-inch-long male adapter.) Rope seal between the flange and counter flange eliminates air leakage. The flue collar has a built-in breeching damper that can be locked in position to maintain positive pressure over fire.

The large access panel gives easy access tot the firebox for servicing. The panel has a refractory liner; an additional refractory heat shield provides further cooling of the panel. An observation port on the access panel permits close study of the flame.

Supply Outlets

The 94 boiler requires only one or tow supply outlets, which reduces installation time. All water boilers and the 894 steam boiler use one supply outlet; remaining steam boilers use two. Three types of supply outlets are furnished as standard equipment depending on boiler size: (1) supply elbow with 6" tapping, (2) supply elbow with 8" flanged opening, and (3) top outlet with 10" flanged opening (see table). The outlets feature a built-in trap, which separates the air from the water.

- Burner input based on maximum of 2,000 ft. altitude-for higher altitudes consult Weil-McLain applications Engineering Department.
- No.2 oil-Commercial standard spec. CS75-56. Heat value 140,000 BTU/G.
- Consult Weil-McLain Applications Engineering Department for gas pressure required.
- Gross I=B=R ratings have been determined under the I=B=R provision governing forced draft boiler-burner units.
- Net I=B=R ratings are based on net installed radiation of sufficient quality for the requirements of the building and nothing need be added for normal piping and pick-up. Water ratings are based on a piping and pick-up allowance of 1.15. Steam ratings on am allowance of 1.288.
- An additional allowance should be made for gravity hot water systems or for unusual piping and pick-up loads. Consult Weil-McLain Applications Engineering Department.
- Based on average water temperature of 170F. in heat distributing units.
- Stack gas volume at outlet tempuature.
- Add .100 to obtain firebox pressure.

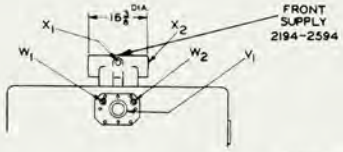
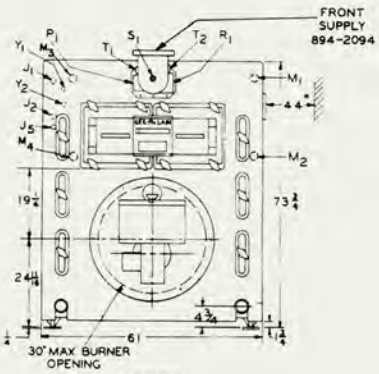
Y2†	Front Section	3/8"	Try Cock	–	Plug	–

DL – Most Desired Location AL – Alternate Location NA – Not Allowed



NOTES:
1. Tappings MArked optional will be provided only when specified on the boiler order.
2. Try Cock Tappings are standard for front section and optional for back section.



† Do not use these tappings for operating control location on water boilers.
* Furnished with 894 through 2094 steam and water boilers only.
∅ When internal water heater (s) are installed in boiler, use temperature control tapping in heater plate for additional operating (low-limit) control.
◉ Furnished with 994 through 2094 steam boilers only.
▲ Furnished with 894 steam boiler only, and 894 through 2594 water boilers.
∅ Furnished with 2194 through 2594 steam and water boilers only.
◆ Furnished with 2194 through 2594 steam boilers only.
• For 894 and 994 steam boilers, one Steam Safety Valve is furnished; 1094 through 2594 steam boilers are furnished with two Steam Safety Valves.
For 894 through 1994 water boilers, one Pressure Relief Valve is furnished; 2094 through 2594 water boilers are furnished with two Pressure Relief Valves.

Key: 1200 OS: *Dow Corning*® 1200 OS Primer; PC: *Dow Corning*® Primer-C OS; PP: *Dow Corning*® Primer P; NA: Not applicable
Dow Corning must test all materials for adhesion in structural applications.
Field adhesion tests must be performed at the jobsite to verify sealant adhesion.

[1] When using a primer with *Dow Corning*® 790 Silicone Building Sealant, apply the primer before installing backer rod and allow the primer to dry. Cold weather and porous surfaces require additional drying time.
[2] Do not apply sealant to EIFS finish coat unless approved by EIFS manufacturer.
[3] Cleaning procedures for EIFS systems should be followed.
[4] The extremely porous nature of some marble, particularly white marble, can contribute to the potential for fluid migration into this substrate. Contact a Dow Corning Specialist when working with marble.
[5] Laminated glass with polyvinyl buyvol (PVB) interlayer may delaminate up to 1/4” at the edges when in contact with a sealant.
[6] Do not use *Dow Corning*® 790 Silicone Building Sealant on copper sputter coated glass.
[7] See *Organic Solvent Usage* in the *Dow Corning Americas Technical Manual* (62-1112) for comment.
[8] Some limestone and other porous stone substrates contain iron and other impurities that can interact with *Dow Corning*® 756 SMS Building Sealant, causing discoloration of the sealant and/or substrate. Prior to use, *Dow Corning*® 756 SMS Building Sealant should be tested for compatibility with these substrates using water immersion.

This surface preparation guide is intended to aid in proper selection of surface preparation techniques and primers, if necessary, to gain adhesion that meets Dow Corning’s requirements. The suggestions in this guide are not blanket-approval recommendations; Dow Corning requires all surface prep recommendations in this guide be verified by field or shop adhesion testing and documented prior to starting the project for each substrate/sealant combination. Failure to verify and document adhesion results may result in adhesion loss that is not covered by the Dow Corning Warranty. Recommendations in this guide have been shown to be the best overall recommendations but do not cover every substrate for each material type or finish listed in this guide. Additionally, substrate manufacturers should be contacted to obtain recommendations for proper cleaning solvents for use with their materials. The entire *Weatherproofing* section of the *Dow Corning Americas Technical Manual*, Form No. 62-1112, should be read and understood before proceeding with the evaluations. The following sections within the manual must be followed to verify and document adhesion:

- *Substrate Cleaning Procedure*
- *“Two Cloth” Cleaning Method*
- *Primer Application Procedure*
- *Field Adhesion Testing Procedure*
- *Field Adhesion Hand Pull Test Criteria*
- *Field/Shop Adhesion Log and Sealant Quality Control Logs*

Structural

All structural applications must be tested by the Dow Corning test lab.

	Dow Corning® 795 Silicone Building Sealant	*Dow Corning*® 983 Structural Glazing Sealant	*Dow Corning*® 995 Silicone Structural Sealant	*Dow Corning*® 121 Structural Glazing Sealant

Honeywell

SLATE™

Base Module

R8001A1001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application—offering virtually limitless development opportunities with far less complexity.

The R8001A1001 base module provides communications and power supply for the SLATE system, configurable safety for Burner Control, Flame Amps, Fuel Air Ratio, and Limit modules, and programmable logic for Digital and Analog I/O, and Annunciation. SLATE is a combustion system with configurable safety and programmable logic. The system is modular in format and DIN rail mountable. Modules include:

- Base
- Burner Control Module
- Flame Amp Modules
- Fuel Air Ratio Control Module
- Limit Module
- Analog I/O Module
- Digital I/O Module
- Annunciator Module

Features

Within the SLATE system, the base module provides:

- Power to all modules with multiple voltage options
- External communication protocols Modbus/TCP, BACnet MSTP or IP, and web services
- Overall health of the system
- The ability to do remote troubleshooting
- Network identification of the system as a single device
- Web-based pages (both Honeywell provided and designer customized) for Web browser access to the system
- Module identification for the system
- Event log storage for user lockouts, fault history, and user requested events
- Trend logging for user specified data

Specifications

Electrical Ratings:

Input Voltage and Frequency:
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85-264 VAC, 50/60 Hz

Output Voltage:
18 VDC (± 1 VDC)

Power Dissipation:
38W max @ 24V (approx. 12 modules),
45W max @ 85-264V (approx. 14 modules)

Fusing Total Connected Modules: 5A, slow type, non-replaceable

Terminal Ratings: See Table 1.

Terminal	Description	Rating
E100-1	L1 - line voltage hot	---
E100-2	L2 - line voltage common	---
E100-3	PE - Earth Ground	---

Terminal	Description	Rating
E200-1	Alarm (dry contacts)	120 / 240 VAC, 1A pilot duty
E200-2	Alarm (dry contacts)	120 / 240 VAC, 1A pilot duty
E200-3	Unused	---
E200-4	A (BACnet MS/TP)	---
E200-5	B (BACnet MS/TP)	---
E200-6	GND (BACnet MS/TP)	---
E200-7	VAUX +	3.3-24 VDC output, 250mA max
E200-8	VAUX - [a]	3.3-24 VDC output, 250mA max

[a] Do not connect to earth ground.

Table 1. Terminal Ratings.

Environmental Ratings

Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
LCD Operating: 32°F to +150°F (0°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C)

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Dimensions: See Fig. 1

Weight: 2 lb 1 oz (0.94 Kg)

Approvals:

Underwriters Laboratories Inc. Listed, File: MP268.
IRI acceptable.
Federal Communications Commission: Part 15, Class A Emissions.
Must be mounted inside a grounded metal enclosure.

Mounting: DIN Rail (See Fig. 4)

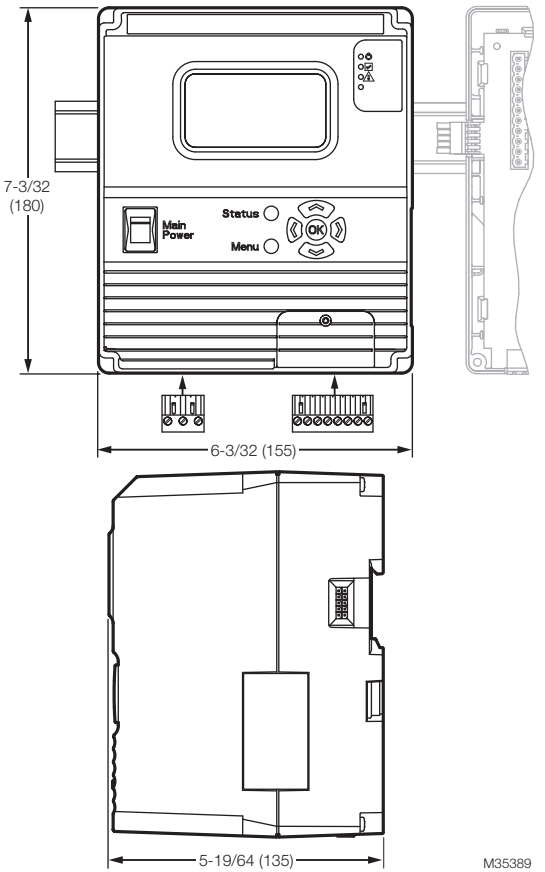

Fig. 1. Dimensions in in. (mm).

Principal Technical Features

The R8001A1001 base module provides communications and power supply for the SLATE system, configurable safety for Burner Control, Flame Amps, Fuel Air Ratio, and Limit modules, and programmable logic for Digital and Analog I/O, and Annunciation.

Communications

The base module provides communications via Modbus IP RS485, BACNet IP/MSTP (RS-485), and Web Services.

User Interface

The menu-driven user interface provides system status and alerts via a dot matrix display on the front of the module. It is controlled by a 7-button keypad.

LED Array

There are three LEDs on the front of the base module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s).

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	Fault
	No light	Running

Table 2. LED Descriptions.

LCD Screen

The base module LCD screen will show information about various modules and other parts of the combustion system. Use the arrow keys to navigate the items on the LCD screen, then press OK to select one.

In Fig. 2, Burner6 is in Lockout. For additional information, navigate to that menu item and press OK.

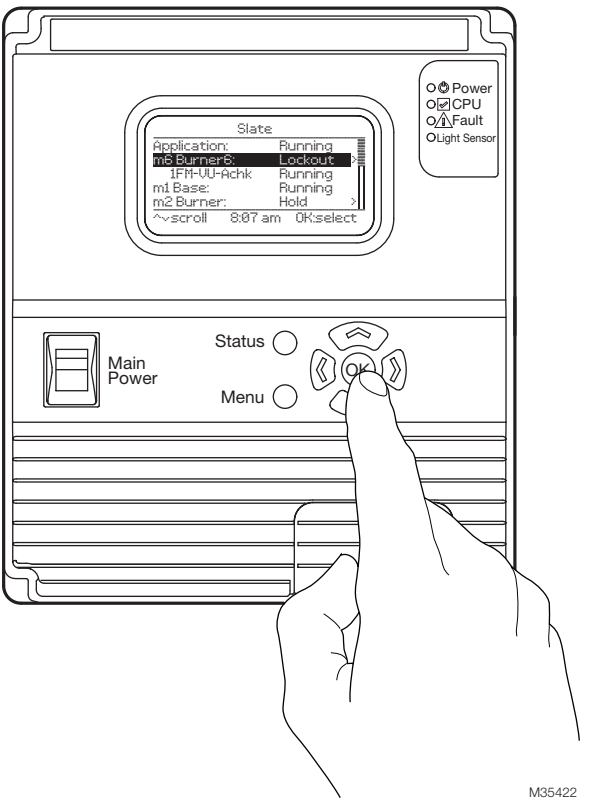

Fig. 2. LCD display showing a fault (Burner6 is in Lockout).

Additional information, as shown in Fig. 3, is displayed. Use this information to troubleshoot the combustion system.

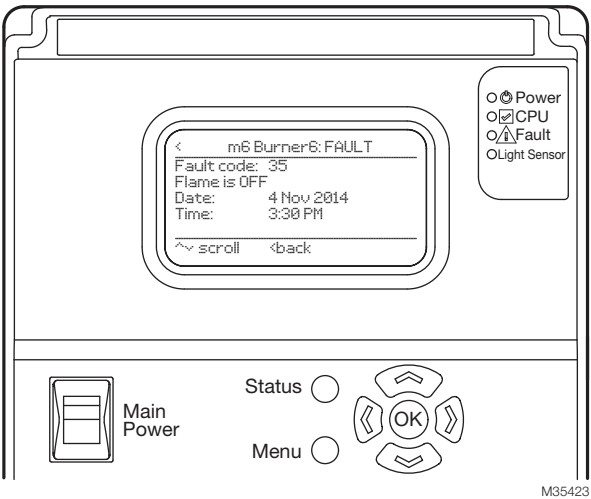

Fig. 3. Additional lockout information.

Light Sensor

SLATE contains a light sensor that is used when the system is exposed to light. This is a power saving feature.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.

Wiring

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death, or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

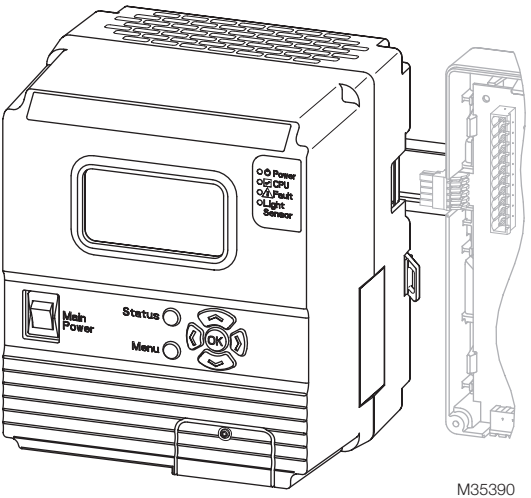

Fig. 4. Installing the Base Module on DIN Rail.

2. Wiring must comply with all applicable codes, ordinances and regulations. See Table 1, Table 3, and “Recommended Grounding Practices” on page 13 for connections and terminals. For DIP switch settings, see “DIP Switches” on page 15.

Note: MS/TP must be wired in a straight line without spurs—no star wiring.

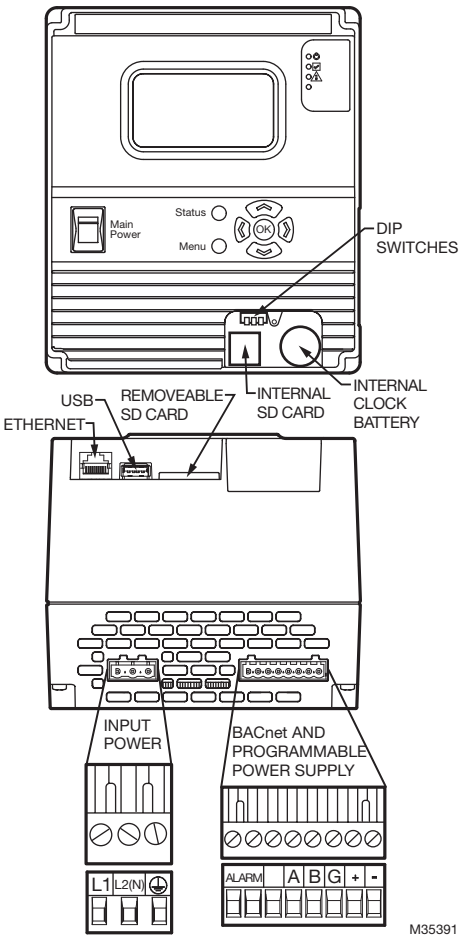

Fig. 5. Base Module inputs and terminals.

3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.
4. The R8001A1001 should not interfere with the proper safety operation of the controls, limits, and interlocks it is monitoring. After installation, check each control, limit, and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS, AND INTERLOCKS.

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16, or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C
Communication lines[a]	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

[a] BACnet MS/TP connections must be wired in daisy chain configuration, 1(a)-1(a), 2(b)-2(b), 3(c)-3(c). The order of interconnection of all the devices is not important. Be aware that the termination DIP switch (number 3) must be used if the SLATE system is at the end of connections over 100 feet.

Table 3. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended wire routing of leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.
- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 1.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interference Regulations of the Canadian Department of Communications.*
3. *For straight gas burner applications, the oil limit and interlock inputs DO NOT need to be jumpered.*
4. *For straight oil burner applications, the gas limit and interlock inputs DO NOT need to be jumpered.*
5. *For combination gas-oil burner applications, a double pole, double throw (dpdt) fuel select switch is required.*
6. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

⚠ WARNING

Electrical Shock Hazard.
Can cause severe injury, death or equipment damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

DIP Switches

The SLATE Base Module has three DIP switches. DIP switches 1 and 2 should be On only if no other MS/TP device providing bias resistors is connected.

DIP switch 3 should be On only if SLATE is the last device in the communication chain.

32-00005-01

For more information and detailed instructions on the SLATE display please refer to the SLATE User Guide document located on our website at http://combustion.honeywell.com/SLATE

SLATE™

Fuel Air Ratio Module

R8001C6001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001C6001 Fuel Air Ratio module uses the latest technology to control up to 4 SLATE actuators and/or 2 Variable Frequency Drives. The Fuel Air Ratio Control module controls the relationship between fuel, airflow and flue gas recirculation on a power burner.

Features

Within the SLATE system, the fuel air ratio module provides:

- Air-fuel ratio control for up to 4 actuators
- Drive 2 Variable Frequency Drives (VFDs)
- RS-485 Modbus communications to communicate to the actuators and receive feedback
- SLATE actuator torque sizes:
  - 50 in/lb (NEMA 1 and NEMA 4)
  - 150 in/lb (NEMA 1 and NEMA 4)
  - 300 in/lb (NEMA 4)
  - 900 in/lb (NEMA 4)
- Up to 24 points
- Field configurable
- Automated actuator endpoint seeking process
- UL Recognized and NFPA acceptable
- Password protected
- Fault information
- Status of four actuator channels
- Unused VFD terminals (Analog Cells) available for general purpose I/O configuration
- Flue Gas Recirculation (FGR)
- Trim
- Dual Fuel

Safety Features

- Class C operating software system
- Fail-safe feedback
- Curve verification algorithms
- Password protected
- Built in self test
- No slope constraints that would limit the steepness of the curve
- Component anti-swap protection
- Off curve checking algorithm

Must be mounted inside a grounded metal enclosure.

Mounting: DIN Rail (See Fig. 2)

Required Components
R8001A1001 SLATE Base Module
R8001S9001 Sub-Base Module

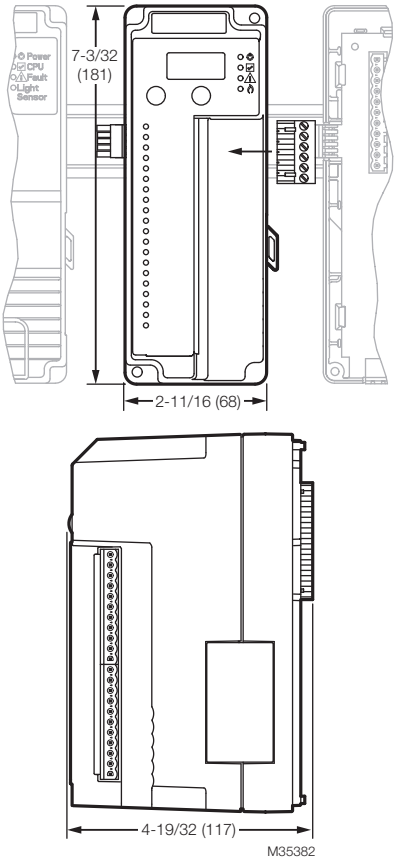

Fig. 1. Dimensions in in. (mm).

Principal Technical Features

The R8001C6001 fuel air ratio module monitors and controls the air-fuel ratio for combustion applications.

LED Array

There are three LEDs on the front of the Fuel Air Ratio module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No Wiresheet (SLATE) loaded
	Green	Running
Fault	Red	Fault
	No light	No fault

Table 1. LED Descriptions.

LED Display

The SLATE system modules have three-character LED displays used for indicating the module number of the SLATE system. They also have three-position LED colors to indicate terminal states as shown in Table 2.

Color	Description
Green	Terminal is on or normal
Red	Fault
No light	Off, not in use, or in power-saving mode

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

Wiring

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

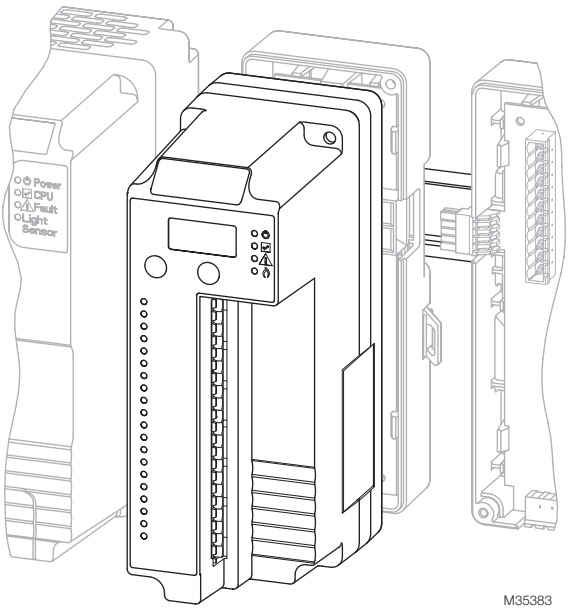

Fig. 2. Installing the Fuel Air Ratio Module on the Sub-Base Module.

2. Wiring must comply with all applicable codes, ordinances and regulations.
3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause* interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interference Regulations of the Canadian Department of Communications.*
3. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

Table 3. Terminal Ratings.

Terminal Functions				Min	Typical	Max	Units	
TF1	Voltage	In	Range	0.0	-	15.0	VDC	
			Resolution	-	2.43	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	Whichever is greater
				-1.0	-	1.0	%	
		Out	Range	0.0	-	15.0	VDC	
			Resolution	-	4.0	-	mV DC	
			Null	100.0	-	100.0	mV DC	
			Accuracy	-50.0	-	50.0	mV DC	Whichever is greater
				-1.5	-	1.5	%	
	Current	In	Range	0.0	-	25.0	mA DC	[a]
			Resolution	-	7.4	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA
		Out[b]	Range	0.0	-	25.0	mA DC	Max Load = 500 Ω
			Resolution	-	4.0	-	mA Ω	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-300.0	-	300.0	uA DC	0 to 25 mA
				-50	-	50	uA DC	4 to 20 mA
TF2	Voltage	In	Amplitude	0.0	-	15.0	VDC	
			Trip Point	-	3.0	-	VDC	Comparator Only
			Hysteresis	-	0.25	-	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
TF3	Voltage	In	Range	0.0	-	15.0	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
	Current	In	Range	0.2	-	25.0	mA DC	
			Resolution	-	3.7	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA

[a] TF1 input terminal is held at constant 2.5VDC over allowable current range.

[b] Accuracy specification given is for 100 Ω load. Resolution specification can be converted to mA by dividing out load.

Table 4. Specifications for Basic Cell Functions.

Specifications based on worst case over ambient temperatures.

	Complex Functions		Min	Typical	Max	Units	
	Thermocouple						
TF2 & TF3	Type J	Range	-200.0		1025.0	°C	
		Resolution	-	0.1	-	°C	
		Accuracy	-5.0	-	5.0	°C	
	Type K	Range	-150.0	-	1000.0	°C	
		Resolution	-	0.1	-	°C	
		Accuracy	-5.0	-	5.0	°C	
	RTD						
TF3 & TF4	Type PT100[a]	Range	-135.0	-	250.0	°C	3 wire, 100 Ω
		Resolution	-	0.5	-	°C	
		Accuracy	-2.0	-	2.0	°C	
	Type PT1000	Range	-135.0	-	250.0	°C	3 wire, 1000 Ω
		Resolution		0.5		°C	
		Accuracy	-2.0	-	2.0	°C	
	NTC						
TF3 & TF4	Type 10K	Range	-40.0[b]	-	175.0	°C	T4 rated to 0 °C
		Resolution	-	0.1	-	°C	
		Accuracy[c]	-2.0	-	2.0	°C	-40 °C to 25 °C
			-1.0	-	1.0	°C	25 °C to 125 °C
			-1.5	-	1.5	%	
			-3.0	-	3.0	°C	125 °C to 175 °C

[a] Shielded cable required for reliable operation in noisy environment.
[b] NTC on terminal TF4 is rated down to 0 °C.
[c] Temperatures refer to sense range.

Table 5. Specifications Cell Complex Functions.

	Frequency / PWM Functions		Min	Typical	Max	Units	
	PWM Out						
TF1	Amplitude		5.0	-	10.0	VDC	Low output state = 0V
	Frequency		100.0	-	1000.0	Hz	
	Duty Cycle		2.0	-	98.0	%DC	Allowable output %DC
	Resolution		-	1.0	-	%	
	Accuracy		-0.5	-	0.5	%DC	10V amplitude
	Frequency In						
TF2	Amplitude		5.0	10.0	15.0	VDC	
	Range		2.0	-	1000.0	Hz	
	Min. “on” pulse width (low %DC)		-	50.0	-	usec	10V amplitude
	Min. “off” pulse width (high %DC)		-	130.0	-	usec	10V amplitude
	Duty Cycle	2 – 100 Hz	2.0	-	98.0	%DC	10V amplitude
		1000 Hz	5.0	-	85.0	%DC	10V amplitude
	Resolution		-	1.0	-	Hz	
	Accuracy		-5.0	-	0.0	%	Whichever is greater
			-1.0	-	0.0	Hz	
	PWM In						
TF2	Amplitude		5.0	10.0	15.0	VDC	
	Frequency		125.0	-	500.0	Hz	
	Min. “on” pulse width (low %DC)		-	50.0	-	usec	10V amplitude
	Min. “off” pulse width (high %DC)		-	130.0	-	usec	10V amplitude
	Duty Cycle	125 – 500 Hz	5.0	-	90.0	%DC	10V amplitude
	Resolution			-	1.0	%DC	
	Accuracy	125 Hz	-1.5	-	1.5	%DC	10V amplitude
		500 Hz	-7.5	-	7.5	%DC	10V amplitude

Table 6. Specifications for Cell Frequency Functions.

Configuration		Min	Optimum Range for Performance	Max	
Thermocouple	J	-50°C		1025°C	± 4 °C
	K	-50°C		1000°C	± 4 °C
RTD		-135°C		250°C	± 2 °C
NTC		25°C		125°C	± 1°C
Current Out		4 mA		20 mA	± .05 mA
Voltage: In / Out		2 V		10 V	0.3 %, typical

Table 7. Suggested Sensor Selection Based on Application.

Application	Recommended Wire Size	Recommended Part Numbers
Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 8. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground

path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended wire routing of leadwires

Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 3.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

Maximum wire length:

- The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)
- For Remote Bus data lines, maximum cable length depends on the number of modules connected, the noise conditions and the cable used. The maximum of all interconnecting wires is 4000 feet.

32-00006-03

For more information and detailed instructions on the R8001C6001 and the entire SLATE system please refer to the SLATE User Guide located on our website at http://combustion.honeywell.com/SLATE

SLATE™

Limit Control Module

R8001L8001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001L8001 SLATE Limit Control Module is part of the SLATE Combustions System. The SLATE Limit Control Module provides the ability to bring in any type of analog signal and create limits on either pressure or temperature without needing a UDC Controller.

Features

- 12 limit blocks with each block monitoring any sensor or pair of sensors
- One limit module for multiple burner controls
- 4 sensors available for Limit Block use (2 sets of redundant safety inputs)
- Unused Analog Cells available for general purpose I/O configuration
- Redundant limit relay output

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

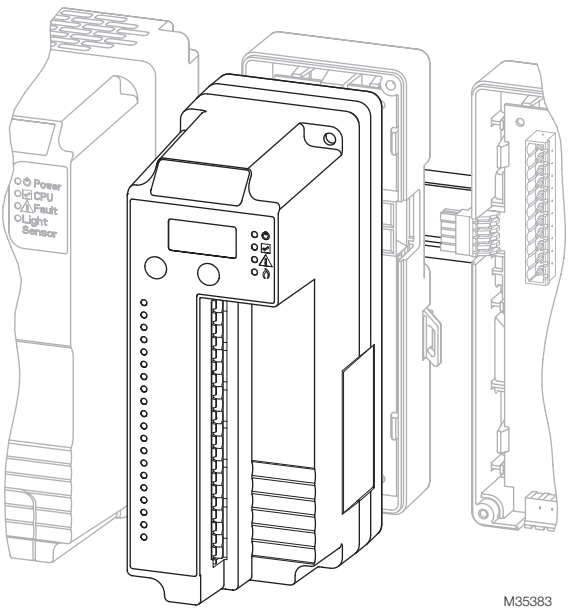

Fig. 2. Installing the Limit Control Module on the Sub-Base Module.

2. Wiring must comply with all applicable codes, ordinances and regulations.

3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interfeence Regulations of the Canadian Department of Communications.*
3. *For combination gas-oil burner applications, a double pole, double throw (dpdt) fuel select switch is required.*
4. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

Table 6. Specifications for Cell Frequency Functions.

Configuration		Min	Optimum Range for Performance	Max	
Thermocouple	J	-50°C		1025°C	± 4 °C
	K	-50°C		1000°C	± 4 °C
RTD		-135°C		250°C	± 2 °C
NTC		25°C		125°C	± 1°C
Current Out		4 mA		20 mA	± .05 mA
Voltage: In / Out		2 V		10 V	0.3 %, typical

Table 7. Suggested Sensor Selection based on Application.

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16 or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 8. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.

3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 2.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock).

32-00007-03

For more information and detailed instructions on the R8001L8001 and the entire SLATE system please refer to the SLATE User Guide located on our website at http://combustion.honeywell.com/SLATE

SLATE™

Digital I/O Module

R8001D4001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001D4001 SLATE Digital I/O module is part of the SLATE Combustion System. The SLATE Digital I/O module offers a universal 14 opto inputs or 6 relays for a wide variety of applications needing additional logic.

Features

- Automatically adapts to 24VDC or 24VAC to 240VAC (one voltage per module)
- Configurable input or relay output format
  - Up to 14 opto inputs
  - Up to 6 relay outputs

Specifications

Electrical Ratings:
Input Voltage and Frequency:
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85-264 VAC, 50/60 Hz
Maximum Total Connected Load: 2000 VA
Fusing Total Connected Load: 15A Fast Blow, type SC or equivalent

Environmental Ratings
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C).

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Dimensions: See Fig. 1.

Weight: 2 lb 1 oz (0.94 Kg)

Approvals
Underwriters Laboratories Inc. Listed, File: MP268
IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

Mounting
DIN Rail (See Fig. 2)

Required Components
R8001A1001 SLATE Base Controller
R8001S9001 SLATE Sub-Base Module

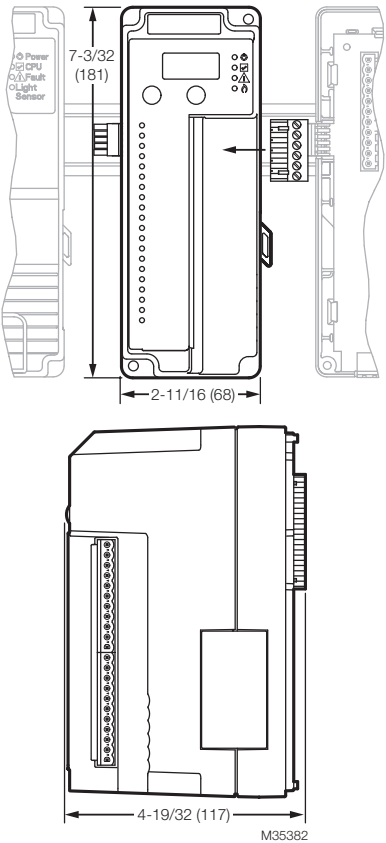

Fig. 1. Mounting dimensions of Digital I/O Module in in. (mm).

Principal Technical Features

The SLATE Digital I/O module offers a universal 14 opto inputs or 6 relays for a wide variety of applications needing additional logic.

LED Array

There are four LEDs on the front of the digital I/O module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s). There are also nine banks of LEDs for the digital terminals. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	Fault
	No light	Running

Table 1. LED Descriptions.

LED Display

The SLATE system modules have a seven-segment, three-position LED display used for indicating the module number of the SLATE system. The LED colors indicate the terminal state as shown in Table 2.

Color	Description
Green	Terminal is on
Red	Fault
No light	Not in use

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have a Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

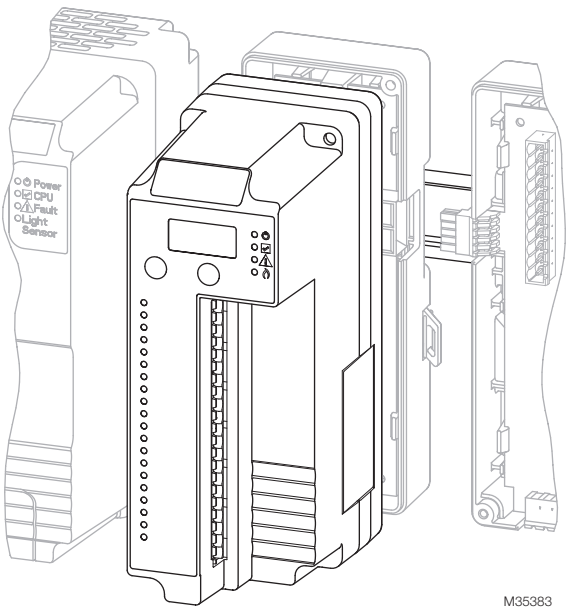

Fig. 2. Installing the Limit Control Module on the Sub-Base Module.

2. Wiring must comply with all applicable codes, ordinances and regulations.

3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interference Regulations of the Canadian Department of Communications.*

Wiring

⚠ WARNING

Electrical Shock Hazard.
Can cause severe injury, death, or equipment damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

Table 3. Terminal Ratings.

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16 or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C
Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 4. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended wire routing of leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.
- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 3.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

Maximum wire length:

- The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)
- For remote reset leadwires, maximum length to remote pushbutton is 1000 feet.
- For Remote Bus data lines, maximum cable length depends on the number of modules connected, the noise conditions and the cable used. The maximum of all interconnecting wires is 4000 feet.

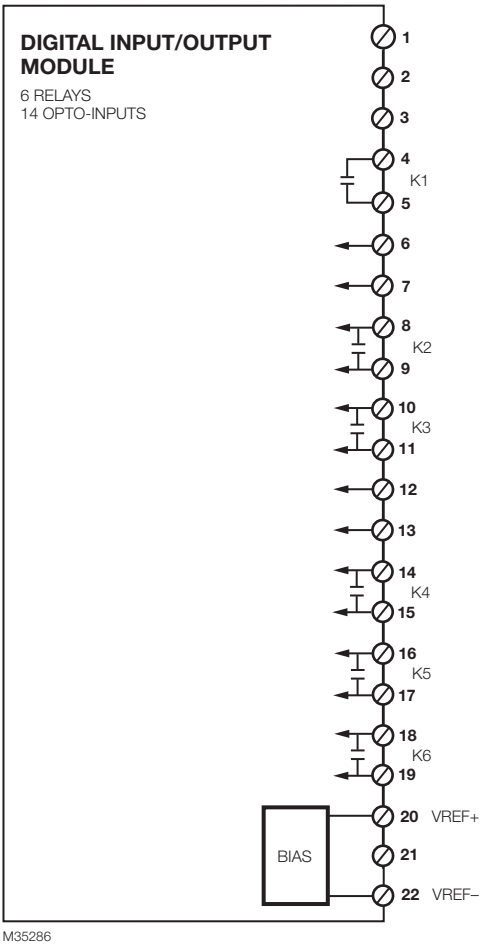

Fig. 3. Wiring diagram for limit control module.

Table 7. Suggested Sensor Selection Based on Application.

Application	Recommended Wire Size	Recommended Part Numbers
Analog Cell terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 8. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 3.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)

32-00009-01

For more information on the R8001U3001 and the entire SLATE system please refer to the SLATE User Guide document located on our website at http://combustion.honeywell.com/SLATE

SLATE™

Burner Control Module

R8001B2001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001B2001 Burner Control module provides flame safeguard controls for a variety of applications within the SLATE system. It can be configured as a primary or programmer, semi-automatic or fully automatic.

Features

- Provides 24 VDC or 24 to 240 VAC flame safeguard
- Valve proving
- Parameters and behaviors that allow emulation of 7800 and SOLA Series flame safeguards
- Dual fuels capability
- Configurable safety
- Safety relay

Specifications

Electrical Ratings:
Voltage and Frequency:
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85-264 VAC, 50/60 Hz
Maximum Total Connected Load: 2000 VA
Fusing Total Connected Load: 15A Fast Blow, type SC or equivalent

Environmental Ratings
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C).

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Dimensions: See Fig. 1

Weight: 2 lb 1 oz (0.94 Kg)

Approvals
Underwriters Laboratories Inc. Listed, File: MP268
IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

Mounting
DIN Rail (See Fig. 2)

Required Components
R8001A1001 SLATE Base Controller
R8001S9001 SLATE Sub-Base Module

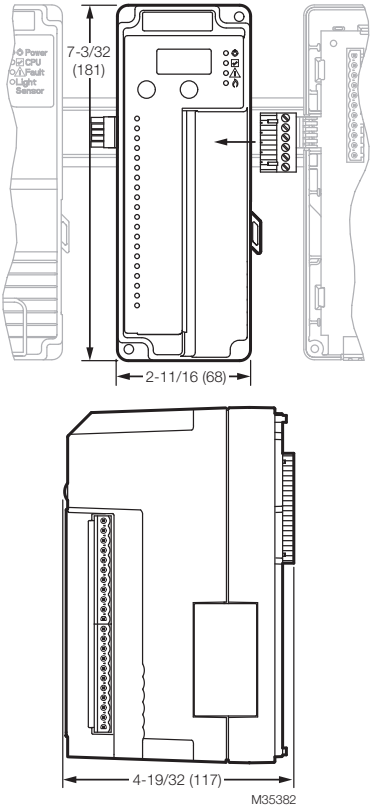

Fig. 1. Dimensions in in. (mm).

Principal Technical Features

The R8001B2001 SLATE Burner Control module provides the SLATE combustion system with flame safeguard capability.

LED Array

There are four LEDs on the front of the burner control module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s). See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	SLATE Burner Control Module has detected a fault
	No light	No fault
Flame	Yellow	Weak flame is detected
	No light	No flame is detected

Table 1. LED Descriptions.

LED Displays

The SLATE system modules have three-character LED displays used for indicating the module number of the SLATE system. They also have three-position LED colors to indicate terminal states as shown in Table 2.

Color	Description
Green	Terminal is on or normal
Red	Fault
No light	Off, not in use, or in power-saving mode

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE Burner Control have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

There are also 22 LEDs for each of the burner control module terminals.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

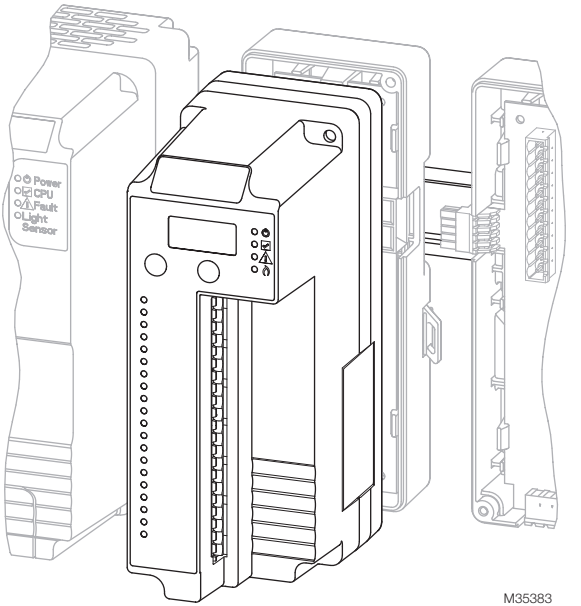

Fig. 2. Installing the Burner Control Module on the Sub-Base Module.

2. Wiring must comply with all applicable codes, ordinances and regulations.
3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.
4. The R8001B2001 should not interfere with the proper safety operation of the controls, limits and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS AND INTERLOCKS.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interfeence Regulations of the Canadian Department of Communications.*
3. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

Wiring

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 5. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended wire routing of leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.
- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 3.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

Maximum wire length:

- The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)
- For remote reset leadwires, maximum length to remote pushbutton is 1000 feet.
- For Remote Bus data lines, maximum cable length depends on the number of modules connected, the noise conditions and the cable used. The maximum of all interconnecting wires is 4000 feet.

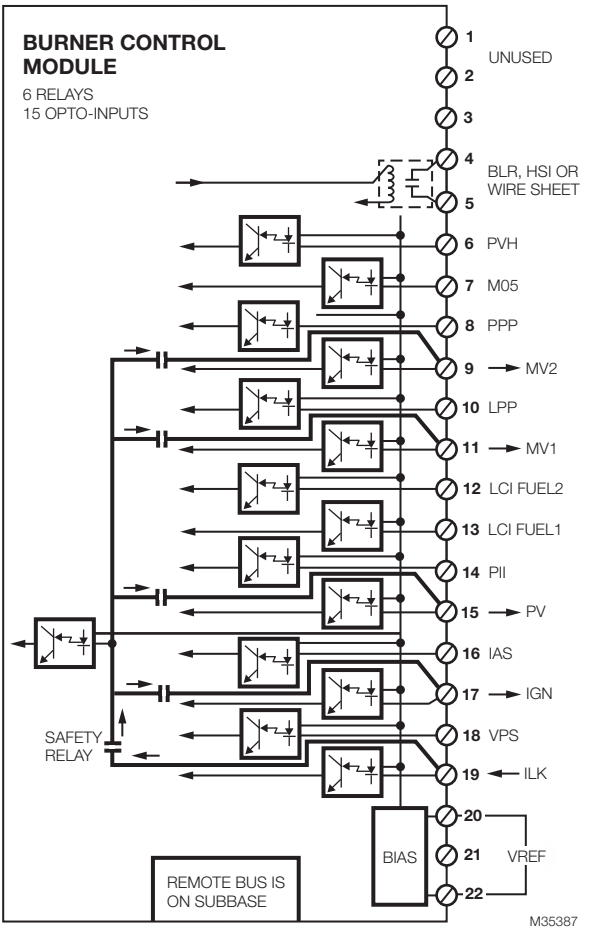

Fig. 3. Wiring diagram for Burner Control Module.

SLATE™

Annunciator Module

R8001N7001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application—offering virtually limitless development opportunities with far less complexity.

The R8001N7001 SLATE Annunciator Module is designed to monitor the status of a series string of limit, control, and interlock contacts for a commercial or industrial burner within the SLATE system. The R8001N7001 Annunciator Module acts as a system monitor and enhances fault and status messages of the R8001B2001 SLATE Burner Control Module.

Features

- 14 opto inputs
- Provides status of multiple inputs that are connected as a string of interlocks for diagnostic and monitoring purposes
- 1 relay output
- Automatically adapts to 24 VDC or 24 VAC to 240 VAC (one voltage per module)

Specifications

Electrical Ratings:
Voltage and Frequency:
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85–264 VAC, 50/60 Hz
Maximum Total Connected Load: 2000 VA
Fusing Total Connected Load: 15A Fast Blow, type SC or equivalent

Environmental Ratings:
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C).

IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

Mounting
DIN Rail (See Fig. 2)

Required Components
R8001A1001 SLATE Base Controller
R8001S9001 SLATE Sub-Base Module
R8001B2001 SLATE Burner Control Module

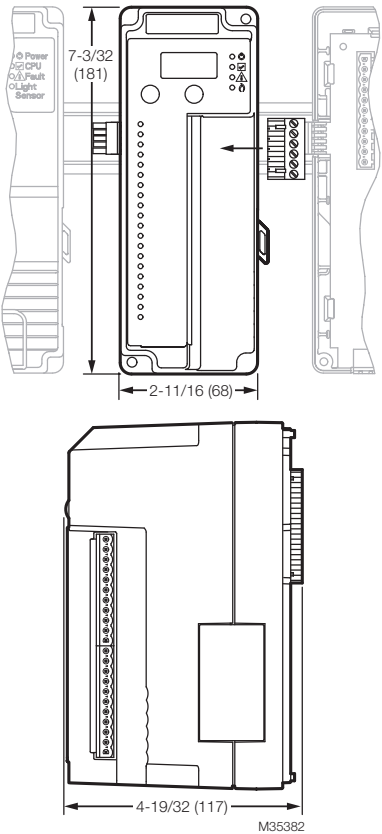

Fig. 1. Dimensions in in. (mm).

Principal Technical Features

The R8001N7001 Annunciator Module is designed to monitor the status of a series string of limit, control, and interlock contacts for a commercial or industrial burner within the SLATE system. The R8001N7001 acts as a system monitor and enhances fault and status messages of the R8001B2001 burner control module.

LED Array

There are four LEDs on the front of the burner control module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s). There are also 18 LEDs for each of the annunciator module terminals. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power.
	Green	System has power.
CPU	Red	No Wiresheet (SLATE) loaded. Remove Limit System Status).
	Green	Running
Fault	Red	Fault
	No light	Running

Table 1. LED Descriptions.

LED Display

The SLATE system modules have a seven-segment, three-position LED display used for indicating the module number of the SLATE system. The LED colors indicate the terminal state as shown in Table 2.

Color	Description
Green	Terminal is on
Red	Fault
No light	Not in use

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have a Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Installation

⚠ WARNING

Fire or Explosion Hazard Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.

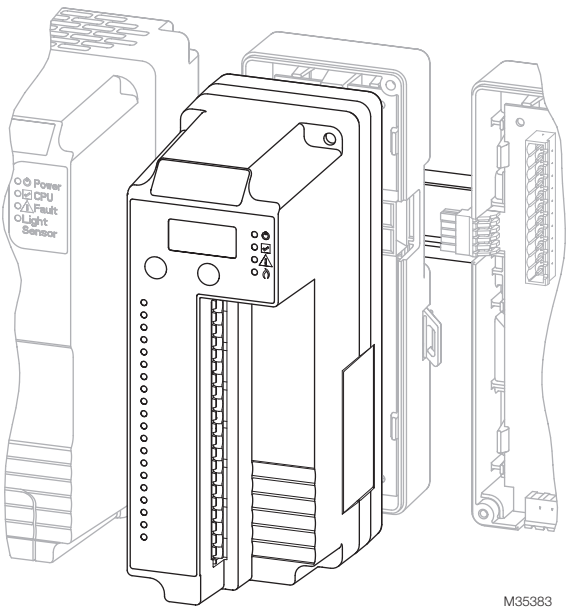

Fig. 2. Installing the Annunciator Module on the Sub-Base Module.

2. Wiring must comply with all applicable codes, ordinances and regulations.

3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interference Regulations of the Canadian Department of Communications.*
3. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

Wiring

⚠ WARNING

Electrical Shock Hazard.
Can cause severe injury, death or equipment damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

Table 4. Recommended Wire Sizes and Part Numbers.

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth ground (Base, Rectification Flame Amp Module, other modules optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended wire routing of leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.
- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 3.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation and removal of SLATE modules.

Maximum wire length:

- The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)
- For remote reset leadwires, maximum length to remote pushbutton is 1000 feet.
- For Remote Bus data lines, maximum cable length depends on the number of modules connected, the noise conditions and the cable used. The maximum of all interconnecting wires is 4000 feet.

SLATE™

Color Touch Screen Display

R8001K5001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001K5001 SLATE Color Touch Screen Display provides users with the ability to create vivid application displays using web technology. The screen is web enabled and with the SLATE Web Editor tool creating screens is simple and easy.

Features

- Display screens are web pages served from SLATE Base Module
- Integrated view of SLATE system
- Standard Honeywell pages for Burner Control, Fuel Air Ratio, Limit and Base modules

Specifications

Electrical Ratings:
Voltage and Frequency: 24 VAC, 50/60 Hz

Environmental Ratings
Ambient Temperature:
Operating: 32° F to 158° F (0° C to 70° C)
Shipping: -40° F to 158° F (-40° C to 70° C)

Humidity: 95% continuous, noncondensing.

Dimensions: See Fig. 1.

Weight: 1 lb 5 oz (0.6 Kg)

Panel Mounting
The display can be mounted through a cutout in the panel door, using four #4 thread-forming Plastite screws. See Fig. 3.

For standard panel thicknesses of 0.060”–0.090” Honeywell recommends screw length of 3/8”. See Fig. 2 for hole spacing.

Required Components
R8001A1001 SLATE Base Controller

Power Plug Recommendations

The SLATE 7 inch color touch screen display will not come with a power plug connector. The following are recommendations for the power connection. See Fig. 4 for plug locations.

- 24VAC Wall Plug-in Transformer
  (Input Voltage: 120VAC, 60HZ – Output Voltage: 24VAC ±5%).
  Honeywell p/n 32006131 or equivalent.
- 18AWG wire
- Plug-in connectors (or equivalent):
  - Phoenix - p/n 1757019
  - EBY Electro - p/n EB1508-02-500
  - Dinkle – p/n 2ESDV-02P
  - Molex – p/n 0395300002

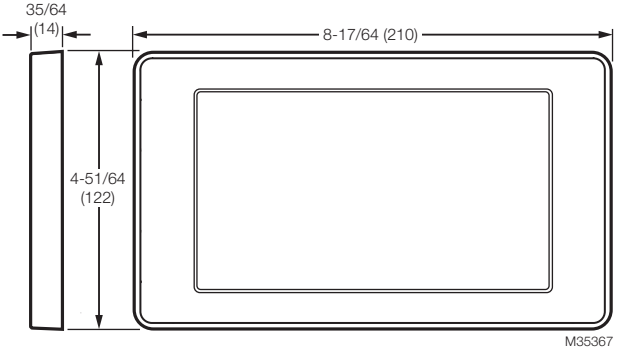

Fig. 1. Dimensions in in. (mm).

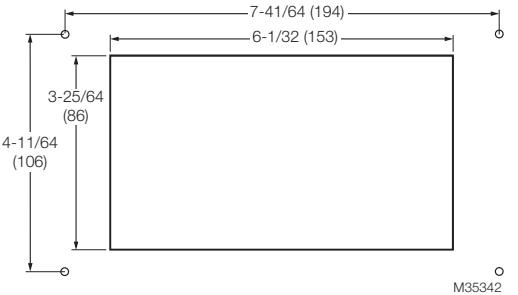

Fig. 2. Mounting dimensions of color touch screen display in in. (mm).

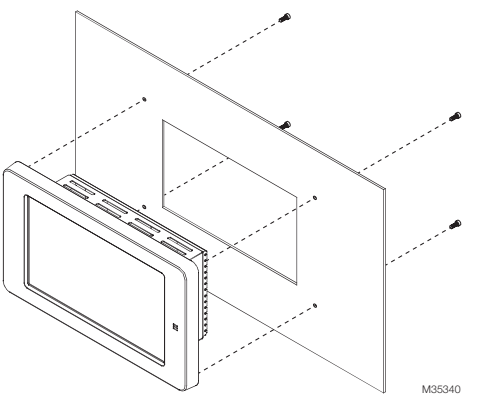

Fig. 3. Panel mounting of color touch screen display.

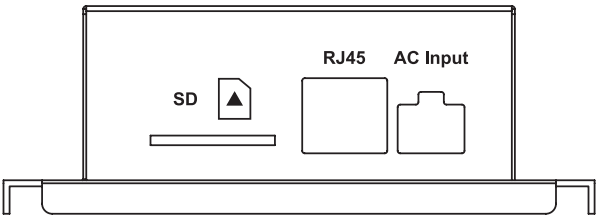

Fig. 4. Touch screen display inputs.

Note: SD card slot for future display firmware updates.

Principal Technical Features

The R8001K5001 color touch screen display provides a web-based user interface for viewing system status, and viewing, creating, or modifying configurations.

Communications and Networking

The R8001K5001 color touch screen display interfaces directly with the SLATE system using a standard Ethernet connection, and can connect directly to the Base module or via an Ethernet switch.

The R8001K5001 color touch screen display locates all base modules on an IP subnet using a subnet broadcast message, and once located allows users to select one to initiate a connection to that SLATE system.

User Interface and Technology

The R8001K5001 color touch screen display is based on the Google Chrome™ browser and supports HTML5.

A double tap on any web screen activates the Home, Back, and Help buttons, URL address bar, plus other controls that are

normally hidden from view. Double tapping again deactivates these controls.

For creating web screens, download the SLATE Web Editor Tool from our website at http://combustion.honeywell.com/SLATE.

Installation

⚠ WARNING

Fire or Explosion Hazard Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.

32-00013-01

IMPORTANT

1. *This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.*
2. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interference Regulations of the Canadian Department of Communications.*

⚠ WARNING

Electrical Shock Hazard.
Can cause severe injury, death or equipment damage.

Disconnect the power supply from the main disconnect before beginning installation to prevent electrical shock and equipment damage. More than one disconnect can be required.

For more information and detailed instructions on the SLATE display please refer to the SLATE User Guide document located on our website at http://combustion.honeywell.com/SLATE

SLATE™

Integrated Combustion Management System

R8001 Series

USER GUIDE

Congratulations on selecting SLATE. SLATE is a revolutionary new combustion system that combines configurable combustion safety with programmable logic in one single platform. SLATE can easily be customized for almost any requirement or application- offering virtually limitless development opportunities with a far less complexity.

SLATE streamlines and simplifies the product development process, allowing customers to bring unique solutions to market in a matter of weeks instead of months.

This User's Guide is designed to guide you through designing and implementing a SLATE system.

Chapter 1: Getting to Know SLATE

Introduction

SLATE is a modular control that integrates configurable safety devices with user-programmable logic, inputs and outputs. Its purpose is to allow equipment manufacturers to create a customized controller by selecting modules and I/O specifically for that equipment and then designing a customized control program to make them work together. The SLATE modules mount on a DIN rail via a sub-base and each includes side by side plugs and jacks to interconnect adjacent modules.

In previous conventional control systems, a control panel often contains a PLC combined with separate safety devices such as burner controls. In this case, the safety devices are separately responsible for the operation and safety of critical equipment. This is maintained also in the SLATE design: safety modules operate as discrete and self contained safety controls. In the previous conventional control systems, the data produced by the safety modules is connected to what the control is doing. Or if the control includes communication, then the programmable logic may capture and interpret this using specialized customer software. In SLATE all safety module status data and all non-safety control of safety modules (such as burner control call-for-hear signal) is fully integrated into the programmable logic. It is one system, even though the safety modules are independent.

The SLATE Base Module provides communication and user-programmable logic, and non-safety digital and analog I/O modules provide inputs and outputs for that logic. The programmable logic can be used to create any non-safety features needed by the equipment that the SLATE device is controlling. This allows a SLATE application designer to implement customized and differentiating features in their controller. The accompany this, SLATE also includes a completely configurable touch screen display.

The configurable SLATE Safety Modules are:

- Burner Control Module
- Flame Amp Modules
- Fuel Air Ratio Control Module
- Limit Module

The programmable SLATE modules are:

- Digital I/O Module
- Analog I/O Module
- Annunciator Module

SLATE Modules and Accessories

The following are the SLATE part numbers.

Honeywell OS Number	SLATE Description
R8001A1001	Base Module
R8001B2001	Burner Control Module includes wiring terminals
R8001C6001	Fuel Air Ratio Control Module includes wiring terminals
R8001L8001	Limit Module includes wiring terminals
R8001N7001	Annunciator Module includes wiring terminals
R8001D4001	Digital I/O Module includes wiring terminals
R8001U3001	Analog I/O Module includes wiring terminals
R8001V1031	Rectification Flame Amp Module with Ampli-check includes wiring terminals
R8001S1071	UV Flame Amp Module with Ampli-check includes wiring terminals
R8001S1051	UV Flame Amp Module with Shutter- check includes wiring terminals
R8001F1091	UV/Visible Flame Amp Module with Ampli-check includes wiring terminals
R8001F1041	Infrared Flame Amp Module with Ampli-check includes wiring terminals
R8001 S9001*	Sub-base assembly for all SLATE modules
R8001M1050	SLATE 50 in/lb actuator with NEMA 1 enclosure
R8001M4010	SLATE 150 in/lb actuator with NEMA 1 enclosure
R8001M1150	SLATE 50 in/lb actuator with NEMA 4 enclosure
R8001M4150	SLATE 150 in/lb actuator with NEMA 4 enclosure
R8001K5001	7” Color Touch Screen Display does not include power transformer or connectors. Please refer to those OS numbers
SLATE AX TOOL	PC tool for programming, configuring and designing the SLATE system
32006131-001	SLATE Display Power Transformer
32008001-002	Connector bag assembly for sub-base and power connector for SLATE display. Connectors for sub-base can be used for remote start and remote flame amp.
50096820-001	Umbilical cord to allow continuation of a SLATE system while attached to a single power supply to additional DIN rail

* Needed for all SLATE modules other than the Base for communications and assembling on the DIN Rail.

Maxon’s Dura Step 300 and 900 in/lb actuators can be used with the SLATE system and need to be configured for SLATE. To purchase Maxon Dura Step actuators, please contact your Maxon sales representative.

Installation

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. Installer must be trained and experienced flame safeguard service technician.
4. After installation is complete, check out the product operation as provided in the instructions.

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

To prevent possible hazardous burner operation, verify safety requirements each time a control is installed on a burner.

⚠ WARNING

Electrical Shock Hazard
Can cause serious injury or death.

Disconnect the power supply before beginning installation. More than one power supply disconnect may be required.

Approvals

Underwriters Laboratories Inc. Listed, File: MP268
Factory Mutual
IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

SLATE Modules

A SLATE system is an array of modules mounted together on one DIN rail that work together to implement a control device for specific equipment. The minimum number of modules that can be used is two and the maximum is twelve, depending on the types of modules and their demand for power. The basic categories of modules are:

SLATE Base Module R8001A1001/U

A SLATE Base Module is always the leftmost module on the DIN rail. There can only be one base per rail. All other module types may occur more than once. The SLATE Base Module provides:

- Power for all of the modules
- External communication (if any; it is not required) either via a 10BASE-T connector for Ethernet-based protocols and/or via a RS-485 3 wire connector for Modbus or BACNet/MSTP protocols and web services.
- Storage of data for device configuration and initialization.
- Real time clock and event logging.
- The SLATE control program.

Most of the SLATE modules are passive; the primary active component in a SLATE system is the control program in the SLATE Base Module, which is typically responsible for making everything else operate.

SLATE modules may contain complex behaviors but they wait for something outside of themselves to trigger the process of doing something useful.

- An I/O module will measure and condition its input signals, but it needs to be told what to do and it doesn't *use* the results, it provides them for some other module or external device to use.
- An I/O module will drive its outputs, but only if something else tells it what output signal to produce.
- A burner control module knows how to start up and operate a burner, but only if something else requests this via a call-for-heat.
- A fuel-air control will modulate, but only if something else indicates the desired firing rate.

The primary active component is the control program, which responds to stimuli and tells other SLATE modules what to do by writing to the registers that control them.

Configurable Safety Modules

The safety modules in a SLATE control are:

SLATE Burner Control Module R8001B2001/U

The SLATE Burner Control provides flame safeguard controls for a variety of applications within the SLATE system. It can be configured as a primary or programmer, semi-automatic, or fully automatic. The Burner Control Module provides 24 VDC to 24 VAC to 240 VAC flame safeguard, valve proving, parameters, and behaviors that emulate the 7800 and Sola series flame safeguard, and dual fuel capability.

SLATE Flame Amplifier Modules

- R8001V1031/U Rectification with Dynamic Ampli-Check
- R8001F1041/U Infrared with Dynamic Ampli-Check
- R8001S1071/U Ultra Violet with Dynamic Ampli-Check
- R8001S1051/U Ultra Violet with Shutter- Check
- R8001F1091/U Ultra Violet/Visible Light with Ampli-Check

The Flame Sensor modules for a burner control belong to and are operated by the parent safety module to implement some of its safety-related inputs and outputs. These Flame Amp modules are configured as part of the parent's safety modules configuration. Flame amp modules can be mounted on the DIN rail or can be mounted remotely, such as to put a flame module close to its flame sensor.

SLATE Fuel Air Ratio Control R8001C6001 and Actuators

(R8001M1050- 50 in/lb NEMA 1, R8001M1150- 150 in/lb NEMA 1, R8001M4050- 50 in/lb NEMA 4, and R8001M4150 NEMA 4 Durastep actuators in 300 in/lb and 900 in/lb may also be used.)

The SLATE Fuel Air Ratio Control Module controls the relationship between fuel, airflow, and flue gas recirculation on a power burner. It provides control for up to 4 SLATE actuators and/or 2 Variable Frequency Drives (VFD).

SLATE Limit Module R8001L8001/U

The SLATE Limit Control Module provides the ability to utilize any type of analog signal and create safety limits on pressure or temperature or both.

SLATE safety modules cannot be programmed; only the SLATE Base provides this feature. The basic behavior of each safety module is fixed but can be adapted to various purposes by changing configuration parameters. The SLATE Burner Control will have 70 parameters to tune and select behaviors. Examples of these parameters include:

- Timings such as prepurge, ignition, and postpurge times.
- The type of ignition such as pilot or direct.
- The response to flame failure such as lockout, recycle, or recycle with a delay.

The inputs and outputs on a safety module are available to the control parameters and status registers that are available to the control program. Each of these also has a dedicated purpose. A few examples, for a burner control:

- Parameter: the call for heat request (a non-safety signal which typically would come from the control program)
- Status: the current burner state (e.g. Standby, Prepurge, Ignition, Firing)
- Status: the elapsed time of the current state

Programmable Logic

A SLATE system also provides configurable I/O modules that provide inputs and outputs for use by the control program. Those modules are:

SLATE Analog Module R8001U3001/U

The SLATE Analog Module provides a variety of different combinations of analog input and output types; 0-10 VDC inputs or outputs, 4-20 mA inputs or outputs, Thermocouples type J and K, RTD, 3 wire NTC, Pulse Width Modulation, and Tachometer.

SLATE Digital Module R8001D4001/U

The SLATE Digital module provides 14 opto inputs or 6 relay outputs.

SLATE Annunciator Module R8001N7001/U

The SLATE Annunciator module is designed to monitor the status of a series string of limit, control, and interlock contacts for a commercial or industrial burner. The Annunciator Module acts as a system monitor and enhances fault and status messages of the SLATE Burner Control Module.

A SLATE control program resides and is executed with the SLATE Base Module. To create a control program the user utilizes a "wire sheet" (part of the Honeywell SLATE tool) that resides on a computer. The programming is performed by dragging-and-dropping function blocks onto an editing screen, dragging lines between the blocks to interconnect them, and opening a block's properties to setup its behavior.

When a wire sheet input block is used, the user can attach it either to the data from an input terminal of any SLATE module, or to a source of data from internal logic such as the burner status information provided by a burner control.

When a wire sheet output block is used, the user can attach it either to control an output terminal of a SLATE I/O module, or to send data to the internal logic of another module such as the call for heat request for a burner control.

More information on programming using the Honeywell SLATE Tool is located in Chapter 2.

Communication

The SLATE Base Module can provide communication with a display, some other device or a building management or industrial control system, or all of these simultaneously.

Blocks placed on the wire sheet provide “points” within the SLATE device that are accessible via the connected external communication protocol. Thus the control program can operate according to inputs from the outside world or provide outputs to the outside world.

Although SLATE is assembled from modules, when finished and installed on a particular piece of equipment the SLATE modules appear to be a single device that operates that piece of equipment. From the external protocol’s viewpoint, all of the points in the SLATE device reside at a single address.

Support is provided for the following protocols:

- BACnet/IP via 802.3i 10BASE-T
- BACnet/ MSTP via RS-485
- Modbus RTU/IP via 802.3i 10BASE-T
- Modbus RTU/485 vis RS-485
- Web browser access (httpd) via 802.3i 10BASE-T

The illustration below shows three SLATE devices:

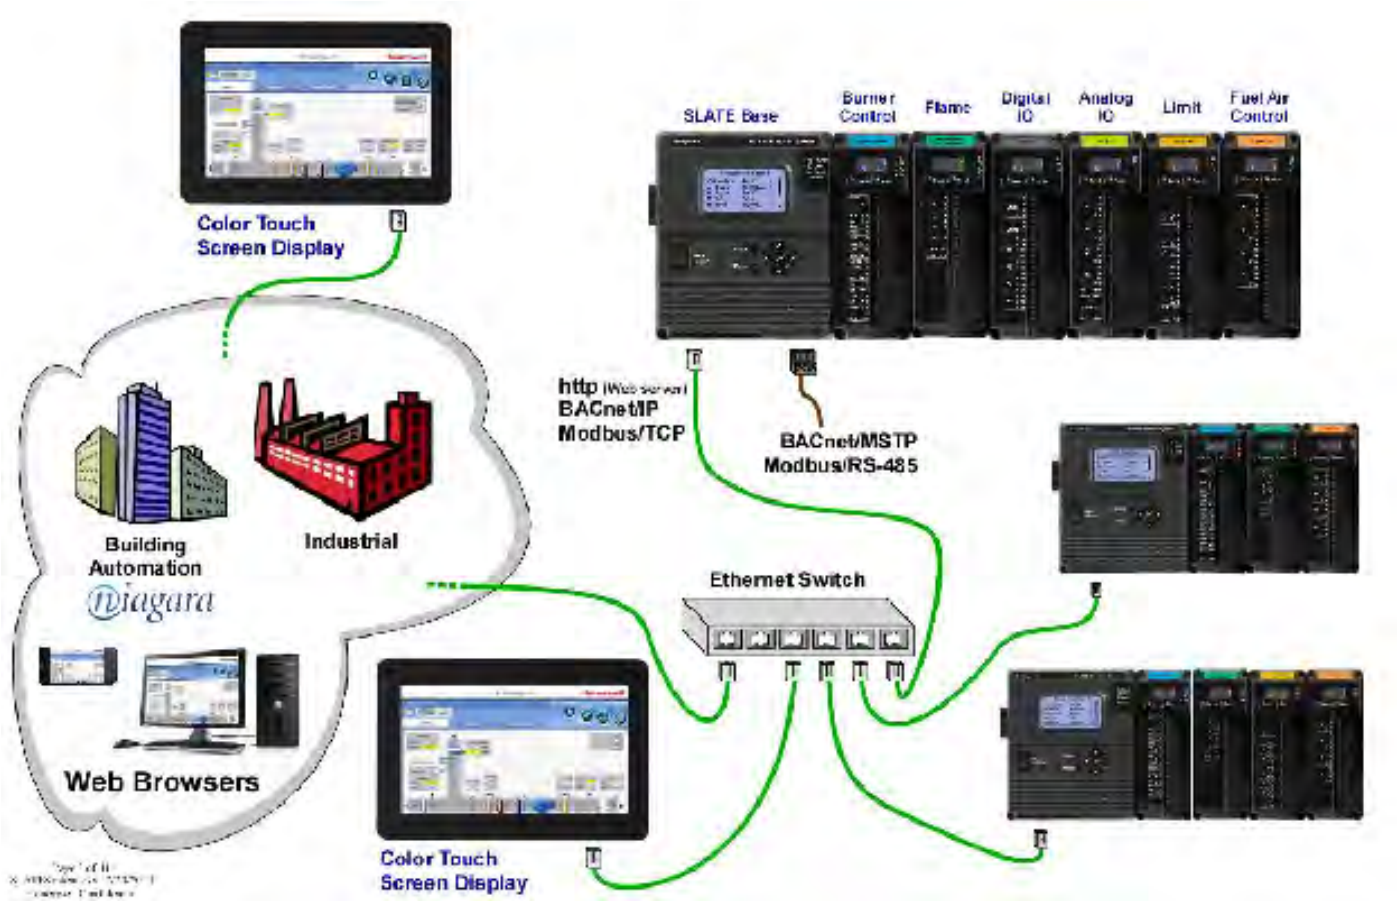

Fig. 1. 3 examples of SLATE devices.

Design Life-Cycle Overview

This section provides a summary of how the Honeywell SLATE Tools and other tools are used in the process of creating a new SLATE device.

Honeywell SLATE Tool

The SLATE systems will use a profiled version of the Niagara AX software as its primary PC-based programming tool for the user. The profiled version provides an environment that is relevant to the SLATE needs; the wire sheet.

The SLATE Designer

In the descriptions below, a user setting up a SLATE device for a particular purpose is called the designer. Typically the designer will be an engineer who works for an OEM or Systems Integrator and is using SLATE to create a control for some equipment. The wire sheet program the designer creates is called the SLATE Control Program.

Skills Needed

Setting up a control program for a SLATE device will inevitably require an understanding of SLATE-related concepts and details.

Mastering these concepts will require at least a good tutorial and some hours of training. Below is a partial list of topics.

- The behavior and configuration of SLATE Safety modules
- The I/O that is available on various SLATE modules
- How a SLATE Control Program is developed, which includes:
  - An understanding of the “wire sheet” design techniques
  - Familiarity with all of the wire sheet blocks
- How to connect wire sheet logic to:
  - Physical inputs and outputs
  - Other internal data in a SLATE module
- How to provide external network connections to the outside world
- How to export the design into a PC file or “kit”
- How to load the design into a SLATE device for testing
- How to use kits and the SLATE Loader in a production environment

Select the Modules

The designer thoroughly understands the equipment that SLATE will control: the switches, blowers, dampers, sensors, burner, etc. All of these and also the procedures for how these should operate are in the designer’s domain. With this background and also with knowledge of what each kind of SLATE module can do, the designer selects modules to be used and determines how each of them will be connected to the equipment.

In the illustration below, the background schematic represents that equipment, and the screw terminals and lines indicate the designer has chosen SLATE modules based on the types of electrical devices that need to be monitored or controlled in that equipment. For an actual design the designer might use a schematic diagram, a list, or a form to record the choices.

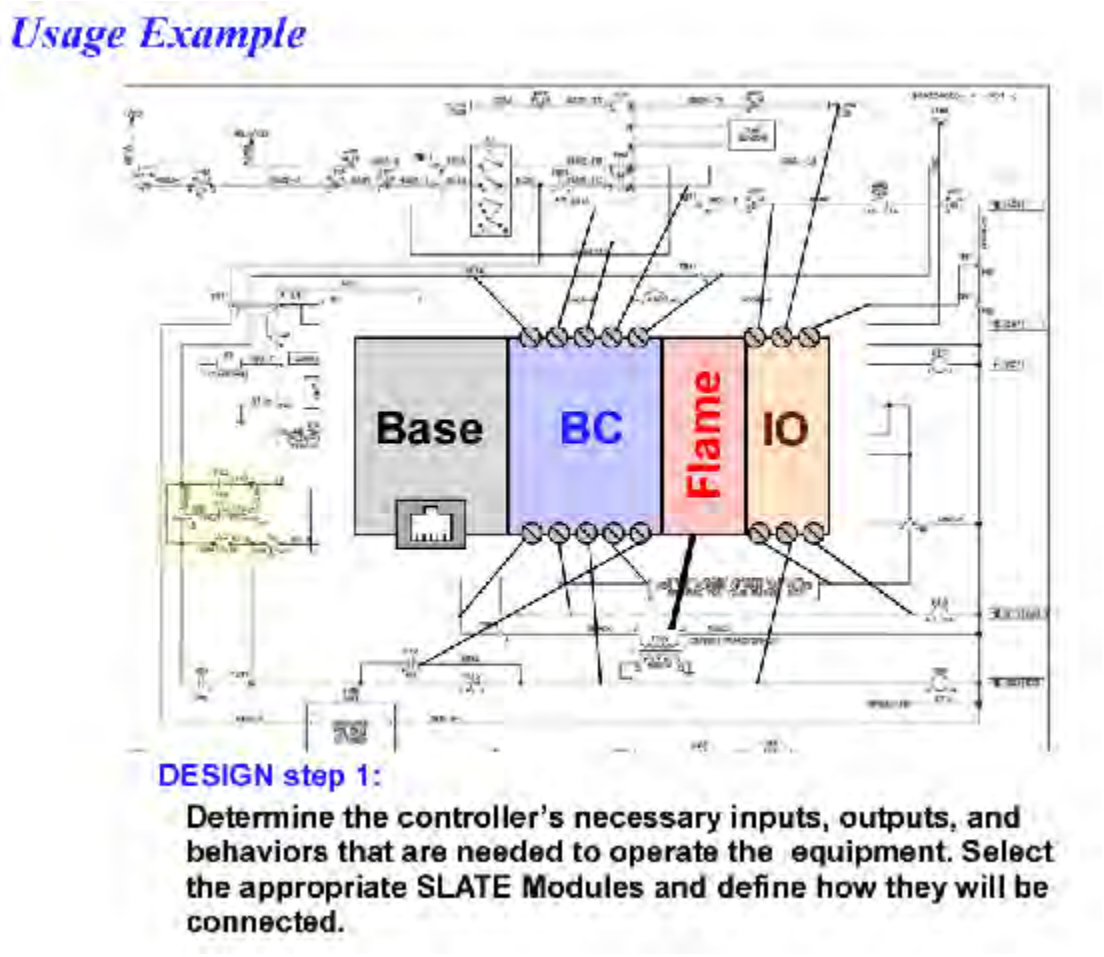

Fig. 2. SLATE usage examples.

Implement the Design

The wire sheet program editing environment is used to create the control program for the equipment. Blocks representing inputs, outputs, and behavior are dragged-and-dropped onto it and then interconnected by dragging “wires” (lines) between them. That step is represented in Fig. 3 along with a list of some of the types of blocks that are available.

The other task performed within the tool is setting up the configuration data for non-programmable devices, such as the SLATE Burner Control Module. This consists of a set of dialog boxes that present choices via drop-down lists, fill-in the blanks, check boxes and other similar techniques.

The results are one block of Program Data (see Fig. 3) that describes the Control Program and blocks of Configuration Data

for each of the safety modules that contain the configuration settings.

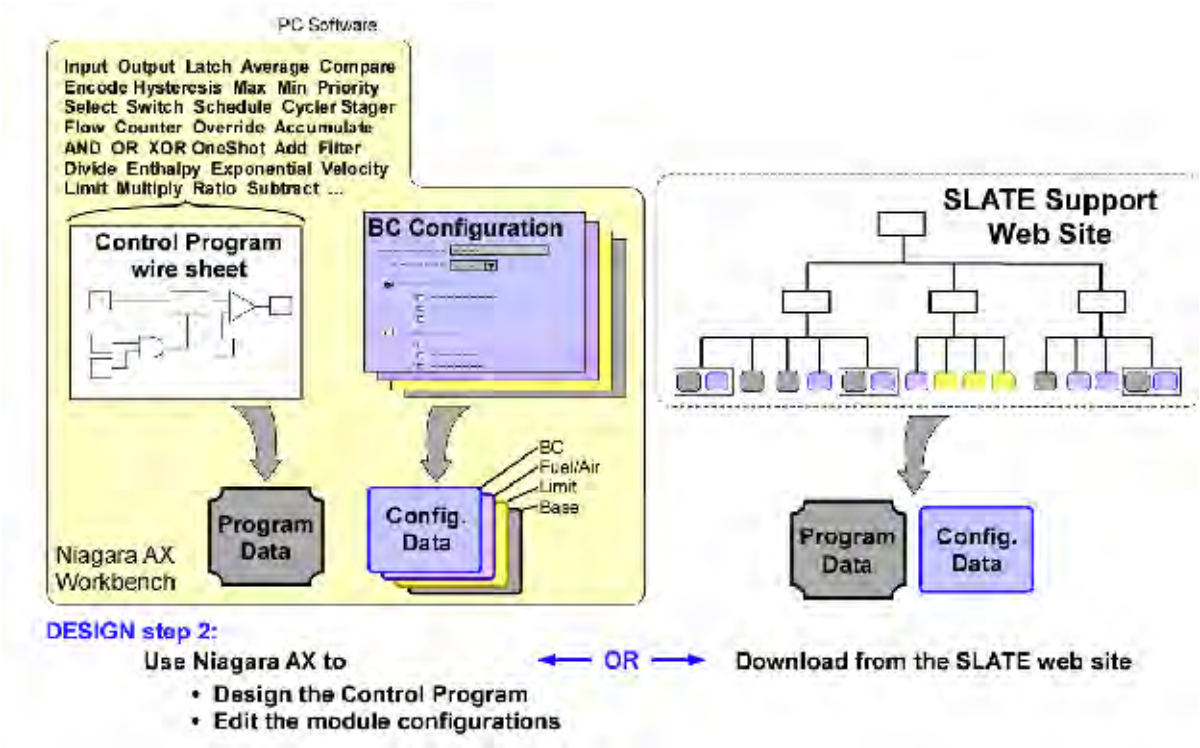

Fig. 3. SLATE program data block.

Other Design-Related Actions

Fig. 4 shows other activities performed by the designer as part of creating a SLATE device.

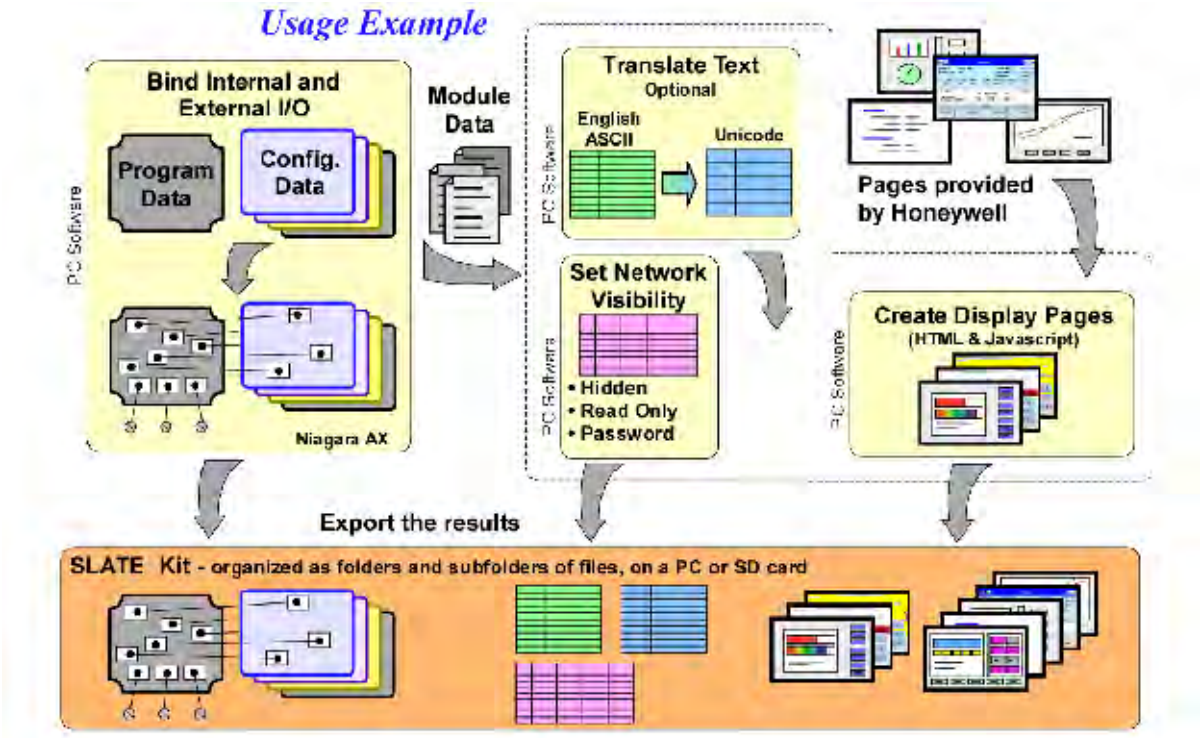

Fig. 4. SLATE other design tasks.

Binding Internal and External I/O

Binding is the process of defining the actual screw terminals or registers in the SLATE modules that will be used by the program logic. It is done within the wire sheet programming environment. It may be done as-you-go, or as a separate step. It is shown separately above. An example of this is a canned program that is downloaded from the SLATE web site that is modified, if needed, and then bound to the actual I/O needed by the equipment.

Text Translation

The text used by SLATE modules to label and describe parameters and their values can be translated into some other language. This is optional. When this is done, the Honeywell-standard English language text is still preserved and available as an option, for use by Honeywell support personnel.

Network Visibility

Simply using any SLATE module will create many network-visible inputs and outputs in a SLATE device and the designer can create others via wire sheet programming. All of these network inputs and outputs (or "points") can be filtered to make them hidden and remove them from visibility to the communication protocols. For example, of the hundreds of points that are available, a particular application design may prefer to reveal only a dozen or so as items that represent the equipment and that are useful to the site where the equipment is installed. Each point that is potentially writable can be set to a Read-Only condition, or a password can be applied, and/or range limits can be set. These choices are made via a form that is available in the Honeywell SLATE Tool as part of creating a control program.

Display Screens

The display screens installed in a SLATE device are web pages and the SLATE Base Module implements a web server to provide these pages to the SLATE display or any web browser, such a browser in a PC or smart device. Honeywell provides a set of display screens for each of the modules that a designer can use as-is or adapt or replace using a different design. The designer also creates screens for the wire sheet programmable logic to represent the status of the controlled equipment.

Export the Results

All of the data created by the designer is exported along with mandatory data provided by Honeywell to create a SLATE Kit File. A Kit File is a single file implemented as a .zip file, containing a folder structure with files in a specific form that is compatible with the SLATE device. The name of the kit is chosen to reflect the purpose of the design; for example it might be named for a particular model of boiler, furnace, air handler, or whatever the design is intended to control.

Verification of Safety Data for Each Module

An important part of a SLATE design is the verification process for safety configuration data. Whenever safety data is changed for any reason, a safety device will enter a "risks addressed" (i.e. shutdown) state until that change has been verified. Verification consists of reviewing each data item without changing it and then, instead of sending a "read" or a "write" command to the module, a "verifying" message is sent. That is, SLATE safety devices recognize those as distinct messages.

The process of verification includes pressing the "Select" button on the module; confirming that the one being verified is the intended module within the intended device, because a SLATE display can be connected to different SLATE devices and a SLATE device can contain multiple safety modules. Verification requires a SLATE password.

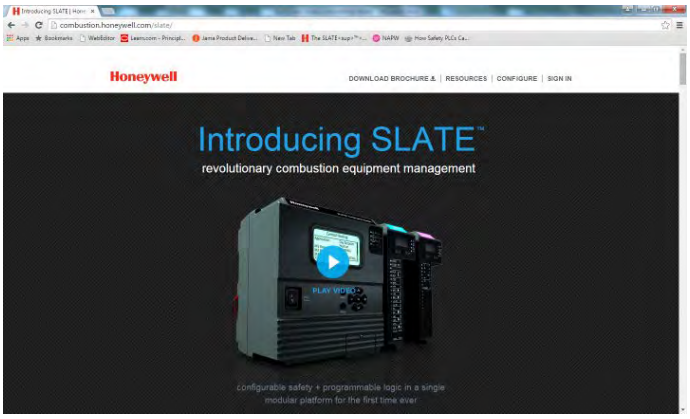
After an entire design is verified, it is possible to save the verification status and load it with the kit (see below) so that an OEM or Systems Integrator does not have to re-verify the same design over and over again each time the design is replicated.

Load the SLATE Device

When loading the Kit into a SLATE Device:

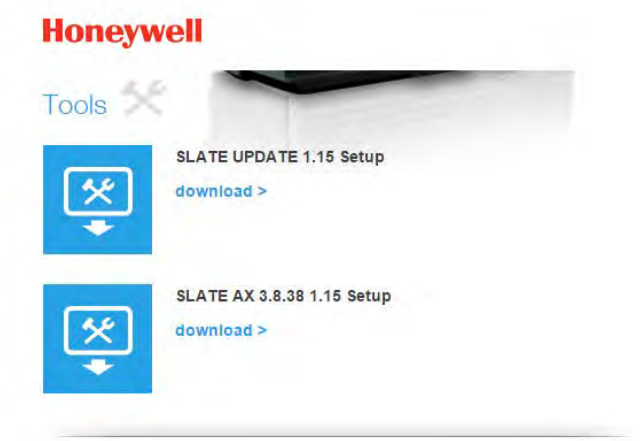
1. Assemble all required modules on the DIN rail.
2. Apply power to the SLATE control.
3. Connect a PC that is running the SLATE Loader program to the SLATE Base Module using a standard Ethernet cable.
4. Select the desired Kit from a drop-down menu (after the first time it will remain selected and this must be done only if it needs to be changed).
5. Click Select to send the Kit to the SLATE control.

The kit is then loaded into the SLATE modules and when this succeeds a "Pass" indication is provided, or if it fails then the reason is logged.



Chapter 2: Using the Honeywell SLATE AX Tool

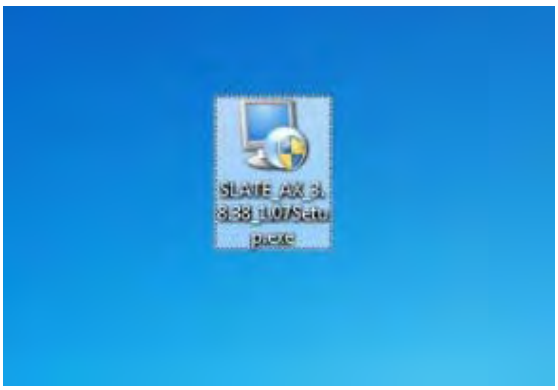
Overview



The SLATE AX Tool is the software application to configure SLATE configurable modules, program application logic using function block programming and design application screens for your graphical display.

Obtaining the Software

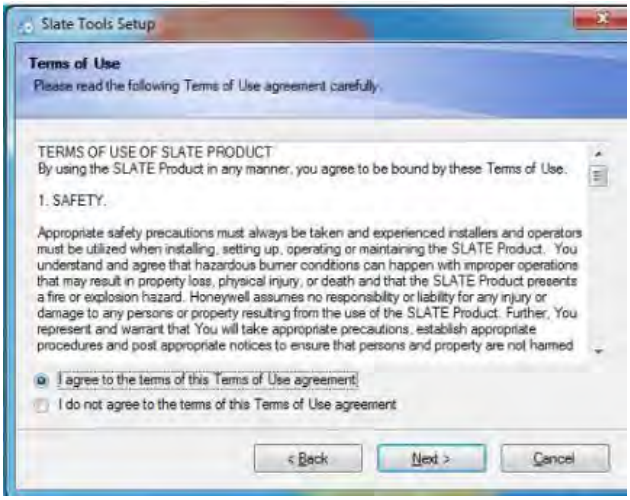
1. Go to the SLATE Website (combustion.honeywell.com/SLATE) to the Resources section. Click on Resources. See figure below:



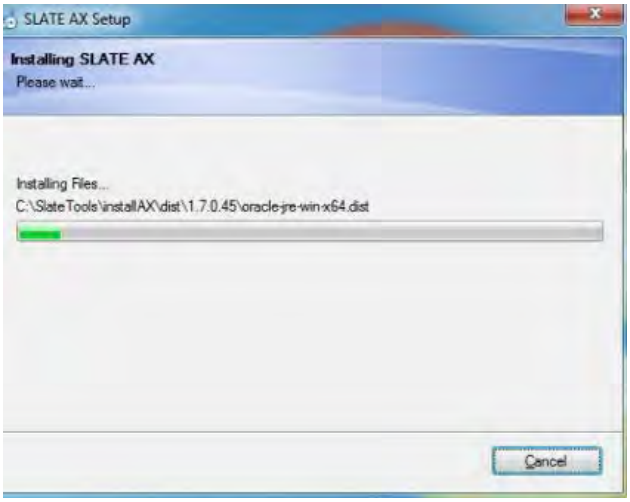
2. You will be prompted to enter a user name and password. If you are a user of customer.honeywell.com you will be able to enter those credentials into the system. You will need to utilize a Chrome browser.
3. Once you are logged in the select the Resources the following web page is displayed. Click on the software section and download.

Installing the Software

1. Download the file to a folder or your PC desktop. There will be a SLATE _AX_XX_XX (depending on the current version level) Setup.exe icon (or file if you selected a folder.)

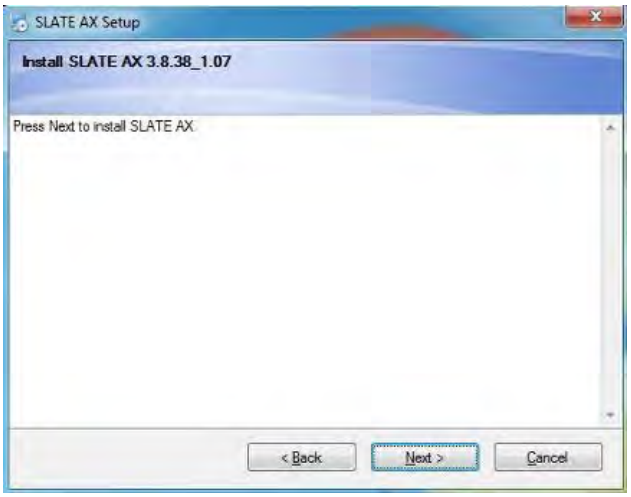


2. Double click on the above icon and allow the setup to install on your computer. This may take several seconds before the install program starts. The following screen is displayed that will begin the SLATE AX installation.

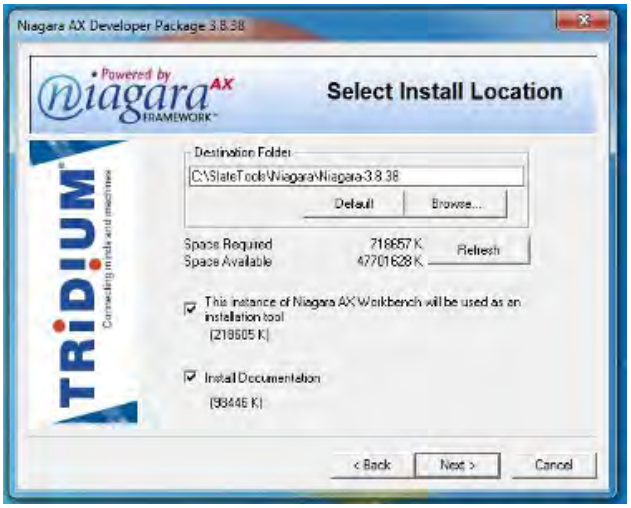


3. Press the Next button to begin the installation. The following screen will be displayed and you will be asked if you agree to

the terms of the Licensing Agreement and the Terms of Use. Please click the “I agree” button to both of these requests.

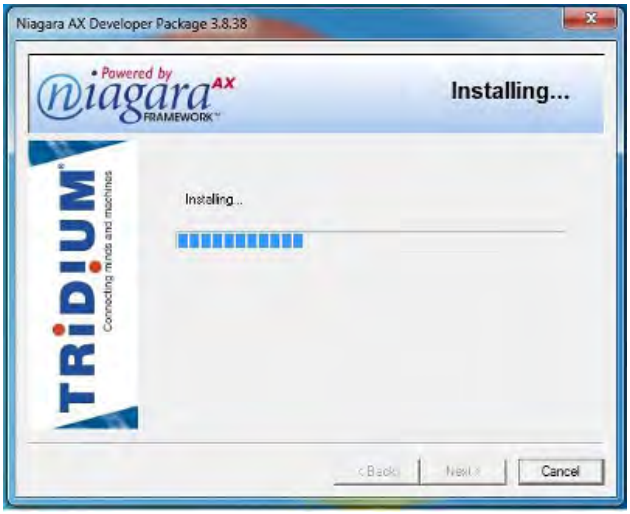


The SLATE AX Tool will start installing. You should see the following screen:

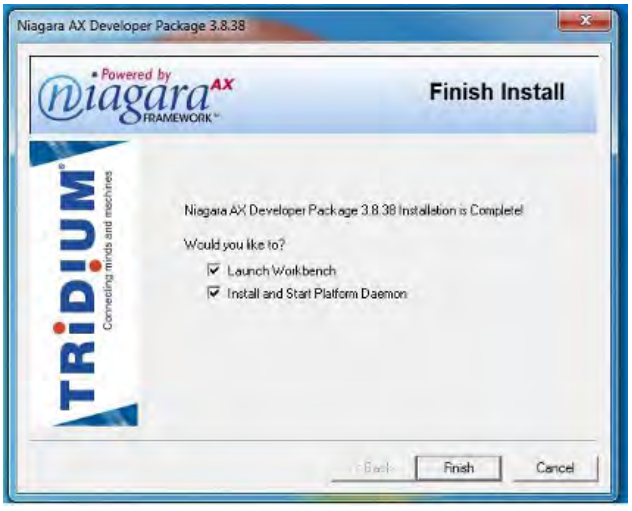


4. When you see the following screen, please press the Next button to continue installing the tool.

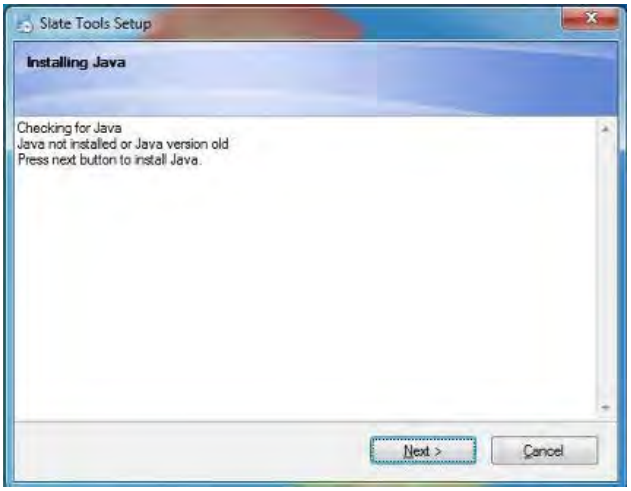
5. Click Next to continue.



You will then see the following screen:



6. Do not change the destination folder location or uncheck any items. Please click Next



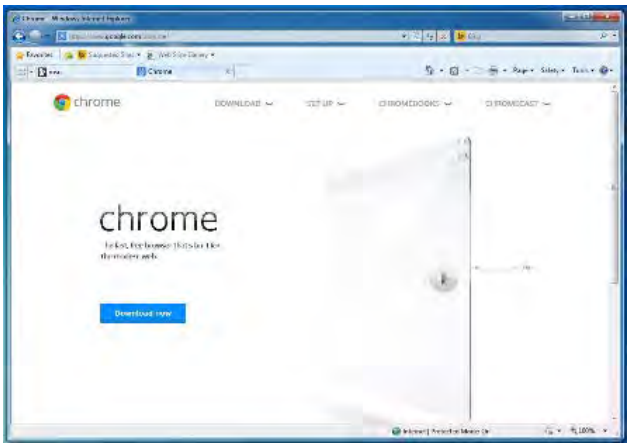
7. Again, do not change anything on the screen and click Next.

The setup program will being installing the SLATE AX software.

8. When you see this screen please do not change anything. Press Finish.
9. You will then see the following screen that will contain your host ID you will need for licensing. Please send the host ID (Win-XXXX-XXXX-XXXX) information for licensing as previously noted above. If your computer doesn't have Java or an older version the installation program will install a new version onto your computer. If you see this screen please press Next to install.

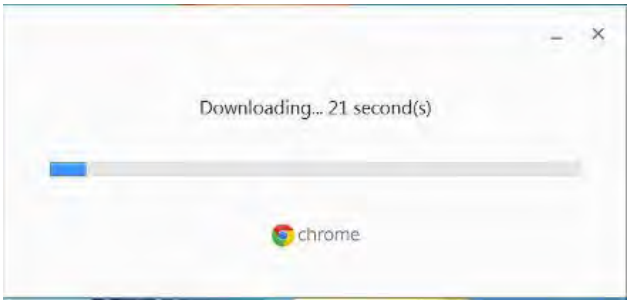
When this screen appears, do not change any settings and click Install to continue.

Please wait while the installation of Java is complete.

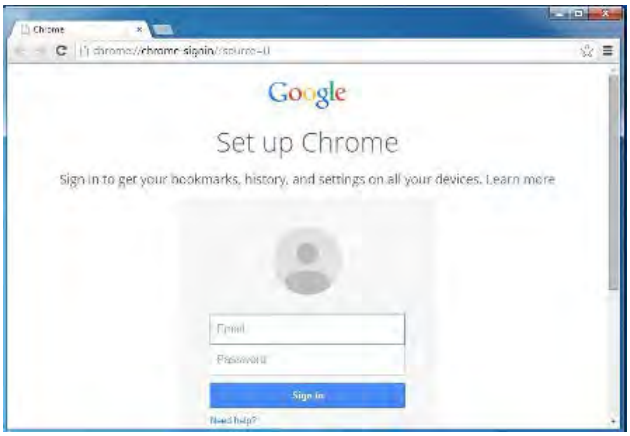


10. When installation is complete, this screen will be displayed. Please press Close to continue.

The SLATE AX Tool has been successfully installed. Please press Finish to close the installation program.

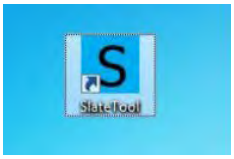


The SLATE AX Tool utilizes the Chrome browser. If you don't have Chrome, please open your web browser and type the following address: www.google.com/chrome. When the web page load, locate the "Download now" button and follow the instructions.



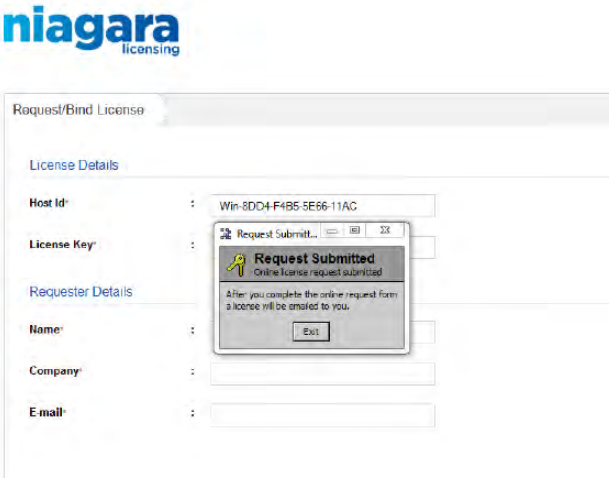
While trying to download Chrome, you may see the following screen. Please press Run to continue to installing the browser.

The Chrome installer should be displayed indicating that the installation progress.



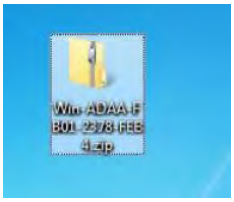
Once Chrome is installed the following screen will be displayed. You can close this window without entering any information if you prefer.

At this point you have successfully installed all of the software components required for the SLATE AX Tool.



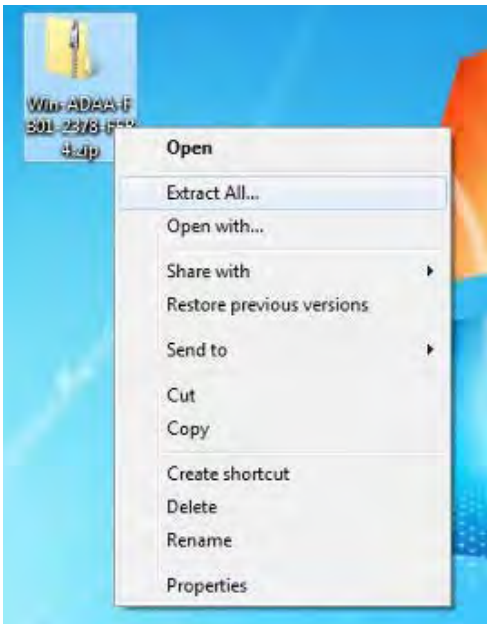
You will see the following icon on your desktop to start using the tool. Please always use this icon to start the SLATE tool in the future.

11. Please double click on the SLATE Tool icon to start the program. You should see the following screen.



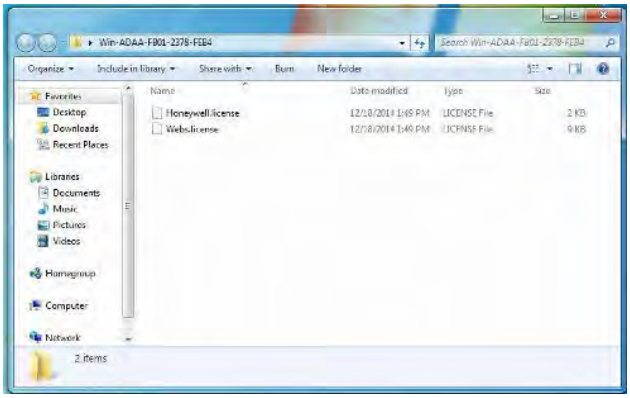
12. Click on Open SLATE AX Tool button. The following screen is displayed.

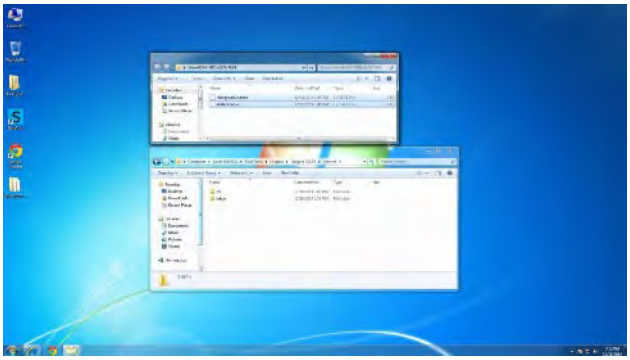
At this point, DO NOT FOLLOW THESE INSTRUCTIONS! Submit the host ID to Honeywell Customer Care for licensing.



As mentioned the SLATE AX Tool requires a license to operate. Once you have received your license, you can only use it on this computer, since the license is tied to the computer hardware.

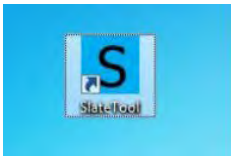
Once you have received your license in your e-mail copy the license file onto your desktop.



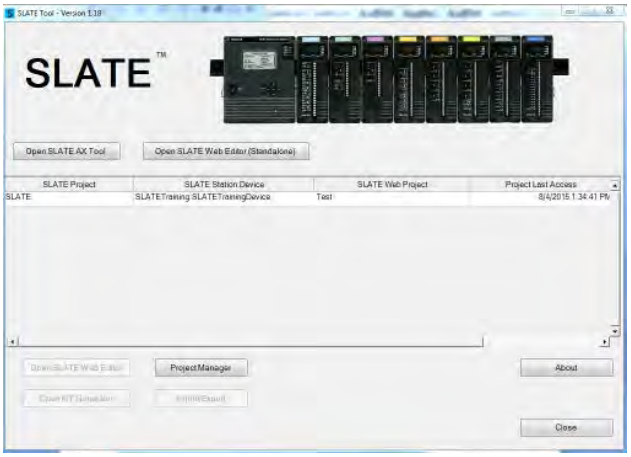


The file will be Win-XXXX-XXXX-XXXX-.zip

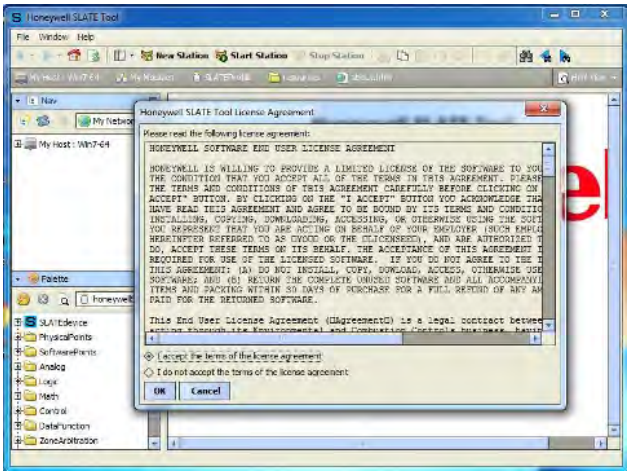
You will need to right click and extract the files inside to a folder on your desktop.



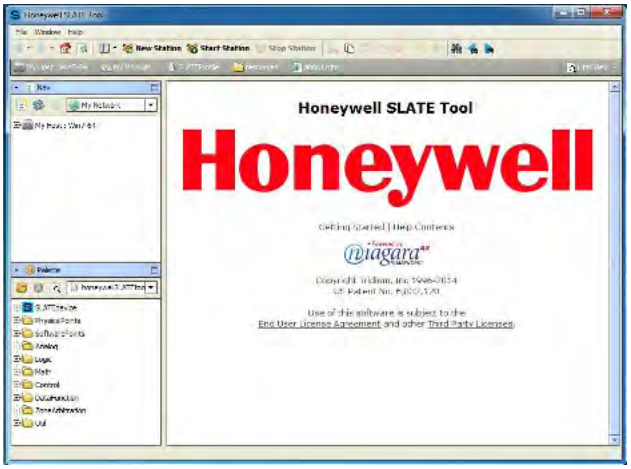
Inside the folder will be one or two license files. These files must be copied to the following location C:\Slate Tools\Niagara\ Niagara-3.8.38 \licenses. Note the license version may be different than highlighted based on updates.



Once the licenses are copied in the correct location, the SLATE AX Tool software is ready to use.



Locate the following icon and double click it to start the SLATE tools.



The SLATE Tool software will show the startup screen.

13. Press the Open SLATE AX Tool button.

The very first time that the SLATE AX Tool is started you will need to accept the End User Software Agreement. This agreement is always available for viewing by pressing the About in the SLATE Tool Program start page.

This screen is shown at the startup of the tool. If you see the above screen you have successfully installed all the components needed to use the SLATE Tool to create a design and web pages for your SLATE device.

14. Next you need to check if the SLATE Web Editor is properly installed. To do this return to the SLATE AX Tool Main page and select Open SLATE Web Editor Tool.

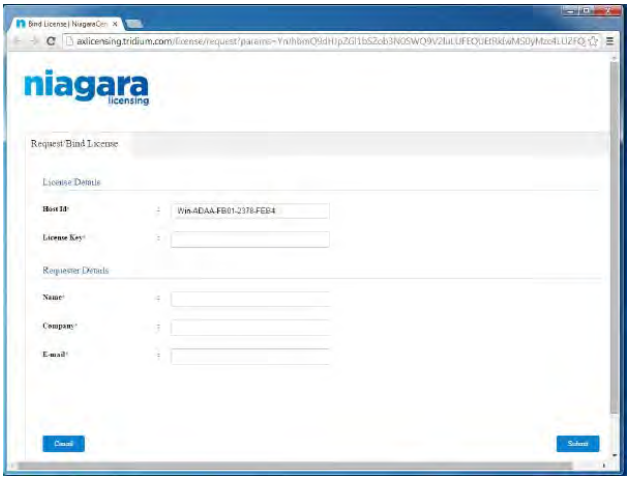
Confirm that the Chrome browser opens with the text below.

If you do not see any of these screens nor cannot launch the SLATE AX Tool please contact the Honeywell Technical Assistance Line at 1-888-516-9282.

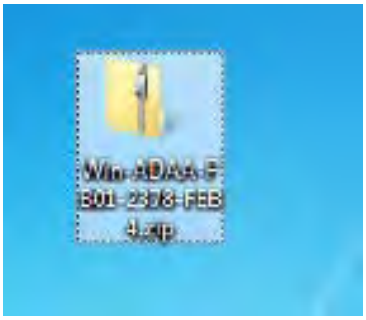
15. Double click on the State Tool icon to start the SLATE tool program.

This screen will be displayed first when starting the SLATE tool program.

16. Click on the Open SLATE AX Tool button.

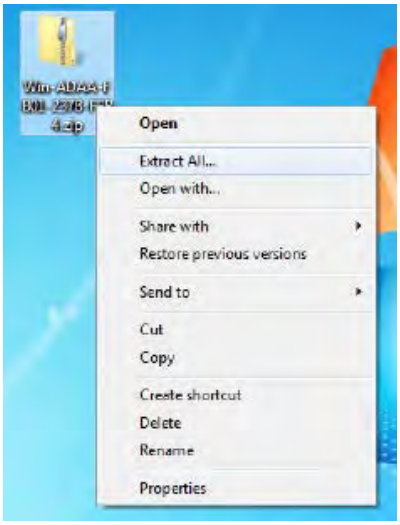


This screen is displayed to start the SLATE AX Tool.

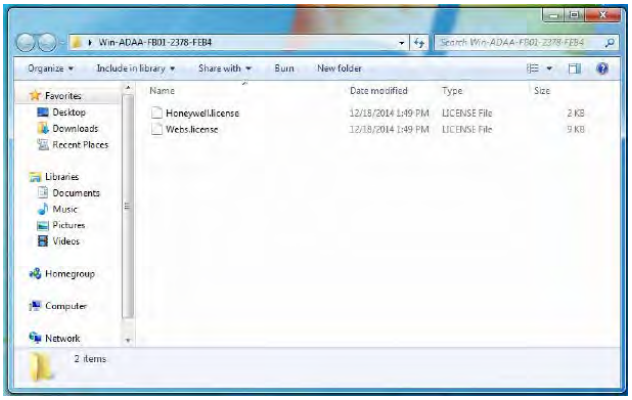


The SLATE AX Tool requires a licensed to operate. Once you receive a license, you can only use it on this computer, since the license it tied to the computer hardware.

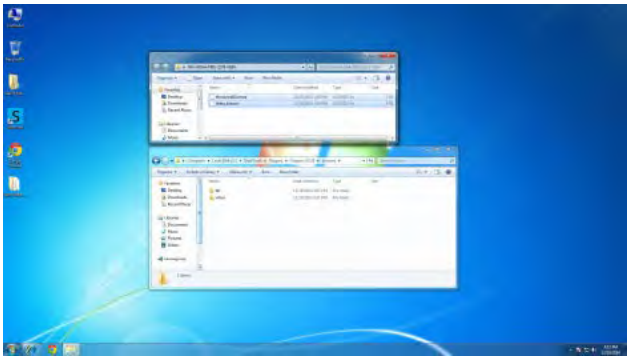
If you do not have a license a screen will be displayed to prompt you to obtain a license.



Note: Instead of requesting a license from Niagara, you must obtain the license from the Honeywell SLATE support team. E-mail the Host ID information Win-XXXX-XXXX-XXXX-XXXX to your Honeywell Customer Care representative and he/she will send you your official license.

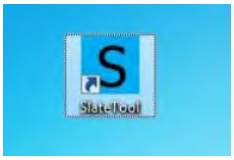


Once you receive your license in your e-mail. Copy the license file onto your desktop.



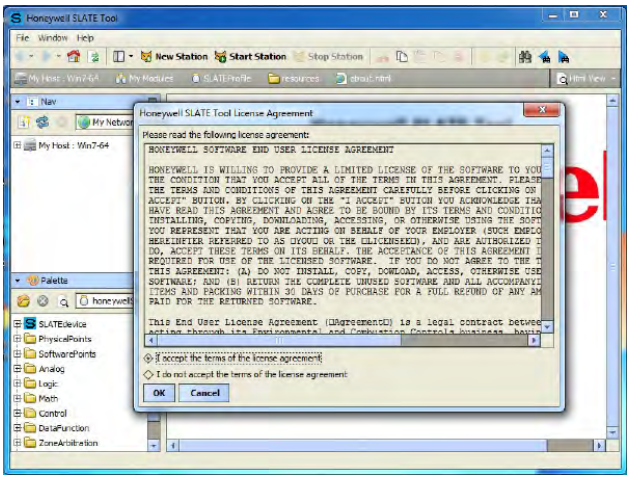
17. The file will be Win-XXXX-XXXX-XXXX-XXXX.zip. Right click and extract the files inside to a folder on your desktop.

Inside the folder will be one or two license files.

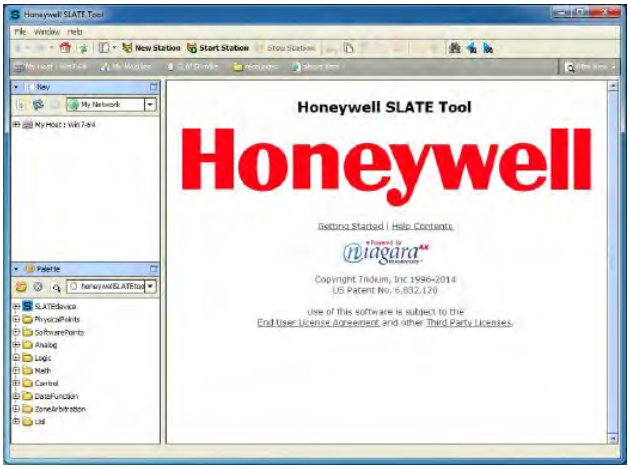


These files must be copied to the following location: C:\SlateTools\Niagara\Niagara-3.8.38\licenses

Once the licenses are copied in the correct location, the SLATE AX Tools software is ready to use.



Locate the following Icon and double click it to start the SLATE tools.



The SLATE tool software will show the startup screen.

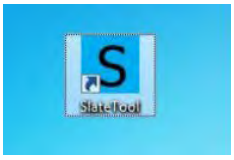
Press the Open SLATE AX Tool button

The very first time that the SLATE AX Tool is started you will need to accept the End User Software Agreement. This agreement is always available for viewing from by pressing the “About “ in the Slate Tool Program Start Page.

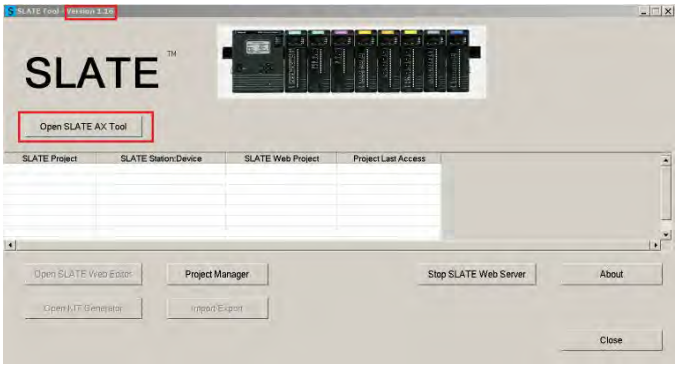
This screen is shown at startup of the SLATE AX Tool.

If you see the above screen you have successfully installed all the components needed to use the SLATE Tools to create a design and web pages for your SLATE device.

At this point follow the instructions on how to use the SLATE AX Tool.



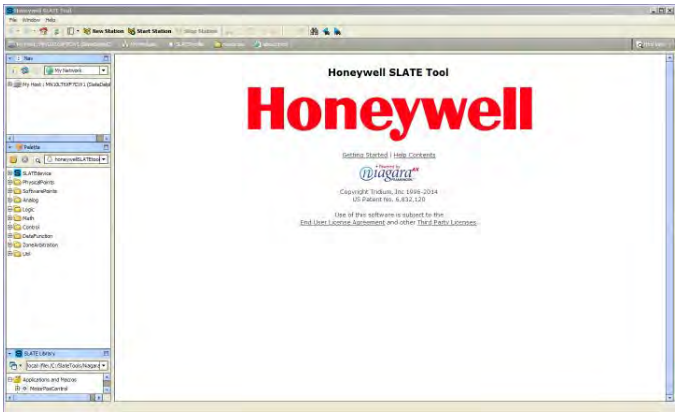
Getting to know the SLATE AX Tool



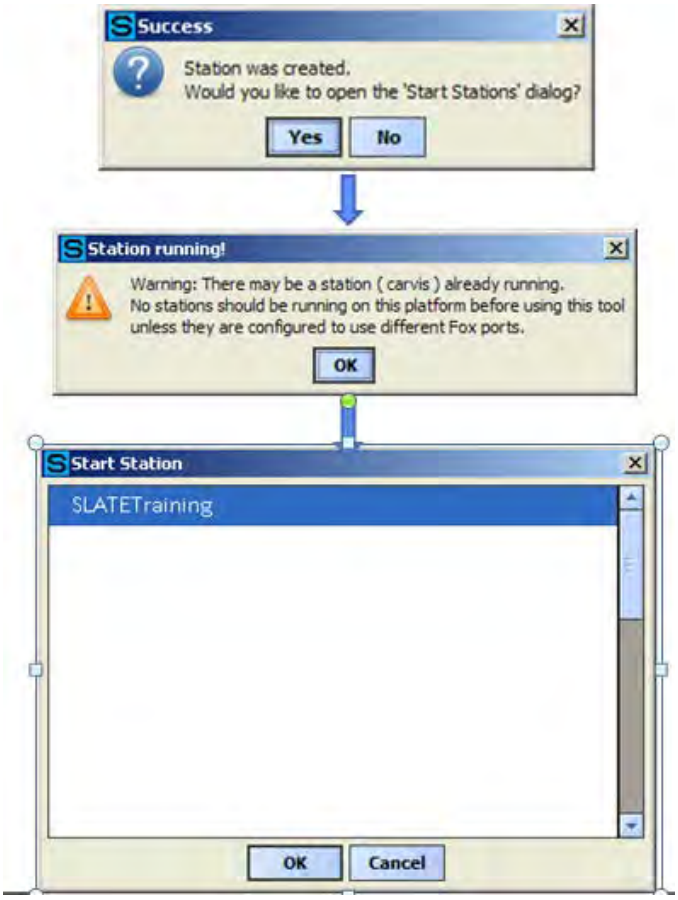
To understand how SLATE AX Tool works it’s important to understand a few terms.

- Platform- where you work, or your laptop or computer. Hosts the SLATE AX software
- Station- a method to group your work. You open a station and connect to it using credentials
- Device- is within a station, you can save your SLATE device: a design for a SLATE control
- Wire Sheet- The logic you create for you application using function blocks. A term that is interchanged with Logic.
- Function Block- Basic unit of programming SLATE logic where blocks represent behavior are placed on the wire sheet and connected with lines that indicate the flow of data.
- Block Configuration- Defining certain properties of a particular function block
- Binding- Assigning a wire sheet input or output to a SLATE register or physical terminal on a SLATE module
- Link- Connecting function blocks with lines that represent data flow
- Kit- Once the wire sheet is complete it must be compiled and loaded into the SLATE Base Module. The file loaded into the base is called the “kit”
- Web Page- A human interface to the SLATE control. The web page may contain controls, readings, graphics, etc. Created using the SLATE Web Editor tool
- Macro- Within a wire sheet the user can create a macro which is a sub-routine (more logic) that may be commonly used in many applications. The macro does not contain links to the “outside” world or bindings. Once created it can be stored in a library and drug into the wire sheet as if it were another function block
- Application- An application is like a macro, but may contain links to the outside world and will require bindings.
- Cloud- Referring to network; pc, internet, intranet, or displays

The SLATE AX Tool Software

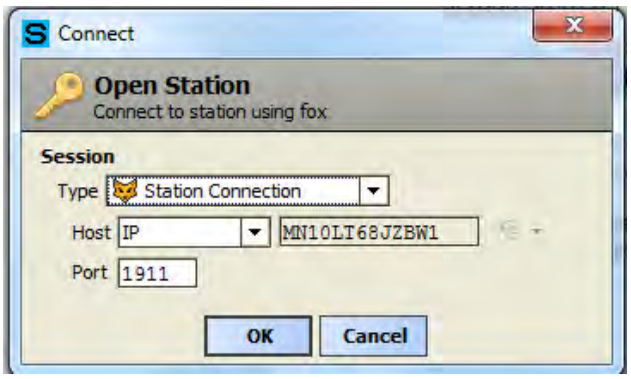


To begin using the SLATE AX Software find the SLATE icon on your desktop and double click it to launch the program.



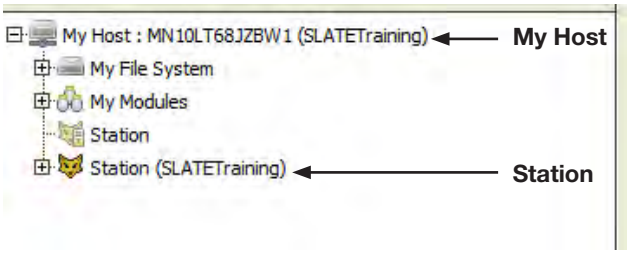
Honeywell will update the SLATE AX Tool periodically when new features are released. It is important to know what version you have installed and that information can be found in the upper left hand corner of the software.

1. To begin working on a project, click on Open SLATE AX Tool.

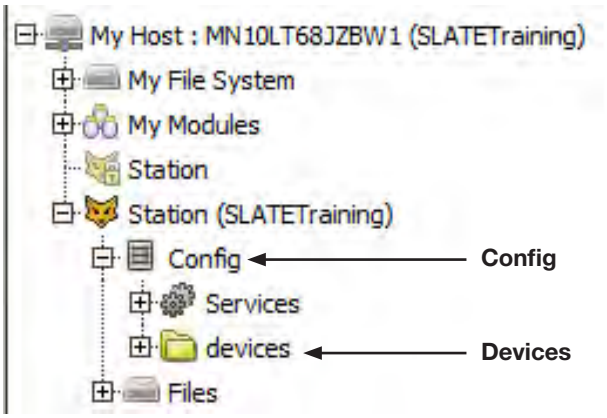


You need to create a Station. Click the New Station button to create the station. A dialog box appears that allows you to name the station. When naming a station do not use any special characters or spaces. Once the is created you will need to start the Station with the Start Station button that will start any existing changes and access any device within that station.

Creating a new station prompts you to name the station and then will ask if you would like to open the station you just created. If the station was already created and you would like to access it, simply click on the “Start Station” button and select the station you would like to open. When you have created or selected your station you will also be prompted to open it and the following dialog box appears with a drop down box. This drop down box includes two selections Station Connection and Station SSL Connection. Please select Station Connection.

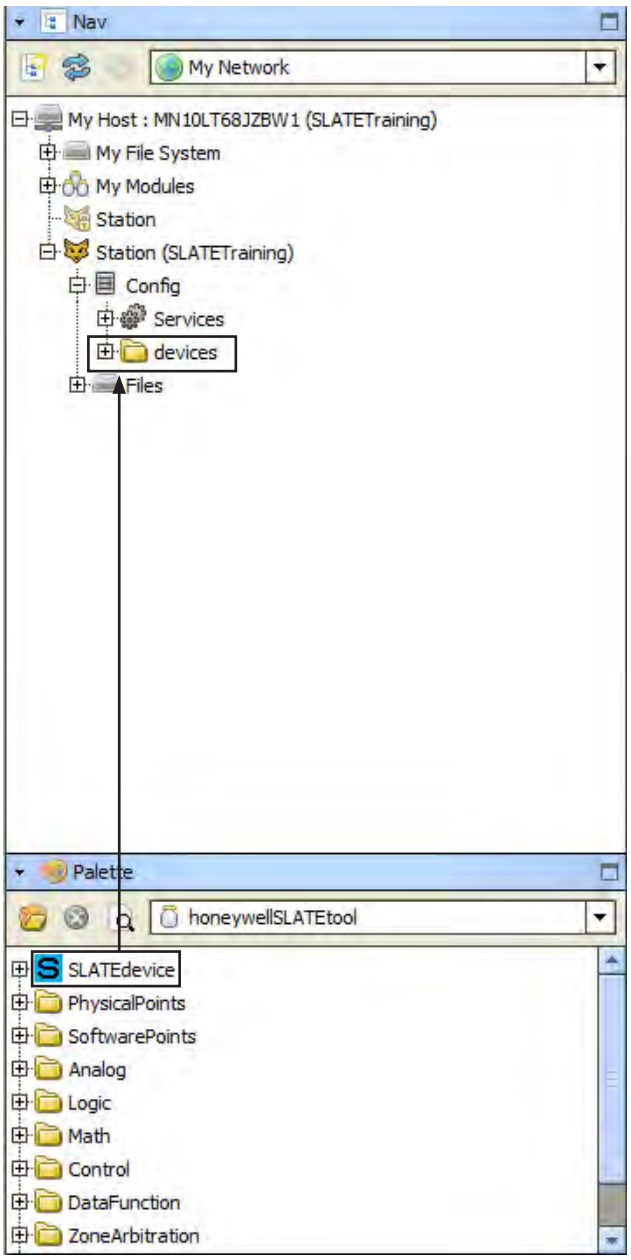


The Station will need authentication. The username is user and the password is SLATE. Please use these credentials. It is useful to select the “Remember these credentials”.

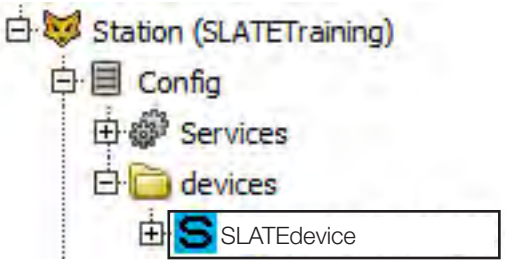


Username: user

Password: SLATE



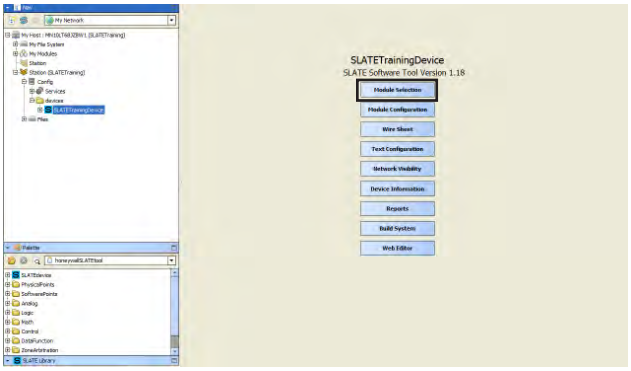
Once you have logged in, expand the My Host item by clicking the +SLATE AX Tool. Expand the Station by clicking it’s + symbol. See fig. below.



Expand the Config+ and expand devices+. This is where you will put SLATE devices. If this is your first device, the devices folder will be empty.

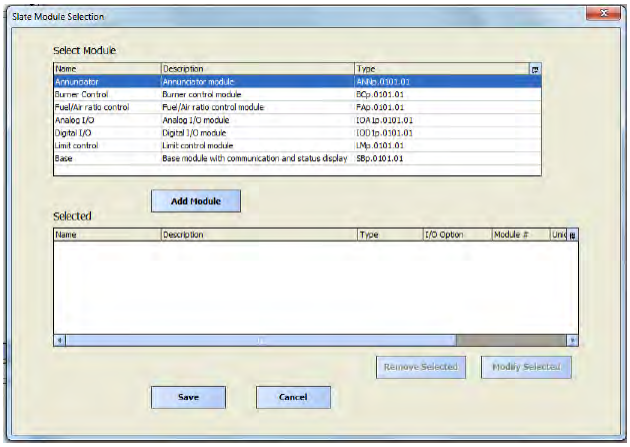
You will need to create a new device and put it in the devices folder. For the SLATE system you will see in the SLATE AX Tool Palette SLATEdevice. Click and drag the SLATEdevice from the Palette to the device folder in the Navigation pane until it is highlighted. Then drop it. See figure below.

This will be the look after you have moved the SLATEdevice folder into the devices folder.



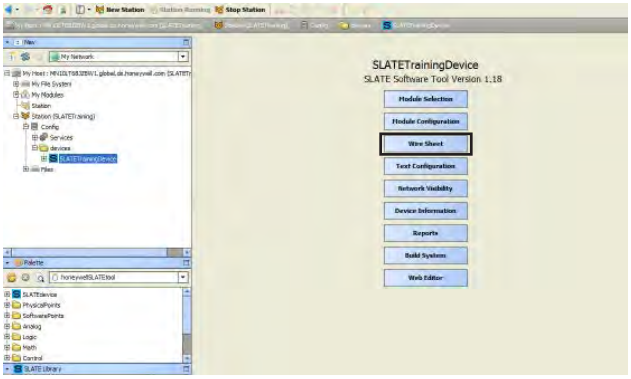
The SLATE AX Tool will require you to create a name for the new SLATE device within the devices folder. You can name the device

anything you would like. Avoid spaced in the device name because it will become the basis for your file name. See the example figure below.



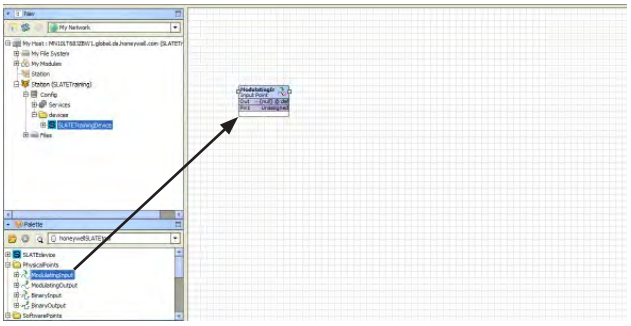
Module Selection

The next step to take is to define or select the modules you will be using in your project. By double clicking the SLATE device you just named, The SLATE AX Tool will display options for additional functionality through the following display. See figure below.



By clicking on the Module Selection tab you can begin adding the modules.

The Module Selection section of SLATE AX Tool let's you add SLATE modules. The top half lists all available modules. Clicking the Add Module button moves the highlighted module to the Selected List section below. The order in which the modules are selected does not have to match the order in which the modules are physically mounted to the DIN rail. However, the SLATE Base will always be module one on the left side of the DIN rail.

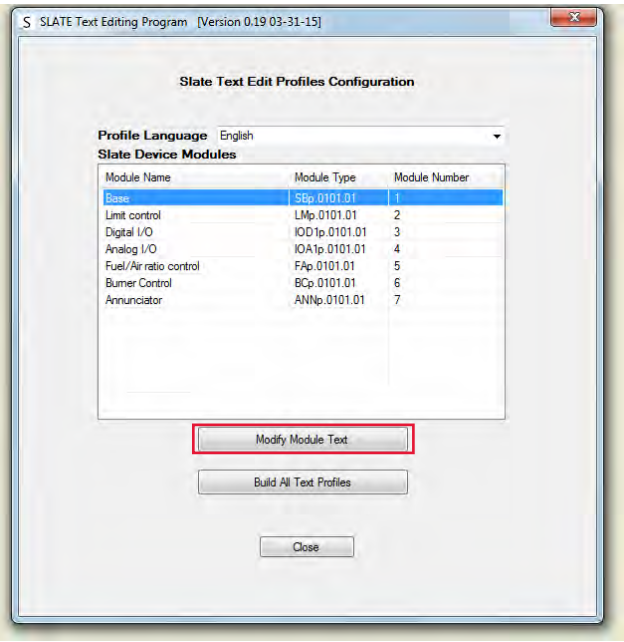


The tool will also allow you to remove or modify any selected modules.

When all modules are configured, you can continue by accessing the wire sheet where you will set up your SLATE devices and can begin programming your logic. Click the “Wire Sheet” button to begin.

Expand the content of the function block folders to expose the different function blocks available. To use them, simply select one and drag it onto the wire sheet. The flow of this editor moves from left to right. You will want to place input blocks on the left, logic in the middle and outputs toward the right to make the logic easier to follow.

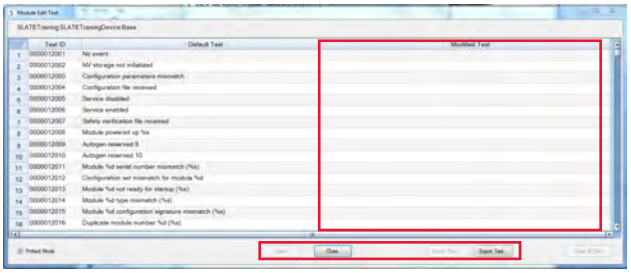
Name the block with an appropriate name for the function of the block, for example “InterlockControl”. Note do not use spaces when naming blocks in SLATE AX Tool. Once the block is named you can reposition it anywhere on the work space and you have the ability to increase or reduce the block size by placing the cursor over the dots on the block and expanding and reducing as needed. For more information regarding SLATE AX Tool and the Wire Sheet functionality, particularly all function blocks please refer to the Function Block (Spyder) Library located on the SLATE website at combustion.honeywell.com.



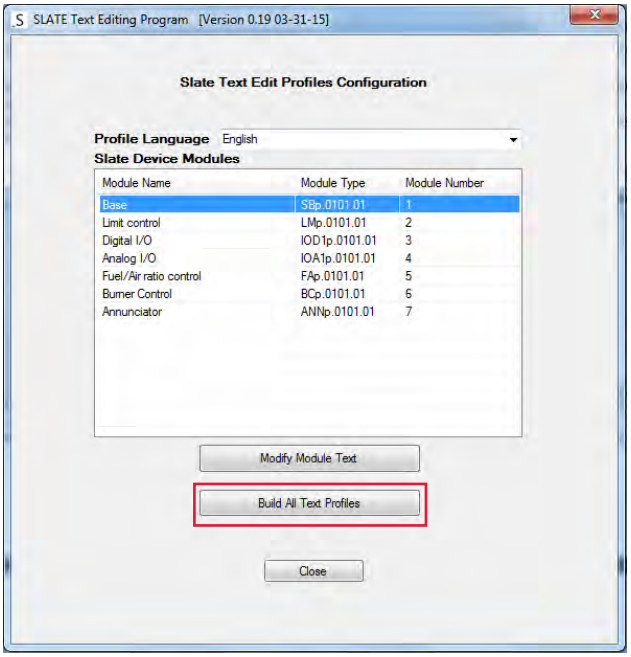
Chapter 3: SLATE Text Configuration and Network Visibility

SLATE Text Configuration

The SLATE Text Configuration feature allows you to edit text strings to provide better descriptions and translate text to other languages to suit your needs.



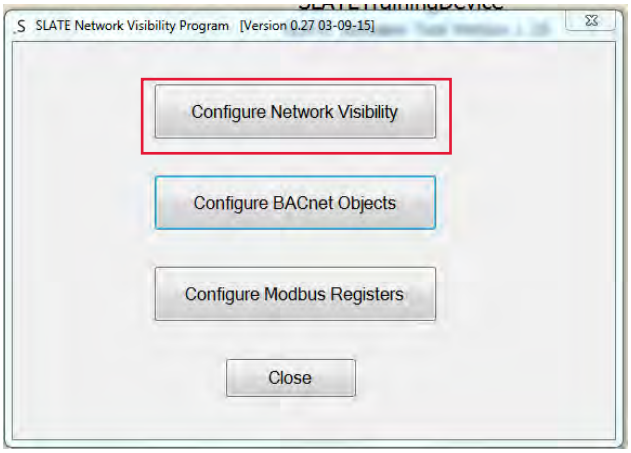
To access the Text Configuration tool launch SLATE AX Tool as shown below:



The Text Edit feature allows you to change any text based on the SLATE modules as highlighted above. Select a module, as in the example the Base, and select Modify Module Text. The drop down selection for the Profile Language is only compatible with English at print time. Other selections, French and Spanish will be completed in the next software release of SLATE.

Type the desired text in the Modified Text section to replace the Default Text. The Default Text is permanently stored in SLATE and will be used whenever no other text option is available. You can export and import text as needed by using the “Import Text” and “Export Text” buttons. When finished, click the “Save” and “Close” buttons.

Click the “Build All Text Profiles” to incorporate the changes into your SLATE Device.

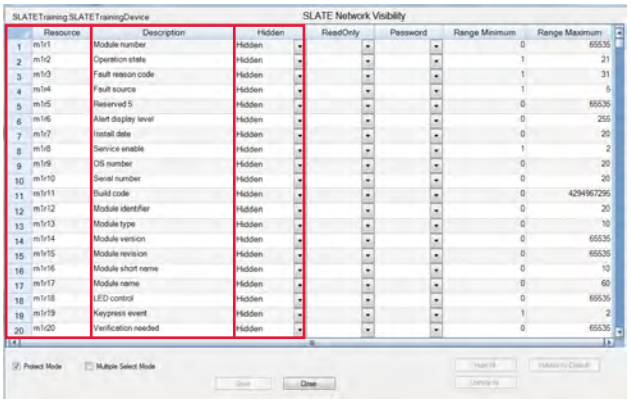


SLATE Network Visibility

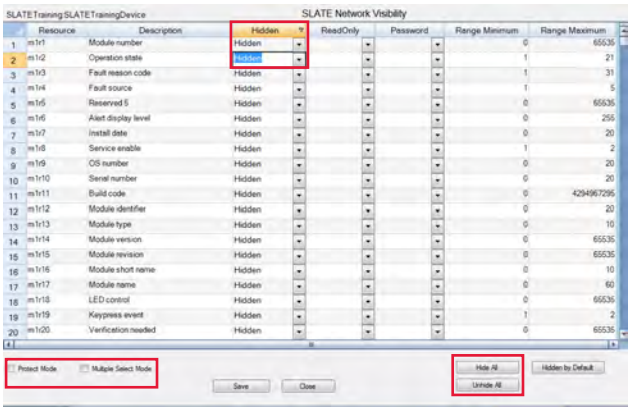
The SLATE Network Visibility feature allows you to hide registers to make them inaccessible to the outside world, set register security

levels, and Configure BACnet objects and Modbus registers. Click on the “Network Visibility” button.

You can begin by setting Network Visibility. Click “Configure Network Visibility”. This is where we hide/unhide registers (external use-BACnet/Modbus) and select levels of security (read only, password protection). In order to see register information, a SLATE Wire Sheet device must have been previously created and built.

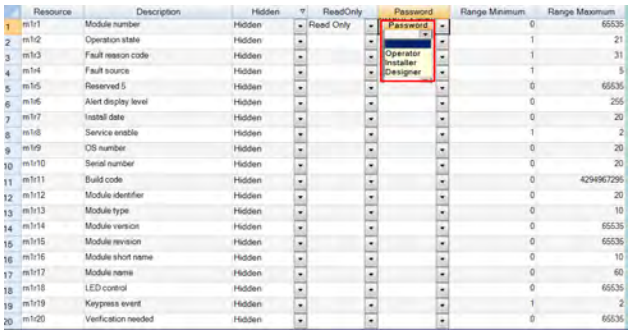


In order to edit values on this page, insure the “Protect Mode” box is unchecked.



The Resource column identifies a SLATE module and register within that module. SLATE internal communication is based on module number and register number (“mr” value).

The Description column provides a short default description for the register.



The Hidden column shows the register will be visible (available) for communication with external devices via BACnet and Modbus. Hidden registers can still be seen if used in a web page.

Expand each register drop down list individually to hide the register or leave blank to make the register information available. Click the “Multiple Select Mode” box to select multiple registers at once or use the “Hide All” or “Unhide All” buttons at the bottom of the window to set all registers. Insure the “Protect Mode” box is unchecked to edit. When finished, click the “Save” and “Close” buttons.

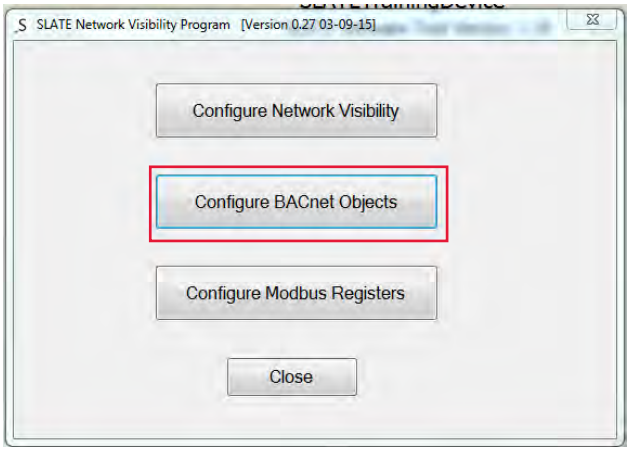
Another method to protect data in a register from being overwritten is by assigning it a security level. This is done in the “Password” column. Click the arrow in the register you want to protect and select the level of security you wish to assign to that register. Insure the “Protect Mode” box is unchecked! When finished, click the “Save” and “Close” buttons.

When setting the security levels, please note the following:

- Designer: Highest level of access: adjust safety parameters, build F/A curves, build kits, change set points, as well as software updates
- Installer: Next level of access: adjust safety parameters, build F/A curves, build kits, change set points, etc.
- Operator: Lowest level of access: change non-safety set points… allowed basic access (such as temp/pressure control and other basic items that keep the equipment running).

To access areas of SLATE including, fuel air commissioning, installing kits, and updating software the following are the passwords used with the different levels of users.

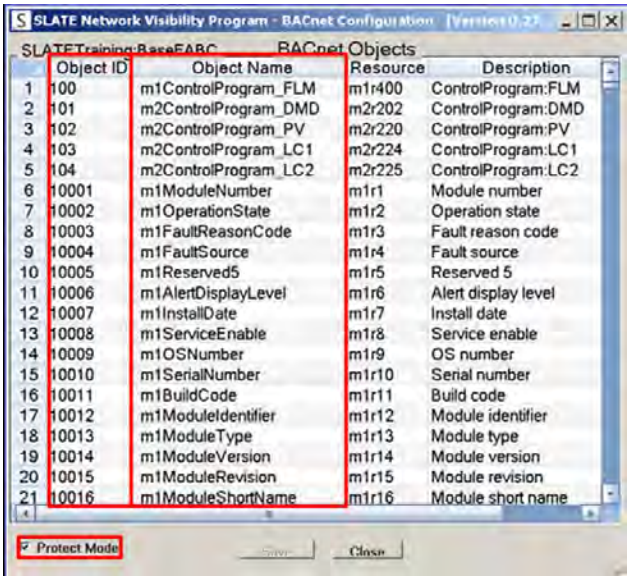
Default passwords:



- Designer: SlateDesignerPassword
- Installer: SlateInstallerPassword
- Operator: SlateOperatorPassword

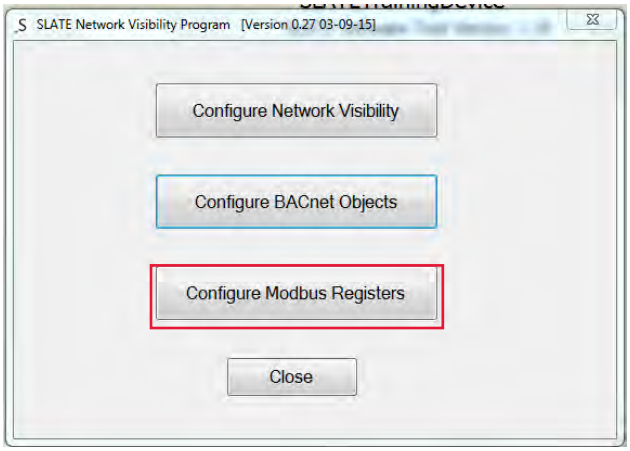
The register minimum and maximum values are shown for all registers in the “Range Minimum” and “Range Maximum” columns. The register minimum and maximum values can be edited as long as the new values are not less than the “Range Minimum” value or greater than the “Range Maximum” value (outside the existing range). When finished, click “Save” and “Close Buttons”

Range Minimum	Range Maximum
0	65535
1	21
1	31
1	5
0	65535
0	255
0	20
1	2
0	20
0	20
0	4294967295
0	20
0	10
0	65535
0	65535
0	10
0	60
0	65535
1	2
0	65535



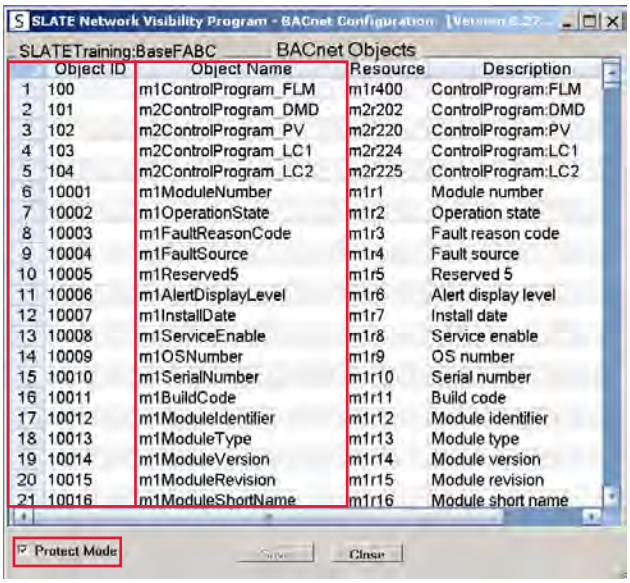
SLATE BACnet Configuration

To enable communication via BACnet, click on the “Configure BACnet Objects” to make modifications as necessary.



You can renumber the BACnet Object ID and Object Name. Uncheck to exit the Protect Mode and enter your changes in the appropriate rows.

Note: If you have not constructed a SLATE Wire Sheet with network inputs, network outputs and registers, your register page will be blank.



Modbus Configuration

To enable communications via Modbus, click the “Configure Modbus Registers” to make modifications as necessary.

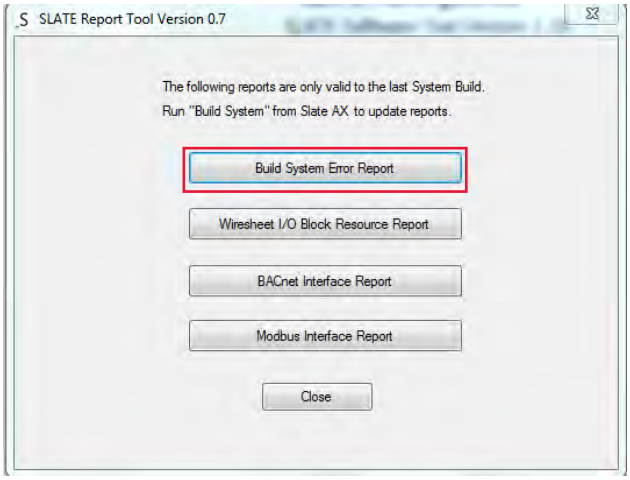
The same rule applies to Modbus registers as BACnet registers, a SLATE Wire Sheet with network inputs, network outputs, and registers must exist to show the registers on the configuration page. This view allows you to renumber the Register value (external) and edit the Register Name. Uncheck to exit the Protect Mode and enter your changes in the appropriate rows.

	Object ID	Object Name	Resource	Description
1	100	m1ControlProgram_FLM	m1r400	ControlProgram:FLM
2	101	m2ControlProgram_DMD	m2r202	ControlProgram:DMD
3	102	m2ControlProgram_PV	m2r220	ControlProgram:PV
4	103	m2ControlProgram_LC1	m2r224	ControlProgram:LC1
5	104	m2ControlProgram_LC2	m2r225	ControlProgram:LC2
6	10001	m1ModuleNumber	m1r1	Module number
7	10002	m1OperationState	m1r2	Operation state
8	10003	m1FaultReasonCode	m1r3	Fault reason code
9	10004	m1FaultSource	m1r4	Fault source
10	10005	m1Reserved5	m1r5	Reserved 5
11	10006	m1AlertDisplayLevel	m1r6	Alert display level
12	10007	m1InstallDate	m1r7	Install date
13	10008	m1ServiceEnable	m1r8	Service enable
14	10009	m1OSNumber	m1r9	OS number
15	10010	m1SerialNumber	m1r10	Serial number
16	10011	m1BuildCode	m1r11	Build code
17	10012	m1ModuleIdentifier	m1r12	Module identifier
18	10013	m1ModuleType	m1r13	Module type
19	10014	m1ModuleVersion	m1r14	Module version
20	10015	m1ModuleRevision	m1r15	Module revision
21	10016	m1ModuleShortName	m1r16	Module short name

SLATE Device Information, Reports and

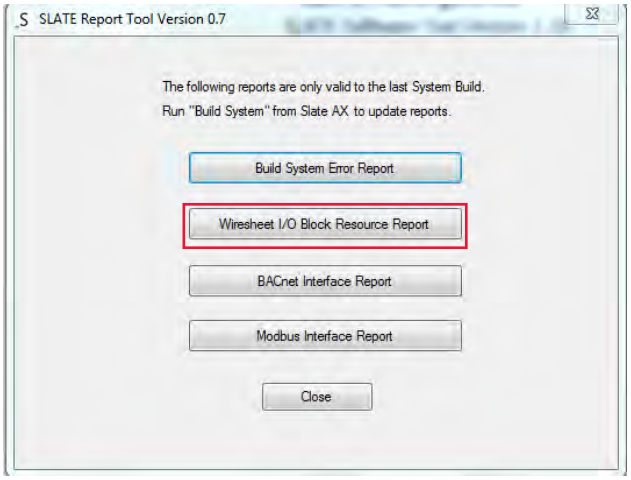
Build System

The SLATE Device Information screen provides information about the SLATE Device, both the SLATE Wire Sheet and the Web pages. Edits can be made from this screen.



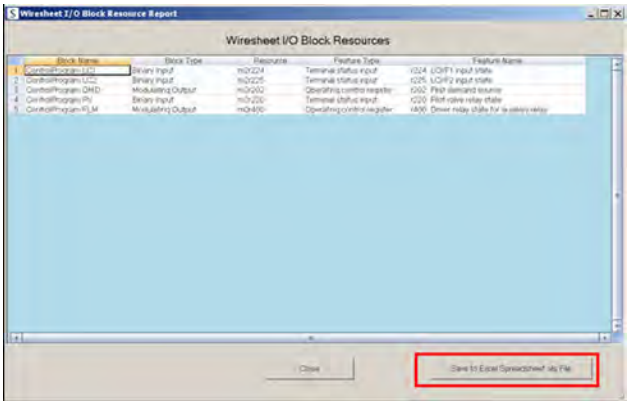
SLATE Reports

SLATE generates reports on all aspects of functionality including generated errors. Click on the “Reports” button for detailed information about your SLATE device.

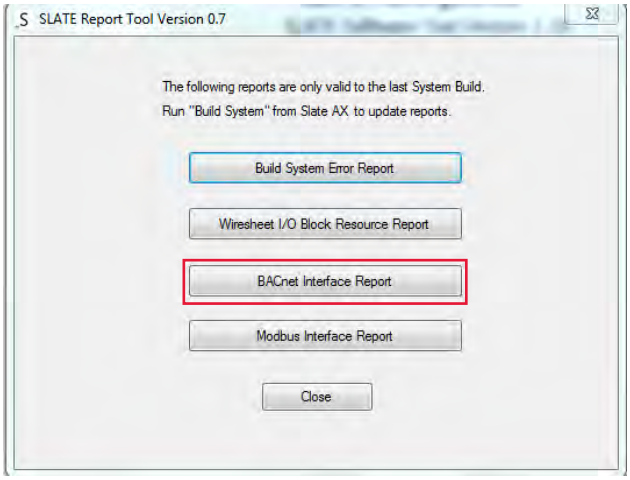


Reports can be generated identifying configurations an I/O usage, build errors, and communication interface for BACnet and Modbus.

Click the “Build System Error Report” when build failures occur. The report will indicate the build failure reason, giving you an opportunity to make corrections to the wire sheet and to build again.

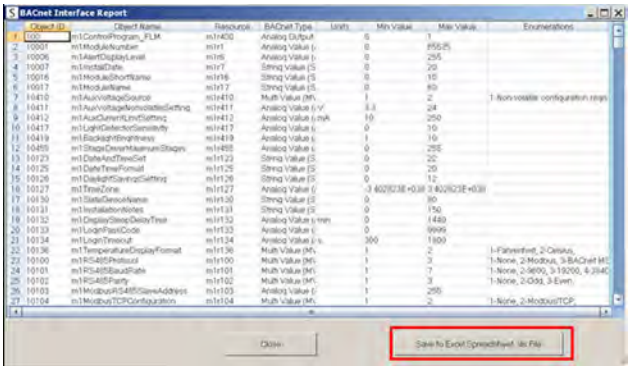


The “Wiresheet I/O Block Resource Report” gives general usage details. Click the “Wiresheet I/O Block Resource Report “button.

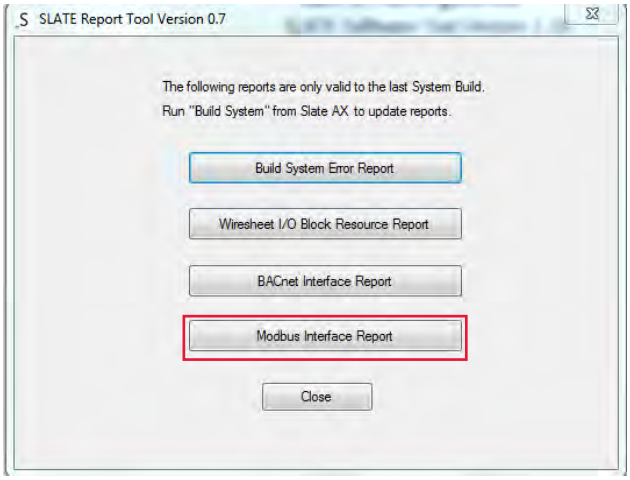


The Wiresheet I/O Block Report summarizes the I/O created in the wire sheet by way of block name, block type, resource or “mr” value, feature type, and feature name. This list can be saved for the project documentation by clicking on the “Save to Excel Spreadsheet” button. When you are finished click “Close” to return to the report selection window.

Note: You need a wiresheet for this report to work.

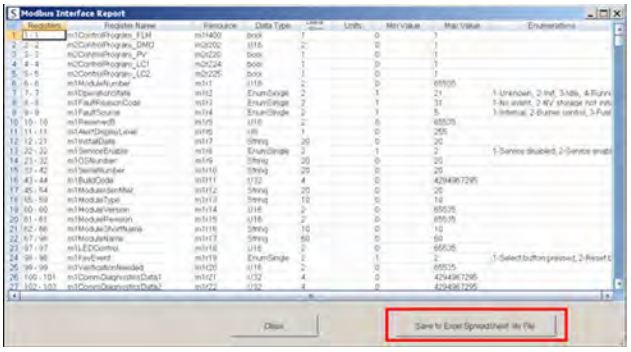


A BACnet object report can be generated for the project records or given to the end user for their records. Click the “BACnet Interface Report” button.



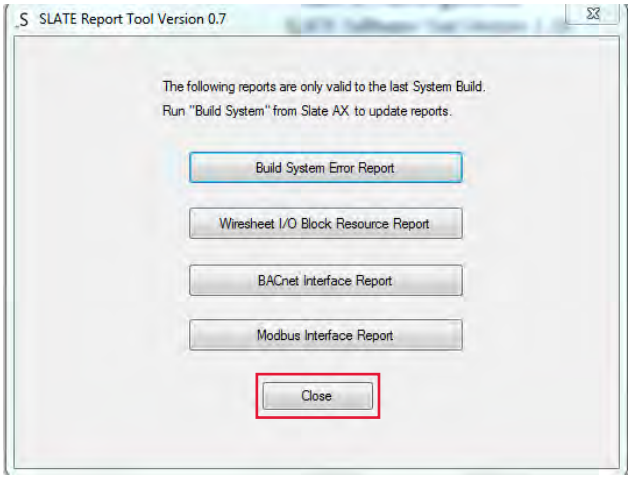
Either highlight the portion of the list that is of interest and copy or use the “Save to Excel Spreadsheet” button to copy the entire BACnet object list.

As noted before, you will need to have in your wiresheet network inputs, network outputs, and setpoints for BACnet registers.



When you are finished click the “Close” button to return to the report selection window.

A Modbus register report can be generated for the project records or to be given to the end user for their records. Click the “Modbus Interface Report” button.



Same rule does apply to the Modbus Interface Report as the BACnet interface report. You will need a SLATE wire sheet with networking inputs, networking outputs and setpoints for this report to work.

Highlight the portion of the list that is of interest and copy or use the “Save to Excel Spreadsheet” button to copy the entire Modbus register list.

When finished click the Close button to return to the report selection window.

When you are finished click the Close button to return to the SLATE device.

The “Build System” button is used to compile the wire sheet. This process makes sure that there are no duplicate or erroneous configurations. Any errors will generate a “Build System Error Report” which can be found in the Reports section.

The SLATE Web Editor section is located in Chapter 14.

Chapter 4: SLATE Base Module Setup and Configuration

Overview

The R8001A1001 SLATE Base Module provides communications and power supply for the SLATE system, configurable safety for the Burner Control, Flame Amps, Fuel Air Ratio, and Limit modules. It also provides programmable logic for the Digital and Analog I/O, and Annunciation.

Within the SLATE system, the Base Module provides:

- Power to all modules with multiple voltage options
- External communication protocols: Modbus/TCP, BACNet MSTP or IP and web services
- Overall health of the system
- The ability to do remote troubleshooting
- Network identification of the system as a single device
- Web-based pages (both Honeywell provided and designer customized) for Web browser access to the system
- Module identification for the system
- Event log storage for user lockouts, fault history, and user requested events
- Trend logging for user specified data

Specifications

Electrical Ratings:

Input Voltage and Frequency:
24 VDC (± 15%)
24 VAC (± 15%)
85-264 VAC, 50/60 Hz

Output Voltage and Frequency:
18 VDC (± 1 VDC)

Power Dissipation:
38W max @ 24V (approx. 12 modules)
45W max @ 85-264V (approx. 14 modules)

Fusing Total Connected Modules: 5A, slow type, non-replaceable

Terminal Ratings are below:

Terminal	Description	Rating
E100-1	L1 - line voltage hot	---
E100-2	L2 - line voltage common	---
E100-3	PE - Earth Ground	---
E200-1	Alarm (dry contacts)	120 / 240 VAC, 1A pilot duty
E200-2	Alarm (dry contacts)	120 / 240 VAC, 1A pilot duty
E200-3	Unused	---
E200-4	A (BACnet MS/TP)	---
E200-5	B (BACnet MS/TP)	---
E200-6	GND (BACnet MS/TP)	---
E200-7	VAUX +	3.3-24 VDC output, 250mA max
E200-8	VAUX - [a]	3.3-24 VDC output, 250mA max

[a] Do not connect to earth ground.

Environmental Ratings

Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
LCD Operating: 32°F to +150°F (0°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C)

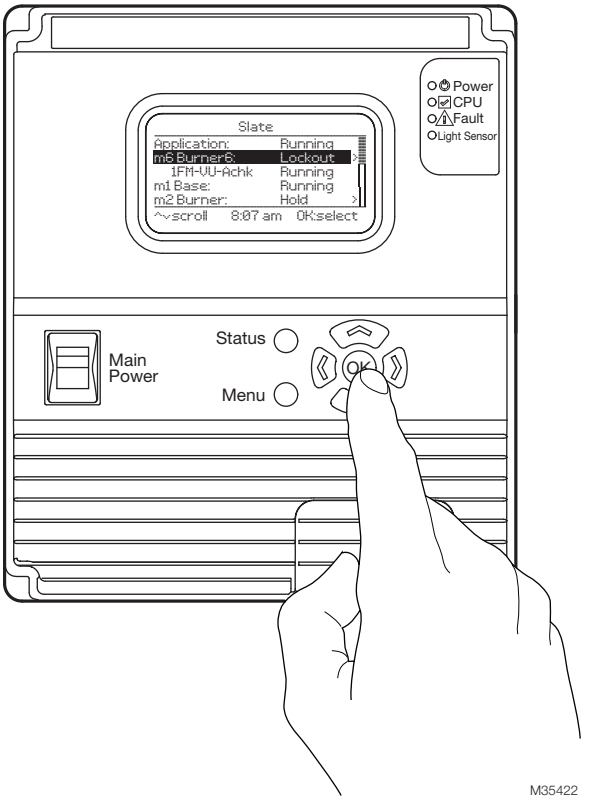
Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Approvals:

Underwriters Laboratories Inc. Listed, File: MP268.
IRI acceptable.
Federal Communications Commission: Part 15, Class A Emissions.
Must be mounted inside a grounded metal enclosure.

LED Array

There are three LEDs on the front of the base module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s).

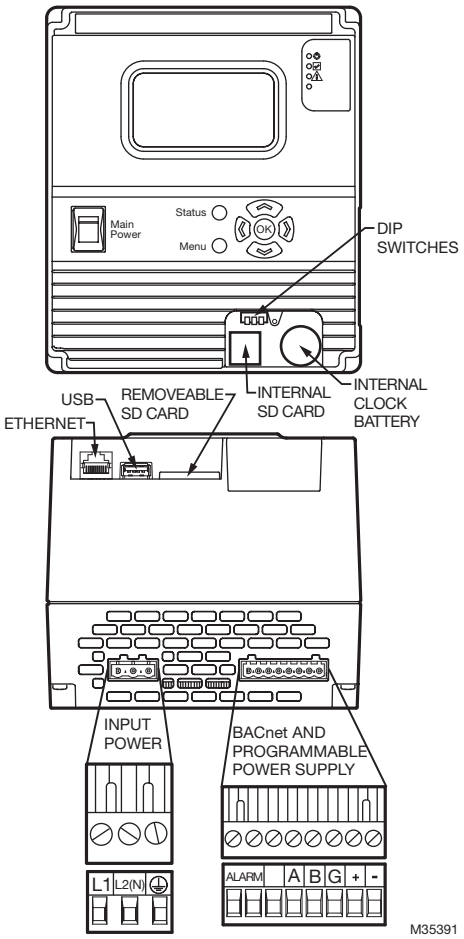


LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	Fault
	No light	Running

There are three LEDs on the front of the Base Module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s).

LCD Screen

The Base Module LCD screen will show information about various modules and other parts of the combustion system. By using the arrow keys to navigate the items on the LCD screen, then press OK to select one.



The figure below shows Burner6 is in lockout. For additional information, navigate to that menu item and press OK.

Wiring

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved
2. Wiring must comply with all applicable codes, ordinances and regulations.

Note: MS/TP must be wired in a straight line without spurs—no star wiring.

3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.
4. The Base Module should not interfere with proper safety operation of the controls, limits, and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS, AND INTERLOCKS.

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16, or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C

Application	Recommended Wire Size	Recommended Part Numbers
Communication lines[a]	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

BACnet MS/TP connections must be wired in daisy chain configuration, 1 (a)-1(a), 2(b)-2(b), 3(c)-3(c). The order of interconnection of all the devices is not important. Be aware that the termination DIP switch (number 3) must be used if the SLATE system is at the end of connections over 100 feet.

Recommended Grounding Practices

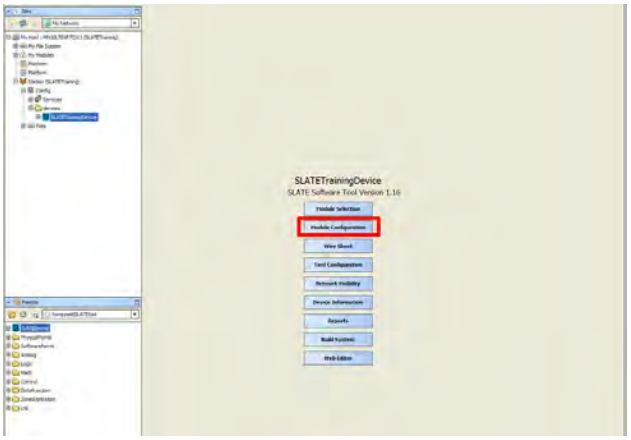
Use an Earth ground or a signal ground as described below.

Earth ground

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Make sure that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

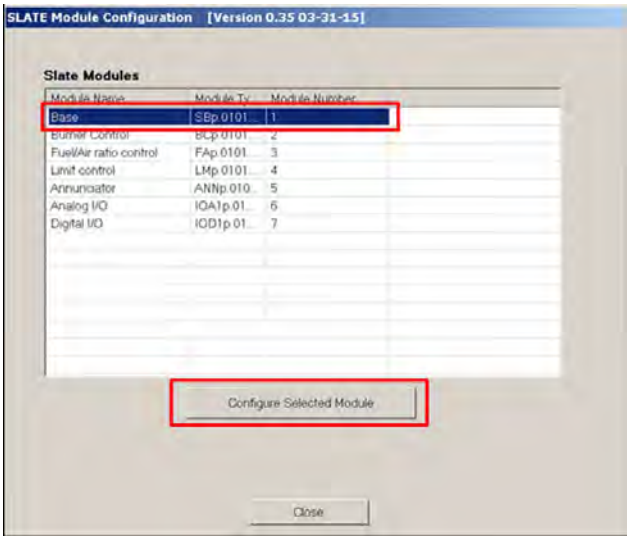
Signal ground

Note the 18V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.



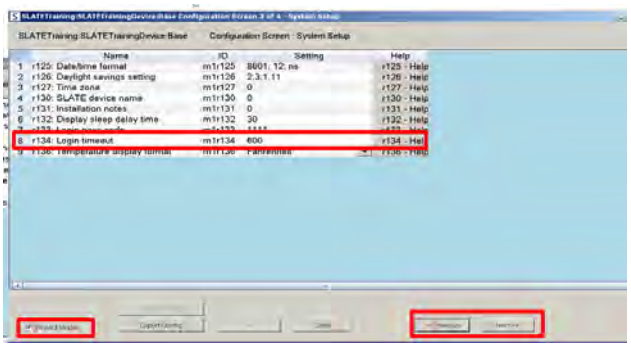
Recommended wire routing of leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.
- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

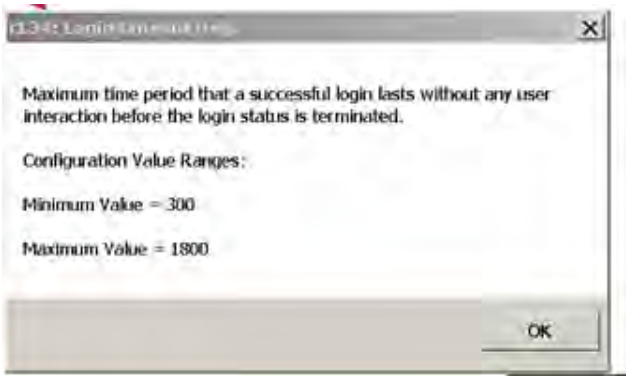


Be sure loads do not exceed the terminal ratings.

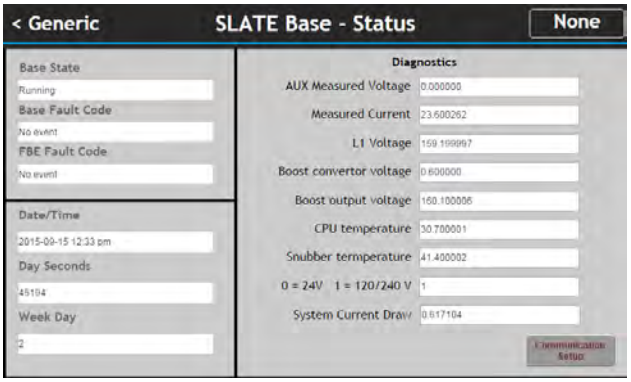
Base Configuration with SLATE AX Tool



The SLATE AX Tool is used to configure all modules within the SLATE family. To configure the Base Module you will use the SLATE AX Tool Module Configuration selection.



1. After selecting Module Configuration you will be presented with the SLATE Module Configuration screen. Select Base.



2. Select Configure Selected Module.
3. All registers containing information related to the Base are made available for editing. Use the Previous or Next buttons to maneuver through the Base registers. Editing these registers is possible only when the “Protect Mode” check box is unchecked.

4. Help files are available to describe the register details. Clicking in the Help column and register will reveal information about the register.

5. After you have completed setting the registers, you will need to click the Save button. You will be asked to confirm that you want to save the changes. Simply click Yes.

SLATE Base HMI Screen

Chapter 5: Burner Control Module and Configuration

Overview

The R8001B2001/U Burner Control Module is a configurable flame safeguard control that can sequence a commercial or industrial burner. Applications include automated fired gas, oil or combination fuel single burners. It may be configured as a primary or programmer, automatic or semi-automatic with many selectable options.

As well, the SLATE Burner Control Module may be configured to emulate various Honeywell 7800 SERIES flame safeguard controls such as RM7800L, RM7800G, RM7800M, RM7800E, RM7838A, RM7838 and EC7850 and many other models. Emulation of the 7800 SERIES controls via canned configurations is completed at the Base Module level, where the entire configuration kit is stored.

The SLATE AX Tool is used to configure the Burner Control Module parameters.

For enhanced diagnostics, the SLATE Annunciator Module can be used. The Annunciator Module monitors the status of individual components in a series wiring of limits, control and/or interlock contacts wired to the Burner Control Module. Refer to Chapter 13 for further information on the Annunciator Module.

Status LEDs

There are 4 LEDs on the front of the Burner Control Module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s). See the table below for descriptions of the four status LEDs.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No valid configuration
	Green	Running
Fault	Red	Fault
	No light	No fault
Flame	Yellow	Flame is detected
	No light	No flame is detected

There are also 17 separate LEDs for each of the Burner Control Module terminals. See the table below for module terminal LED descriptions.

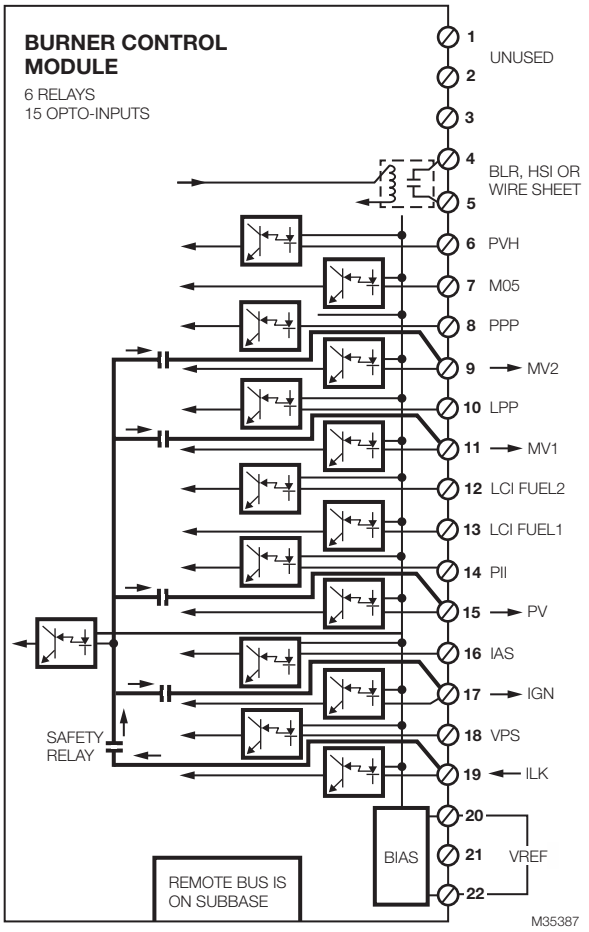
Color	Description
Green	Terminal is ON or is Normal
Red	Fault
No light	Terminal is OFF or Not in use

LED Display

All SLATE system modules have a seven-segment, three-position LED display for indicating the assigned module number of the SLATE system.

Select and Reset Buttons

All SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.



Understanding the Terminals

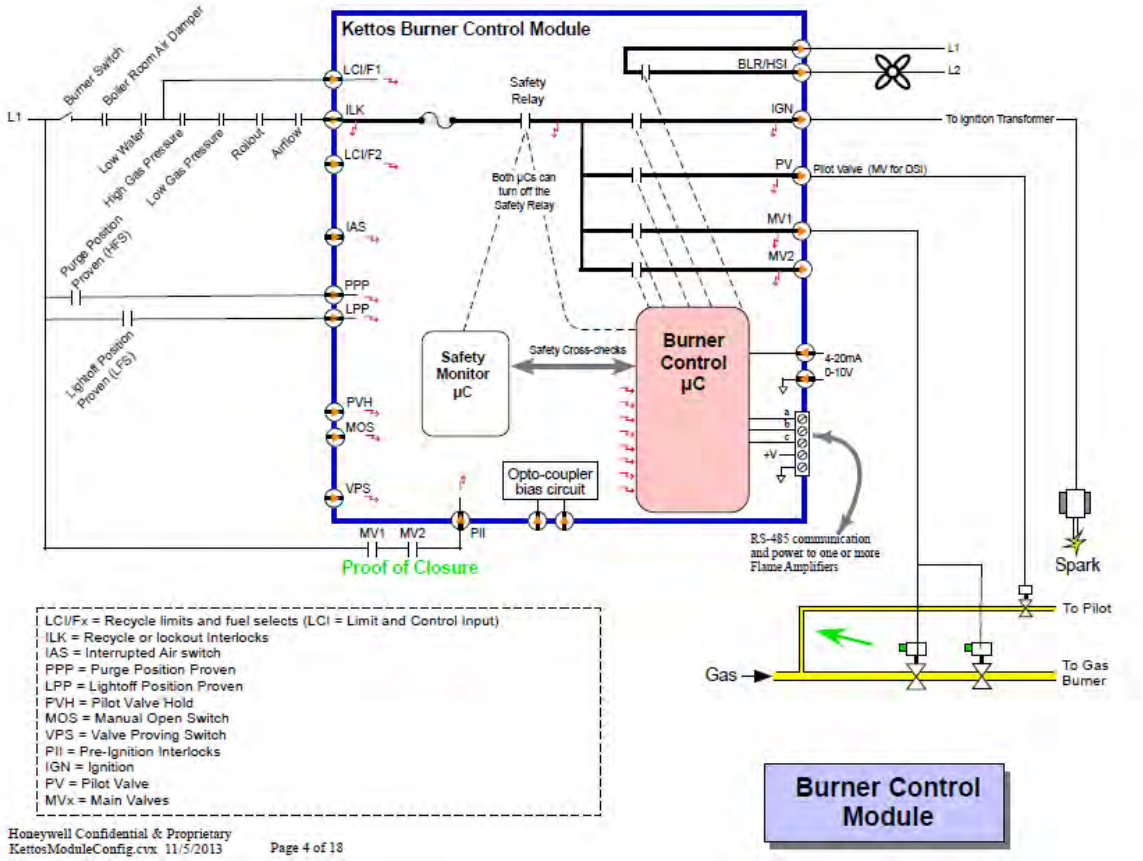
The SLATE Burner Control Module contains 22 wired terminals. All terminals are 24VDC or 24-240VAC and automatically adapt to the applied system voltage.

The LCI (limit and control input) terminals 12 and 13 for fuel 2 and 1 provide connection to limits and operating controls. They must be closed before burner startup is allowed. If they are open during Run mode, it causes the burner to shut down. The LCI terminals can optionally generate a call-for-heat when they are closed. When the dual fuel option is enabled, the LCI/F2 or LCI/F1 LED indicates the selected fuel. The Burner Control Module wiring terminal descriptions can be found in the table below.

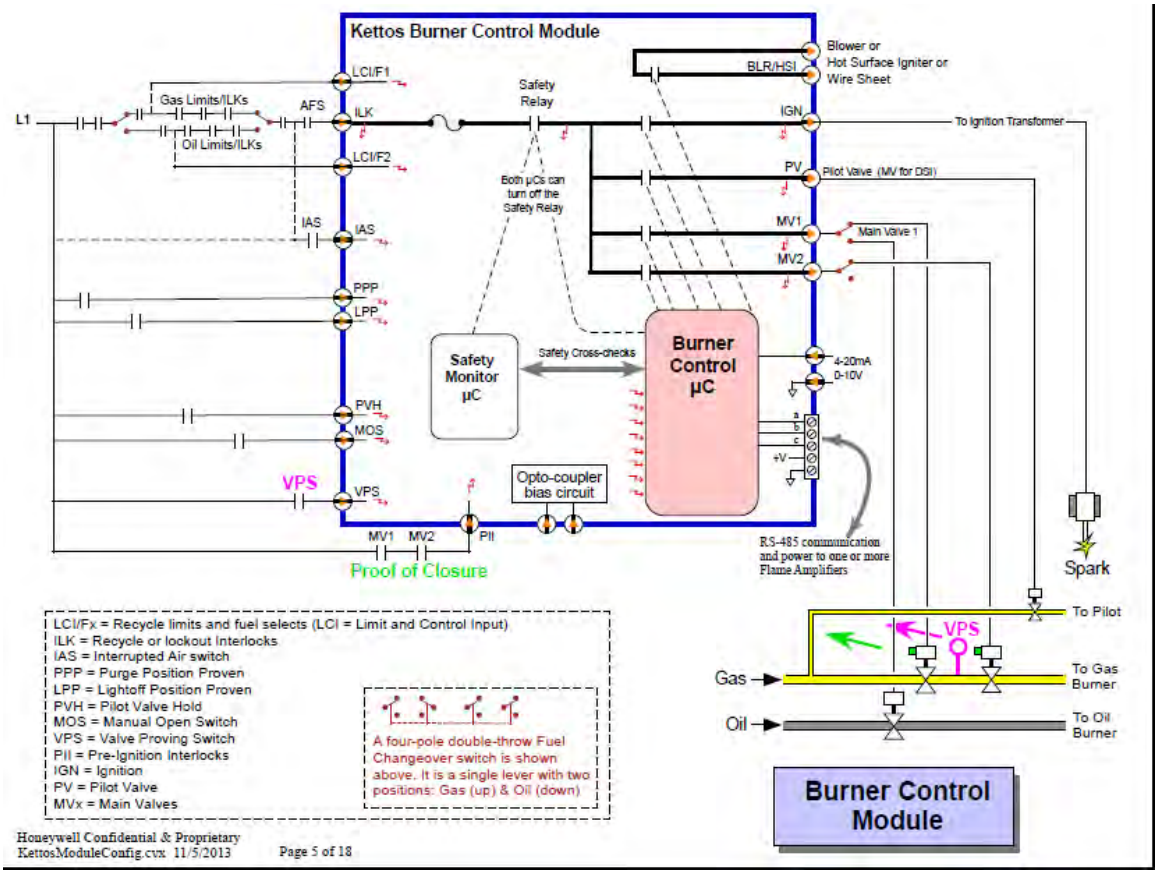
Note: Only one voltage can be applied per module (same at all terminals).

Label	Terminal	Description	Rating	Information
mA/V ↓	1	Not used	-	-
	2	Not used	-	-
-	3	Not used	-	-
K1	4	BLR, HSI or Wire Sheet, K1 relay dry contacts	9.8 FLA, 58.8 LRA @120VAC, 20A inrush @240VAC	Dry contacts for burner, fan, blower or HSI (hot surface ignition) or used by SLATE wire sheet
	5			
PVH	6	Pilot valve hold	24VDC (0.5 mA), 24-240VAC (0.2 mA)	Manually operated during Run to relight the pilot and then turn off the main burner, until PVH is turned off again, which relights the main burner.
MOS	7	Manual open switch		Used when a main valve must be opened normally before lighting the burner. The switch closes when the manual valve is fully open.
PPP	8	Purge position proven)		A PPP switch (or High Fire Switch) is used for mechanical throttle systems. It closes when airflow is sufficient to purging.
MV2 ►	9	Main valve 2	4A (0.5 PF) @120VAC, 2.0A inrush @240VAC, 2A continuous, 10A inrush @ 24VDC	Second main fuel valve in a double block system. May be used for delayed main (2nd stage) valve or VPS (valve proving sequence).
LPP	10	Lightoff position proven	24VDC (0.5 mA), 24-240VAC (0.2 mA)	An LPP switch (or Low Fire Switch) is used for mechanical throttle systems. It closes when the throttle position is correct for lightoff.

Label	Terminal	Description	Rating	Information
MV1 ▶	11	Main valve 1	4A (0.5 PF) @120VAC, 2.0A inrush @240VAC, 2A continuous, 10A inrush @ 24VDC	First main fuel valve in a double block system. May be used to power both main valves or for VPS (valve proving sequence).
LCI/F2	12	Limit and control input, Fuel 2	24VDC (0.5 mA), 24-240VAC (0.2 mA)	Provide connection to limits and operating controls. It must be closed before burner startup is allowed. If it is open during Run, it causes burner shutdown. It can optionally generate a call-for-heat when it closes. When the dual fuel option is enabled, the LCI/F2 or LCI/F1 LED indicates the selected fuel.
LCI/F1	13	Limit and control input, Fuel 1		
PII	14	Pre-ignition interlocks		Interlock connection required to be closed before ignition sequence begins. Typically POC (proof of closure switch).
PV ▶	15	Pilot Valve	4A (0.5 PF) @120VAC, 20A inrush @240VAC, 1A continuous, 5A inrush @ 24VDC	Pilot valve connection point.
IAS	16	Interrupted Airflow Switch/ Lockout input	24VDC (0.5 mA), 24-240VAC (0.2 mA)	Airflow proving switch input or lockout input for EU.
IGN ▶	17	Ignition	4A (0.5 PF) @120VAC, 20A inrush @240VAC, 1A continuous, 5A inrush @ 24VDC	Ignition transformer connection point.
VPS	18	Valve Proving Switch (VPS)	24VDC (0.5 mA), 24-240VAC (0.2 mA)	Valve proving sequence (VPS) switch input. Provided from a pressure switch which is mounted between the two main gas shutoff valves (MV1 and MV2). It is used to perform the systematic gross leakage test.
ILK ◀	19	Lockout Interlocks		Lockout interlock input string connection point.
Vref+	20	Reference voltage +	24VDC (0.1 mA), 24VAC (0.1 mA) 85-264VAC (0.2 mA)	Voltage reference circuit.
-	21	Not used	-	-
Vref-	22	Reference voltage -	24VDC (0.1 mA), 24VAC (0.1 mA) 85-264VAC (0.2 mA)	Voltage reference circuit



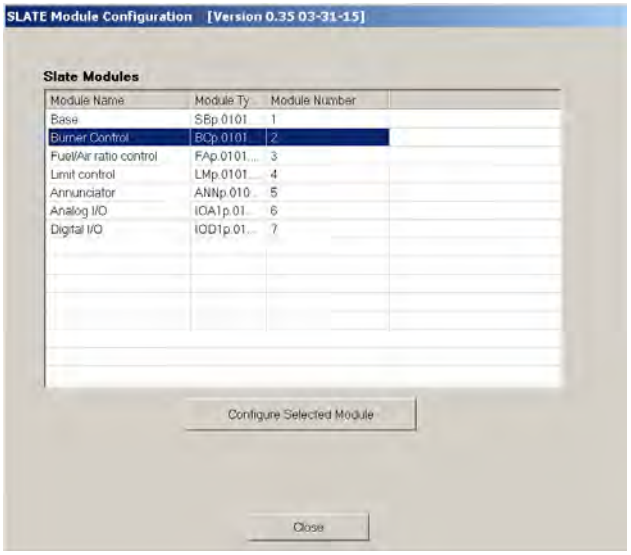
Wiring



For installation and wiring information, refer to document 32-00010, the SLATE Burner Control Module Installation Instructions.

The SLATE AX Tool is used to configure the 128 available Burner Control Module parameters which are relative to the type of burner and terminals used.

It is important to lie out and understand the wiring to and from the Burner Control Module as well as the full system wiring before proceeding with configuration.



Examples of single and dual fuel wiring with the SLATE Burner Control Module are shown below.

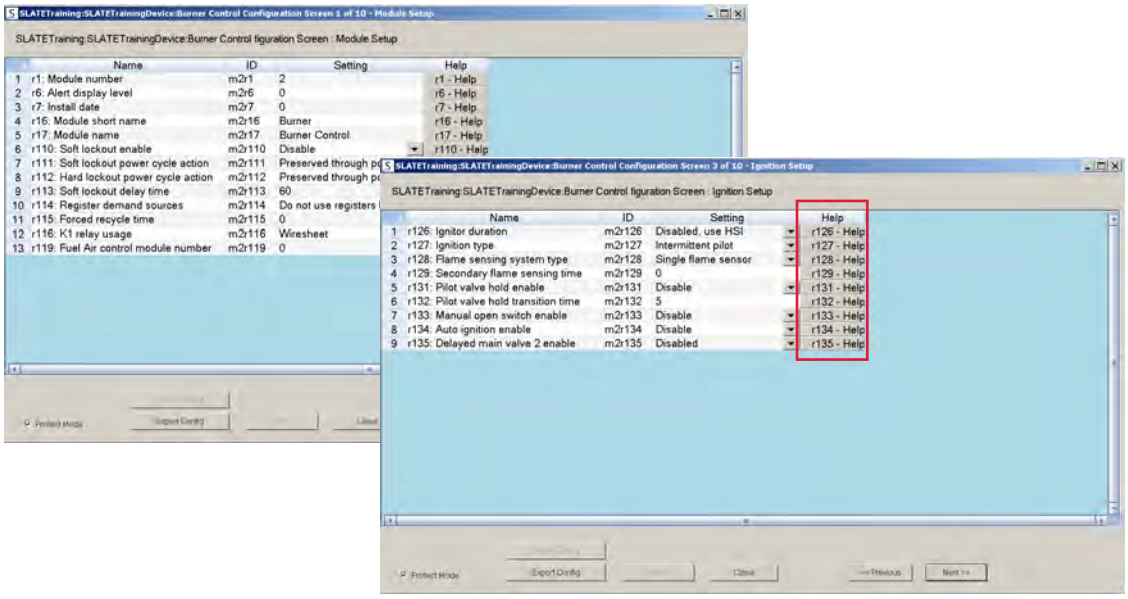
Burner Control Module

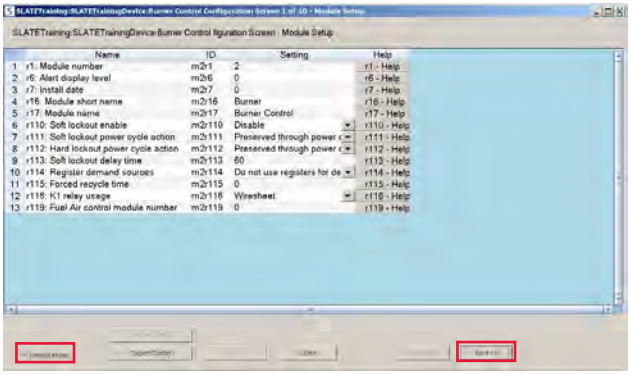
Getting Started

1. To access the configuration tool you will need to launch the SLATE AX Tool
2. If you have not created a Station please refer to Chapter 2 of this manual to learn how to create a new station.
3. If you have created a Station open up the Navigation pane until to reach your SLATE Device. Double-click on the SLATE device to launch the Module Configuration Tool.
4. Select “Burner Control” from the module list as shown below, then click on “Configure Selected Module.”



5. You should be taken to a set of screens that allow you to setup the burner control parameters. This is how the SLATE Burner Control Module is configured for use. The settings are selected by utilizing the pull-down menus. There are 128 parameters that will need to be configured.

Note: Help files are available to describe the parameter / register details. For further information on a specific parameter/register, select the Help button on the far right of the screen.



After you have configured all of the parameters you will need to click the Save button.

Once you are done with all of the SLATE programming and configuration it will be stored as a kit file as explained in “Load the SLATE Device” on page 8.

6. Before proceeding, you must uncheck the “Protect Mode” box to allow editing of the configuration.

   Use the “Next” and “Previous” buttons to move through the Burner Control Module configuration pages.

7. There are 128 configurable registers/parameters in the SLATE Burner Control Module. Not all available parameters must be used since fuel air and limit module interactions are included. There are 10 categories of setup parameters; module, rate, ignition, flame module, timings, interlocks, failure response, recycle, valve proving and limit socket. These are shown in the table below.

Category	Register #	Name	Description	Default Value	Range
Module Setup	r1	Module number	Assigned module number in SLATE rack	-	2-99
	r6	Alert display level	Enable/disable alert output	0	0 Disable >0 Alert context level
	r7	Install date	Date when this module was installed in the system	-	-
	r16	Module short name	For Base Module use	Burner	-
	r17	Module name	For Base Module use	Burner Control	-
	r110	Soft lockout enable	Master enable for soft lockouts. If this parameter value is Disable, then all soft lockouts become hard lockouts.	1	1 Disable 2 Enable
	r111	Soft lockout power cycle action	Action to follow when the control power cycles and it is in a soft lockout condition.	1	1 Preserved through power cycle 2 Cleared by power cycle
	r112	Hard lockout power cycle action	Action to follow when the control power cycles and it is in a hard lockout condition.	1	1 Preserved through power cycle 2 Cleared by power cycle
	r113	Soft lockout delay time	Length of time to delay after a lockout occurs before automatically clearing the lockout and resuming	60	0-60 seconds
	r114	Register demand sources	Identifies the registers used to request burner demand.	1	1 Do not use registers for demand 2 Demand 1 Register 3 Demand 2 Register 4 Demand 1 OR Demand 2 Register
	r115	Forced recycle time	Maximum time length that the burner can continuously run before it is automatically recycled.	0	0-24 hours 0=Disabled
	r116	K1 relay usage	Specifies how the K1 relay will be used. 1 If wire sheet is chosen, the relay is not used by the burner control and may be controlled by wire sheet logic. 2 If Hot surface igniter (HSI) is chosen, the relay is closed during the pre-ignition state and throughout the Direct Burner Ignition (DBI) state or Pilot Flame Establishing Period (PFEP), whichever is enabled. Turning on the HSI option disables the IGN output; it remains off. 3 If Blower is chosen, the relay is closed at the start of prepurge and it remains closed up through the end of postpurge.	1	1 Wire sheet 2 Hot surface igniter 3 Blower
	r119	Fuel air control module number	Assigned Fuel/Air Module number in SLATE rack	0	0, 2-99 0=Disabled

Category	Register #	Name	Description	Default Value	Range
Rate Setup	r120	Prepurge rate (RPM)	The rate used for prepurge when this rate is a direct RPM value provided by the Burner Control. Wire sheet logic may read this value to operate the rate output control. When rate proving is via RPM feedback, the value provided here is the value that is tested vs. the feedback	0	-
	r121	Prepurge rate proving	Determines whether and how the modulation rate is proven during prepurge. 1 Disabled 2 If PPP switch is chosen, the purge position proven switch is used. 3 If Fuel air control is chosen, the modulation rate is proven by data sent from the fuel air ratio control. 4 If Fan RPM is chosen, the modulation rate is proven by the RPM feedback via the tachometer input. For options 2, 3 and 4, failure to prove lightoff rate follows the configured response (r154). Related registers: r124 Rate proving delay r152 Early purge proving delay r154 Purge rate proving failure response	1	1 Disable 2 PPP switch 3 Fuel air control 4 Fan RPM
	r122	Lightoff rate (RPM)	The rate used for lightoff when this rate is a direct RPM value provided by the burner control. Wire sheet logic may read this value to operate the rate output control. When lightoff rate proving is via RPM feedback, the value provided here is the value that is tested vs. the feedback. Related register: r123 Lightoff rate proving	0	-
	r123	Lightoff rate proving	Determines whether and how the modulation is proven during lightoff. 1 Disabled 2 If LPP switch is chosen, the lightoff position proven switch is used. 3 If Fuel air control is chosen, the modulation rate is proven by data sent from the fuel air ratio control. 4 If Fan RPM is chosen, the modulation rate is proven by the RPM feedback via the tachometer input. For options 2, 3 and 4, failure to prove lightoff rate follows the configured response (r155). Related registers: r124 Rate proving delay r153 Early lightoff proving delay r155 Lightoff rate proving failure response	1	1 Disable 2 LPP switch 3 Fuel air control 4 Fan RPM
	r124	Rate proving delay	Identifies how long to wait for the modulation rate to be proven before giving up and taking the configured response (r154, r155). Includes Prepurge and Lightoff. Related registers: r121 Prepurge rate proving r123 Lightoff rate proving r154 Purge rate proving failure response r155 Lightoff rate proving failure response	0	0-300 seconds (0-5 minutes) 0=Must be proven immediately
	r125	Fan speed tolerance	When prepurge and/or lightoff proving is configured to occur depending on measured fan RPM and when the measured speed differs from the specified speed by less than the value of this parameter and it has been in this range for 3 seconds, then fan speed is considered to be proven. It then remains proven as long as the speed remains within the tolerance band of this parameter.	0	0-100%

Category	Register #	Name	Description	Default Value	Range
Ignition Setup	r126	Igniter duration	Specifies how long a spark igniter (IGM output, T17) should be turned on during ignition. 1 If a Hot Surface Igniter (HSI) is enabled (r116), this parameter must be disabled. 2 Normal duration provides IGN power throughout the Pilot Flame Establishing Period (PFEP) or Direct Burner Ignition (DBI) time, whichever is enabled. 3 Early spark termination turns the IGN output off halfway through the PFEP period or one second prior to the end of DBI time.	1	1 Disabled, use HSI 2 Normal duration 3 Early spark termination
	r127	Ignition type	Type of ignition system used.	1	1 Intermittent pilot 2 Interrupted pilot 3 Direct burner ignition
	r128	Flame sensing system type	Describes the number of flame sensors and how they are compared to determine whether successful flame is present. 2 Two flame sensors with OR logic: flame detection is true if either sensor detects flame 3 Two flame sensors with AND logic: flame detection is true only if both sensors detect flame 4 Two flame sensors DELAYED: the first sensor must detect flame within the normal tim, then a second sensor must also detect flame after a delay time expires. 5 Four flame sensors-DELAYED OR logic: same as previous case, except each sensor is now paired with another sensor and within those pairs OR logic is used; a pair detects that flame is present if either sensor detects flame. 6 Four flame sensors-DELAYED AND logic: same as previous case, except each sensor in the pair uses AND logic with its partner; each pair detects flame only if both sensors in the pair are sensing flame. For DELAYED options, the delay time (see Secondary Flame Sensing Time, r129) may be set to 0 to mean “no delay” which causes the evaluation to be done immediately. Doing this makes some of the options above equivalent.	1	1 Single flame sensor 2 Two flame sensors -OR 3 Two flame sensors -AND 4 Two flame sensors-DELAYED 5 Four flame sensors-DELAYED OR 6 Four flame sensors-DELAYED AND
	r129	Secondary flame sensing time	Time until the second flame sensor must report a flame when a DELAYED flame detection option is used. The delay time starts at the same time that the non-delayed sensor’s time starts, and it is subject to the same pilot test hold.	0	0-30 seconds
Flame Module Setup	r130	Flame failure response time	Maximum time length between a loss of the sensed flame and the turn-off of power to the main fuel valve(s).	1	1 Unknown 2 0.8 seconds 3 1 second 4 2 seconds 5 3 seconds

Category	Register #	Name	Description	Default Value	Range
Ignition Setup	r131	Pilot valve hold enable	Identifies whether Pilot Valve Hold (PVH) behavior is enable or not	1	1 Disable 2 Enable
	r132	Pilot valve hold transition time	Timing used to establish the Pilot Valve Hold condition.	5	5-60 seconds
	r133	Manual open switch enable	Specifies if a manual open switch is to be used. Note: It is a configuration fault if this input and also Direct Burner Ignition (DBI) is enabled (r127); this feature must be used with a pilot system. 2 When enabled with MFEP hold for MOS closure: a hold occurs at the MFEP start if this input is off. There is no limit to the hold time. During the hold the pilot remains on as normal, and all normal flame monitoring and input monitoring performed during MFEP still occur. However, the MFEP timer is held and during this hold the Main Valve outputs are commanded off and monitored to ensure they are off. As soon as the MOS input is detected as on, then a normal MFEP state occurs: normal MFEP timing begins and proceeds without monitoring of the MOS input. 3 When enabled with immediate MFEP: no hold occurs and MFEP proceeds normally as if MOS were not used at all. In both cases 2 and 3, when MOS is enabled: at the end of MFEP and throughout subsequent states while the main valve is commanded on (e.g. Run Stabilization, Run), a MOS fault configured response occurs if the MOS input is detected as off (r173). Related register: r173 Manual open switch off response	1	1 Disable 2 Enable with MFEP hold for MOS closure 3 Enable with immediate MFEP
	r134	Auto ignition enable	Allows a Limit Module to provide indication that the combustion chamber is at or above an auto ignition temperature (typically 1400°F/760°C minimum) and in this case the flame signal from the flame amplifier can be ignored. For this feature to become active one of the limit sockets (r600-r645) in the Burner Control must be configured to accept auto ignition status, and this status must actually be received. Related registers: r600-648 Socket limit 1-8	1	1 Disable 2 Enable
	r135	Delayed main valve 2 enable	If enabled, the MV2 is turned on after flame has been established via MV1 (upon entry to Run). Note: It is a configuration fault to enable this feature for a fuel that is also enabled for valve proving (see r186).	1	1 Disable 2 Enable always 3 Enable for fuel F1 4 Enable for fuel F2

Category	Register #	Name	Description	Default Value	Range
Timings Setup	r136	Prepurge time	Time length to prepurge the burner to clear out any possible leftover fuel or products of combustion.	0	0-65535 0=Disable
	r137	Preignition time	During the preignition state the igniter is on but neither main valve(s) nor pilot are powered. Time period typically used either to prove that flame is not simulated by spark, since no flame signal is allowed during preignition, or it is used as pre-heat time for a Hot Surface Igniter (HIS)	0	0-120 seconds 0=Disable
	r138	Pilot fame establishing time	Time length allowed before requiring a flame to be present during ignition, when a pilot is used. Ignored if Direct Burner Ignition (DBI) is enabled (r127).	0	0-30
	r139	Fuel 1 main flame establishing time	Time length that an interrupted pilot is on along with the main valve(s) for Fuel 1. At the end of this time an interrupted pilot is turned off and only the main flame provides proof of combustion. Notes: - This parameter is ignored for an Intermittent pilot because there is no MFEP, and for Direct Burner Ignition (DBI) because DBI time is a separate parameter (r127, r140). - Fuel 2 main flame establishing time is register r190	0	0-30
	r140	Direct burner ignition time	Time length main valve may be on before flame must be proven when Direct Burner Ignition (DBI) is used. Note: This parameter is ignored for other ignition types (r127).	0	0-4 seconds
	r141	Postpurge time	Time length to wait for the burner to clear excess fuel and products of combustion after it has been running or attempted to ignite.	0	0-65535 seconds 0=No postpurge

Category	Register #	Name	Description	Default Value	Range
Interlocks Setup	r142	Fuel selection setup	1 When NA-No fuel air module is selected, the Burner Control does not use fuel air communication. Note: If the Fuel air control module number (r119) is non-zero, a configuration fault exists and a lockout occurs. A configuration fault lockout also occurs if this parameter has any other value but the Fuel air control module (r119) is zero 2/3 If a single fuel is selected via Always use Fuel 1/2 the reported fuel selection sent to a Fuel Air Ratio Control Module will be according to that selection, no matter how the LCI/F1 and LCI/F2 input are used (or not used) 4 If Use Limits LCI/F1 (T13) and LCI/F2 (T12) to select the fuel is chosen, it is a dual fuel application and both LCI/F1 and LCI/F2 must be configured for Limit functions (r143, r145). This condition both may be off or one may be on, but a configured response (r167) occurs if both are on at the same time (except for a brief transition tolerance of 1 second). Note: It is a configuration fault lockout if LCI/F1 and LCI/F2 are not configured for Limit functions (r143, r145).	1	1 N/A-No fuel air module 2 Always use Fuel 1 3 Always use Fuel 2 4 Use Limit LCI/F1 and LCI/F2 to select the fuel
	r143	LCI/F1 enable	1 Disabled = the input is disabled and ignored. 2 When used as demand, the input acts as a demand input and call for heat is true when it is on. A call for heat is present when the input is energized and when it is off (and also there is no other source for a call for heat) , then the system returns to an idle condition in Standby with no call for heat and no hold condition. This return to Standby may include going through postpurge if the burner was igniting or firing, but eventually it becomes idle 3 When used as a limit, the input acts as a run-permissive input. The call for heat comes from some other source and this input must turn on before startup will proceed. During the time demand is present but LCI is open, a hold is annunciated, describing the reason. An LCI input configured as a limit must remain on throughout the prepurge, ignition and run states; if it opens during these states the startup or run condition is aborted abnormally and a configured response occurs (r160). Note: This selection is required for dual fuel applications.	1	1 Disable 2 Use as demand 3 Use as limit (dual fuels)
	r144	LCI/F2 enable			
	r145	Demand hold limit time	Maximum time to wait in a Standby hold condition when demand is present. If it fails to resolve for this amount of time, a configured response occurs (r161).	0	0-65535 0=no limit, wait forever

Category	Register #	Name	Description	Default Value	Range
Interlocks Setup	r146	Preignition interlock enable	1 Disabled = the PII input (T14) is disabled and ignored. 2 When enabled with no dynamic check is selected, the PII input is not monitored for any condition. The PII input is tested to ensure that it's energized whenever the main valve(s) should be off. Whenever the main valve status changes from one or both valves on, to both valves off, 5 seconds is allowed before checking if the energized state has resumed to allow time to fully close their proof of closure switches. Normal PII open response followed via configured response (r162). 3 When enabled with dynamic check, the PII input is monitored for both On and Off conditions during specific burner sequences. During the Run state, the PII input must be de-energized and during the Standby state, the PII must be energized. If any test reveals that the PII is not in its mandated position, a configured response occurs (r166).	1	1 Disable 2 Enable with no dynamic check 3 Enable with dynamic check
	r147	ILK start check enable	Selects whether the interlock input (ILK, T19) must be off at startup as a check that proves it is possible for it to signal the off condition. 1 Disable=start check not performed. Normal ILK open response followed via a configured response (r163). 2 If ILK is on during the start check, the control waits for it to turn off before startup is allowed. If it fails to turn off for 4 minutes, then a configured response occurs (r165).	1	1 Disable 2 Enable
	r148	IAS start check enable	Selects whether the interrupted airflow switch (IAS, T16) must be off at startup as a check that proves it is possible for it to signal the off condition. 1 Disable=start check not performed. Normal IAS open response followed via a configured response (r164). 2 If IAS is on during the start check, the control waits for it to turn off before startup is allowed. If it fails to turn off for 4 minutes, then a configured response occurs (r165).	1	1 Disable 2 Enable
	r149	IAS/LOI monitoring	The T16 input can be configured as either an Interrupted Airflow Switch (IAS) or a Lockout Input (LOI). The LOI is primarily used in EU applications. 1 Disable=no airflow switch in system. 2/3 When monitored as an IAS input during prepurge, it is not a fault for this input to be off until the IAS proving maximum wait time has elapsed (r151). The measured purge timing does not begin until the IAS is energized 4 If configured as a LOI input, it must be energized at all times, with the only exception being during initialization when it is given time to turn on. If the T16 input is in an incorrect state, a configured response occurs (r164).	1	1 Disable 2 IAS: Prepurge only 3 IAS: Prepurge/ Ignition 4 LOI: At all times including Standby
	r150	ILK monitoring	Selects when the Interlock string (ILK, T19) is monitored by the Burner Control. 1 Use this input as a lockout input (LOI). It must be energized at all times, with the only exception being during initialization when it is given time to turn on. Typically used in EU applications. 2 Use the input as a normal interlock input. During prepurge, it is not a fault for this input to be off until the IAS proving maximum wait time has elapsed (r151). The measured purge timing does not begin until the ILK is energized. If the T19 input is in an incorrect state, a configured response occurs (r163).	1	1 LOI: At all times including standby 2 During Prepurge, Ignition and Run

Category	Register #	Name	Description	Default Value	Range
Timings Setup	r151	ILK/IAS proving maximum wait time	Time that a de-energized ILK or IAS (whichever is configured) is tolerated from the start of the prepurge state. If this time is exceeded without establishing the input as energized, a configured response occurs (r163 or r164??) Note: In previous Honeywell controls this time was fixed. In this system it is programmable to accommodate VFDs which take a longer time to provide optimum airflow.	0	0-60 seconds
	r152	Early purge proving delay	If purge proving is enabled (r121) and it is proven immediately upon entry to the prepurge state, an extra delay occurs that lasts for the duration defined by this parameter. Related register: r121 Prepurge rate proving	30	0-65535 0=accept the proven condition with no delay
	r153	Early lightoff proving delay	If lightoff proving is enabled (r123) and it is proven immediately upon entry to the drive to lightoff state, an extra delay occurs that lasts for the duration defined by this parameter. Related register: r123 Lightoff rate proving	30	0-65535 0=accept the proven condition with no delay
Failure Response Setup	r154	Purge rate proving failure response	The action taken upon a failure to achieve the target firing rate during purge within the time provided by the Rate proving delay parameter (r124). Related register: r124 Rate proving delay	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r155	Lightoff rate proving failure response	The action taken upon a failure to achieve the target firing rate during lightoff within the time provided by the Rate proving delay parameter (r124). Related register: r124 Rate proving delay	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r156	Valve proving failure response	The action taken upon a failure to prove the valve is functioning properly during the valve proving test.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r157	Pilot ignition failure response	The action taken when the pilot fails to light.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r158	Main ignition failure response	The action taken when a satisfactory main flame is not established during ignition. This response is used for flame failure during DBI (direct burner ignition), MFEP (main flame establishing period) and during the first 10 seconds of the Run state.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r159	Run flame failure response	The action taken upon loss of satisfactory flame after the burner has been in the Run state over 10 seconds. Prior to this, during DBI, MFEP or the first 10 seconds of Run, the Ignition flame failure response (r158) is used.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout

Category	Register #	Name	Description	Default Value	Range
Failure Response Setup	r160	LCI open response	Action taken when the LCI (T12, T13) opens abnormally while it should be closed during the burner sequence. Note: Only applies when LCI/F1 or LCI/F2 is defined as a Limit input (r143, r144). It does not apply if LCI/F1 or LCI/F2 is defined as a Demand input because its opening during a sequence is a normal indication of the end of demand. Related registers: r143 LCI/F1 enable r144 LCI/F2 enable	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r161	Demand hold limit response	Action taken when the Demand hold limit time is exceeded (r145). Related register: r145 Demand hold limit time	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r162	PII open response	Action taken if the PII is open when it should be closed during the burner sequence. Related register: r146 Preignition interlock enable	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r163	ILK open response	Action taken if the ILK is open when it should be closed during the burner sequence. Related registers: r147 Preignition interlock enable r151 ILK/IAS proving maximum wait time	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r164	IAS/LOI open response	Action taken if the Interrupted Airflow Switch (IAS) is open when it should be closed during the burner sequence. Related registers: r148 IAS start check enable r150 ILK monitoring r151 ILK/IAS proving maximum wait time	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r165	ILK/IAS start check failure response	Action taken if a start check failure occurs of the ILK and/or IAS inputs. Related registers: r147 ILK start check enable r148 IAS start check enable	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r166	PII dynamic check failure response	Action taken if a dynamic check failure occurs of the PII input. Related register: r146 Preignition interlock enable	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r167	Dual fuel fault response	Action taken if both the LCI/F1(T13) and LCI/F2 (T12) are energized when dual fuel is enabled (this is an invalid condition). Related register: r142 Fuel selection setup	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r168	Flam amplifier fault response	Action taken for a failure in the flame detector system.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout

Category	Register #	Name	Description	Default Value	Range
Failure Response Setup	r169	MV PV IGN on should be off response	Action taken if the MV, PV or IGN outputs are on when they should be off (T9, T11, T15, T17). An example might be shorted power.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r170	MV PV IGN should be on response	Action taken if the MV, PV or IGN outputs are off when they should be on (T9, T11, T15, T17).	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r171	Safety relay fault response	Action taken if the Burner Control safety relay is in the wrong state (internal fault).	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r172	Flame on should be off response	Action taken if flame is detected when it should not be.	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r173	Manual open switch off response	Action to take if the Manual Open Switch (MOS) is off when it should be on (during MFEP and Run). Related register: r133 Manual open switch enable	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r174	Fuel air communication fault response	Action to take if the Fuel Air Ratio Control does not have reliable communication with the Burner Control. Related register: r119 Fuel air control module number	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r175	Limit communication fault response	Action to take if a Limit Module does not have reliable communication with the Burner Control. Related registers: r600 Socket 1 limit module number r606 Socket 2 limit module number r612 Socket 3 limit module number r618 Socket 4 limit module number r624 Socket 5 limit module number r630 Socket 6 limit module number r636 Socket 7 limit module number r642 Socket 8 limit module number	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout
	r176	Stuck reset switch response	Action taken if the reset push button is stuck	1	1 Unknown 2 Recycle 1 3 Recycle 2 4 Recycle 3 5 Soft lockout 6 Hard lockout

Category	Register #	Name	Description	Default Value	Range
Recycle Setup	r177	Recycle 1 delay time	Delay time that must take place while in Standby before retrying the burner sequence for the 1st recycle handler. The 5 second minimum ensures the recycle reason has time to be displayed. Related registers: r154-r176 Failure Response Setup	5	5-65535 seconds
	r178	Recycle 1 retry limit count	Maximum number of recycle tries before giving up for the 1st recycle handler. Retry counting is cleared when the burner reaches the Run state or when the call for heat disappears Related registers: r154-r176 Failure Response Setup r 179 Recycle 1 retry limit response	3	0-65535 seconds
	r179	Recycle 1 retry limit response	Action taken if the number of recycles hits the retry limit count for the 1st recycle handler. When the response is None, the recycles continue indefinitely until successful or the call for heat is lost. Related registers: r154-r176 Failure Response Setup r 178 Recycle 1 retry limit count	1	1 None 2 Soft lockout 3 Hard lockout
	r180	Recycle 2 delay time	Delay time that must take place while in Standby before retrying the burner sequence for the 2nd recycle handler. The 5 second minimum ensures the recycle reason has time to be displayed. Related registers: r154-r176 Failure Response Setup	5	5-65535 seconds
	r181	Recycle 2 retry limit count	Maximum number of recycle tries before giving up for the 2nd recycle handler. Retry counting is cleared when the burner reaches the Run state or when the call for heat disappears Related registers: r154-r176 Failure Response Setup r 182 Recycle 2 retry limit response	3	0-65535 seconds
	r182	Recycle 2 retry limit response	Action taken if the number of recycles hits the retry limit count for the 2nd recycle handler. When the response is None, the recycles continue indefinitely until successful or the call for heat is lost. Related registers: r154-r176 Failure Response Setup r 181 Recycle 2 retry limit count	1	1 None 2 Soft lockout 3 Hard lockout
	r183	Recycle 3 delay time	Delay time that must take place while in Standby before retrying the burner sequence for the 3rd recycle handler. The 5 second minimum ensures the recycle reason has time to be displayed. Related registers: r154-r176 Failure Response Setup	5	5-65535 seconds
	r184	Recycle 3 retry limit count	Maximum number of recycle tries before giving up for the 3rd recycle handler. Retry counting is cleared when the burner reaches the Run state or when the call for heat disappears Related registers: r154-r176 Failure Response Setup r 185 Recycle 3 retry limit response	3	0-65535 seconds
	r185	Recycle 3 retry limit response	Action taken if the number of recycles hits the retry limit count for the 1st recycle handler. When the response is None, the recycles continue indefinitely until successful or the call for heat is lost. Related registers: r154-r176 Failure Response Setup r 184 Recycle 3 retry limit count	1	1 None 2 Soft lockout 3 Hard lockout

Category	Register #	Name	Description	Default Value	Range
Valve Proving Setup	r186	Valve proving enable	If enabled, valve proving is performed when the configured fuel is selected. Note: It is a configuration fault to enable this feature for a fuel that is also enabled to use a delayed main valve (see r135). 2 Enable always causes valve proving to be performed always, either for a single fuel or for both fuels in a dual fuel system. 3/4 Enable for dual fuel selected by LCI/F1 and Enable for dual fuel selected by LCI/F2 are allowed only if the Fuel selection setup parameter (r142) enables dual fuels; otherwise a configuration fault occurs. Related registers: r142 Fuel selection setup	1	1 Disable 2 Enable always 3 Enable for dual fuel selected by LCI/F1 4 Enable for dual fuel selected by LCI/F2
	r187	Valve proving occurrence	Determines when valve proving occurs if enabled. VPS includes two tests; one where the short pipe between the two shutoff valves is pressurized (high pressure test) and one where it is depressurized (low pressure test). VPS Before Run occurs simultaneously with prepurge and will delay lightoff if it lasts longer. VPS After Run occurs simultaneously with postpurge (if any) and will delay re-entry into Standby until completed. 1 Both pressure tests BEFORE entering the Run state 2 Both pressure tests AFTER in the Run state 3 Both pressure tests BEFORE and AFTER entering the Run state 4 High pressure test BEFORE Run and low pressure test AFTER Run.	1	1 Before Run 2 After Run 3 Both before and after Run 4 Split
	r188	Valve proving open time	How long one valve is commanded open to pressurize or depressurize the pipe between the two shutoff valves. A typical value is t seconds for a slow valve. Shorter times may be used for faster valves.	5	0-60 seconds
	r189	Valve proving time	Test time used for valve proving leakage test.	0	0-65535 seconds
Timings Setup	r190	Fuel 2 main flame establishing time	Time length that an interrupted pilot is on along with the main valve(s) for Fuel 2. At the end of this time an interrupted pilot is turned off and only the main flame provides proof of combustion. Notes: - This parameter is ignored for an Intermittent pilot because there is no MFEP, and for Direct Burner Ignition (DBI) because DBI time is a separate parameter (r127, r140). - Fuel 1 main flame establishing time is register r139	0	0-30

8. When finished with the final Burner Control Module configuration, click the “Save” button.

   Click “Yes” when prompted to save the changes.

Click the “Close” button to go back to the SLATE Module Configuration page.

9. The Burner Control Module is now part of your kit file. You may proceed to configuration of the next module. If you are finished with all of the SLATE modules programming and configuration, you may load the kit file. Refer to “Load the SLATE Device” on page 8.

Chapter 6: SLATE Flame Amp Modules

Installing Flame Detectors with the SLATE System

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire length is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the SLATE Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the SLATE Burner Control Module, then it must be externally wired to it via the remote bus communications.

Preliminary Inspection

Make certain that:

1. Wiring connections are correct and all terminals screws and electrical connections are tight.
2. Proper flame failure response time is selected.
3. Amplifier is securely mounted on the DIN Rail and bus
4. Detectors are properly positioned and cleaned according to Detector Instructions.
5. Correct combination of amplifier and flame detector is used.

Note: R7842C, Series 2 or greater, pulse shutter when signal of 1.5VDC is sensed. Display readings of 0.7 to 2.4 Vdc are common.

The flame signal for the pilot alone, the main burner flame alone, and both together must be steady and a minimum of 0.8 V. If the flame signal is unsteady, or less than the minimum acceptable voltage, check the detector installation and circuitry in the following procedure.

1. Check the supply voltages. Make sure the master switch is closed, connections are correct, and the power supply is of the correct voltage and frequency and is sinusoidal.
2. Check the detector for the defects including:
   - **a.** Incorrect connections
   - **b.** Wrong type of wire
   - **c.** Deteriorated sire
   - **d.** Open circuits
   - **e.** Short circuits
   - **f.** Leakage paths caused by moisture, soot or accumulated dirt.
7. For all optical detectors, clean the detector viewing window, lens, and inside of the sight pipe as applicable.
8. With the burner running, check the temperature at the detector. If it exceeds the detector maximum rated temperature
   - **a.** Add a heat block to stop conducted heat traveling up the sight pipe.
   - **b.** Add a shield or screen to reflect radiated heat.
   - **c.** Add cooling (refer to sight pipe ventilation in the detector Instructions).
4. Make sure that the flame adjustment is not too lean
5. Make sure the optical detector is properly sighting the flame
6. If necessary, resight or reposition the detector
7. If you cannot obtain proper operation, replace the plug-in amplifier
8. If you cannot yet obtain proper operations, replace the flame detector

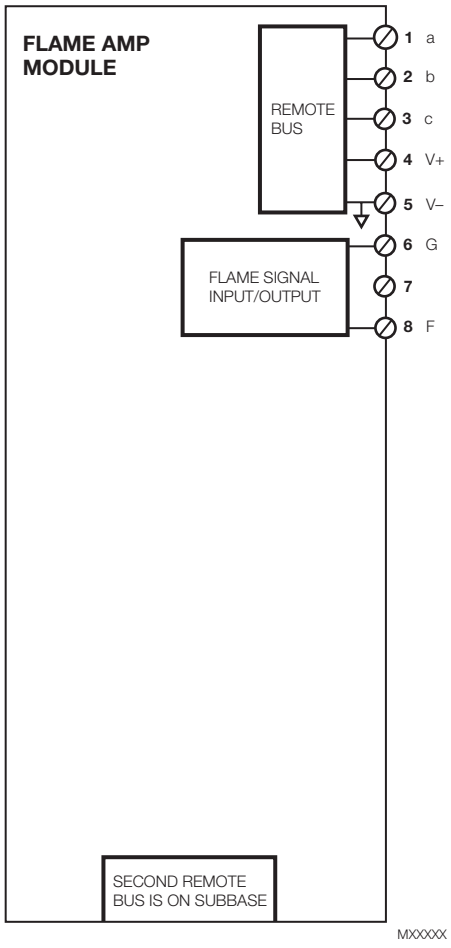
LED Array

There are four LEDs on the front of the UV/Visible Ampli-Check Flame Amp modules that provide quick identification of the system status and any other problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	SLATE Burner Control Module has detected a fault
	No light	Running
Flame	Yellow	Weak flame is detected
	No light	No flame is detected

LED Display

The SLATE system modules have a seven-segment, three position LED display used for indicating flame strength. It is also used to identify the module of the SLATE system.



Color	Description
Terminal T2	

Color	Description
Green	Communicating with burner
Red	Communication fault
Terminal T8	
Green	Flame
Off	No flame

Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Overview of the SLATE Flame Amplifier Modules

The R8001F1091 UV Visible Ampli-Check Flame Amplifier module responds to an ultraviolet/visible light signal from an UV/visible light type flame detector to indicate the presence of flame. The flame amplifier is used with the C7927 (UV), C7962 (Visible) detector series.

The R8001V1031 Rectification Ampli-Check Flame Amplifier module responds to a rectified signal from a rectification type flame detector to indicate the presence of flame. This flame amp is used with the C7000X detector series.

The R8001F1041 IR Ampli-Check Flame Amplifier module responds to an infrared signal from an infrared type flame detector to indicate the presence of flame. This flame amplifier is used with the C7915 detector series.

The R8001S1051 UV Shutter-Check module responds to an ultraviolet signal from an ultraviolet type flame detector to indicate the presence of flame. This flame amplifier is used with the C7061 detector series.

The R8001S1071 UV Ampli-Check module responds to an ultraviolet signal from an ultraviolet type flame detector to indicate the presence of flame. This flame amplifier is used with the C7027 and C7035 detector series.

Chapter 7: SLATE Fuel Air Control Module and Commissioning

Overview

The R8001C6001 SLATE Fuel Air Ratio module uses the latest technology to control up to 4 SLATE actuators and or 2 Variable Frequency Drives. The Fuel Air Control module controls the relationship between fuel, airflow and flue gas recirculation on a power burner.

Within the SLATE system, the fuel air ratio module provides:

- Air fuel ratio control for up to 4 actuators
- Drive 2 Variable Frequency Drives (VFDs)
- RS-485 Modbus communications to communicate to the actuators and receive feedback
- SLATE actuator torque sizes:
  - R8001M1050 50 in/lb in NEMA 1
  - R8001M1150 150 in/lb NEMA 1
  - R8001M4050 50 in/lb NEMA 4
  - R8001M4150 150 in/lb NEMA 4
- Up to 24 points on the curve
- Field configurable
- Automated actuator endpoint seeking process
- UL Listed, FM and NFPA acceptable
- Password protected
- Fault information
- Status of four actuator channels
- Unused VFD terminals can be used as analog cells for general purpose I/O configuration
- Flue gas recirculation (FGR)
- Trim
- Dual Fuel
- Seasonality or recipe curves

Safety Features

- Class C operating software system
- Fail-safe feedback
- Curve verification algorithms
- Password protected
- Built in self test
- No slope constraints that would limit the steepness of the curve
- Component anti-swap protection
- Off curve checking algorithm

LED Array

There are three LEDs on the front of the Fuel Air Ratio module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power

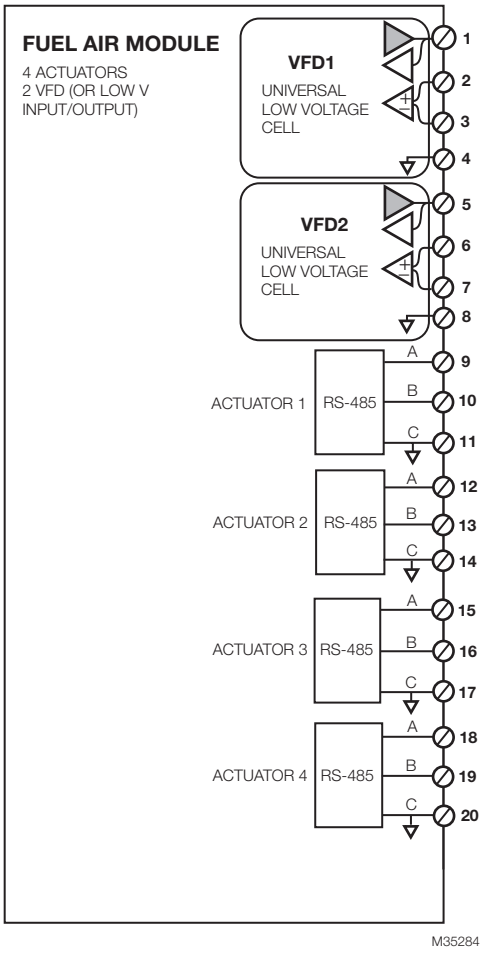
LED	Color	Description
☑ CPU	Red	No valid configuration
	Green	Running
⚠ Fault	Red	Fault
	No light	No fault

LED Display

The Fuel Air Ratio module has three-character LED display used for indicating the number it is in the SLATE system. It also has a three-position LED colors to indicate the states as shown below.

Color	Description
Green	Terminal is ON or is Normal
Red	Fault
No light	Terminal is OFF or Not in use

Select and Resent Buttons



The Fuel Air Ratio module have Select and Reset buttons located on the front module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Fig. 1. Fuel Air Ratio Control LED Display

Understanding the Terminals

The SLATE Fuel Air Ratio Control Modules contains 20 wired terminals.

Terminal Functions and Configurations

Terminal Functions				Min	Typical	Max	Units	
T1	Voltage	In	Range	0.0	-	15.0	VDC	Rin=1MOhm
			Resolution	-	2.43	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	Whichever is greater
				-1.0	-	1.0	%	
		Out[c]	Range	0.0	-	15.0	VDC	10KOhm load
			Resolution	-	4.0	-	mV DC	
			Null	100.0	-	100.0	mV DC	
			Accuracy	-50.0	-	50.0	mV DC	Whichever is greater
				-1.5	-	1.5	%	
	Current	In	Range	0.0	-	25.0	mA DC	[a]
			Resolution	-	7.4	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA
		Out[b,c]	Range	0.0	-	25.0	mA DC	Max Load = 500 Ω
			Resolution	-	4.0	-	mA Ω	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-300.0	-	300.0	uA DC	0 to 25 mA
				-50	-	50	uA DC	4 to 20 mA

Terminal Functions				Min	Typical	Max	Units	
T2	Voltage	In	Amplitude	0.0	-	15.0	VDC	
			Trip Point	-	3.0	-	VDC	Comparator Only
			Hysteresis	-	0.25	-	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
T3	Voltage	In	Range	0.0	-	15.0	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
	Current	In	Range	0.2	-	25.0	mA DC	
			Resolution	-	3.7	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA

[a] T1 input terminal is held at constant 2.5VDC over allowable current range.
[b] Accuracy specification given is for 100 Ω load. Resolution specification can be converted to mA by dividing out load.
[c] Imax=25mA for Vout<10V
Imax=20mA for 10V<Vout<15V

Specifications based on worst case over ambient temperatures.

	Complex Functions		Min	Typical	Max	Units	
	Thermocouple						
T2 & T3	Type J	Range	-200.0		1025.0	°C	
		Resolution	-	0.1	-	°C	
		Accuracy	-5.0	-	5.0	°C	
	Type K	Range	-150.0	-	1000.0	°C	
		Resolution	-	0.1	-	°C	
		Accuracy	-5.0	-	5.0	°C	
	RTD						
T2 & T3 & T4	Type PT100[a]	Range	-135.0	-	250.0	°C	3 wire, 100 Ω
		Resolution	-	0.5	-	°C	
		Accuracy	-2.0	-	2.0	°C	
	Type PT1000	Range	-135.0	-	250.0	°C	3 wire, 1000 Ω
		Resolution		0.5		°C	
		Accuracy	-2.0	-	2.0	°C	
	NTC						
T1-T3, T1-T4	Type 10K	Range	-40.0[b]	-	175.0	°C	T4 rated to 0 °C
		Resolution	-	0.1	-	°C	
		Accuracy[c]	-2.0	-	2.0	°C	-40 °C to 25 °C
			-1.0	-	1.0	°C	25 °C to 125 °C
			-1.5	-	1.5	%	
			-3.0	-	3.0	°C	125 °C to 175 °C
T1-T3, T1-T4	Type 12K	Range	-20.0	-	125.0	°C	T4 rated to 0 °C
		Resolution	-	0.1	-	°C	
		Accuracy[c]	-2.0	-	2.0	°C	-20 °C to 30 °C
			-1.0	-	1.0	°C	30 °C to 120 °C
			-1.5	-	1.5	%	
			-3.0	-	3.0	°C	120 °C to 125 °C

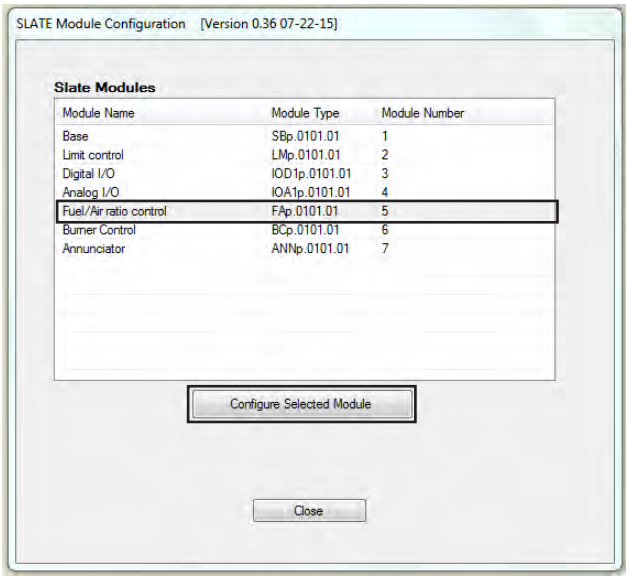
			-1.0	-	1.0	°C	50 °C to 135 °C
			-1.5	-	1.5	%	
			-3.0	-	3.0	°C	135 °C to 150 °C

[a] Shielded cable required for reliable operation in noisy environment.
[b] NTC on terminal T4 is rated down to 0 °C.
[c] Temperatures refer to sense range.

	Frequency / PWM Functions		Min	Typical	Max	Units	
	PWM Out						
T1	Amplitude		5.0	-	10.0	VDC	Low output state = 0V
	Frequency		100.0	-	1000.0	Hz	
	Duty Cycle		2.0	-	98.0	%DC	0-100% output allowed
	Resolution		-	1.0	-	%	
	Accuracy		-0.5	-	0.5	%DC	10V amplitude
	Frequency In						
T2-T4	Amplitude		5.0	10.0	15.0	VDC	
	Range		2.0	-	1000.0	Hz	
	Min. "on" pulse width (low %DC)		-	50.0	-	usec	10V amplitude
	Min. "off" pulse width (high %DC)		-	130.0	-	usec	10V amplitude
	Duty Cycle	2 – 100 Hz	2.0	-	98.0	%DC	10V amplitude
		1000 Hz	5.0	-	85.0	%DC	10V amplitude
	Resolution		-	1.0	-	Hz	
	Accuracy		-5.0	-	0.0	%	Whichever is greater
			-1.0	-	0.0	Hz	
	PWM In						
T2-T4	Amplitude[a]		5.0	10.0	15.0	VDC	
	Frequency		125.0	-	500.0	Hz	
	Min. "on" pulse width (low %DC)		-	50.0	-	usec	10V amplitude
	Min. "off" pulse width (high %DC)		-	130.0	-	usec	10V amplitude
	Duty Cycle	125 – 500 Hz	5.0	-	90.0	%DC	10V amplitude
	Resolution			-	1.0	%DC	
	Accuracy	125 Hz	-1.5	-	1.5	%DC	10V amplitude
		500 Hz	-7.5	-	7.5	%DC	10V amplitude

[a] Trip points = 3.0V +/- 0.25V
Hysteresis Voltage = 0.5V

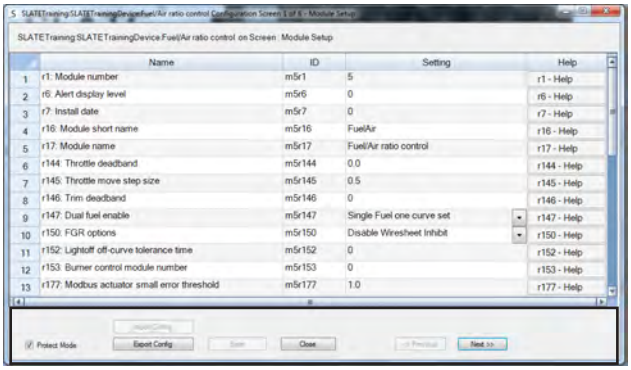


Configuration		Min	Optimum Range for Performance	Max	
Thermocouple	J	-50°C		1025°C	± 4 °C
	K	-50°C		1000°C	± 4 °C
RTD		-135°C		250°C	± 2 °C
NTC		25°C		125°C	± 1°C
Current Out		4 mA		20 mA	± .05 mA
Voltage: In / Out		2 V		10 V	0.3 %, typical

Application	Recommended Wire Size	Recommended Part Numbers
Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Fuel Air Ratio Configuration

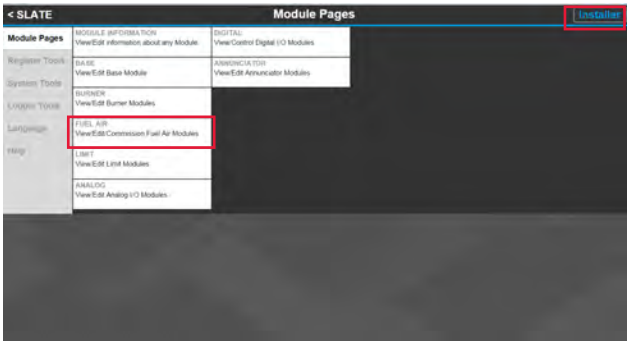
Getting Started



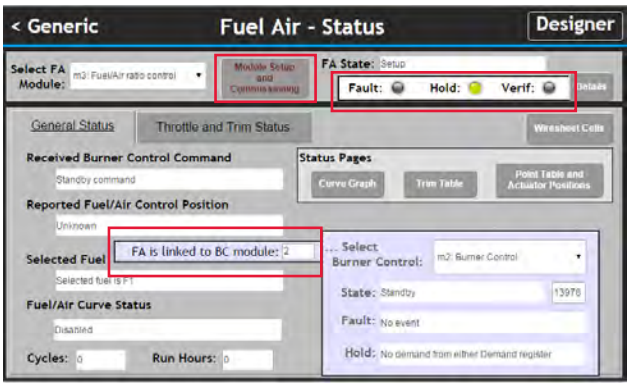
1. To access the configuration tool you will need to launch the SLATE AX Tool.
2. If you have not created a Station please refer to Chapter 2 of this manual to learn how to create a new station.
3. If you have created a Station open up the Navigation pane until to reach your SLATE Device. Double-click on the SLATE device to launch the Module Configuration Tool.
4. Select the Fuel/Air ratio control, then click Configure Selected Module.

When configuring, you will need to uncheck the “Protect Mode” box. As you move through the registers you will use the Next and Previous buttons to move to the next page or back to the previous page.

Curve configuration and preset setup (positions for purge, ignition, etc) are configured using the Honeywell built in web pages as part of the installation.

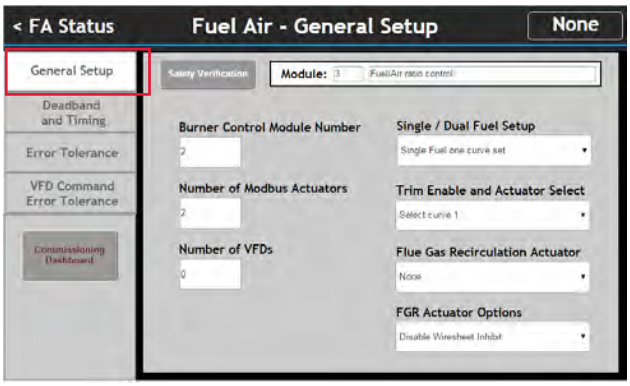


When all registers have been configured, click the Save button. Click the Close button to go back to the SLATE Module Configuration page.

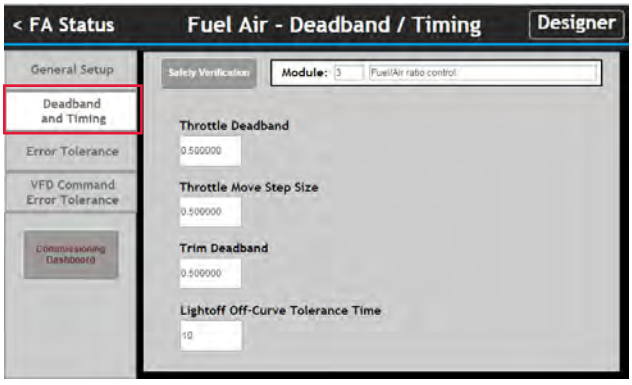


SLATE Fuel Air Commissioning

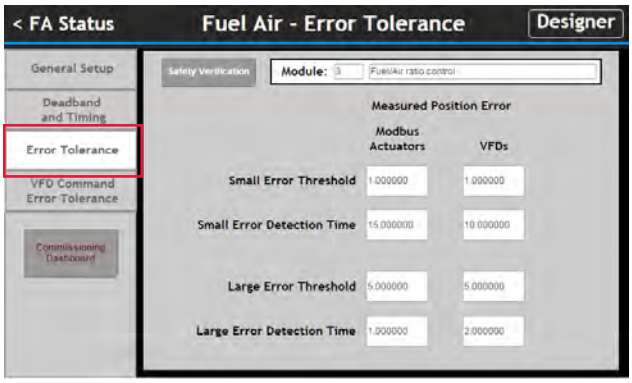
Fuel Air Commissioning begins at the SLATE Generic Web Pages provided. For better commissioning you can connect your laptop to the SLATE Base and connect via Ethernet. You will need to setup you IP address as previously noted in this User Guide under Network Setup section.



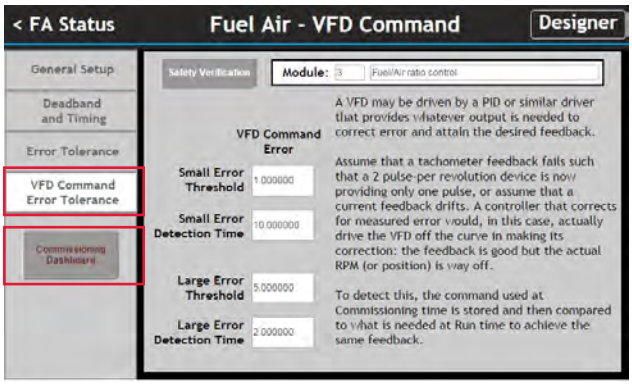
When you are connected to begin you will need to make sure you are logged in as an Installer or Designer. See figure below. The log in is located in the upper right hand corner. Select the Log In. You will then see the log in screen. To log in as an Installer the password is SlateInstallerPassword. When you log in as a designer the password will be SlateDesignerPassword. After entering the password you will need to select Request RIN. This is an indication to SLATE to provide you with a 6 digit number. The SLATE Base Display will provide a 6 digit number. You will need to enter those numbers in along with the dash. Then you will be connected to the system for commissioning.



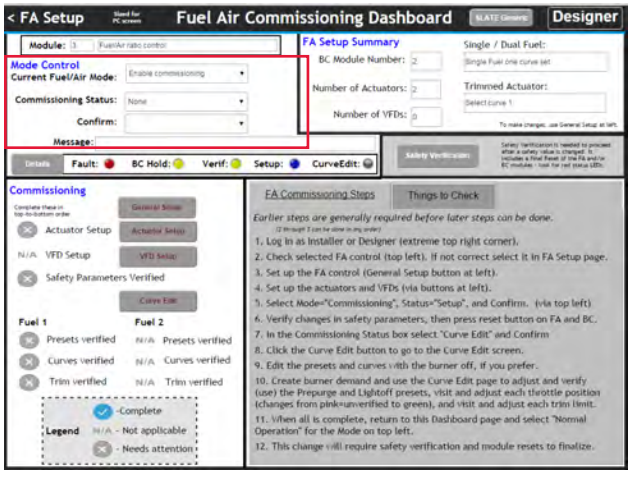
Clicking on the Fuel Air Commissioning screen takes you to the Fuel Air Status screen. Here you will see any faults that may occur since the SLATE Burner Control is linked to the Fuel Air Ratio Module and any other important information. To move to commissioning you will select Module Setup and Commissioning.



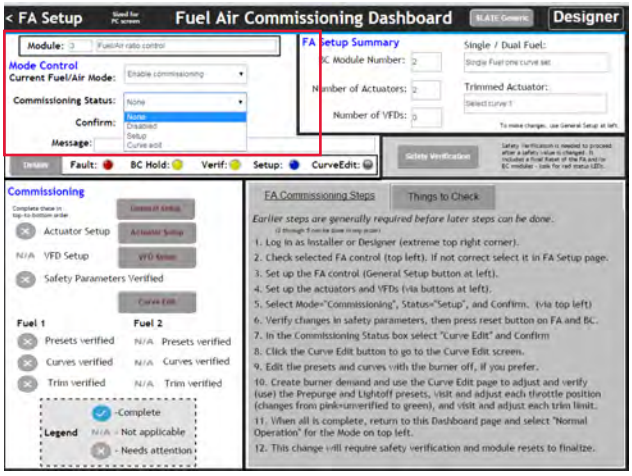
General setup allows you to set up information about the SLATE Burner Control and Fuel Air Ratio device environment. If you have configured the SLATE Fuel Air Ratio using the SLATE AX Tool that information will be displayed on this page.



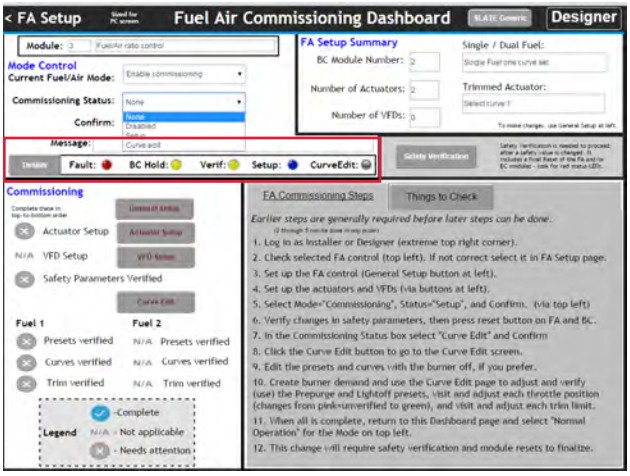
Deadband and Timing is used to set the throttle deadband, move step size and light off-curve tolerance time. The light off curve tolerance time is important because it's the time allotted for the actuators to reach the curve after light off, when the light off is not on the curve.



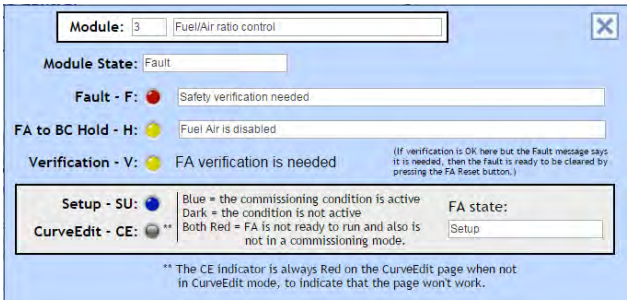
The Error Tolerance defines the large and small errors, position wise. It also defines how much time you will be in the large error or small error zone before an error occurs.



The VFD Command and Error Tolerance selection allows users to set small and large error tolerances with the VFD. To begin the Fuel Air Commissioning process Click the Commissioning Dashboard.

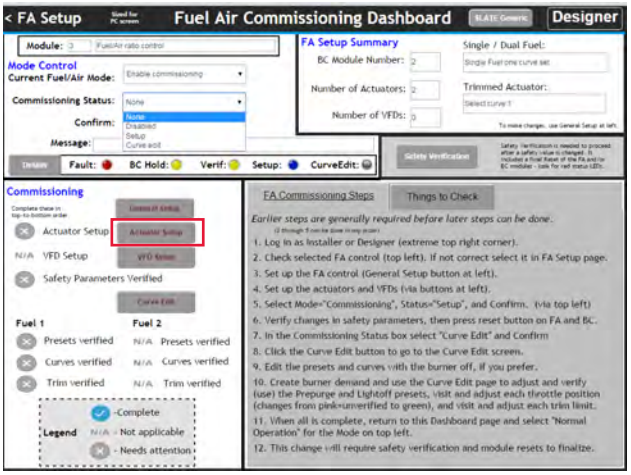


The Fuel Air Commissioning provides an area that shows the current state of the Fuel Air Ratio system. This is for placing the fuel air commissioning into a desired mode via a drop down list. The current view shown is Enable Commissioning.

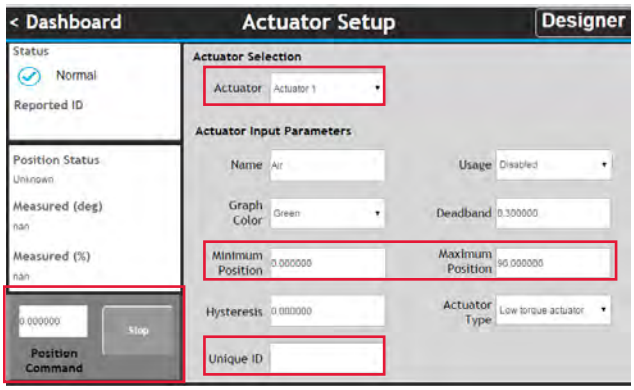


Within Commissioning, the Commissioning Status, as highlighted below allows you to select either Setup or Curve Edit. Once you make your selection, you will need to confirm your decision with the next selection box.

The Details section shows you the current state of your system. It is a good tool to use to understand what item is holding up the commissioning.

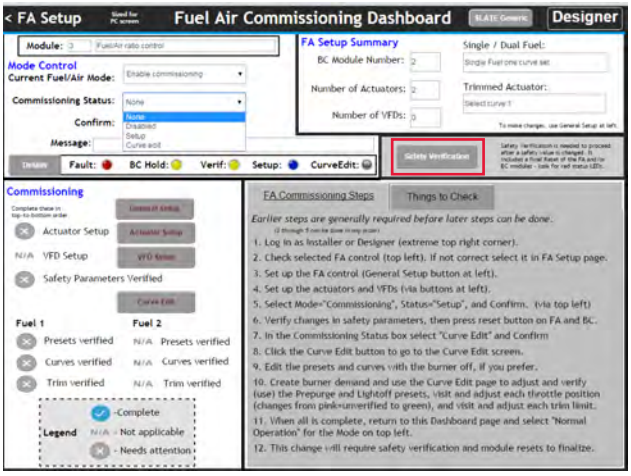


Clicking Details will provide more detailed information as shown below.



The Commissioning Section will be used to setup the actuators, the VFD, and do the curve edit. The gray area to the right of this section will provides help information that will walk through the process.

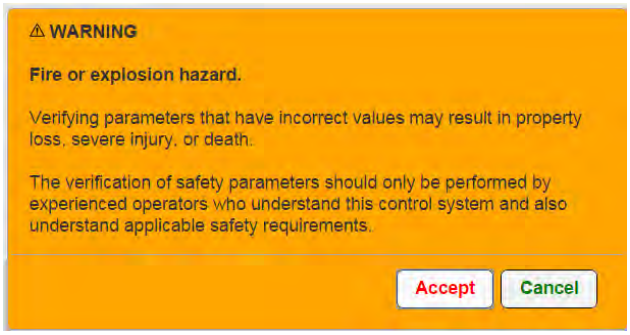
The General Setup has been completed using the SLATE AX Tool so you can begin (if you configured it) with the Actuator Setup. Click Actuator Setup.



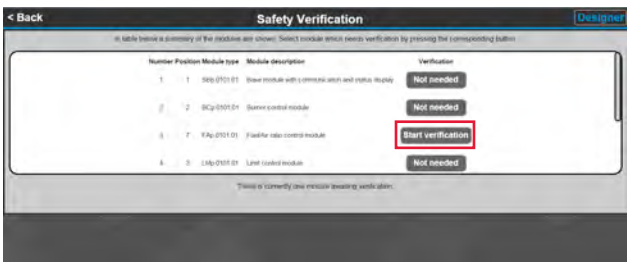
Begin with the Actuator Selection as highlighted below. Notice the Position Command Section. This section will allow you to enter a value to drive the motor to that position. You can use this to determine the minimum and maximum positions located in the middle of this screen.

The SLATE Fuel Air Ratio system will also automatically provided the unique ID for those actuators and will we be found in the highlighted area above. This is the information found on the label of the actuator. If this is unavailable at the time of designing, SLATE will automatically get it from the motor at commissioning time.

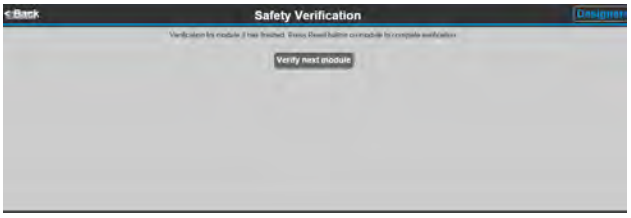
After the actuators are setup, you will need to run a safety verification test. Safety verification is required each time a safety parameter is changed. You will need to perform this multiple timed during the start up/configuration process, especially in the Fuel/Air Control Module.



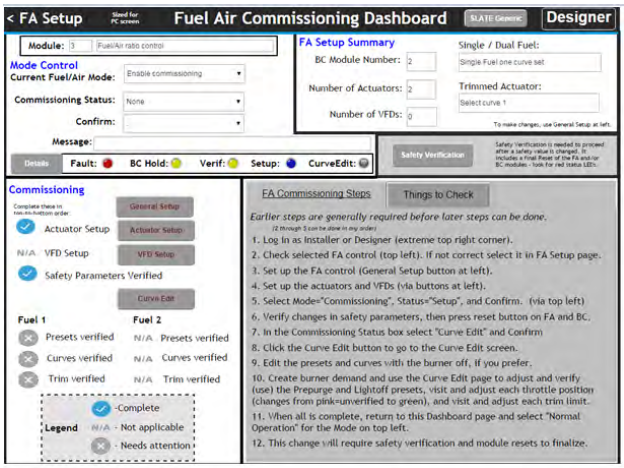
To begin the safety verification process, click the Safety Verification button.



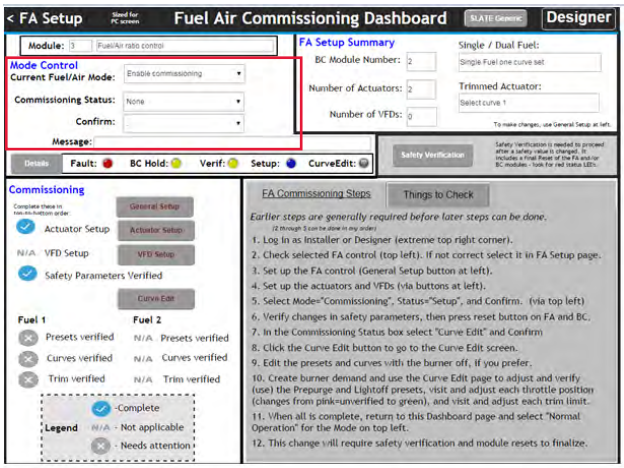
The Safety Verification screen will allow users to start the verification process. Click Start Verification button.



You will be alerted to a warning that you will need to accept. Press Accept.

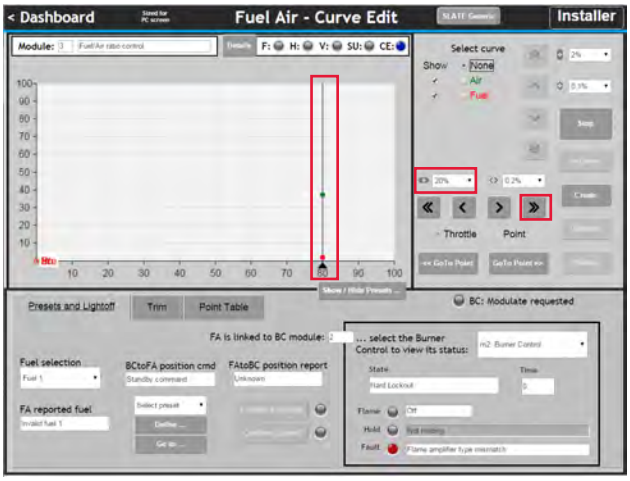


Now start the Verification.

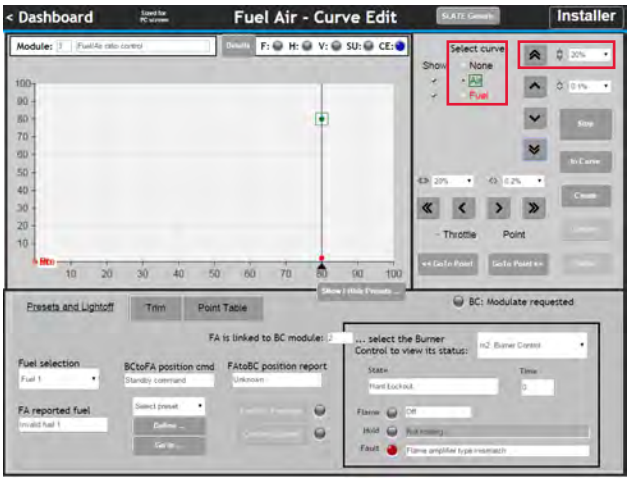


After the Safety Verification steps you will need to push the Reset button located on the Fuel Air Ratio module to complete the verification process. At this point you can go back to the Dashboard.

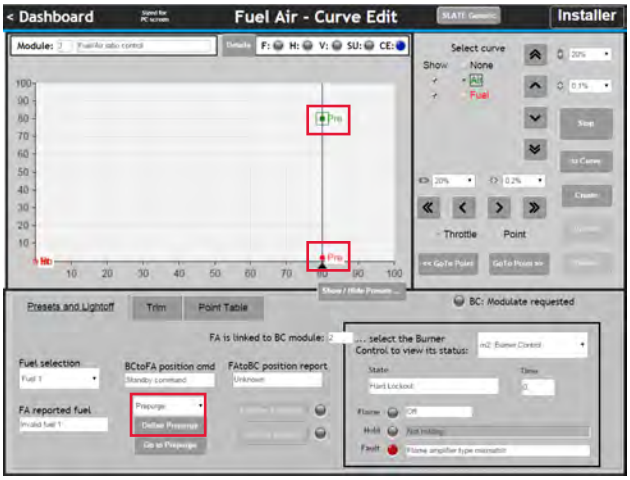
You can see two blue circles with checks to indicate that this step has been completed and verified. Now you can move to the next step, enabling the edit curve.



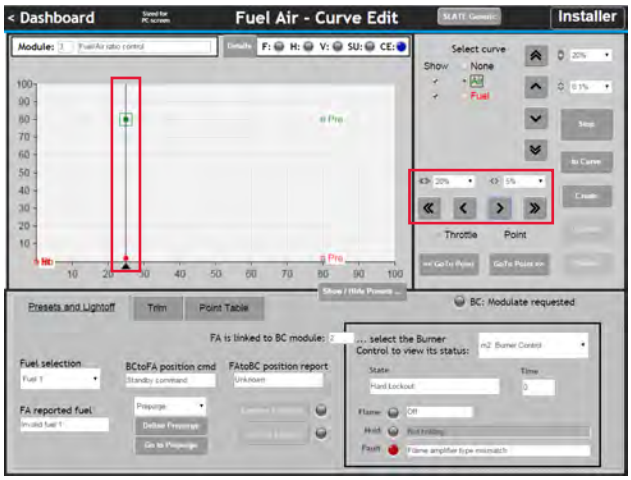
Next select and confirm “Curve Edit” mode as highlighted below.



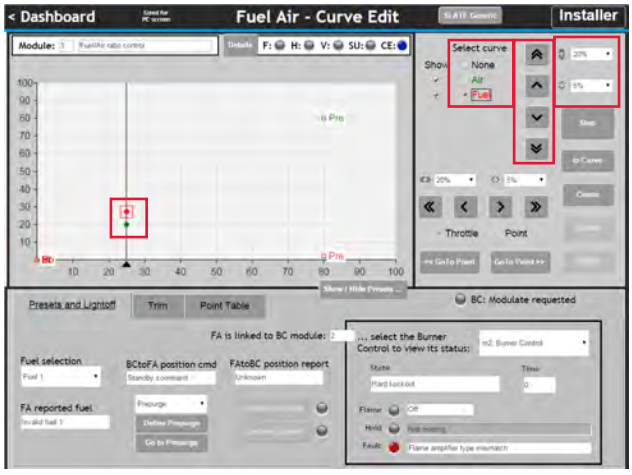
The Curve Edit feature allows you to begin building your curve for Fuel Air Ratio.



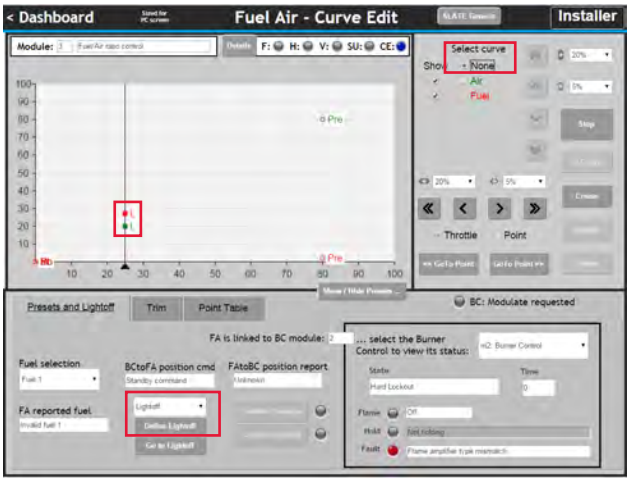
You will begin to set a Pre-Purge Preset. Use the drop-down to set a larger left-right motion of 20%, then click the >> button several times to move the throttle cursor over to the 80% position.



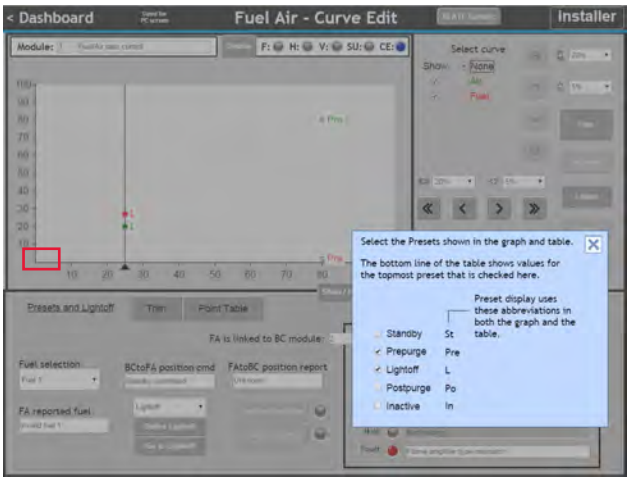
Select the Air actuators using the radio button, set the large up/down motion to 20%, and use the double-up-arrow button to move it up to around 80% (on the Y axis).



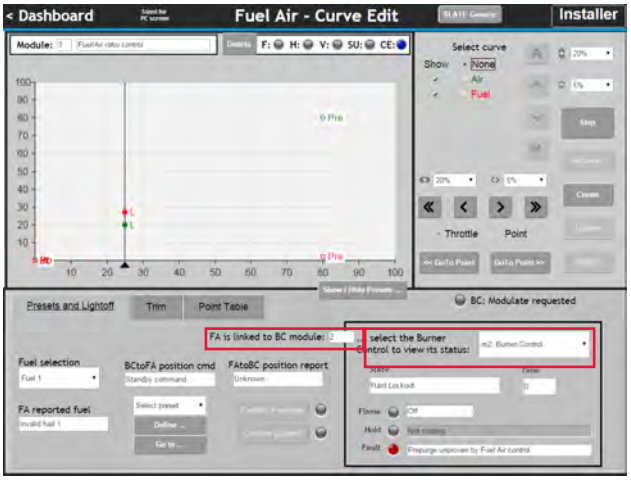
Select the Pre-purge Preset from the drop down list then click the Define Prepurge button. Note that the label “Pre” now shows next to the air and fuel positions.



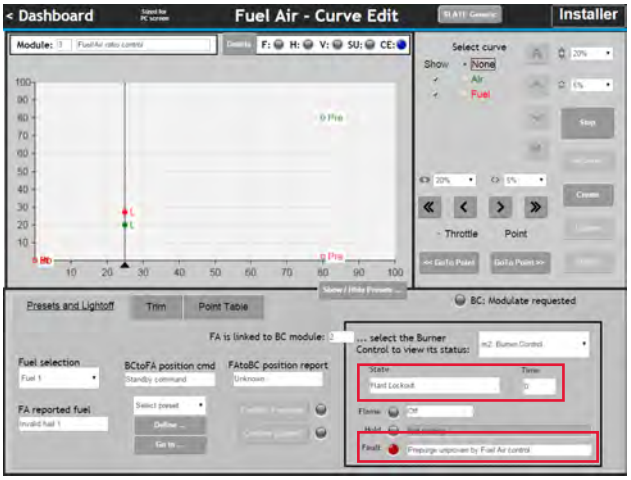
In a similar way, you will now need to set the estimated Lightoff position. First move the throttle cursor over to about 25% (use the small and large movement selectors and buttons)



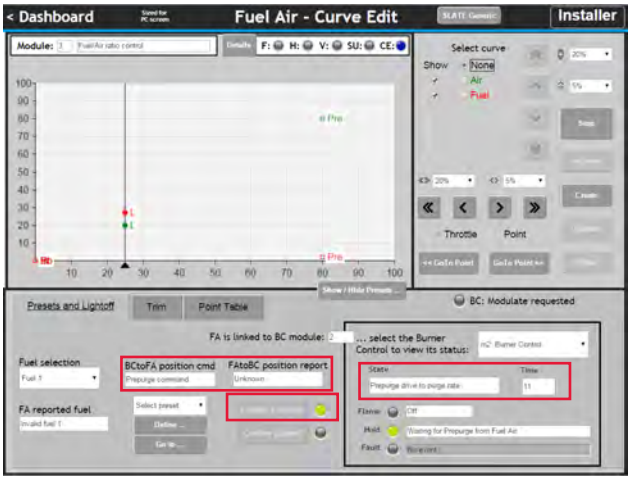
Next use the curve select and the up/down movement selectors and buttons to move the air actuator to about 20%, and the fuel actuator to about 25% (on the Y axis).



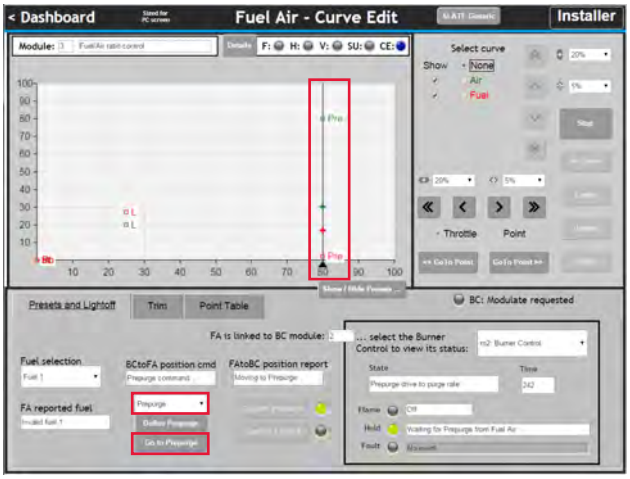
You will now need to define the Lightoff Preset by selecting “Lightoff” and clicking “Define Lightoff”. Note that L appears next to these positions (below “None” has been chosen for the curve select to hide the selector box and show this more clearly).



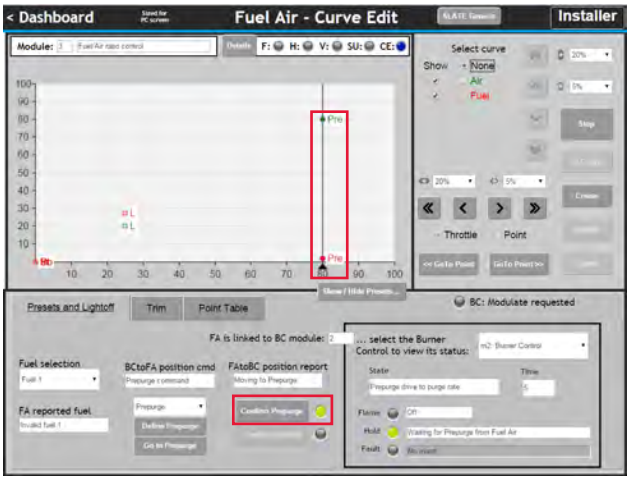
The Presets that are shown determine by the Show/Hide Presets dialog box. Click the button (at arrow). Turning off those off not currently in use will help clean up your screen. Also note the abbreviations.



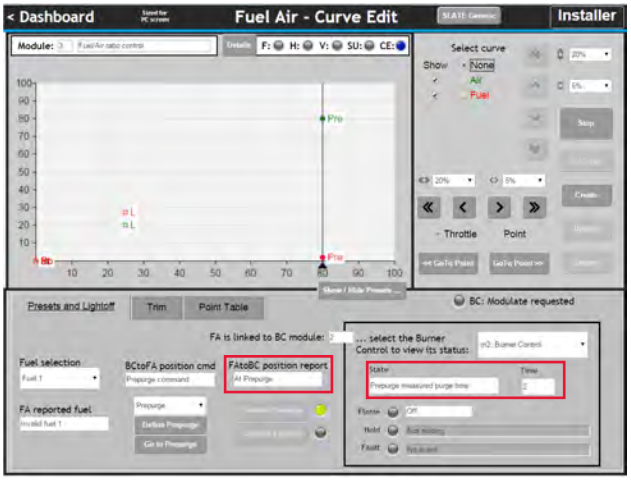
You are now ready to start the Burner. The SLATE Fuel Air reports to the SLATE Burner Control that is linked to it, but you must select it to show its status (if there is only one SLATE Burner Control it will be connected automatically).



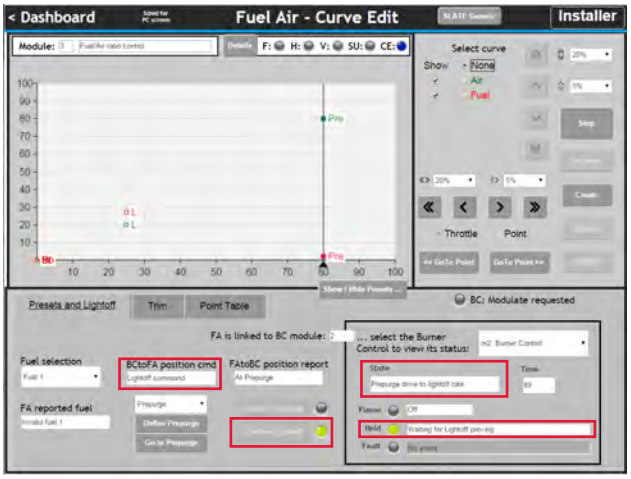
You will need to fix any problems and clear (press Reset) any lockouts in the SLATE Burner Control, and then give it a demand signal in a way that it is configured to accept a call for heat.



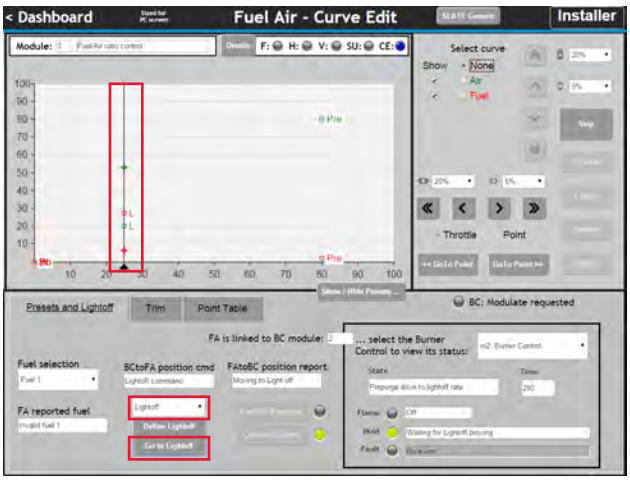
When the demand is on, the SLATE Burner Control will go through Initiate (10 sec.), Standby and Safe Start Check (briefly) and then request the SLATE Fuel Air to go to Prepurge. The amber LED is next to “Confirm Prepurge” button indicating that it is required, but the button is grayed out because the SLATE Fuel Air is not at that position.



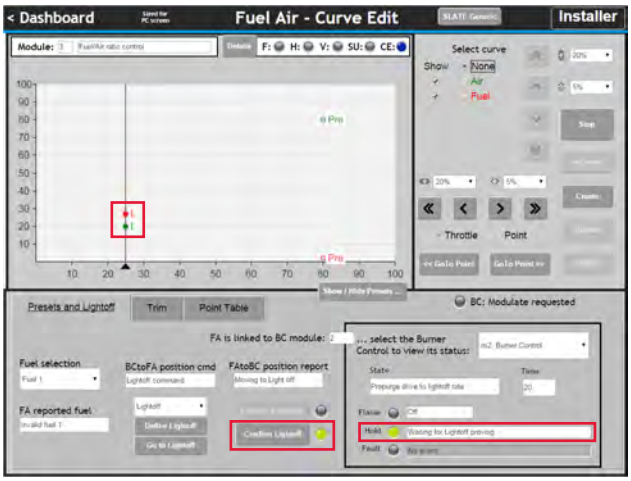
To send the SLATE Burner Control to the Prepurge position, select Prepurge in the drop down list and then click the “Go to Prepurge” button. The commanded position will move, and the actuators will move to the Prepurge position.



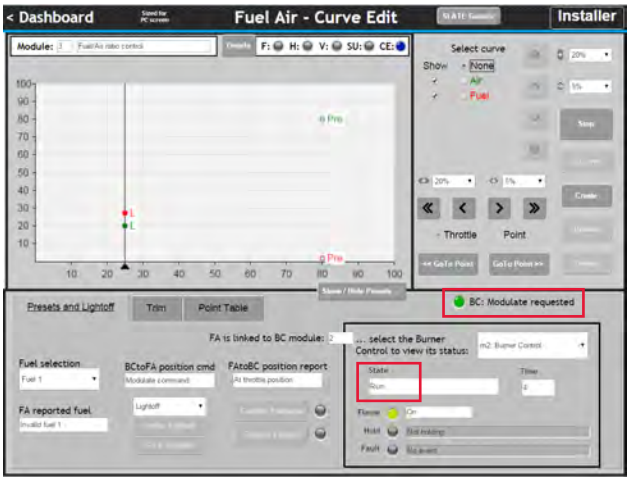
When the actuators have stopped the “Confirm Prepurge” button will become enabled. During commissioning, none of the steps occur automatically, the installer is always in control. Click the Confirm Prepurge button.



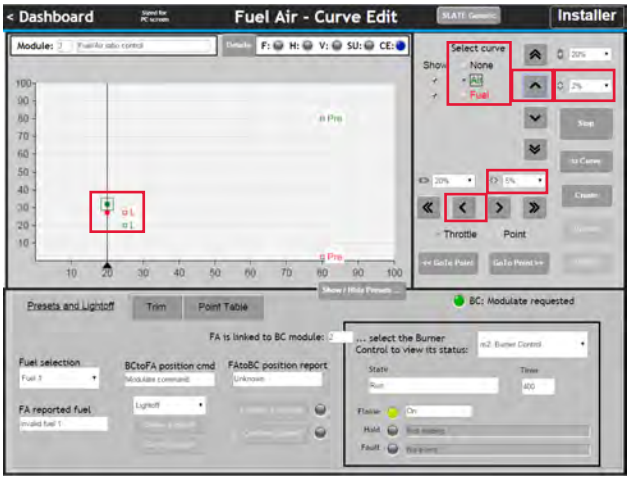
When Prepurge is confirmed, the SLATE Fuel Air Ratio reports that it is “At Prepurge” and this causes the SLATE Burner to measure the prepurge time.



When Prepurge is done the SLATE Burner Control will then request the Lightoff position. The yellow light is on next to the Confirm Lightoff button, but again it is gray because the actuators are not in position.



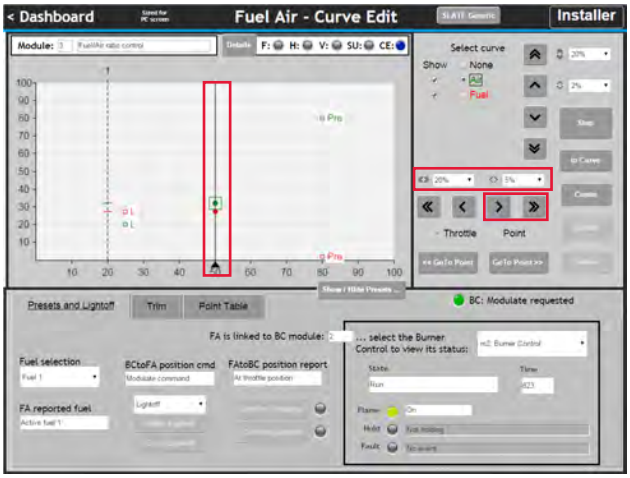
Select “Lightoff” from the drop-down list and click the Go to Lightoff button to move the actuators to the lightoff position.



Once the Lightoff position has been reached, the Confirm Lightoff button will become enabled. Click it to confirm that you want the SLATE Burner Control to light the burner. NOTE: You may have just a few seconds to get the flame turned on at just the right time, after clicking this button.

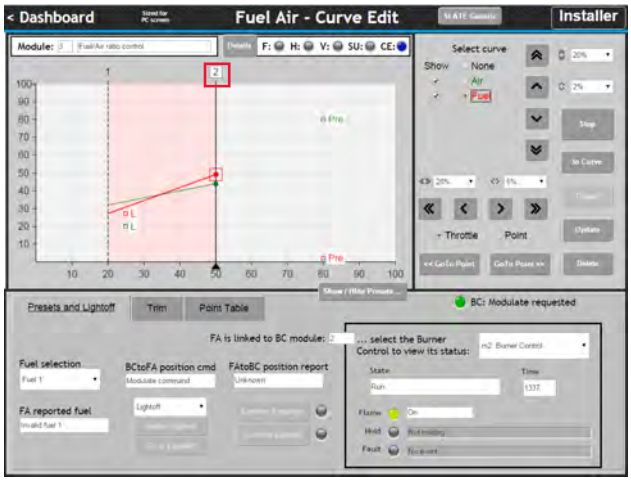
After Pilot and Main flame establishing periods have been completed, the SLATE Burner Control will be in the Run condition and will request modulation from the SLATE Fuel Air Ratio Control. It is now time to start building the Fuel/Air Curve.

As an example, start by moving the throttled down to about 20%, select and move the air up to above the Fuel a bit to just make it different. (Normally this is done while watching a combustion analyzer.)

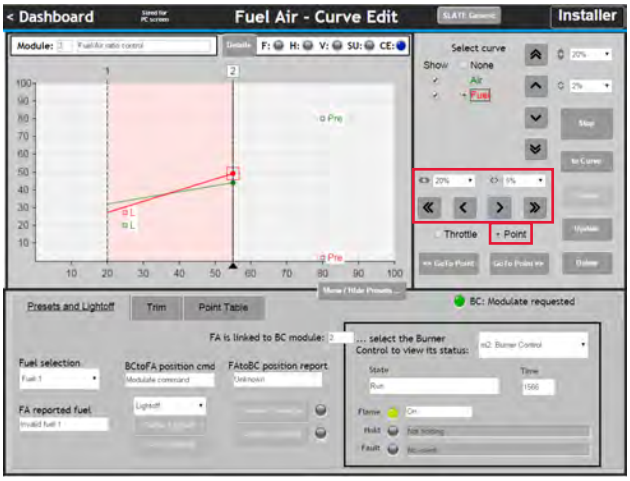


When done, click the Create button to create a point.

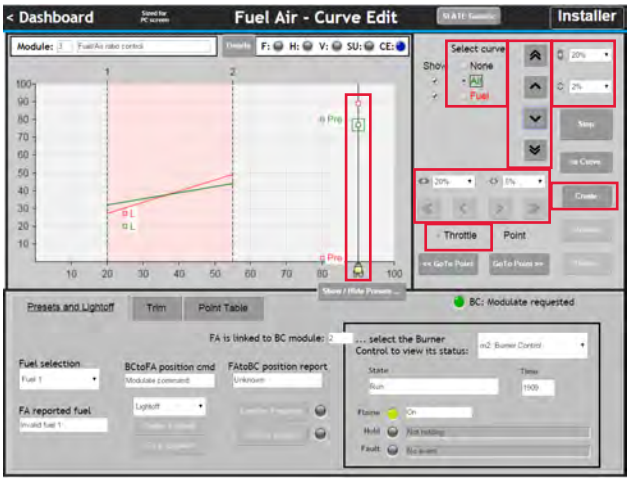
Point 1 now exits. (It is also selected because the throttle is close to the point, as shown by the box around the number.



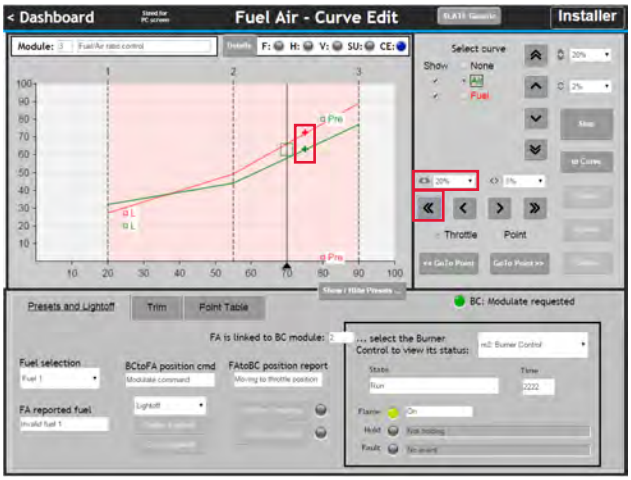
Move the commanded throttle over to around 50% (x axis). Note that the actuators do not change the position (y axis) because there is no curve to follow yet.



Select the Air and move it up to about 45% (y axis). Select the fuel and move it up to about 50%, above the air. Not that the throttle is locked (padlock icon) and the stopped actuator icons are circles instead of dots, indicating an off-curve condition. When done, click Create to create a second point.



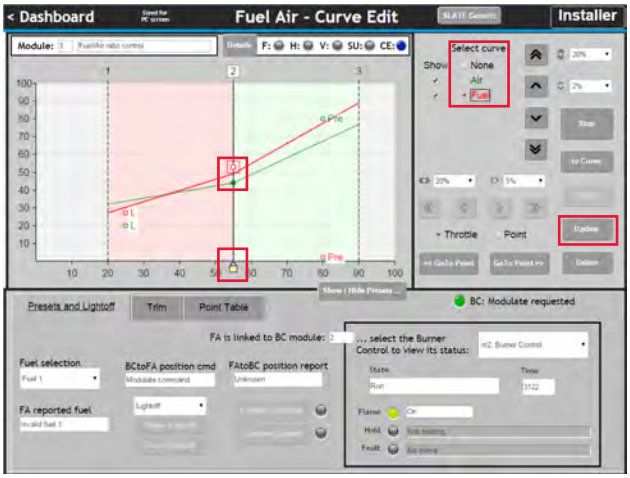
Point 2 now exists (and is selected). The curve segment between the points is pink colored because it has not been verified yet: there are ratios of fuel and air within the region that have not been visited and confirmed as OK. The throttle is unlocked because the actuators are now on-curve.



It is possible to move a selected point. Choose the “Point” radio button and move point 2 around to the left and right. Leave it at the 55% position.

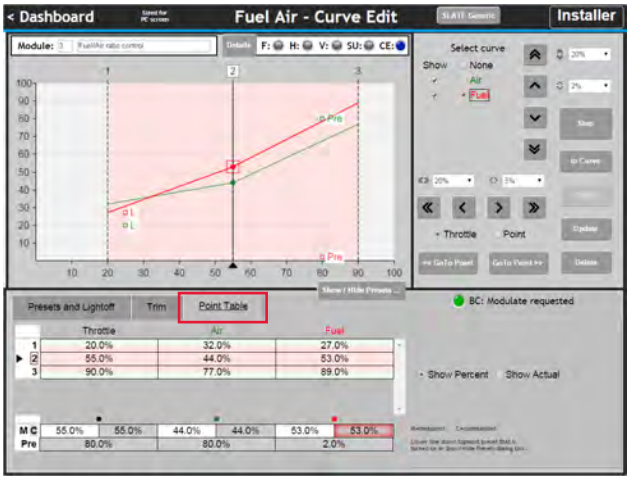
Create a third point. Select “Throttle” for the left-right button function and move the throttle over to around 90% (x axis). Select and move the Fuel up to about 90% (y axis) and the air up to about 75%. Then click “Create” to create a point.

Now that a curve exists, actuators will follow it. Move the commanded throttle to the left by 20% and watch the actuators follow the curve to the new position. They are shown as “+” symbols while in motion.



Jump up the throttle left by another 20% and note that as the actuators cross point 2, the segment turns green. It has been verified because all of it has been “visited”. Normally this is done slowly while watching a gas analyzer, making any necessary adjustments, and creating new points as needed.

Adjust point 2. Select the second point, which means the actuators must stop very close to the point. There is a Go to Point button that allows the actuator to move to the point.



Select the fuel and move it up 5%. Not that the throttle gets locked and the fuel position is shown as an open circle when it stops. Both of these indicate it is off curve. Also not that Update is enabled. Click it to update point 2.

When the point changed, the adjacent segments become invalid and turn pink again, the ratios have changed.

SLATE Fuel Air Ratio commissioning also provides a Point Table. This table is another source of information and is more precise. To access the Point Table Click the tab.

The Point Table shows the same information as the chart; including

- The value of each point
- The Throttle position (triangular arrow) and a lock icon if it is locked.
- The Point that is selected indicated by a box around the number.
- Pink and green shading for verification status

It also shows the exact Measured and the Commanded positions of the throttle and each actuator, and if the actuator is selected, it is shaded (example of the red shaded area at 53% above)

The bottom line shows whichever Preset is the top most selected item in the Show/Hide Presets dialog, so you can see one at a time. Right now the Prepurge (“Pre”) values are shown.

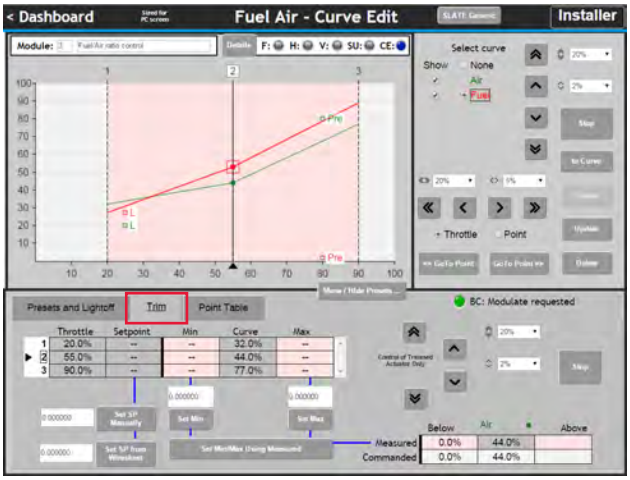
You can also switch the table between showing percent values and actual values. For angular actuators this reads in degrees. Example: an actuator configured to be closed at (0%) at 10 degrees and open (100%) and 70 degrees would show 40 degrees at its 50% position. For a VFD it would typically show RPM (or whatever units are configured), which 0% corresponding to minimum RPM and 100% to maximum RPM. Throttle is always a percentage value.

	Throttle	Air	Fuel
1	20.0%	32.0%	27.0%
2	55.0%	44.0%	53.0%
3	90.0%	77.0%	89.0%

	LOCKED					
M C	55.0%	55.0%	44.0%	44.0%	55.0%	55.0%
Pre	80.0%		80.0%		2.0%	

In the case above, the actuator is above the curve. Note that at point 2 the Fuel position is 53% but the actuator has been commanded to go to and has achieved the position of 55%.

It is above the curve and stopped (open circle) and the throttle is locked.



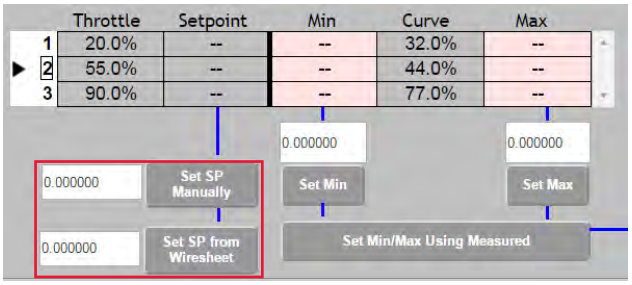
Trim Function

Because Tim is enabled, every point also has:

- Trim Limits - Contains the maximum movement of the actuator

- Trim Setpoint - The desired operating condition (e.g. a percent of O2)

Click the Trim tab to show the Trim Control Panel

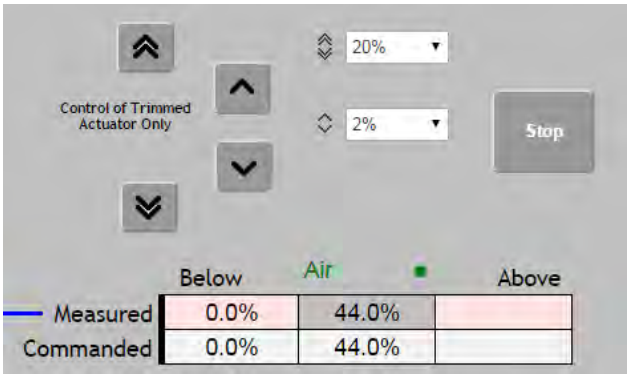


Points are again shown on the left, with a selected point shown by a box around the number. Trim settings must be performed when a point is selected: the buttons are gray and disabled otherwise.

Below, nothing has been entered yet.

At each point, there must be a Setpoint value. There are two ways to provide them.

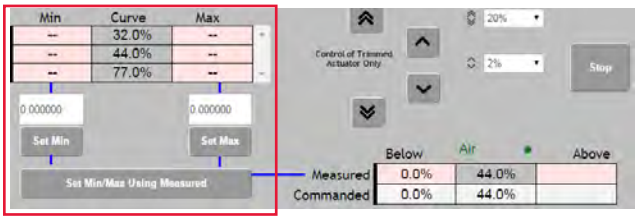
1. Enter a number into the top box and click the “Set SP Manually” button
2. If SLATE AX Tool Wire Sheet logic exists to read one or more sensors and provide a measurement then it will be shown in the bottom box and can be entered using the “Set SP from Wiresheet” button.



At each point, there must be a Min and a Max actuator deviation. These provide safety limits as a percent of actuator travel (e.g. the maximum amount it is allowed to deviate such as 5% or 2%. Both Min and Max are positive numbers. They are the magnitude of offset that is allowed)

The Min limit is mapped to a -100.0 (negative 100%) trim request coming from the SLATE AX Tool Wire Sheet and the Max is mapped to +100.0 (positive 100%). For example, assume that Min for point 2 is set to 3% and as-shown, the curve says 44.0% is the on-curve value for the trimmed actuator at point 2.

If the Wire Sheet then asked for maximum negative (-100.0) the actuator would move to its 41% position, which is 44% minus the full 3% deviation that is allowed. If it asked for -50.0 (-50%) the actuator would move to its 42.5% position (44% minus half of 3%, or 1.5%). Two different used of percent are occurring: maximum actuator deviation is in percent of actuator travel and is a safety limit. Trim requests are a pure number between minus 100% and plus 100% and are non-safety requests.

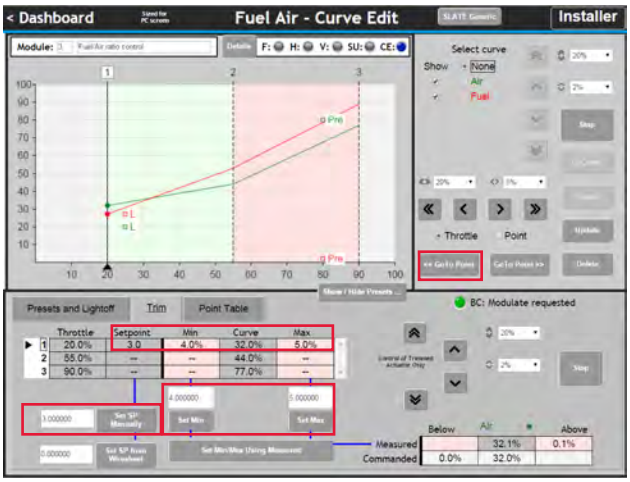


The controls shown below move the Trimmed actuator. The drop-down selectors are actually just a repeat of those you have already used. The normal up/down buttons that you have used can be used to move any selected actuator. However, the four up/down buttons shown above are unique. As the text describes they always move the Trimmed actuator, no matter what actuator is selected.

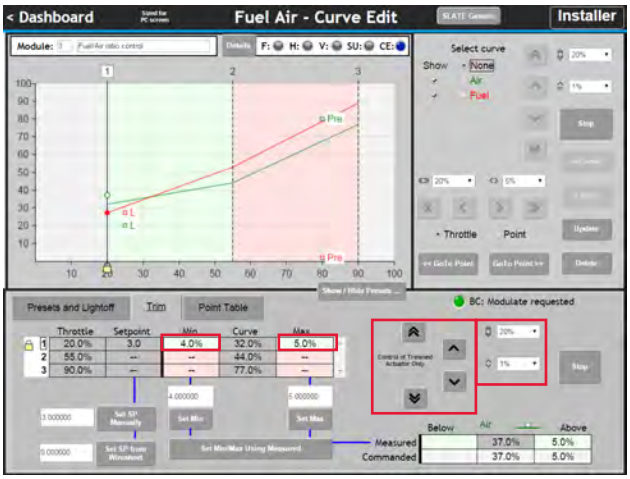
A table shows the status of the Trimmed actuator, Air in this case. The table automatically fills in and shows values on one side or the other, depending on whether the actuator is Below or Above the curve.

There are two ways to enter trim limit Min and Max values:

1. Enter numbers into the boxes and click the Set Min and/or Set Max buttons
2. Click the “Set Min/Max Using Measured” button.



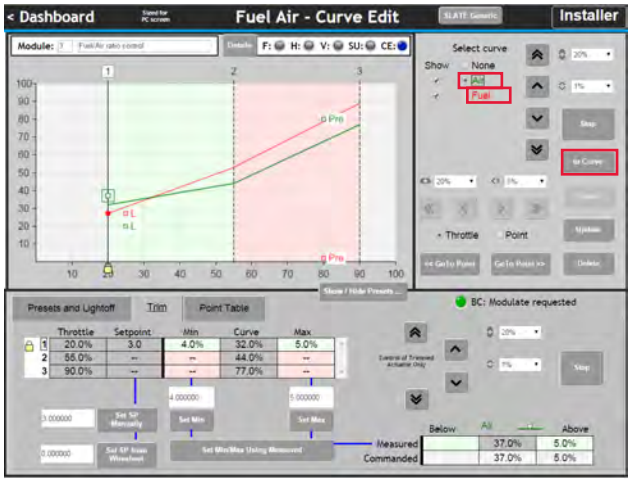
The latter button uses the measured value and it knows which to set. If the actuator is Below the curve it sets the Min value, and if it is Above the curve it sets Max. Normally Trim limits are set while watching a gas analyzer and making small adjustments to determine how far an actuator can deviate and still remain safe.



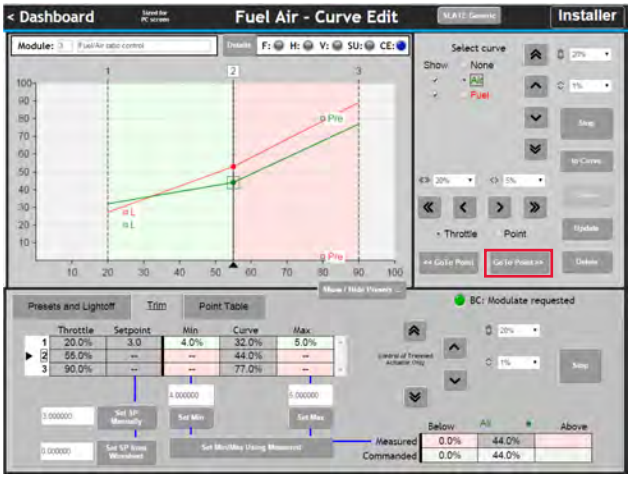
Trim also must be verified before the Fuel Air Ratio can be set for normal operation. Each limit extreme must be “visited” to turn the boxes from pink to green.

Use the “<<Goto Point” button to move point 1. Wait for the actuators to get there and the point to be selected. Your graph segment may stay pink or turn green; either is OK.

Manually enter a Trim Setpoint example of 3.0 and click “Set SP Manually”. Manually enter a Min of 4 and a Max of 5 and click “Set Min” and “Set Max”.

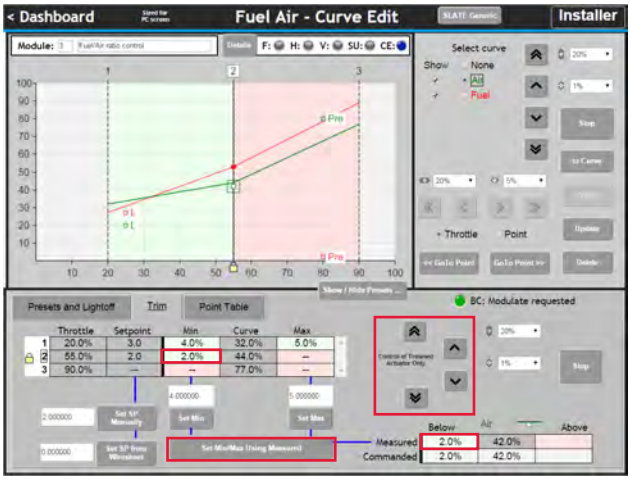


Next visit these two limits by using the trimmed actuator controls. Move the trimmed actuator up to Above limit (32 plus 5=37) and down the Below limit (32 minus 4 = 28). You’ll have to stop right on the limiting value. The boxes should turn green.



Tip! After visiting the second extreme (either below or above) to the actuator back to the curve quickly:

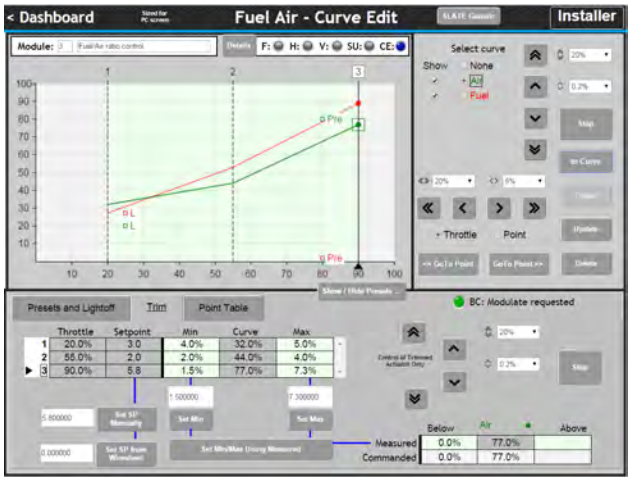
In the selector at the top, select the trimmed actuator (Air in this case). This will enable the “to Curve” button in the top section. Click that button to send the actuator back to the curve and unlock the throttle.



Use “Goto Point>>” to move the throttle to point 2. Again, normally this would be done slowly and one step at a time, while watching a gas analyzer.

If the segment between points 1 and 2 was pink before, it should now be green since all positions between 1 and 2 have been visited.

Set the Trim Setpoint to 2.0 by editing the box and clicking “Set SP Manually”. This time, set the Min value using the other method. First move the trimmed actuator down until it’s 2% below the curve, then click “Set Min/Max Using Measured”. Notice that it turns green right away because it’s already there.



Set the Max value in the same way. Move the actuator up until it's 4% above the curve then click the "Set Min/Max Using Measured" button. When done, click "to Curve" to go back to the curve and unlock the throttle.

Note: You don't have to wait for the actuator to finish moving before advancing its commanded position again.

Finally, move to point 3. Set the final trim setpoint to 5.8, the Min to 1.5% and the Max to 7.3%, using any technique you prefer. Visit the trim limits. Make sure everything is green. Return the actuator to the curve. Click on the top left button in the title bar to go back to the dashboard.

Note that all of the blue check mark circles are complete. The final step is to select the "Enable normal operation" in the Current Fuel Air Mode dropdown. Red lights will occur and the system will shut down. This is normal.

Click the "Details" button and you will see that Verification is needed. Proceed with Verification and you will find just one parameter that needs verifying. It will be one that says the system is now ready to operate. Verify it. Then press the reset button to clear the fault on the SLATE Fuel Air Ratio Module and SLATE Burner Control Module.

The system should now start up, purge, ignite, and run, follow the curve for modulation and also trim according to trim commands.

Built-in screens let you monitor and control these, even if you don't have SLATE AX Tool Wire Sheets controlling the set up yet.

Chapter 8: SLATE Limit Module and Configuration

Overview

The R8001L8001 SLATE Limit Control Module is part of the SLATE Combustion System. The SLATE Limit Control Module provides the ability to bring in any type of analog signal and create limits on either pressure or temperature.

The R8001L8001 provides up to 12 limit blocks with each block monitoring any sensor or pair of sensors. One limit module can be used for multiple SLATE Burner Controls.

LED Array

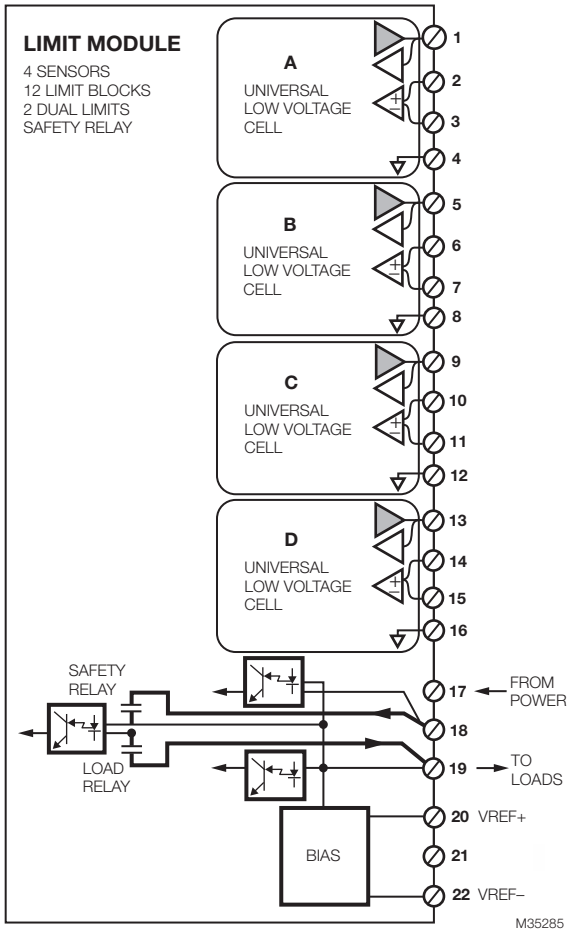
There are three LEDs on the front of the SLATE Limit Control Module that provide quick identification of the system status and any problems that might have occurred. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable module.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No valid configuration
	Green	Running
Fault	Red	Fault
	No light	No fault

LED Display

The SLATE system modules have three-character LED displays used for indicating the module number of the SLATE system. They also have three-position LED colors to indicate the terminal states as shown below.

Color	Description
Green	Terminal is ON or is Normal
Red	Fault
No light	Terminal is OFF or Not in use



Select and Resent Buttons

The SLATE system modules have Select and Reset buttons located on the front of the modules and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Understanding the Terminals

The SLATE Limit Module contains 22 wired terminals. All terminals are 24VDC or 24-240VAC and automatically adapt to the applied system voltage. The Limit Module wiring terminal descriptions can be found below.

Terminal Functions				Min	Typical	Max	Units	
TF1	Voltage	In	Range	0.0	-	15.0	VDC	
			Resolution	-	2.43	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	Whichever is greater
				-1.0	-	1.0	%	
		Out	Range	0.0	-	15.0	VDC	
			Resolution	-	4.0	-	mV DC	
			Null	100.0	-	100.0	mV DC	
			Accuracy	-50.0	-	50.0	mV DC	Whichever is greater
				-1.5	-	1.5	%	
	Current	In	Range	0.0	-	25.0	mA DC	[a]
			Resolution	-	7.4	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA
		Out[b]	Range	0.0	-	25.0	mA DC	Max Load = 500 Ω
			Resolution	-	4.0	-	mA Ω	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-300.0	-	300.0	uA DC	0 to 25 mA
				-50	-	50	uA DC	4 to 20 mA
TF2	Voltage	In	Amplitude	0.0	-	15.0	VDC	
			Trip Point	-	3.0	-	VDC	Comparator Only
			Hysteresis	-	0.25	-	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
TF3	Voltage	In	Range	0.0	-	15.0	VDC	
			Resolution	-	0.37	-	mV DC	
			Null	-25.0	-	25.0	mV DC	
			Accuracy	-25.0	-	25.0	mV DC	
	Current	In	Range	0.2	-	25.0	mA DC	
			Resolution	-	3.7	-	uA DC	
			Null	-0.5	-	0.5	mA DC	
			Accuracy	-1.5	-	1.5	%	0 to 25 mA

[a] TF1 input terminal is held at constant 2.5VDC over allowable current range.

[b] Accuracy specification given is for 100 Ω load. Resolution specification can be converted to mA by dividing out load.

	Complex Functions		Min	Typical	Max	Units	
	Thermocouple						
TF2 & TF3	Type J	Range	-200.0		1025.0	°C

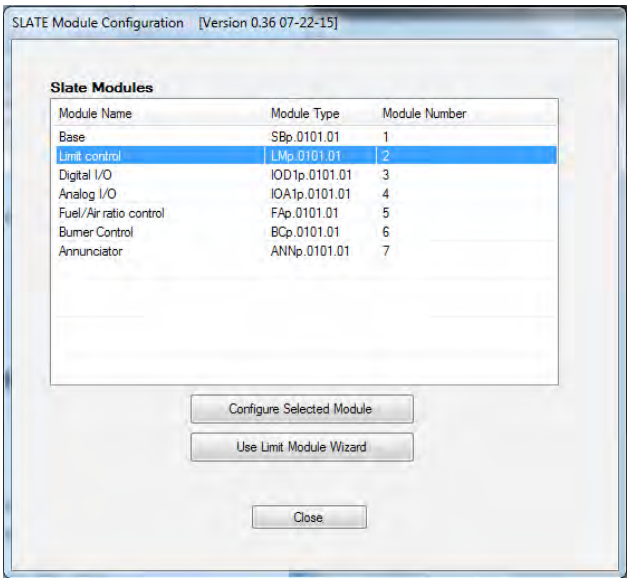
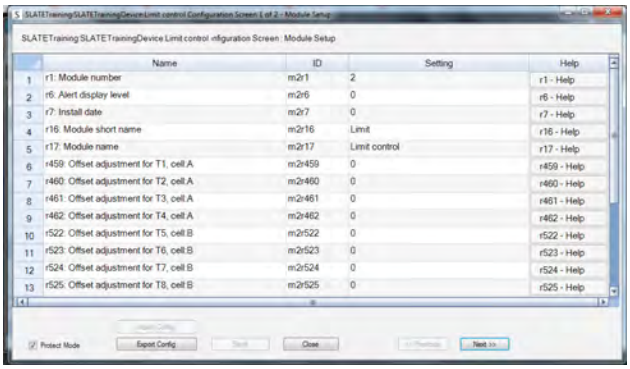
Table 1. Suggested Sensor Selection based on Application.

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16, or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Understanding the SLATE Limit Capabilities

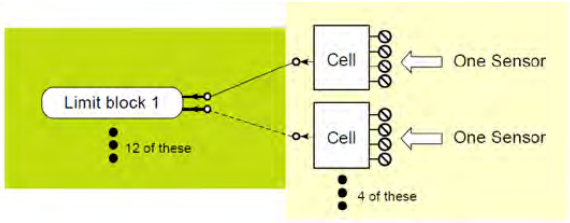


- There are 12 limit blocks
- Each can be a high limit, low limit or dual track limit
- Each block can monitor any sensor or a pair of sensors
- Each block can be assigned to one particular SLATE Burner Control. This is optional. Instead a blocky may cause a Limit lockout directly, or it may simply provide a non-safety notification status
- When the SLATE Limit notifies the SLATE Burner Control of an event, the Burner Control must acknowledge this notification, otherwise the Limit locks out



- The SLATE Burner Control must acknowledge, but the details how the SLATE Burner Control handles each limit event is a safety configuration parameter in the Burner Control.
- Limit blocks have names such as “Outlet High Temp” or “Low Gas Press”. To acknowledge notification, a limit event handler in the SLATE Burner Control must have a matching name. Both names are part of the safety data in each device
- Thus for a Limit lockout to be effective in the case of an acknowledgment failure, all SLATE Burner Controls using the limit for safety must get the power for their outputs via the SLATE Limit module.

Getting Started



1. To access the configuration tool you will need to launch the SLATE AX Tool.
2. If you have not created a Station please refer to Chapter 2 of this manual to learn how to create a new station.
3. If you have created a Station open up the Navigation pane until to reach your SLATE Device. Double-click on the SLATE device to launch the Module Configuration Tool.
4. Select Limit Control

5. Configure the parameters in the configuration section based on the outcomes you need for your application.

Limit Block Concepts

A Limit Block is programmable logic inside the SLATE Limit Module. A SLATE Limit Module contains 12 limit blocks. They are all identical. Each can monitor one cell or two cells. A block may be configured to perform a simple function:

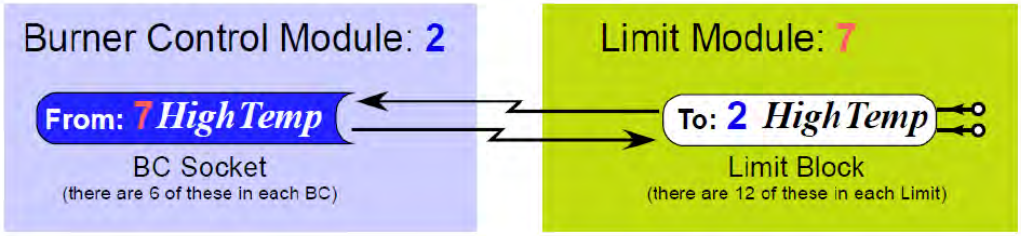
- High Limit- Compare the sensor reading vs. a threshold, react if it is too high
- Low Limit- Compare the sensor reading vs. a threshold, react if it is too low
- Dual Track Limit- Compare two sensors, react if the difference exceeds a threshold

Limit Block Configuration

Enable

- Block name- The name is a reminder of the purpose and is also used for the SLATE Burner Control notification
- Disable- A block that is not needed is disabled
- Status Only- A block may be used to provide only a status value
- Limit Lockout- The block will react by causing a lockout of Limit module
- SLATE Burner Control Notification- The block will react notifying a particular SLATE Burner Control
- Auto-ignition Burner Control Notification- The block will react by notifying a particular burner that the auto-ignition temperature has been reached (typically 1400°F)

Assignment



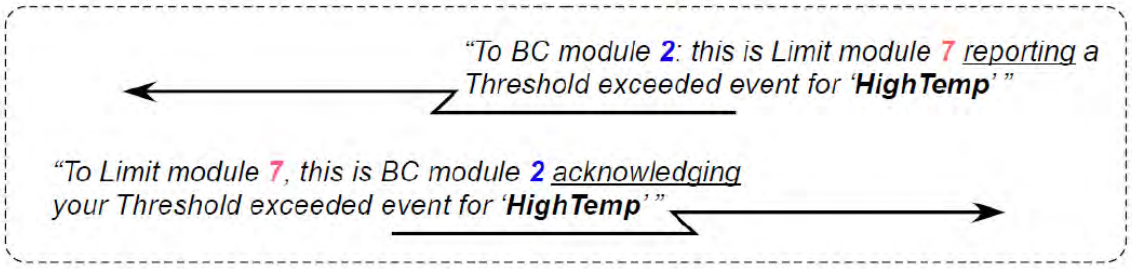
- A,B,C,D – The block may be assigned to cell A, B, C or D
- AB closest, AB average, CD closest, CD average, Dual Track AB, Dual Track CD- It can use the closest sensor to the threshold or can average two of them or it can compare them to each other

Threshold- This is the high limit, low limit or maximum difference for Dual Track

Hysteresis- Hysteresis currently is not used

Detection time- The threshold must be exceeded for this amount of time, before the block will react

Burner Control Notification



A socket is configured with the module number of a Limit module: 7

And a socket name: HighTemp

A block is configured to send notification to BC module: 2

using the Block's name: HighTemp

- The BC will only acknowledge a message from a Limit module whose number matches what is configured for the Socket, and only if it has an exactly matching socket name.

- The Burner Control implements 6 "sockets", which are logic blocks that can receive notifications from a Limit module.

- The response to the Limit's notification is determined by the configuration of the socket in the Burner Control. Each of the sockets has **Socket configuration parameters:**

- **Limit module number** This is the module number of the Limit which has a block that is set up to notify this burner control.
- **Limit name** The name in the socket must be and EXACT match for the block's name.
- **Limit response enable:** (also called Limit response "trigger")

  Disable
  Always
  Prepurge, Ignition, and Run
  Ignition and Run
  Flame is on
  Run

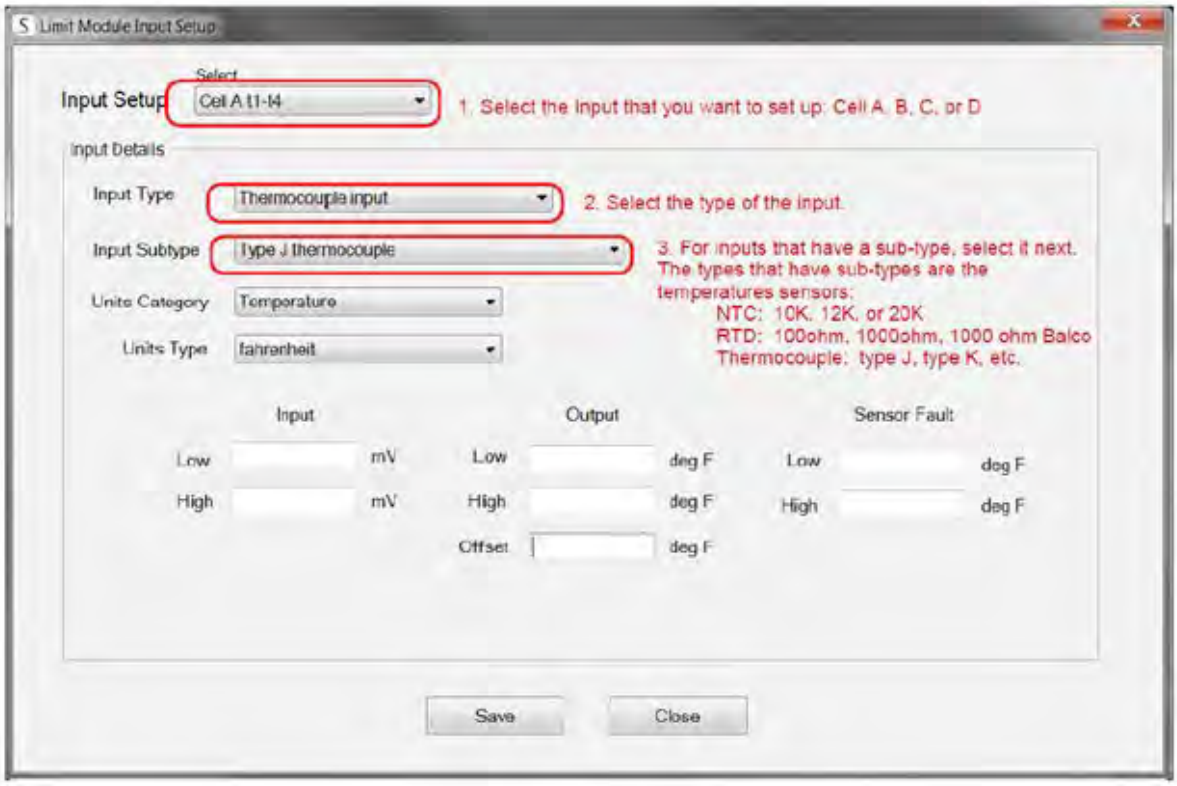
  The socket is Disabled if it is not used. Otherwise it can respond Always, or only when the BurnerControl is in a specific condition.

- **Limit response:**

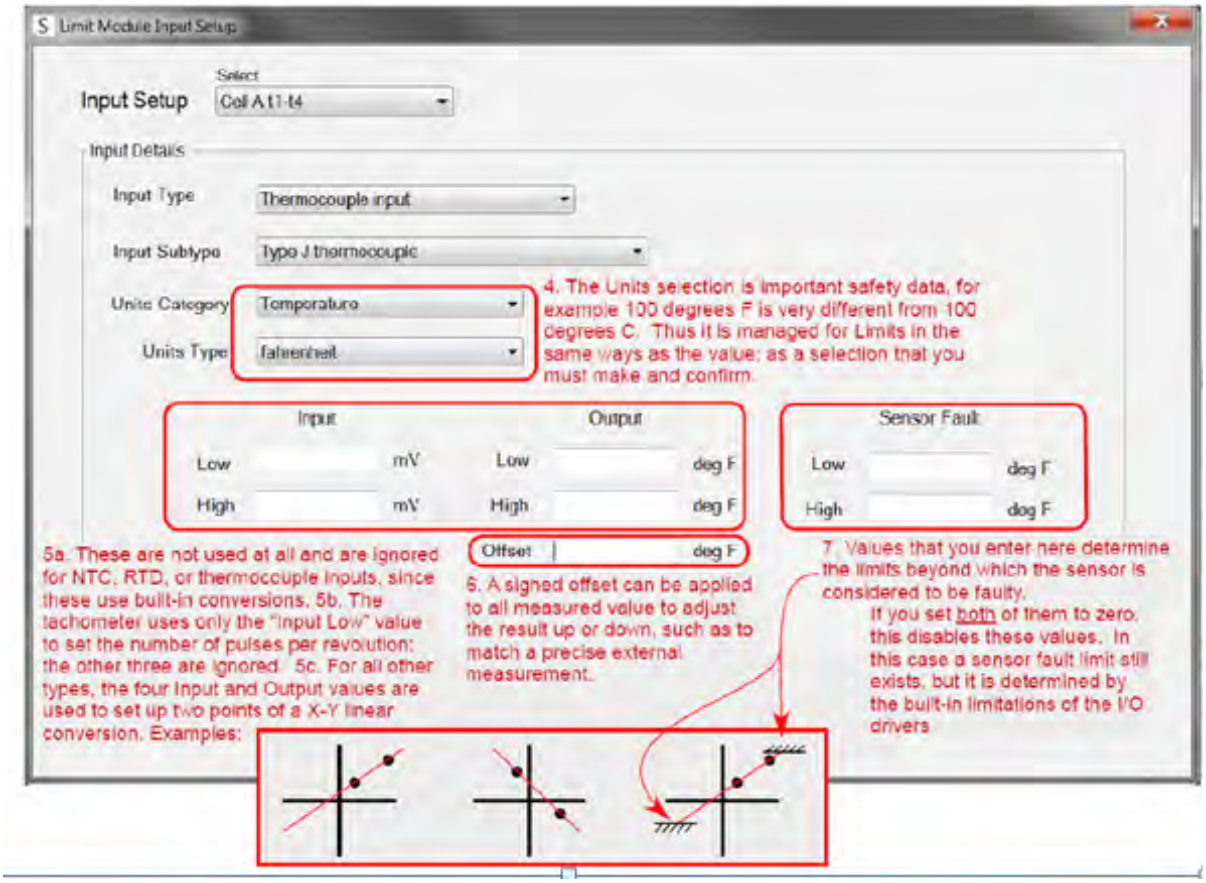
  Recycle 1/2/3
  Soft or Hard Lockout
  Auto-ignition

  The response can be one of the three Recycle "recipes", a Soft Lockout, a Hard lockout, or can be the special case which notifies the BC that an autoignition temperature (1400 F is typical) has been reached and thus flame amp signals can be ignored.

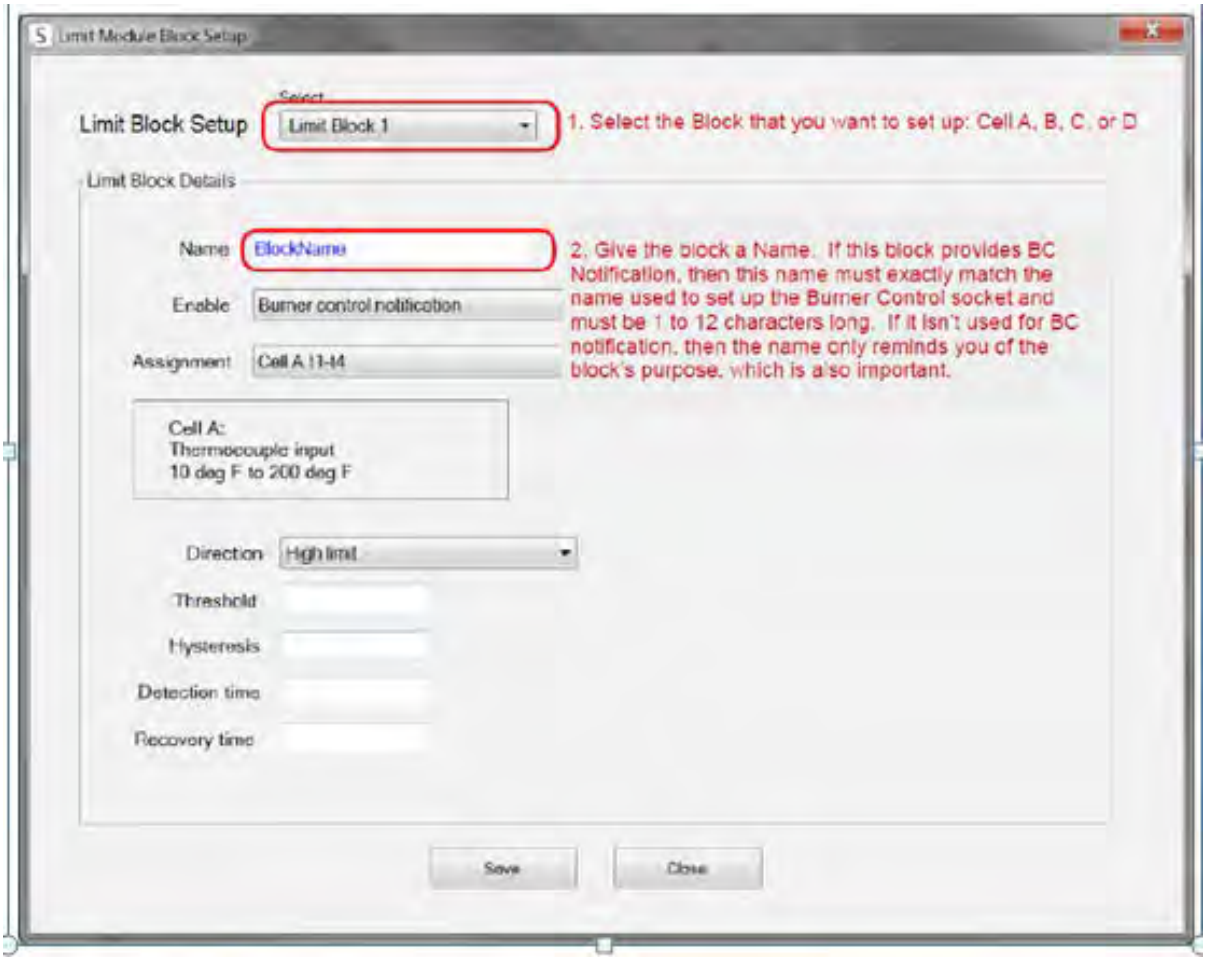
• Each Socket provides a status register that reports whatever the Limit block is currently sending, for display or for wire sheet use. The values of the Limit block **status reported by a socket** may be:



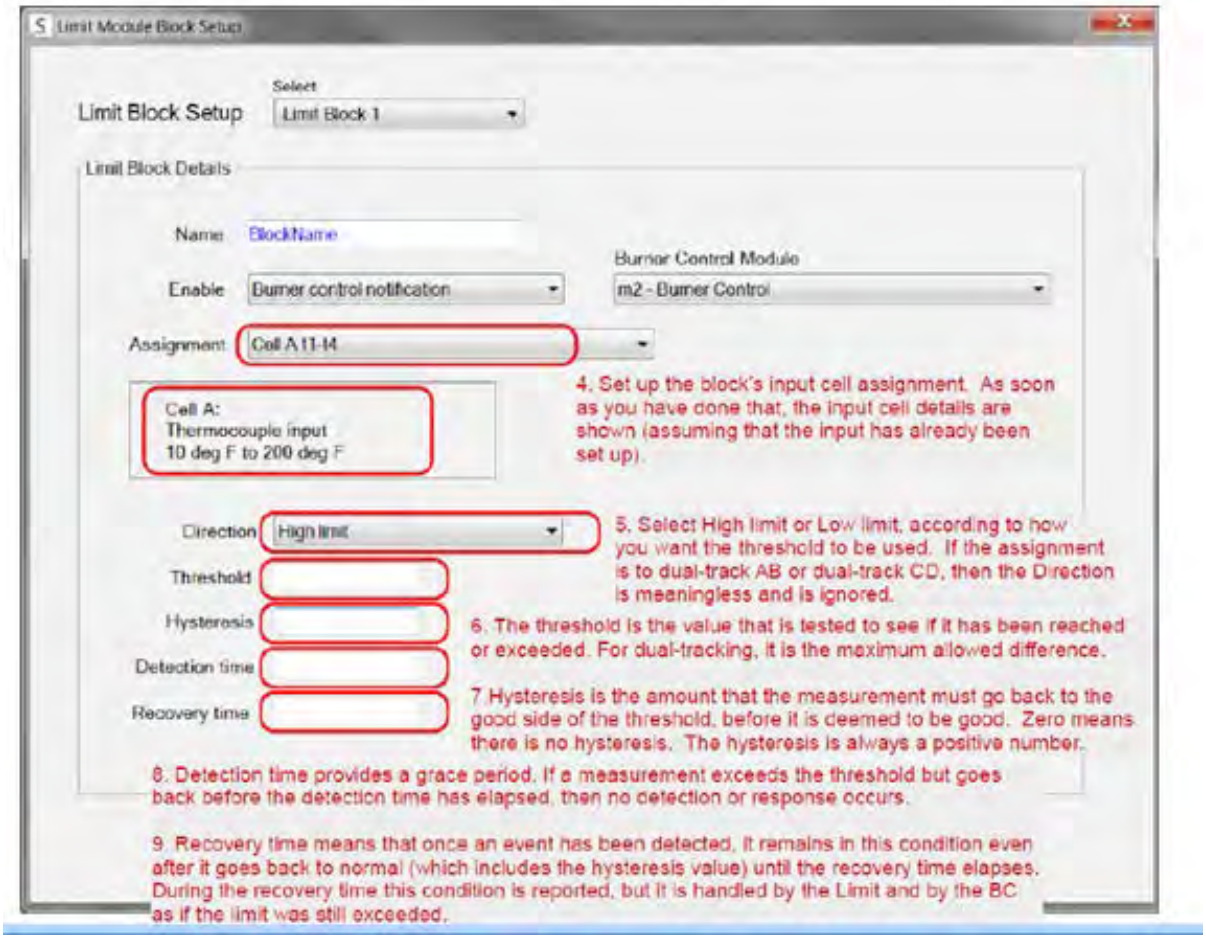
• **Limit status**



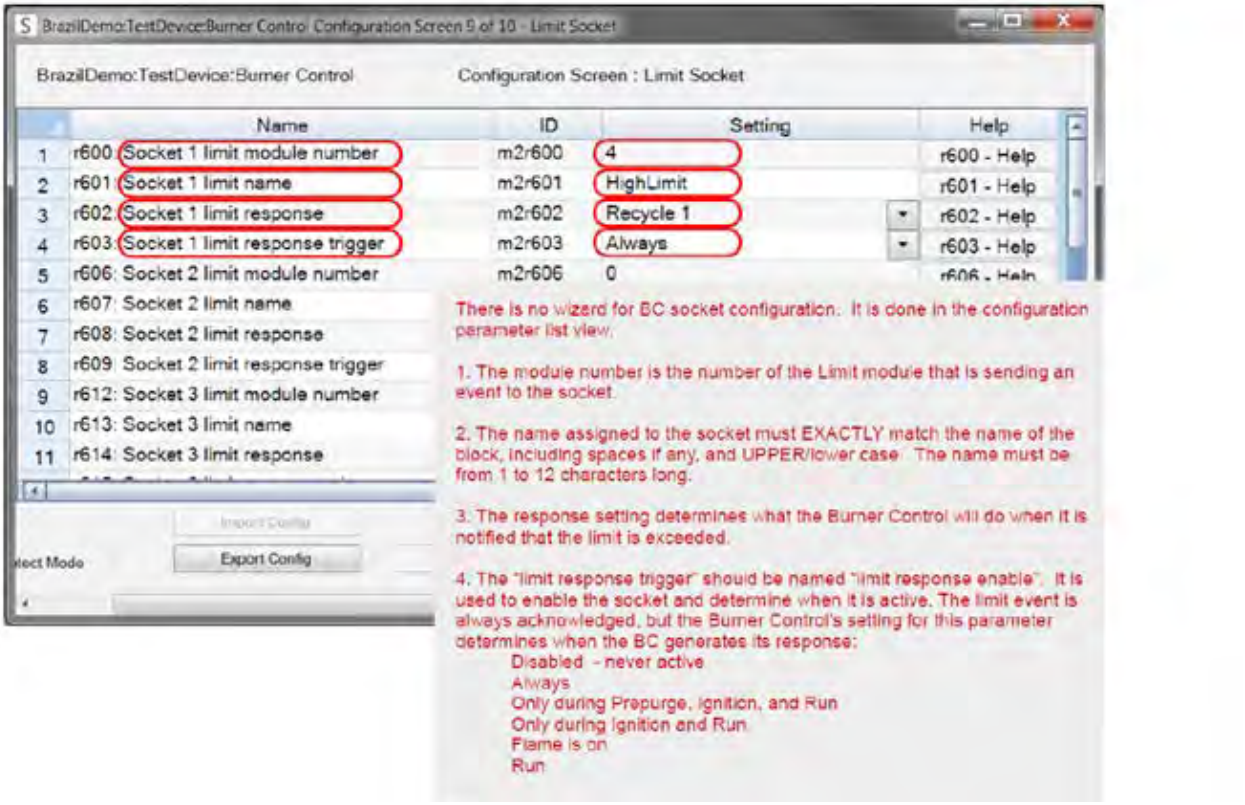
Unknown	**Unknown can occur briefly at startup time. Limit OK means the limit condition is normal. Limit Exceeded means the threshold has been exceeded (too high for a high limit, too low for a low limit, too far apart for a dual tracking limit). Limit Recovery means that the threshold was exceeded in the past, is OK now, but the recovery time has not yet elapsed.**
Limit OK **Limit Exceeded** **Limit Recovery**	
Autoignition threshold exceeded	**The report for autoignition has its own, separate value.**
Limit communication failure	**If the socket is set up but a Limit module is not communicating, then this value will occur.**
Sensor fault	**A sensor fault indicates that the Limit block is having trouble with the sensor reading.**



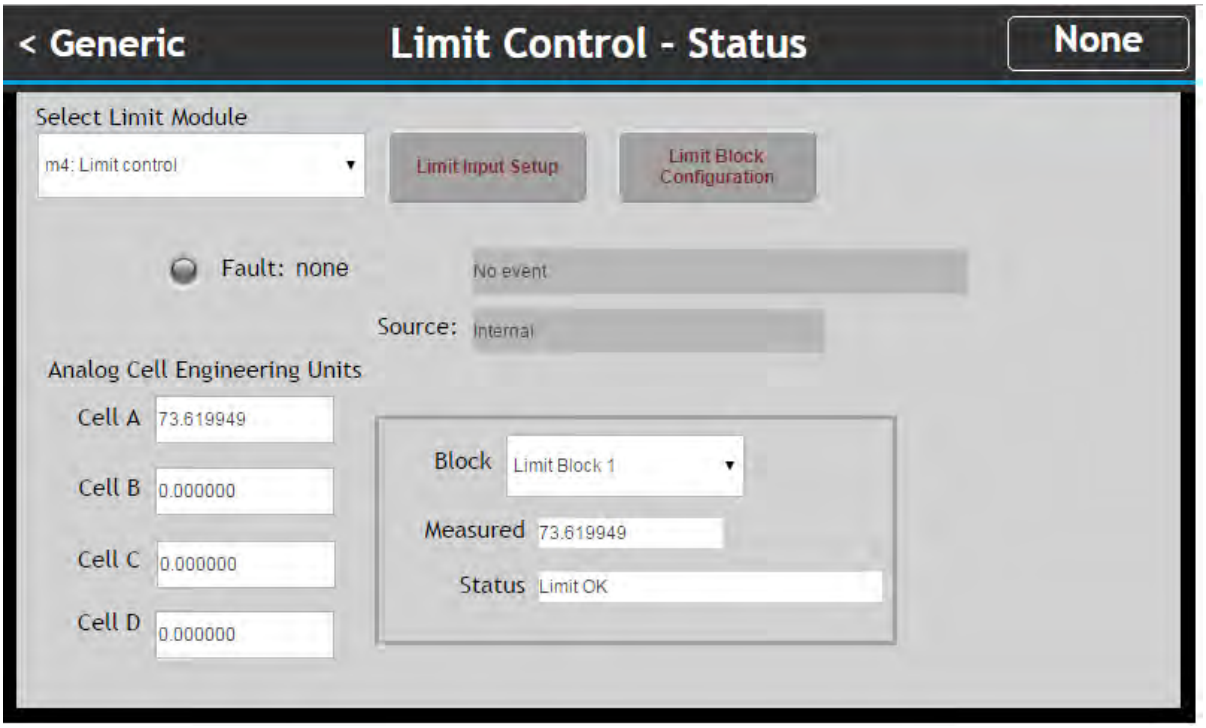
For a socket set up to monitor a limit threshold, any value other than Limit OK will cause a fault response.



For a socket set up to receive autoignition notification, any value other than Autoignition threshold exceeded is treated as if the threshold is not exceeded.



Setting up a Limit Input Cell only using the configuration wizard



Limit Module Input Setup
Input Setup
Select
Cell A t1-t4
Input Details
Input Type
Thermocouple input
Input Subtype
Type J thermocouple
Units Category
Temperature
Units Type
fahrenheit
4. The Units selection is important safety data, for example 100 degrees F is very different from 100 degrees C. Thus it is managed for Limits in the same ways as the value; as a selection that you must make and confirm.
Input
Output
Low
mV
Low
deg F
High
mV
High
deg F
Sensor Fault
Low
deg F
High
deg F
Offset
deg F
5a. These are not used at all and are ignored for NTC, RTD, or thermocouple inputs, since these use built-in conversions. 5b. The tachometer uses only the "Input Low" value to set the number of pulses per revolution; the other three are ignored. 5c. For all other types, the four Input and Output values are used to set up two points of a X-Y linear conversion. Examples:
6. A signed offset can be applied to all measured value to adjust the result up or down, such as to match a precise external measurement.
7. Values that you enter here determine the limits beyond which the sensor is considered to be faulty.
If you set both of them to zero, this disables these values. In this case a sensor fault limit still exists, but it is determined by the built-in limitations of the I/O drivers

Limit Module Block Setup
Limit Block Setup
Select
Limit Block 1
1. Select the Block that you want to set up: Cell A, B, C, or D
Limit Block Details
Name
BlockName
Enable
Burner control notification
Assignment
Cell A I1-I4
2. Give the block a Name. If this block provides BC Notification, then this name must exactly match the name used to set up the Burner Control socket and must be 1 to 12 characters long. If it isn't used for BC notification, then the name only reminds you of the block's purpose, which is also important.

4. Set up the block's input cell assignment. As soon as you have done that, the input cell details are shown (assuming that the input has already been set up).
Direction
High limit
Threshold
Hysteresis
Detection time
Recovery time
5. Select High limit or Low limit, according to how you want the threshold to be used. If the assignment is to dual-track AB or dual-track CD, then the Direction is meaningless and is ignored.
6. The threshold is the value that is tested to see if it has been reached or exceeded. For dual-tracking, it is the maximum allowed difference.
7 Hysteresis is the amount that the measurement must go back to the good side of the threshold, before it is deemed to be good. Zero means there is no hysteresis. The hysteresis is always a positive number.
8. Detection time provides a grace period. If a measurement exceeds the threshold but goes back before the detection time has elapsed, then no detection or response occurs.
9. Recovery time means that once an event has been detected, it remains in this condition even after it goes back to normal (which includes the hysteresis value) until the recovery time elapses. During the recovery time this condition is reported, but it is handled by the Limit and by the BC as if the limit was still exceeded.

11 r614: Socket 3 limit response
Export Config
There is no wizard for BC socket configuration. It is done in the configuration parameter list view.
1. The module number is the number of the Limit module that is sending an event to the socket.
2. The name assigned to the socket must EXACTLY match the name of the block, including spaces if any, and UPPER/lower case. The name must be from 1 to 12 characters long.
3. The response setting determines what the Burner Control will do when it is notified that the limit is exceeded.
4. The "limit response trigger" should be named "limit response enable". It is used to enable the socket and determine when it is active. The limit event is always acknowledged, but the Burner Control's setting for this parameter determines when the BC generates its response:
Disabled - never active
Always
Only during Prepurge, Ignition, and Run
Only during Ignition and Run
Flame is on
Run

SLATE Limit Standard Screens

Chapter 9: SLATE Analog I/O Module

Overview

The R8001U3001 SLATE Analog I/O module provides analog input and output capability for all combustion applications. SLATE has a concept of an analog cell per module. The SLATE analog sell allows you to configure multiple combinations of functionality. The SLATE Analog Module provides voltage inputs and outputs, current inputs and outputs, PWM, tach, RTD, NTD and support for type J and K thermocouples.

LED Array

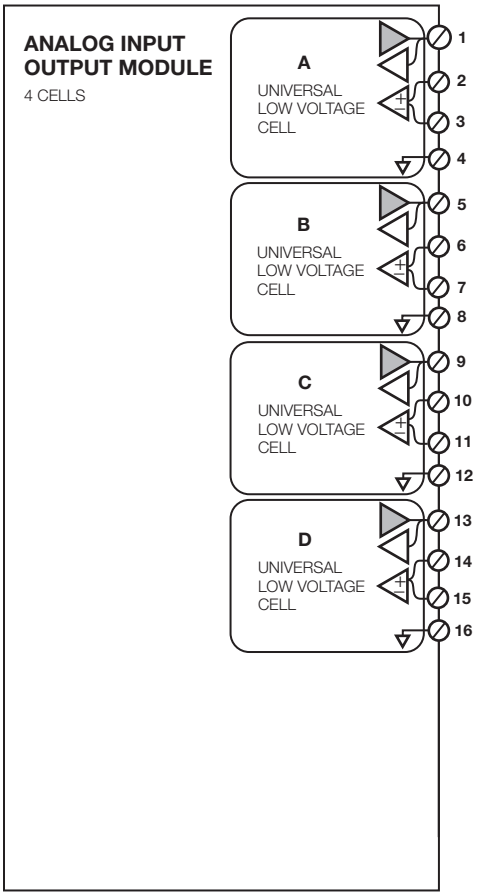
There are three LEDs on the front of the SLATE Analog Module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No valid configuration
	Green	Running
Fault	Red	Fault
	No light	No fault

LED Displays

The SLATE system modules have three-character LED displays used for indicating the module number of the SLATE system. It also has a three position LED colors to indicate terminal states shown in the table below.

Color	Description
Green	Terminal is ON or is Normal
Red	Fault
No light	Terminal is OFF or Not in use



Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Understanding the Terminals

The SLATE Analog I/O module contains 16 wired terminals.

Chapter 10: SLATE Digital I/O Module

Overview

The R8001D4001 SLATE Digital I/O module offers universal 14 opto inputs or 6 relays for a wide variety of combustion applications. It automatically adapts to 24 VDC or 24VAC to 240 VAC (one voltage per module).

Status LEDs

There are 3 LEDs on the front of the Digital Module provides quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module.

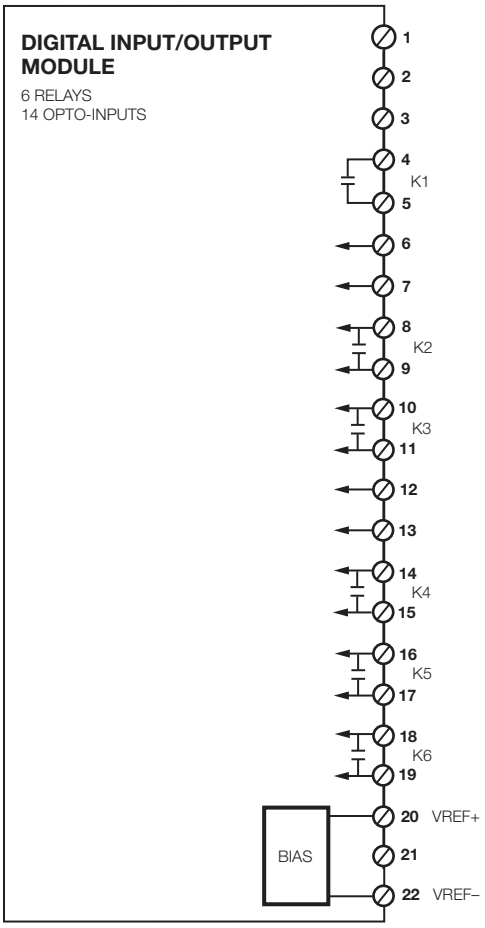
LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	Fault
	No light	Running

There are 16 separate LEDs for each of the Digital Module terminals. Refer to the table below for module LED descriptions

Color	Description
Green	Terminal is on
Red	Fault
No light	Not in use

LED Display

All SLATE system modules have seven-segment, three positioned LED display for indicating the assigned module number of the SLATE System. See figure below.



Select and Reset Buttons

All SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment the segment display information.

Understanding the Terminals

The SLATE Digital Module contains 18 wired terminals. Refer to the diagram below. All digital terminals are 24 VDC or 24 -240 VAC and automatically adapt to the applied system voltage.

M35286

Wiring

The following table highlights the wiring for the SLATE Digital I/O Module.

Terminal	Description	Rating
1	Unused	---
2	Unused	---
3	Unused	---
4	K1 Relay Dry Contacts	9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC
5	K1 Relay Dry Contacts	(see Terminal 4 above)
6	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
7	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
8	K2 Relay Dry Contacts or Input	**Relay:** 9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC **Input:** 24VDC (0.5mA), 24-240VAC (0.2mA)
9	K2 Relay Dry Contacts or Input	(see Terminal 8 above)
10	K3 Relay Dry Contacts or Input	**Relay:** 9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC **Input:** 24VDC (0.5mA), 24-240VAC (0.2mA)
11	K3 Relay Dry Contacts or Input	(see Terminal 10 above)
12	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
13	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
14	K4 Relay Dry Contacts or Input	**Relay:** 9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC **Input:** 24VDC (0.5mA), 24-240VAC (0.2mA)
15	K4 Relay Dry Contacts or Input	(see Terminal 14 above)
16	K5 Relay Dry Contacts or Input	**Relay:** 9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC **Input:** 24VDC (0.5mA), 24-240VAC (0.2mA)
17	K5 Relay Dry Contacts or Input	(see Terminal 16 above)
18	K6 Relay Dry Contacts or Input	**Relay:** 9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC **Input:** 24VDC (0.5mA), 24-240VAC (0.2mA)
19	K6 Relay Dry Contacts or Input	(see Terminal 18 above)
20	Vref+	24VDC (0.1mA), 24VAC (0.1mA), 85–264VAC (0.2mA)
21	Unused	---
22	Vref-	(see Terminal 20 above)

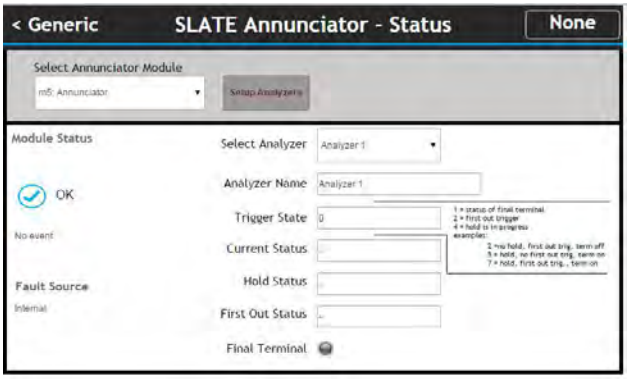
Note: Only one voltage can be used per module.

Recommended Wire Size

Application	Recommended Wire Size	Recommended Part Numbers
Line voltage terminals	14, 16 or 18 AWG copper conductor, 600 volt insulation, moisture-resistant wire.	TTW60C, THW75C, THHN90C

Application	Recommended Wire Size	Recommended Part Numbers
Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Chapter 11: SLATE Annunciator Module



Overview

The R8001N7001/U Annunciator Module is designed to monitor the status of individual components in a series wiring of limits, control and/or interlock contacts wired to the SLATE Burner Control Module on a commercial or industrial burner.

The Annunciator Module acts as a system monitor, providing first-out annunciation of individual components for effective burner and system troubleshooting. In the SLATE AX Tool, the 14 available annunciator terminal labels may be renamed to reflect the actual connected device. Additionally, extra diagnostic text may be added to further enhance diagnostic user information. All modified annunciator terminal labels and additional diagnostic text will be reflected on the Annunciator Module HMI screen.

The SLATE Annunciator Module also contains one programmable relay output, which can be configured from the wire sheet.

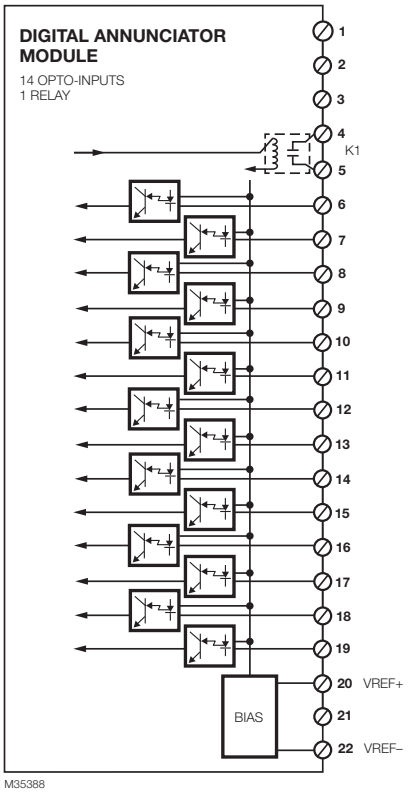
Status LEDs

There are 3 LEDs on the front of the Annunciator Module that provide quick identification of system status and problems. This status is broadcast to other modules on the platform bus in case they are affected by the inoperable module(s).

LED	Color	Description
Power	No light	System does not have power.
	Green	System has power.
CPU	Red	No Wiresheet (SLATE) loaded. Remove Limit System Status).
	Green	Running
Fault	Red	Fault
	No light	Running

There are also 16 separate LEDs for each of the Annunciator Module terminals.

Color	Description
Green	Terminal is on
Red	Fault
No light	Not in use



LED Display

All SLATE system modules have a seven-segment, three-position LED display for indicating the assigned module number of the SLATE system.

Select and Reset Buttons

All SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Understanding the Terminals

The SLATE Annunciator Module contains 18 wired terminals. All annunciator terminals are 24VDC or 24-240VAC and automatically adapt to the applied system voltage.

Terminal	Description	Rating
1	Unused	---
2	Unused	---
3	Unused	---
4	K1 Relay Dry Contacts	9.8 FLA, 58.8 LRA @ 120VAC, 4A (0.5 PF), 20A inrush @ 240VAC, 2A cont, 10A inrush @ 24VDC
5	K1 Relay Dry Contacts	(see above)
6	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
7	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
8	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
9	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
10	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
11	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
12	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
13	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
14	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
15	Input	24VDC (0.5mA), 24-240VAC (0.2mA)

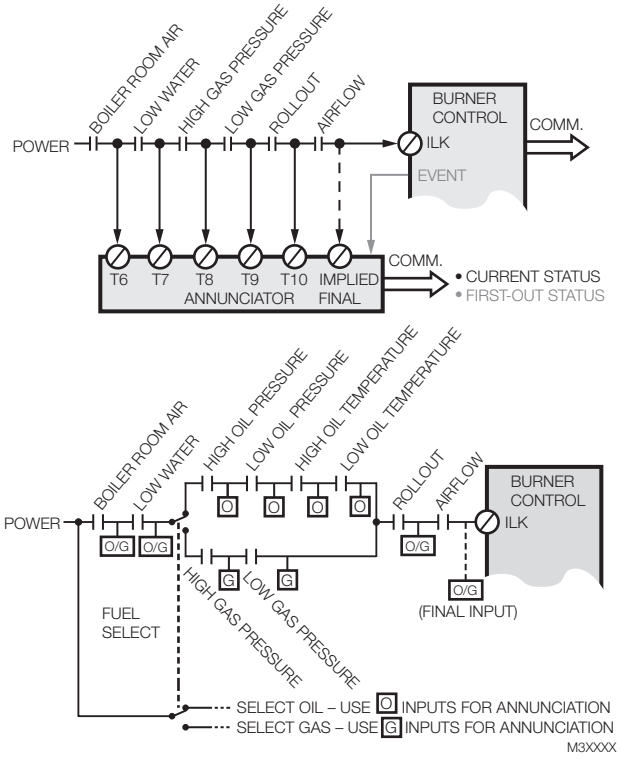
Terminal	Description	Rating
16	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
17	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
18	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
19	Input	24VDC (0.5mA), 24-240VAC (0.2mA)
20	Vref+	24VDC (0.1mA), 24VAC (0.1mA), 85-264VAC (0.2mA)
21	Unused	---
22	Vref-	(see Vref+ above)

Note: Only one voltage can be applied per module (same at all terminals)

Wiring

For installation and wiring information, refer to document 32-00012, the SLATE Annunciator Module Installation Instructions.

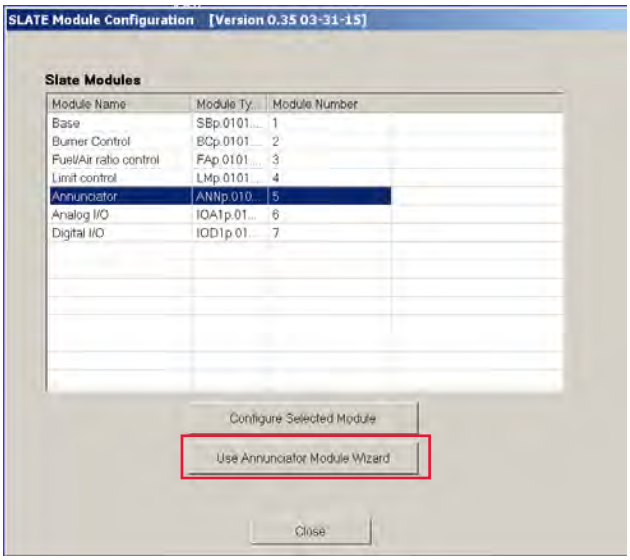
Any series string of limits, control and/or interlock contacts wired to the SLATE Burner Control Module may be wired to the Annunciator Module. Sample wiring diagrams are shown below.



For clarity, there are some guidelines regarding Annunciator terminal wiring and usage:

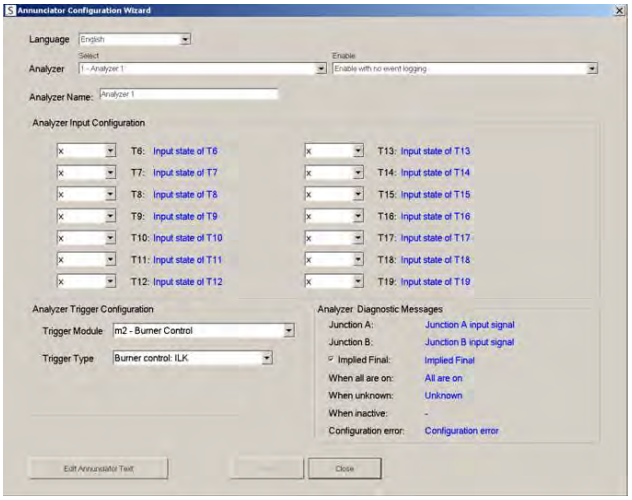
- Lower numbered terminals must be closer to the source of power than higher numbered terminals
- A series string input to the Annunciator should utilize contiguous Annunciator terminals because that is easiest to understand, however it is not necessary.
- Multiple Annunciator Modules can be used with a single SLATE device.
- A series string input to the Annunciator cannot be split up between two different Annunciator modules. The entire string must fit on a single Annunciator.
- Each series string can have an Implied Final input. It is the last item in the Annunciator input series string and is not wired to the Annunciator. It is not wired to the Annunciator because it's the last component in the wiring string going into the Burner Control Module and thus is directly monitored by the Burner Control; if all other contacts in the string are closed and powered, then it is the Implied Final (last) component which is causing the fault. Using Implied Final inputs allows the use of fewer terminals.
- The longest series string input that can be monitored is 15 contacts including the 14 inputs on the Annunciator & the Implied Final input.

The SLATE AX Tool is used to configure the Analyzer (trigger) input string, the SLATE Trigger Module, Module Trigger Type, rename the Annunciator terminal labels and add additional diagnostic text.



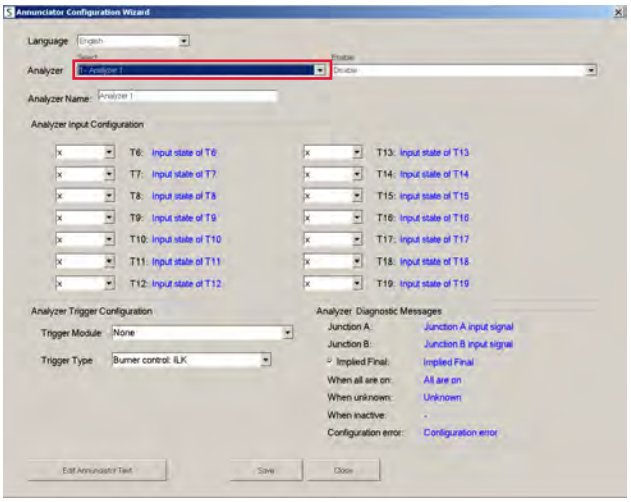
The Annunciator safety relay output can be used for any purpose, thus the wiring will be application specific.

It is important to lie out and understand the series string circuits which are to be monitored by the Annunciator Module before proceeding with configuration.



Getting Started

1. To access the configuration tool you will need to launch the SLATE AX Tool.
2. If you have not created a Station please refer to Chapter 2 of this manual to learn how to create a new station.
3. If you have created a Station open up the Navigation pane until to reach your SLATE Device. Double-click on the SLATE device to launch the Module Configuration Tool.
4. Next click on "Use Annunciator Wizard"

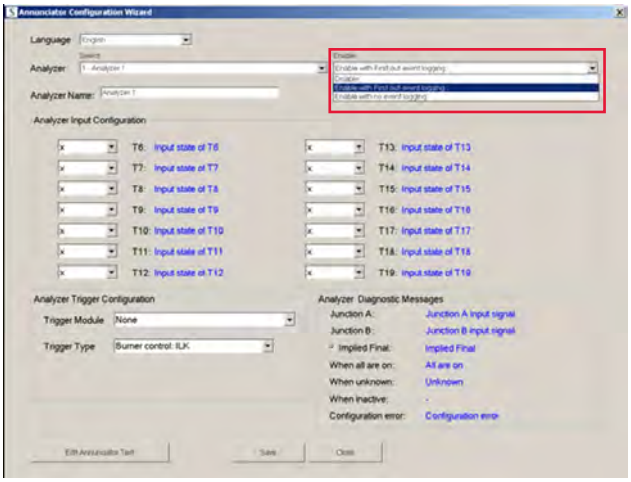


5. You should be taken to the Annunciator Configuration Wizard, which allows you to set up the Annunciator Module input terminals. This is how the SLATE Annunciator Module is configured for use. There are 14 Annunciator terminal inputs that will need to be configured (T6-T19). After you have configured all of the terminals you will need to click the Save button.

   Once you are done with all of the SLATE programming and configuration it will be stored as a kit file as explained in Chapter 15 and Loading a SLATE Kit.

6. Each separate input string to the Burner Control Module is considered an Analyzer (trigger). Examples of Analyzer (trigger) input strings are the burner control interlock, airflow switch/ lockout input, pre-ignition interlock, limit control inputs for fuel 1 or fuel 2, limit module LCI input or other wire sheet user-defined triggers.

   Define your input string to the Annunciator Module by selecting the Analyzer (trigger) from the drop-down menu. Type in a descriptive Analyzer Name as desired. Up to 6 Analyzers are available.



7. Next select how the Annunciator will handle the input string via the Enable drop-down menu. The options are:

   Disable: All configuration and setup values can be edited but no action is taken at run time until the Analyzer (trigger) is enabled.

   Enable with First out event logging: Whenever a first-out trigger is detected, a time-stamped event log record is generated, describing the result of the first-out analysis.

   Enable with no event logging: All of the first-out actions are still generated, however, the Annunciator does not generate any event log records. It shows live status only.

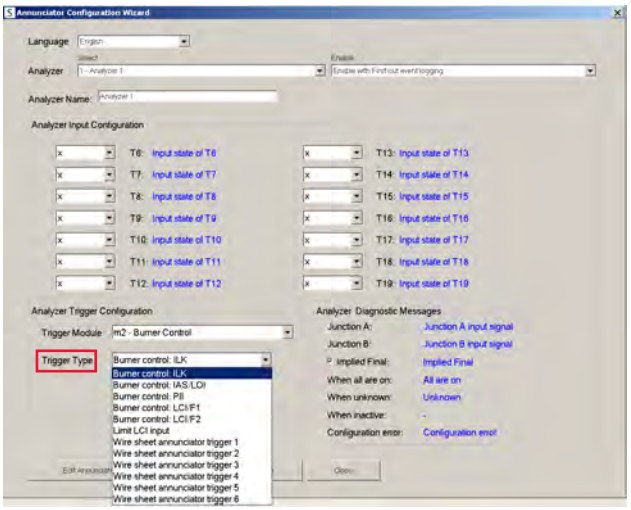
8. The Analyzer Trigger Configuration attaches the Analyzer to a trigger source. Next select the Trigger Module for this particular Analyzer (trigger). The options are:

   - None
   - m1 - Base
   - m2 - Burner Control
   - m3 - Fuel/Air ratio control
   - m4 - Limit control
   - m5 - Annunciator

- m6 - Analog I/O
- m7 - Digital I/O

9. The next step is to select the Trigger Type for the previously selected Trigger Module. There are 5 specific Burner Control Module triggers, 1 specific Limit Module trigger and 6 generic wire sheet triggers.

The 6 generic wire sheet triggers allow the annunciator to monitor a series string that the SLATE designer creates for some purpose related to the SLATE Control Program (i.e. wire sheet) on the Base Module. For any of the 6 generic annunciator triggers, a standard wire sheet Modulating Output block may be bound to the corresponding generic annunciator trigger register. The trigger value is sent whenever the wire sheet changes its value, thus no special action is needed to cause the trigger to be sent.



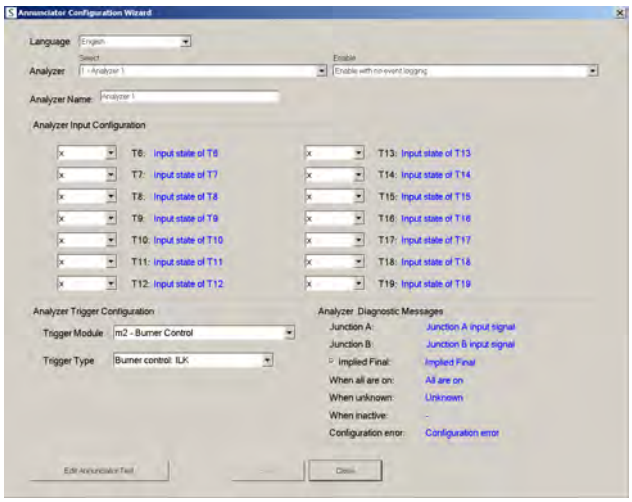
Explanations of the available Trigger Types are shown below.

Burner control: ILK	Interlock string (T19 on Burner Module)
Burner control: IAS/LOI	Interrupted airflow switch / lockout input (T16 on Burner Module)
Burner control: PII	Pre-ignition interlock (proof of closure switch) (T14 on Burner Module)
Burner control: LCI/F1	Limit control input for fuel 1 (T13 on Burner Module)
Burner control: LCI/F2	Limit control input for fuel 2 (T12 on Burner Module)
Limit LCI input	Limit Module load control input (T18 on Limit Module)
Wire sheet annunciator trigger 1-6	Wire sheet user-defined triggers

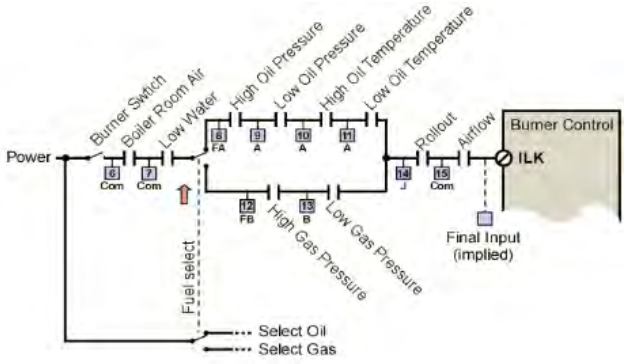
Since the Limit Module contacts might be connected downstream of other contacts, it has a separate trigger for its safety relay input.

Note: Each Analyzer (trigger) will have its own:

- Enable
- Trigger Module
- Trigger Type
- Analyzer Input Configuration



10. After completing setup of your various Analyzers (triggers), you can begin to define the input string on each Analyzer. This includes:



Naming the contacts in the input string – this is a global feature (optional)

Defining their location in each string – this is Analyzer specific

Select the specific Analyzer you wish to edit. To name the inputs, click on the Edit Annunciator Text button.

The following pages will utilize the example shown below, which illustrates a dual string path (dual fuel system).

11. Under Annunciator Input Text, type in the desired name of each Analyzer Input string contact (T6-T19) in all of the strings used (refer to your application-specific wiring diagram). This function is not Analyzer specific; it's done at the Annunciator level so names can be written for all Analyzers (triggers) in this window. The following steps illustrate the dual path example provided in the image above.

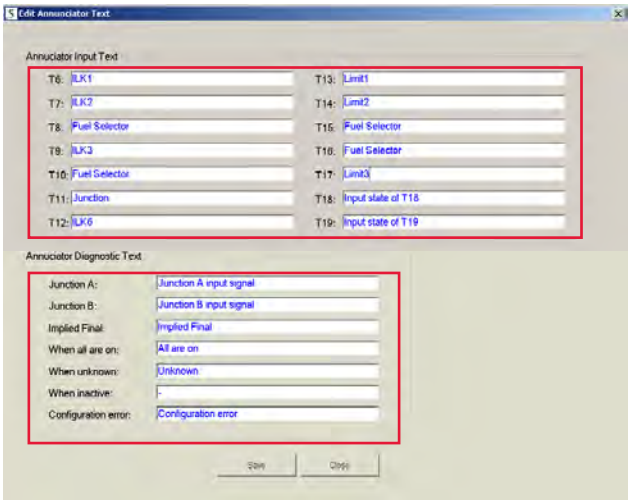
Note: On the screen shown below, T8 and T12 are both named "Low water". The duplication occurs because an input is needed on either side of fuel changeover switch for the dual fuel example shown above to allow the analyzer to discern the position of the switch. In this case, both T8 and T12 annunciate the set of contacts that directly proceed them in the series string; the Low Water.

Under Annunciator Diagnostic Text, type in the desired description for the input string location item. Refer to the extended descriptions below, step 12. and the image above for elaboration on input string locations. This function is Analyzer specific; it must be done for each individual Analyzer. The Analyzer is chosen on the previous page.

Notes:

It may be more efficient to complete this task after completing step 12 in which the location of each contact in the specific Analyzer input string is identified.

For the dual path (fuel) example above, T14 is the junction point of path A and B, monitoring the Low Oil Temperature in path A and the Low Gas Pressure in path B. Thus in the Annunciator Diagnostic Text section, the two monitoring points are separately identified.



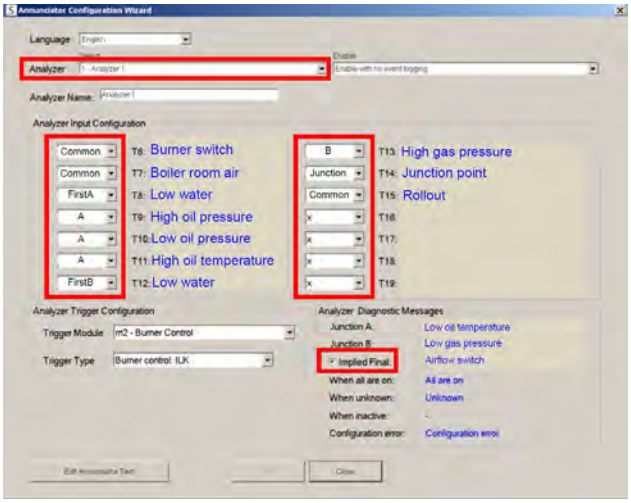
Annunciator Diagnostic Text can be individually assigned to the Implied Final input for each Analyzer (trigger) in order to provide diagnostic indications. The Implied Final input is the last connection (the wire) between the Annunciator and the Analyzer (trigger) which is not wired to the Annunciator. It is not wired to the Annunciator because it is the last component in the wiring string going into the Burner Control Module and thus is directly monitored by the Burner Control; if all other contacts in the string are closed and powered, then it is the Implied Final (last) component which is causing the fault.

For example, if the Implied Final input (last terminal in the string) is closed yet the Analyzer (trigger) is showing 0.0V, then the issue could be a broken wire or an unmonitored contact on that wire. In this case, the Analyzer Diagnostic Text might show "broken wire or an unmonitored contact on that wire". Refer to the SLATE AX Tool page below and the image above.

Descriptions of the available field in the Annunciator Diagnostic Text section are shown below.

Junction A	Used when the last terminal in string path A of a dual path (fuel) string causes an event.
Junction B	Used when the last terminal in string path B of a dual path (fuel) string causes an event.
Implied Final	Used when the last connection between the Annunciator and the Analyzer (trigger) is the event cause.
When all are on	Used when the Analyzer detects that nothing is interrupting power to the terminal.
When unknown	Used when some anomalous condition prevents the analyzer from making sense of the inputs that it is receiving.
When inactive	Used when the first out or hold status registers contain no values. This may be an empty string, a "-" or any other preferred value.
Configuration error	Used when some error in setup prevents the annunciator from working.

After you are finished on this screen, click the Save button.

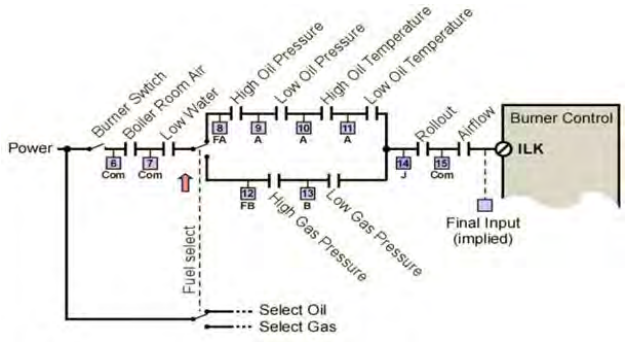


12. Return to the main page of the Annunciator Configuration Wizard. In order to facilitate proper Annunciator diagnostics, you will need to indicate where in the input string each contact lies for a particular Analyzer.

Notes:

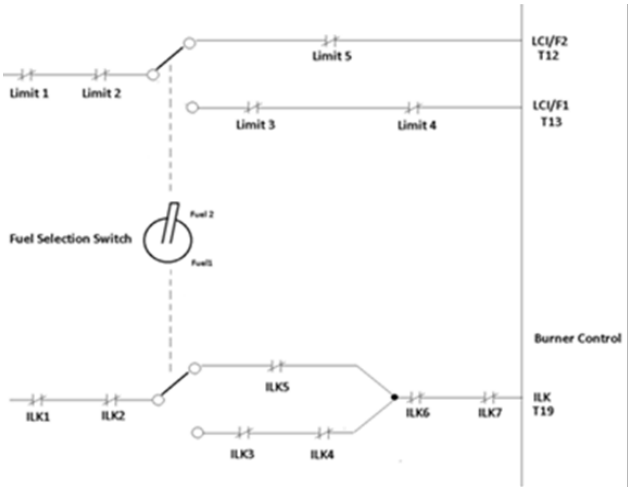
This function is Analyzer specific; it must be done for each individual Analyzer.

Make sure to check the Implied Final check box in order to enable the diagnostic message for it (if applicable).

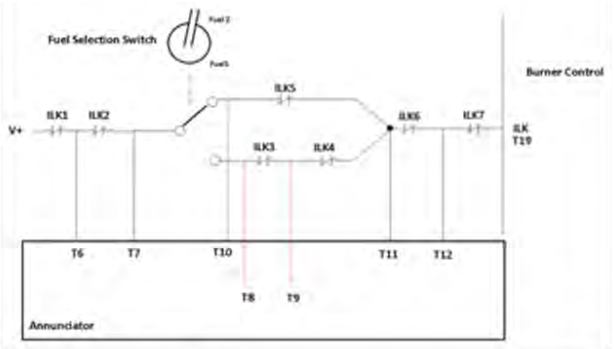


Note that the Annunciator Diagnostic Text entered on the previous screen now appears in the lower right-hand corner of this screen under Analyzer Diagnostic Messages.

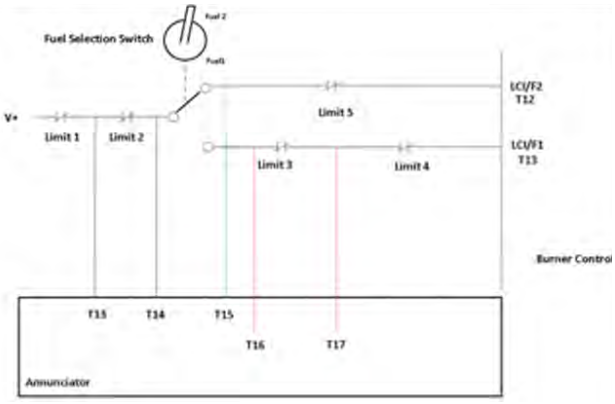
For each Analyzer Input Configuration (T6-T19), select the proper item from the drop-down menu. The possible input string location options are shown below. In all cases, the Annunciator terminal annunciates the set of contacts which directly precede it in the series wiring string. The screen above reflects a dual fuel example.



x	Lower case x indicates the input is unused by this Analyzer
A	Indicates a terminal in string path A
B	Indicates a terminal in string path B
FirstA	Indicates the first terminal in string path A of the dual paths
FirstB	Indicates the first terminal in string path B of the dual paths
Common	Indicates that the input is common to both string paths
Junction	Indicates the terminal where string paths A and B rejoin. Annunciates the last terminal in each string path. In Fig. 5 it is Low Oil Temperature or Low Gas Pressure.

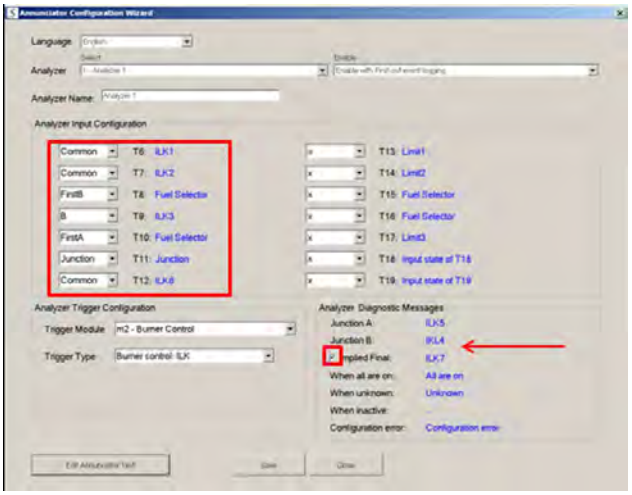


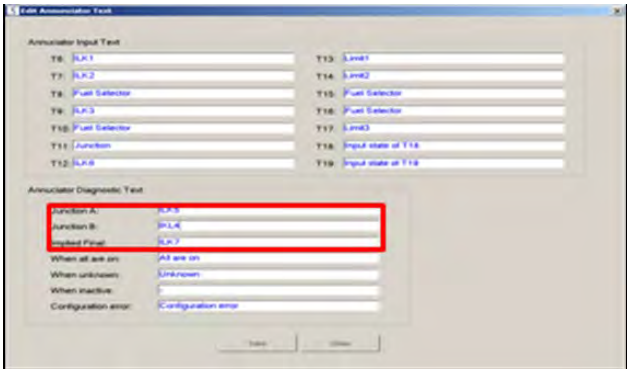
The illustration below shows how the above possible options for the Analyzer Input Configuration in a dual string path (dual fuel system) might look.



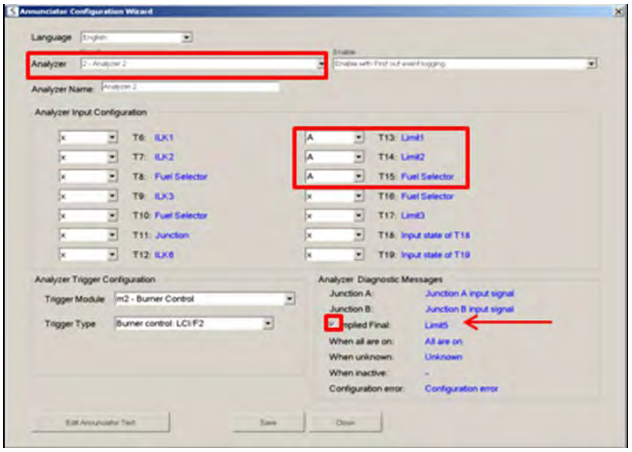
Example

The example below is for a dual fuel system with 3 Analyzers or series string input to the Burner Control Module that utilizes the Annunciator Module.

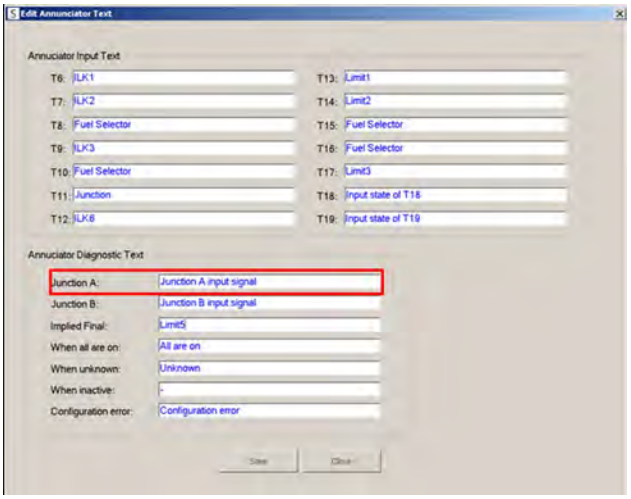




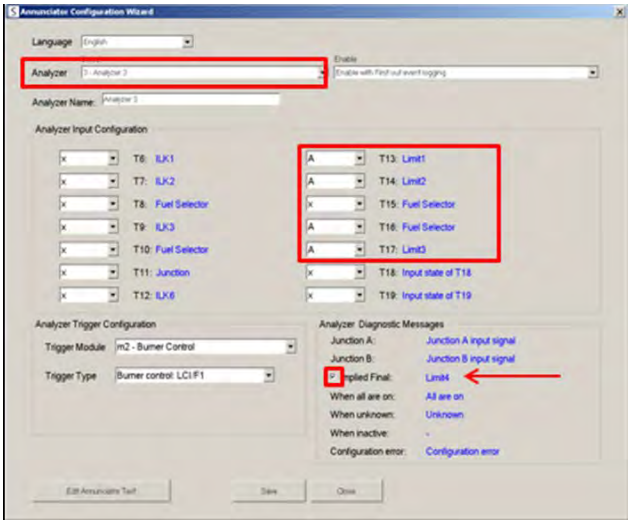
Analyzer	Trigger	Components	Annunciator Terminals	Path Designations
1: ILK	Burner control: ILK	Path A: ILK1, ILK2, Fuel Selector, ILK5, ILK6, ILK7	6, 7, 10, 11, 12	T6 = ILK1 (Common) T7 = ILK2 (Common) T10 = Fuel Selector (FirstA) T11 = ILK5 (Junction A) and ILK4 (Junction B) T8 = Fuel Selector (FirstB) T9 = ILK3 (B) T12 = ILK6 (Common) Implied Final = ILK7
		Path B: ILK1, ILK2, Fuel Selector, ILK3, ILK4, ILK6, ILK7	6, 7, 8, 9, 11, 12	
2: LCI/F2	Burner control: LCI/F2	Limit1, Limit2, Fuel Selector, Limit5	13,14, 15, Implied Final	T13 = Limit1 (A) T14 = Limit2 (A) T15 = Fuel Selector (A) Implied Final = Limit5
3: LCI/F1	Burner control: LCI/F1	Limit1, Limit2, Fuel Selector, Limit3, Limit4	13, 14, 16, 17, Implied Final	T13 = Limit1 (A) T14 = Limit2 (A) T15 = x (not used) T16 = Fuel Selector (A) T17 = Limit3 (A) Implied Final = Limit4

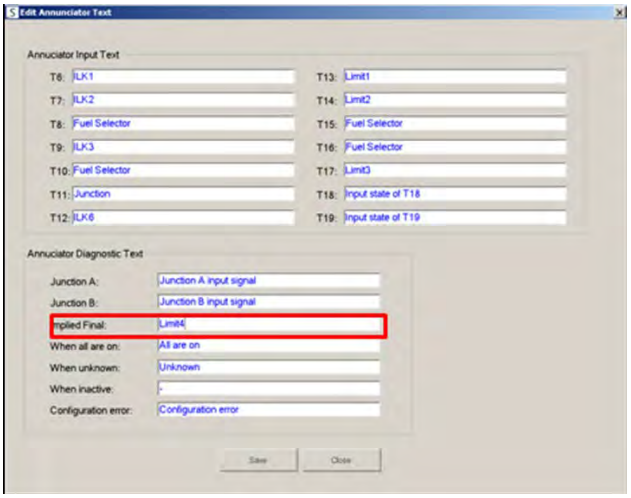


Below are the completed Annunciator Configuration Wizard pages for each Analyzer in the example.

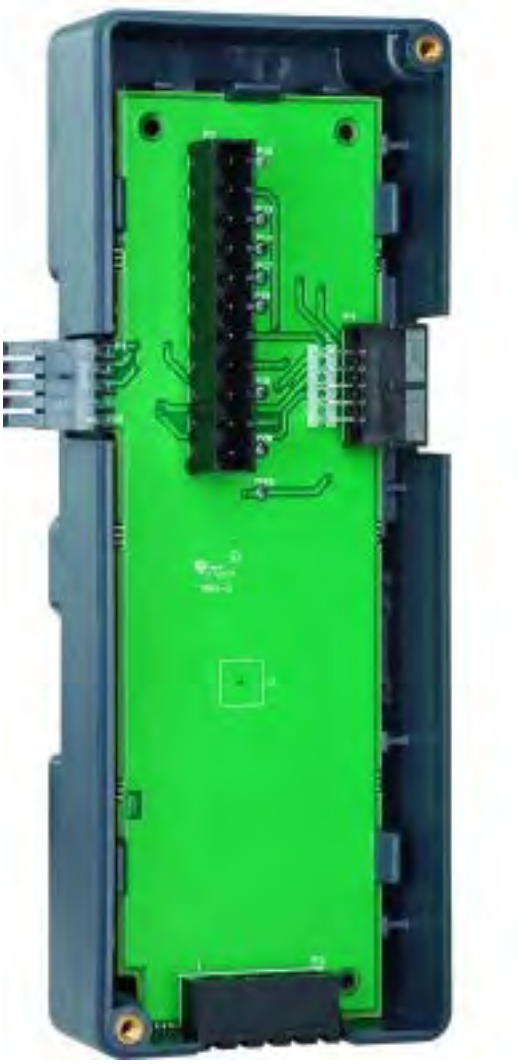


1: ILK Analyzer



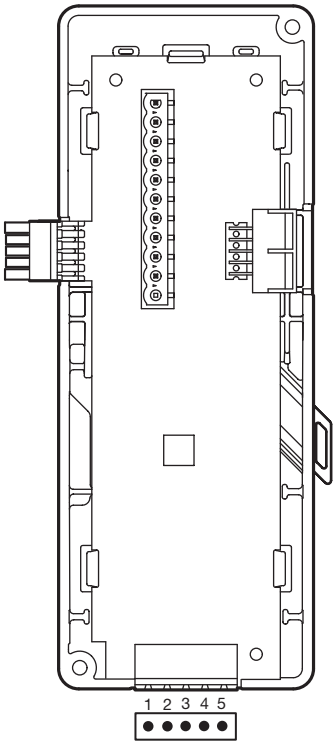


2: LCI/F2 Analyzer



3: LCI/F1 Analyzer

Chapter 12: SLATE Sub-Base

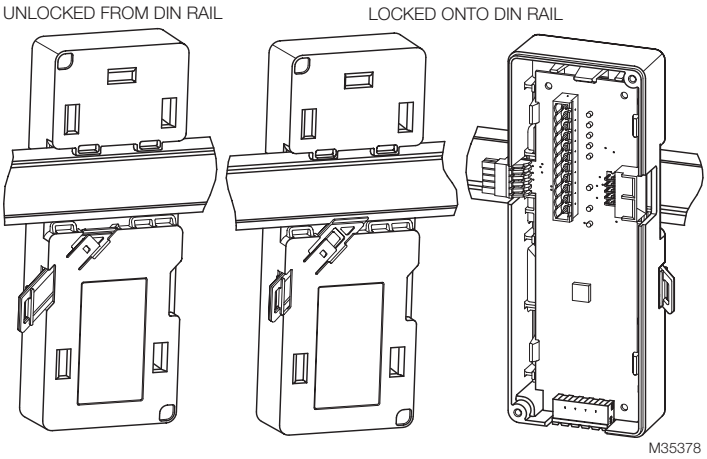


Overview

The R8001S9001 SLATE Sub-Base Module provides the ability for the SLATE system to be mounted via DIN Rail in a panel. All SLATE modules need this sub-base except for the SLATE Base Module.

Understanding the Sub-Base

Terminal	Description	Rating
1	18 V Power	2.5 A max including modules
2	18 V Ground	---
3	Remote Reset (Burner Control and Limit modules only)	Connect to Terminal 2 (18 V Ground) via external pushbutton
4	B (Remote Bus RS485)	Used for Remote mounted flame amplifiers
5	A (Remote Bus RS485)	Used for Remote mounted flame amplifiers



TERMINAL	DESCRIPTION
1	18V POWER
2	18V GROUND
3	REMOTE RESET (BURNER CONTROL AND LIMIT MODULES ONLY)
4	B (REMOTE BUS RS485)
5	A (REMOTE BUS RS485)

M35430

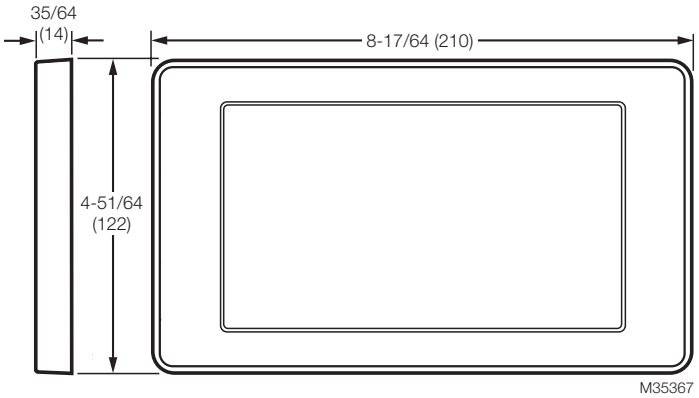
Mounting

1. The sub-base module can be mounted on type C 20 DIN Rail
2. Mount the sub-base module first. The sub-base has locking mechanisms on both sides of the module. Pull to unlock position.

3. Slide sub-base on the DIN rail and lock into place.
4. When securing subsequent sub-base modules make sure communication ports are aligned and locked into place.
5. After securing the sub-base module, snap the SLATE module into place and secure the module to the sub-base using screws which are included with SLATE.

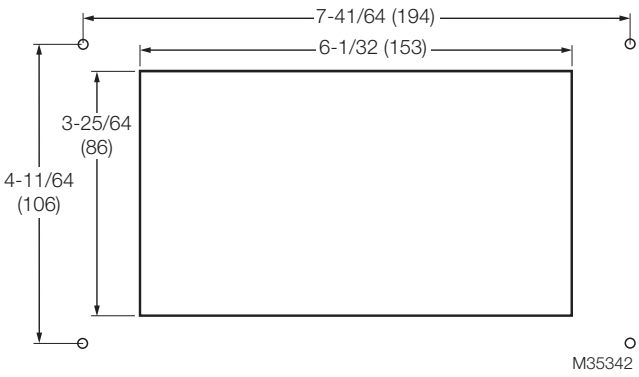
Chapter 13: SLATE Display

Overview



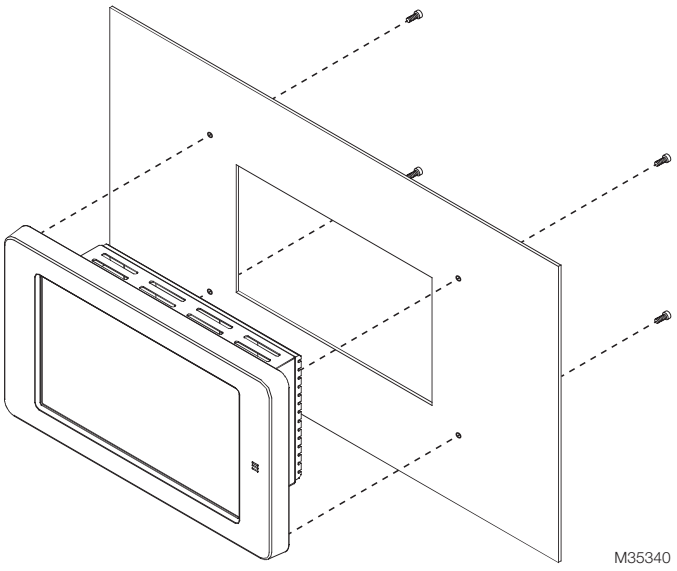
The R8001K5001 SLATE Color Touch Screen Display provides users with the ability to create vivid application displays using web technology. The screen is web enabled and with the SLATE Web Editor tool creating screens is simple and easy.

Power Plug Recommendations



The SLATE Color Touch Screen display does not come with a power plug or power plug connector. You have the option of purchasing the SLATE Display connector kit and transformer (Honeywell OS 32008001-002) or source through your own vendors. The following are recommendations for the power connection.

- 24VAC Wall Plug-in Transformer
  (Input Voltage: 120VAC, 60HZ – Output Voltage: 24VAC ±5%).
  Honeywell p/n 32006131 or equivalent.
- 18AWG wire
- Plug-in connectors (or equivalent):
  - Phoenix - p/n 1757019
  - EBY Electro - p/n EB1508-02-500
  - Dinkle – p/n 2ESDV-02P
  - Molex – p/n 0395300002



Cutout and Mounting

Dimensions in in. (mm).

Mounting dimensions of color touch screen display in in. (mm).

Principle Technical Features

The R8001K5001 color touch screen display provides a web-based user interface for viewing system status, and viewing, creating, or modifying configurations.

Communication and Networking

The R8001K5001 color touch screen display interfaces directly with the SLATE system using a standard Ethernet connection, and can connect directly to the Base module or via an Ethernet switch.

The R8001K5001 color touch screen display locates all base modules on an IP subnet using a subnet broadcast message, and once located allows users to select one to initiate a connection to that SLATE system.

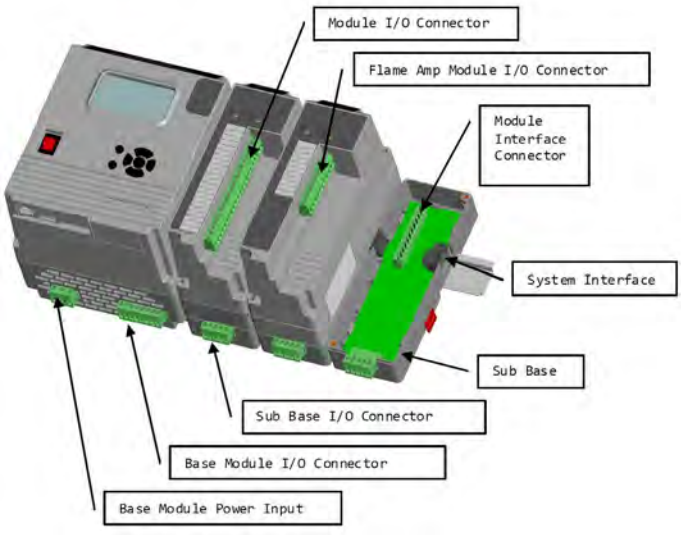
User Interface and Technology

The R8001K5001 color touch screen display is based on Google Chrome browser and supports HTML5.

A double tap on any web screen activates then Home, Back, and Help buttons, URL address bar, plus other controls that are normally hidden from view. Double tapping again activates these controls.

Chapter 14: SLATE Wiring Basics

Overview



This overview is intended to aid the SLATE system integrator in choosing the best method for ground and power connections. Every installation is different, but following these recommendations will greatly reduce potential for damaged equipment and incorrect I/O readings.

The figure below shows the different connections possible on the assembled Slate system.

Base Module Power Input	Provides the main power interface for the Base module and modules on the DIN rail.
Base Module I/O	Supplies the auxiliary power output, and the BACnet interface and alarm relay contacts.
Sub Base	The sub base provides I/O module mounting.
Sub Base I/O	The I/O on this connector provides access to the system power supply (18VDC) and the flame safety bus if a flame amp is mounted.
Module Interface Connector	Connects the I/O module signal to the main system interface.
System Interface	Contains the module power[1] (18VDC) and the inter module communication lines.
Module I/O	The standard 22 terminal connector for most I/O modules.
Flame Amplifier Module I/O	The 11 terminal connector for the flame amplifier modules.

[1]Information only, not intended for user interface. General Terminology

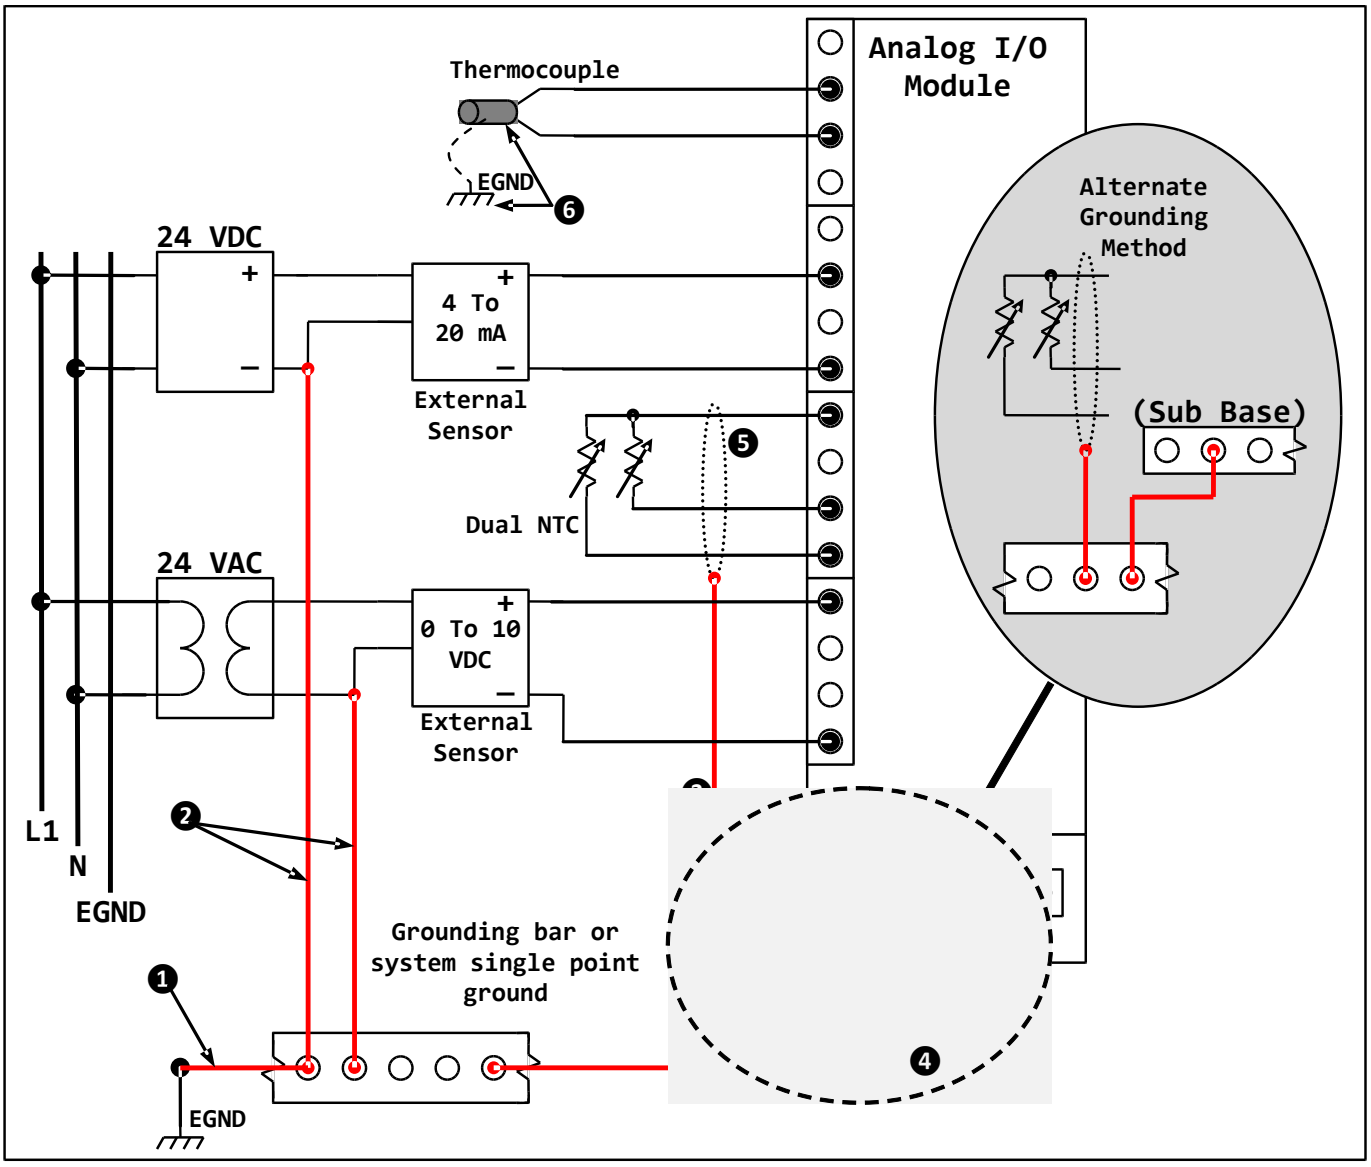
Slate Connector Definitions

SLATE System Ground: The ground for the 18V system power supply.

Single Point Ground (SPG): This term refers to a wiring point which provides little or no voltage differential between connections. A metal bar or a barrier terminal block with shorting bars between terminals is the most common type of implementation. Wiring which uses “daisy chain” connections is not considered to be a SPG and should be avoided.

Digital Reference: Terminals labeled “Vref+” and “Vref-“used on the Limit, Burner, Digital, and Annunciator modules. The “Vref-“term should not be confused with the V+ or V- on the flame amplifiers. These references are electrically isolated from each other have different purposes.

General Description of the SLATE Power and Ground

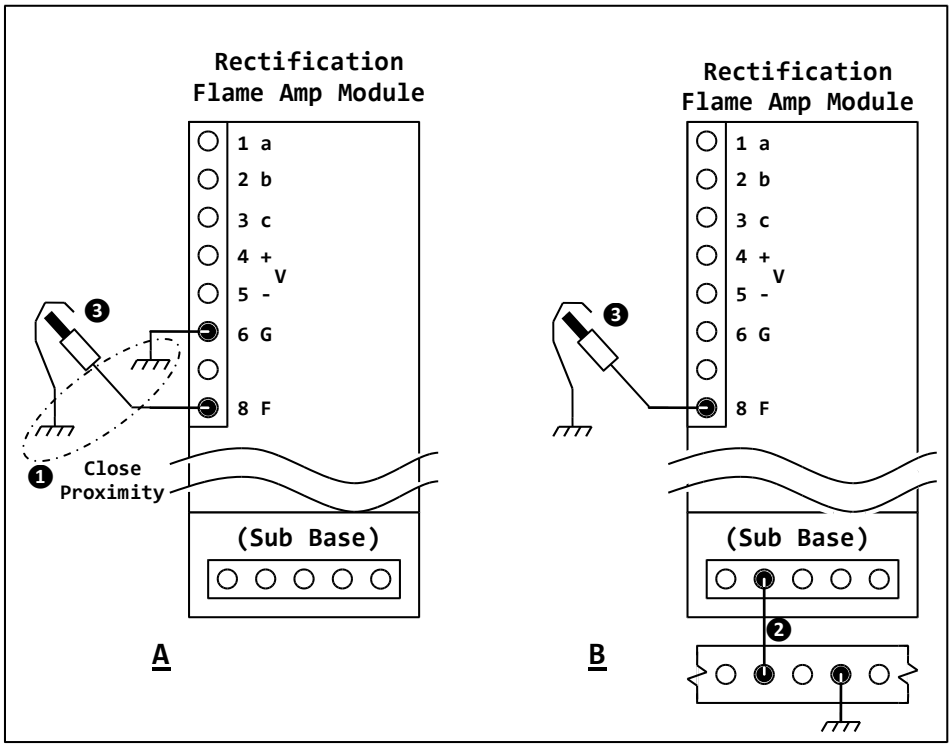


The SLATE system power supply (18VDC output) is isolated from the system power input (i.e. not internally connected to Earth ground).

Unless application specifics preclude it, it is advisable to reference the SLATE system power supply to Earth ground by attaching a wire from terminal 2 on the sub-base I/O connector of any module to Earth ground, or alternatively to terminal 6 on the Base Module I/O connector or the G terminal on the flame amp.

Analog Modules (Analog I/O, Limit, Fuel/Air)

The analog cell terminals within these modules are not isolated; they are all referenced to the SLATE system ground.



An externally powered sensor (such as voltage, current or PWM input) to an analog cell must come from a power supply that is ground referenced to the Slate system ground. Failure to do so may result in inaccurate sensor readings and possible damage to the analog cell or sensor. The power supply generating the voltage or current input should have its ground/common connected to terminal 2 of the sub-base I/O connector of the module utilizing the analog function. None of the four terminals of an analog cell are intended for grounding external equipment. The image below shows proper ground connections.

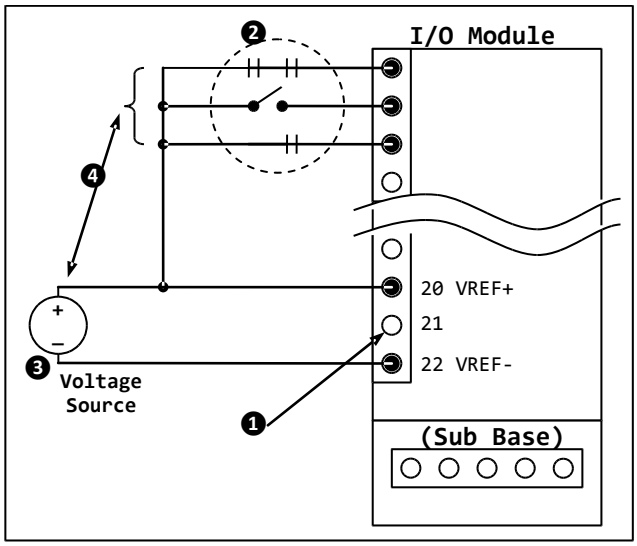
1. Recommended unless application specifics preclude this.
2. Applications using external power supplies to power external sensors must have their ground reference terminal(s) in common with the SLATE system ground.
3. Shields for sensor cabling should be tied to SLATE system ground (terminal 2 of the sub base I/O connector) or the single point ground.
4. Add this connection when external supplies are present (**2**) or when tying shields directly to single point ground.
5. Shielded cable recommended for applications where electrical noise exists.
6. Thermocouples must be isolated from SLATE system ground, Earth ground or any conductive path.

Flame Rectification Amplifier Modules

The Rectification Flame Amplifier module requires the SLATE system ground be connected to the burner ground (typically Earth ground). Drawing A below shows best practice for a SLATE system that does not have any other points tied to earth ground. If the SLATE system ground is already connected to burner (Earth) ground, the wire from terminal G to earth ground is not required (see drawing B).

1. The connection from the flame rod return (G lead wire) should use the shortest direct path back to the Flame Amplifier Module. For best practice, the flame rod return (G lead wire) should be in close proximity with the F lead wire.
2. Grounding bar or system single point ground.
3. The Rectification Flame Rod.

Digital Reference Terminals



The terminals labeled “Vref+” and “Vref-“ (found on the Limit, Burner, Digital, and Annunciator modules) are electrically isolated from the Slate system power supply and the Slate system ground. These terminals are used only to configure the digital (relay) inputs of a module for operation at various voltage levels (24VDC, 24 VAC or line voltages).

The digital reference terminals have no impact on analog cell functionality.

Any device providing voltage to the digital inputs or receiving voltage from the relay outputs of these modules must be referenced to the Vref- terminal. The voltage must be the same phase and magnitude of the Vref+ reference voltage. Failure to comply may result in erroneous terminal readings or possible damage to the Slate module or connected device.

The Vref terminals on a module are unique to that specific module. Different modules may use different Vref voltages.

Proper connections are shown in the image below. It is not permissible to make any connections the terminal 21.

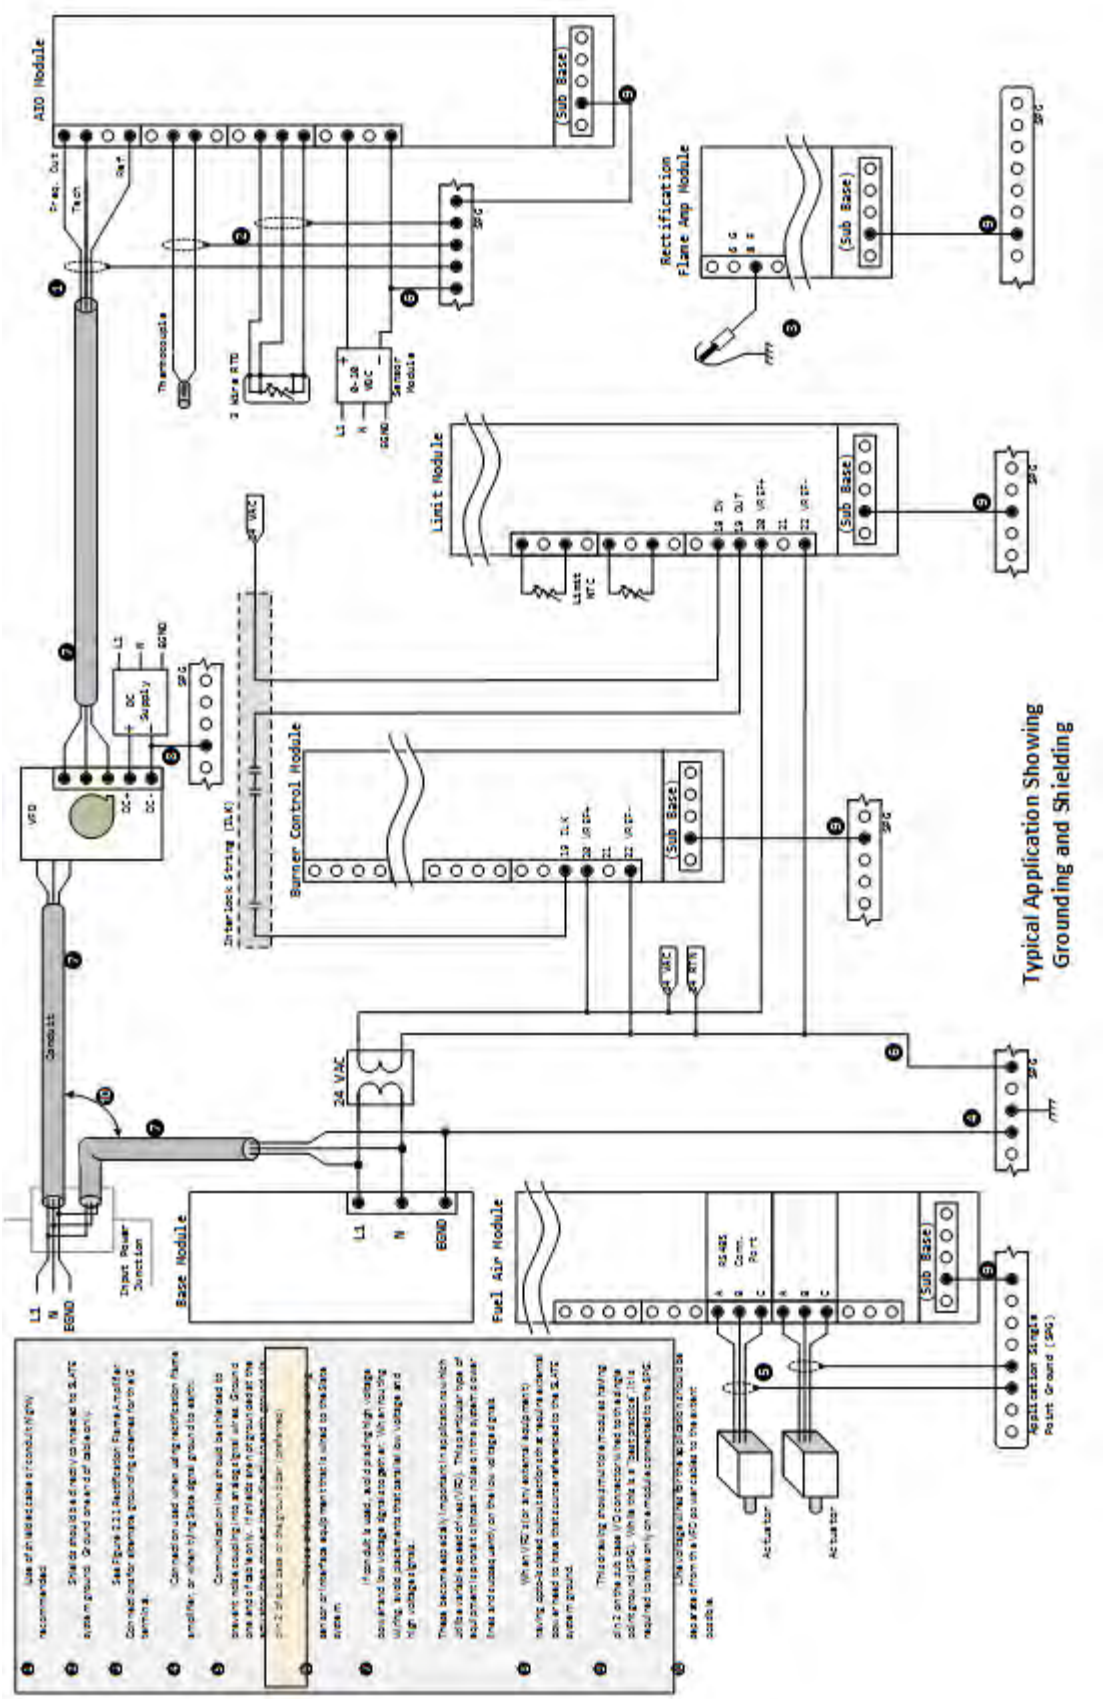
1. Do not make any connections to this terminal.
2. Typical application shown.
3. Voltage source may be 240 / 120 VAC, 24 VAC. or 24 VDC.
4. The voltage being sensed at the module I/O connector must originate from the same voltage source at the VREF terminals.

Shielded cables

It is strongly advised that the shielded cable be used for analog signals that are sensitive to electrical noise and for digital or line voltage signals that can radiate electrical noise.

The RS-485 cables to the actuator can be an electrical noise radiator and should be grounded at one end of the cable. The actuator interface provides a terminal for grounding the shield(s). If this connection at the actuator is not made, or a different actuator used, then the cable shield should be tied to Earth ground at module using terminal 2 on the sub base I/O connector.

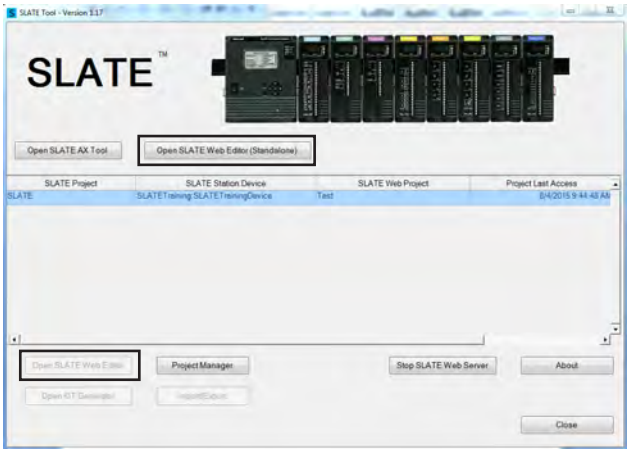
Do not ground both ends of the cable shield as a possible loop current may occur producing offsets in the analog signals.



Thermocouple and RTD signals are susceptible to electrical noise and it is recommended that shielded cabling be used with the shield tied to system or Earth ground (preferred). The connection point of the shield should be made at the SLATE end of the cable.

All analog signals should be separated from VFD (if present) cabling. Avoid running analog wires parallel to VFD wires (especially line voltage). The analog wires should never be placed in conduit with line voltage or VFD wires.

Thermocouples



The thermocouple circuit in the SLATE module uses a biasing voltage that is present on the wire sensing junction. Although the analog cell's input is heavily protected against static and short term over voltages, it still possible to damage the input if care is not exercised in placement of the sense point (junction).

The thermocouple sense point (junction) is required to be isolated from ground and other conductive paths. Failure to isolate the sense point may also result in additional electrical noise pickup on the thermocouple signals or offset readings.

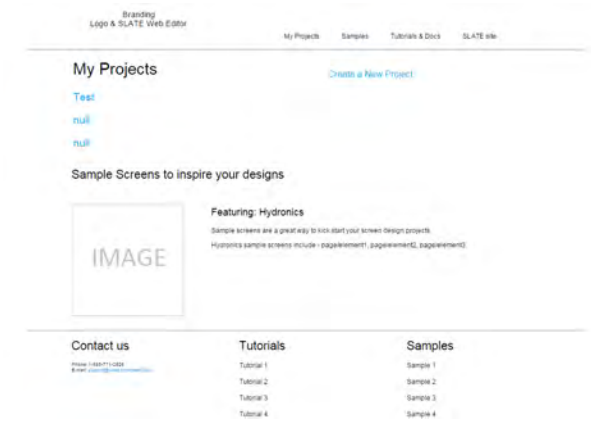
Chapter 15: SLATE Web Editor

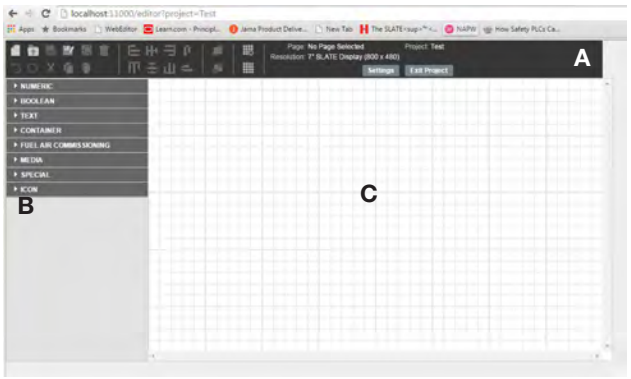


The SLATE Web Editor is an environment within the SLATE AX Tool to configure and design HMI (Human Machine Interface) screens for your application. This editor is installed at the time of the SLATE AX installation.

The Web Editor can be accessed through the SLATE Tools Start Page. In version 1.17 there are two ways to access the Web Editor. If you do not have any SLATE projects available you can use the Open SLATE Web Editor (Standalone) button to launch the Web Editor to work on screens without attaching them to a project.

If you have projects have been built and you want to associate them with your Web Editor screens you can also select the Open SLATE Web Editor button after you highlight the SLATE project as shown above.

Click on either button.



You will be taken to the My Projects section of the Web Editor Tool. This page is designed to organize your projects. When you select

Create a New Project you will be prompted to name that project through the following wizard.

You will enter a new Project Name and Project ID. (Caveat we need to know what Project ID is). When the project is saved in the list, simply click on the project to take you to the Web Editor Designer.

Using the Editor

The page is divided three sections:

Section A contains the information about edited file, project and buttons for widget operations.

Section B contains the structured list of available widgets.

Section C is the main editor area, where you will place desired widgets for your application

When you expand selections in section B, you open another environment that allows you to customize widgets by setting their individual properties. It can be enlarged by clicking on the arrow in the upper left corner.

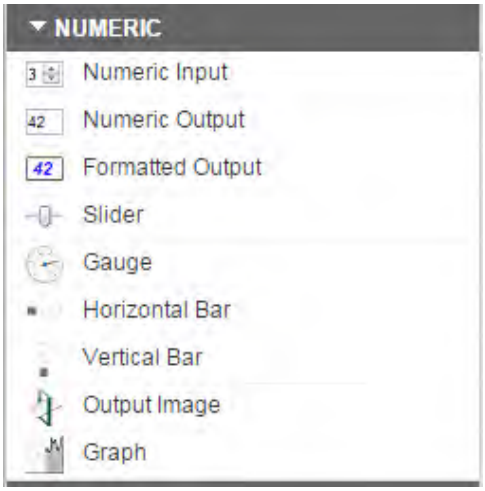
Adding new widgets is performed by making a selection from the given set and dragging it anywhere on the Editor Area (Section C). Whenever a single widget is selected, its attributes appear to the side of the work space. From this section you have the ability to "bind" the widget to a specific module, specific category and register. Some changes may be immediately visible on the widget, such as color, while some are invisible, such as register mapping. When you are satisfied with the editor content you can save it via the Save or or Save As . You can preview your work in simulation mode by clicking Preview or symbol. You need to save the work to preview it.

Linking Dynamic Widgets

Some widgets are static. They appear exactly the same way at all times. Bust some widgets can be dynamic and reflect values obtained from the SLATE Base Module (in the production mode) or from the local server (in the development mode). The widget can be linked to registers in the SLATE modules. For example, if you select an output widget (Numeric Output, Gauge, or Vertical Bar) it periodically asks for the value of the register and accordingly updates its value, image or shape. If you select an input widget, it displays the value provided by the server and if the user chooses to change it, the widget propagates this change to the server. As long as the widget is selected, it is not updated, so the user can perform the change.

Editor Commands

The SLATE Web Editor Commands are summarized in the table below.

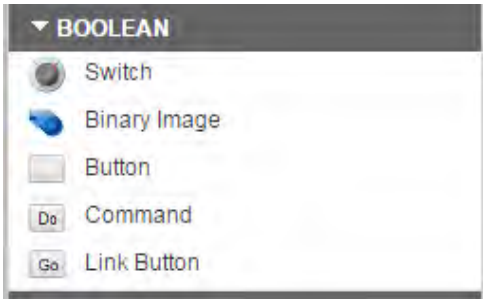


Button	Shortcut	Effect
New		Clears the editor content and file name.
Open		Loads the content of the chosen file into the editor area.
Save	Ctrl+S	Saves the editor content into the previously chosen file, or asks for a file name if none was specified.
Save As		Asks for a file name and saves the editor content into this file.
Preview		Opens a new tab with the saved page in the simulation mode.
Undo	Ctrl+Z	Reverts the last action.
Redo	Ctrl+Y	Re-performs the last reverted action.
Copy	Ctrl+C	Copies selected widget(s) into the editor clipboard.
Cut	Ctrl+X	Copies selected widget(s) into the editor clipboard and removes the widget(s).
Paste	Ctrl+V	Pastes the widget(s) from the editor clipboard to the editor area.
	Ctrl+A	Selects all widgets.
Up	Alt+U	Shifts the selected widget(s) to the front (above all other widgets).
Down	Alt+D	Shifts the selected widget(s) to the bottom (below all other widgets).
Align Buttons	Alt+Num Arrows	Aligning all selected widgets in the particular direction: 2 is down, 6 is right, 8 is up, 4 is left.
Vertical Align	Alt+V	Align widgets by their center vertically
Horizontal Align	Alt+H	Align widgets by their center horizontally
Vertical Distribute	Alt+B	Evenly distribute widgets vertically
Horizontal Distribute	Alt+J	Evenly distribute widgets horizontally
In Grid Options	Alt+Q	Increase grid (for snapping when shift is held while dragging)
In Grid Options	Alt+A	Decrease grid
In Settings		When designing page different from the default project resolution, the width and height can be changed here.
Exit Project		Navigates the browser back to the welcome page.
Delete	Del	Deletes the selected widgets.

The remaining operations are described in the following table.

Operation	Effect
Right Click	Invokes the context menu (on the widget or on the editor area).
Ctrl + Left Click	Toggles selection for the widget that has been clicked.
Left Click widget + Drag	If a widget was selected in the editor area, this widget is moved.
Left Click resizing handle + Drag	If the right or bottom bound or right bottom corner arrow is clicked, the widget is resized.

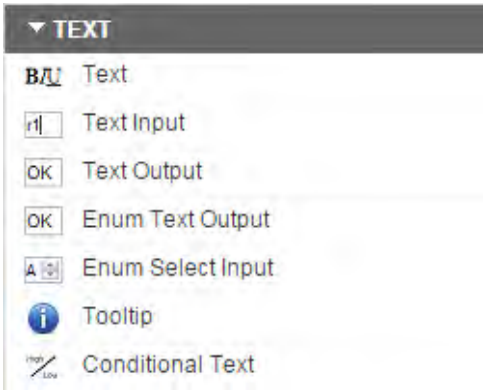
Operation	Effect
Left Click to open area + Drag	A rectangle is shown, which can be used to select all widgets contained in or touched by the rectangle.
Left Click to open area + Drag + Ctrl	With the control key the selection rectangle behavior is modified to select only those widgets that are completely contained within the rectangle.
Right Click anywhere + Drag	By using a right-click, only a selection rectangle occurs, that is if a widget happens to be at the position of the mouse-down it does not move, whereas a left click would select and move that widget. A rectangle is shown, which can be used to select all widgets contained in or touched by the rectangle.
Right Click anywhere + Drag + Ctrl	With the control key the selection rectangle behavior is modified to select only those widgets that are completely contained within the rectangle.
Ctrl + Arrows	Moves the selected widget(s) by one pixel.
Alt	Removes handles for resizing (to enable dragging of small widgets) and borders (to get a better idea about the final look of the page)
Ctrl + Drag	“Snap to object” feature is active while dragging (can be changed in Grid Options)
Shift + Drag	“Snap to grid” feature is active while dragging (can be changed in Grid Options)



Numeric Section

The numeric section contains “widgets” that will work with numerical values. These widgets will display values from particular registers, slider bars that will allow you to change a numerical value to a particular register, gauges that will display values of registers using a gauge and a horizontal bar. The Output Image would allow you to display a specific image according to the numeric value of a register. It can compare the value to the stored conditions and display the image of a satisfied condition. It is possible to change the form of the conditions. The allowed operators are:

- Less than or equal to
- Less than
- Greater than or equal to
- Greater than
- Equal to
- Not equal to

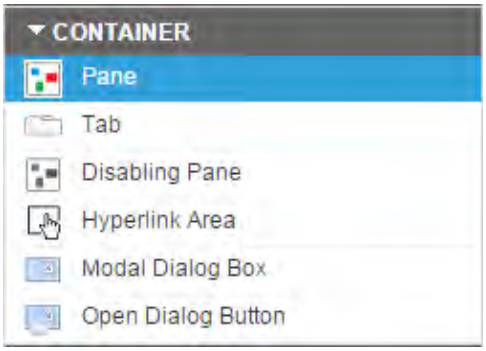


Boolean Section

The Boolean section contains the following widgets:

- **Switch:** a dynamic read/write widget working with two states on or off.
- **Binary Image:** dynamic read only version of the Switch widget. It operates only with an On value. If On value is read from a register it shows an On state.
- **Button:** a widget that represents a button commonly used in HMI applications. The functionality can be specified by the designer
- **Command:** dynamic write only widget which sends specified values to a specified register when clicked
- **Link button:** static widget acting as a link. When clicked, the user is navigated to a specific page

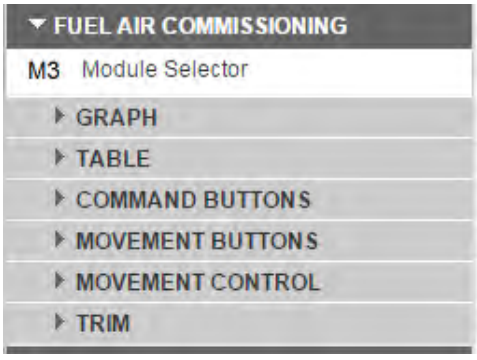
Text Section



The text section contains tools to create text on your display screens.

- **Text selection:** provides rich formatted text.
- **Text Input:** provides dynamic read/write widgets allowing you to change the text values of a particular register
- **Text Output:** provides read only which displays the text value of a particular register

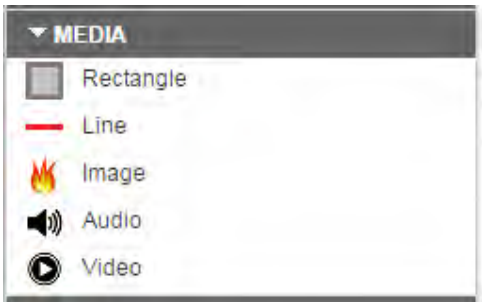
- **Enum Text Output:** dynamic read only widget which works with enumeration values of the register
- **Enum Select Input:** dynamic read/write widget which works with enumeration values as a enumerated text output but it also allows you to change the value
- **Tooltip:** allows you to create tool tips when hovering mouse over a specific area
- **Conditional Text:** dynamic read-only variant of the output image widget with the ability to handle texts instead of images



Container Section

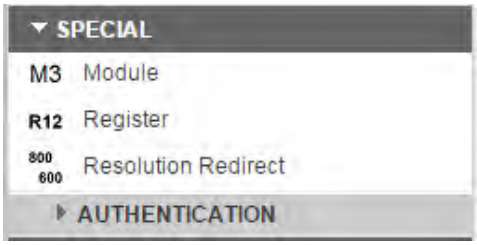
This group contains widgets, into which other widgets can be placed.

- **Pane:** static widget which can be used for inheritance or styling reason
- **Tab:** static widget useful for diving the content into tabs that can be added and removed
- **Disabling Pane:** widget that reads a given register value and compare it with a given value
- **Hyperlink Area:** widget that allows you to define areas that when clicked takes you to a specified location
- **Model Dialog Box:** tightly linked to the Open Dialog Button widget. Allows you to create custom modal dialog windows and buttons to invoke them.
- **Open Dialog Button:** the only widget that can invoke Modal Dialog windows



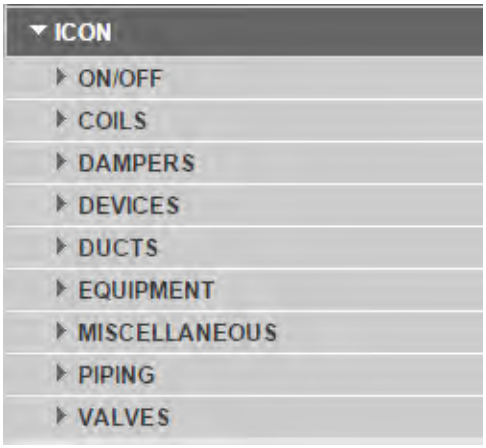
Fuel Air Commissioning Section

This section is dedicated to fuel air commissioning.



- **Graph:** displays the curves, points, throttle positions, presets, status of the throttle, validity of the segments and curve selection
- **Table:** all fuel air widgets are designed in a way that the form a table. Always displays all available curves in columns
- **Command Buttons:** widgets representing buttons sending a fixed value to a fixed register of a module defined by Fuel Air Module selector widget
- **Movement Buttons:** widgets that simply send the movement commands to the server
- **Movement Control:** widgets having impact on movement
- **Trim:** widgets dedicated to fuel air trimming

Media Section

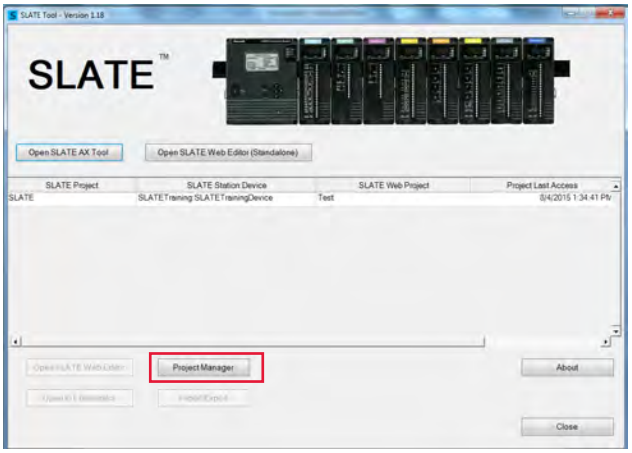


- **Rectangle:** widgets representing rectangles with a wide variety of options for styling
- **Line:** widgets representing lines with a wide variety of options for styling and placement
- **Image:** a widget representing an image that can be given a link
- **Audio:** allows you to play audio with audio files
- **Video:** allows you to play videos with video files

Special Section

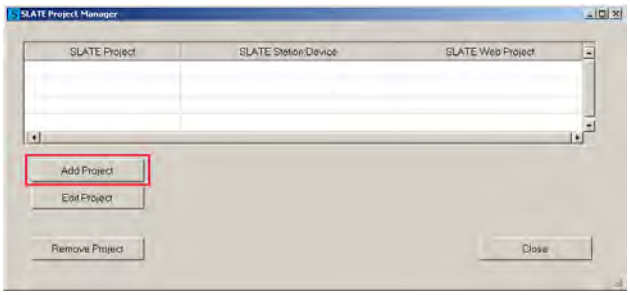
- **Module:** widgets having impact on inheritance
- **Register:** widgets having impact on inheritance
- **Resolution Redirect:** special widget that can be sued to react to different browser resolutions
- **Authentication:** widgets contained in this section are tightly related to the user authentication, logging in and out, password management and widgets to the logged user

Icon

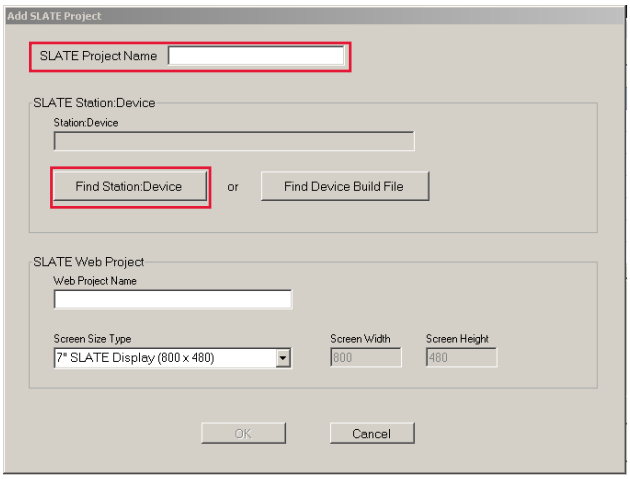


This section provides a library of widgets for use that are indicative of commercial or industrial equipment.

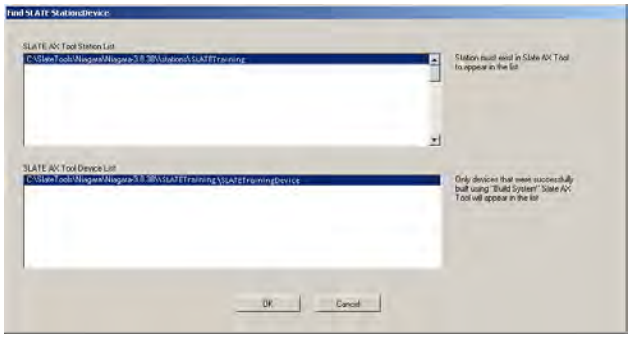
Chapter 16: SLATE Project Manager and Kit Loading



Overview

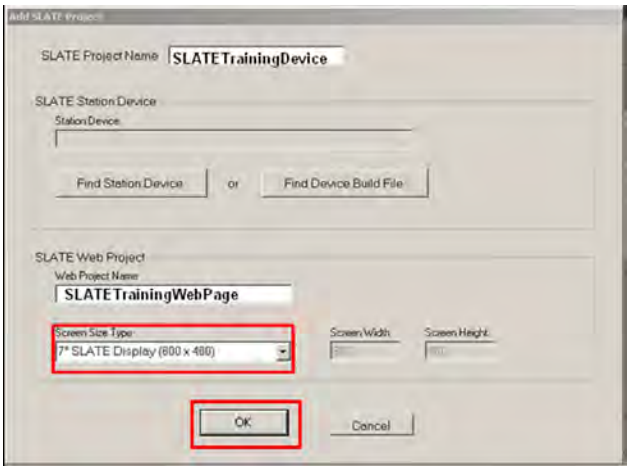


The SLATE Project Manager function allows the user to tie the SLATE AX wire sheet to the Web Editor and transfer the required files as necessary. It is the first step to creating a SLATE Kit. In order to use the Project Manager function, a SLATE device must exist in SLATE AX Tool. Click the “Project Manager” button.



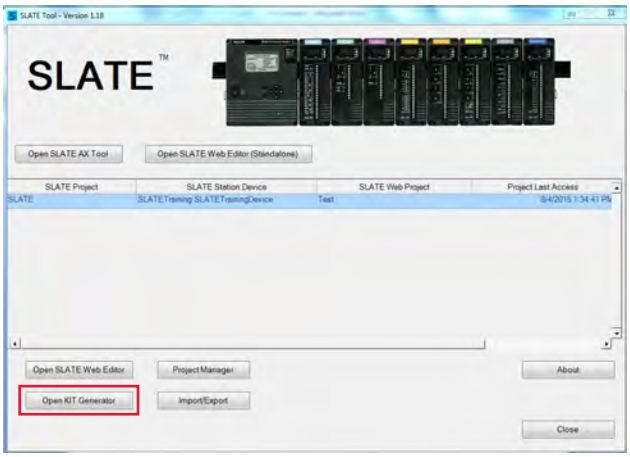
The SLATE Project Manager window will show all existing projects. Click the “Add Project” button to add a project.

You will enter a wire sheet project name.

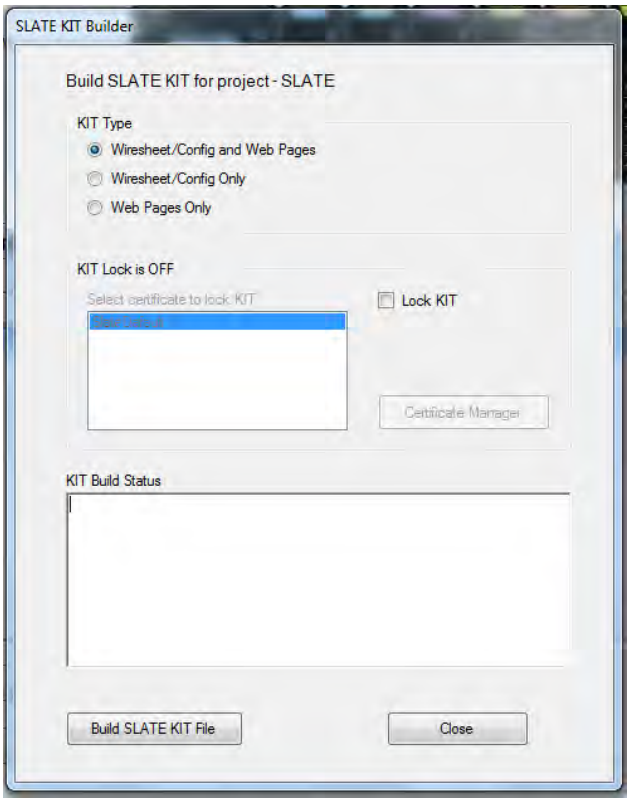


Click the “Find Station Device” button to locate the SLATE device we want to add. The SLATE AX Tool Station list shows all created stations and the SLATE AX Tool Device List shows all created and built devices with that station.

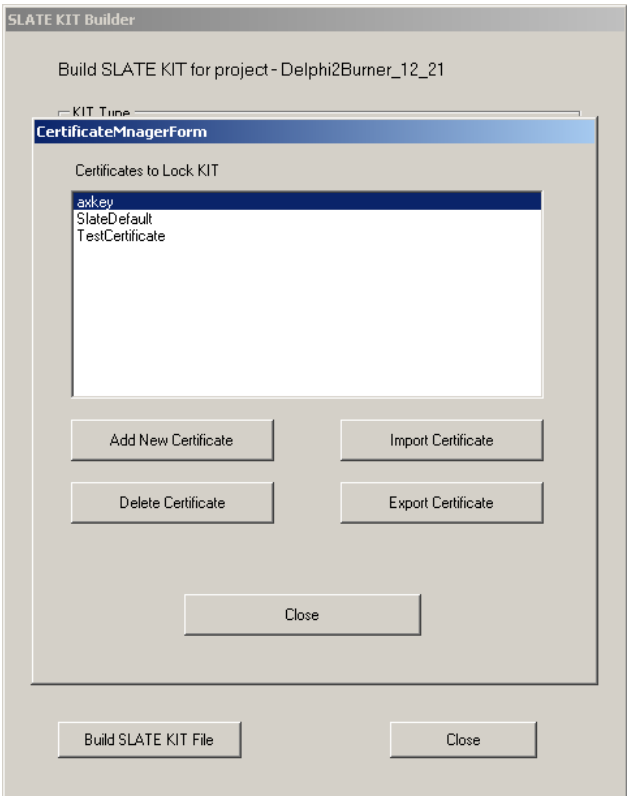
Next, name the web portion of the kit. See example below.



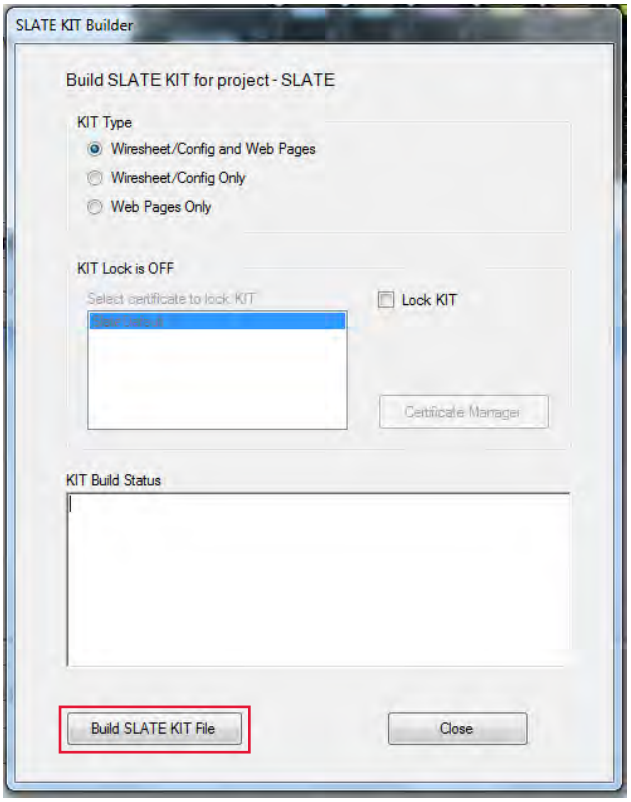
You can select the screen size for which your web pages will be designed. This will limit the size of the Web Editor work space to that available on a screen with the selected resolution.

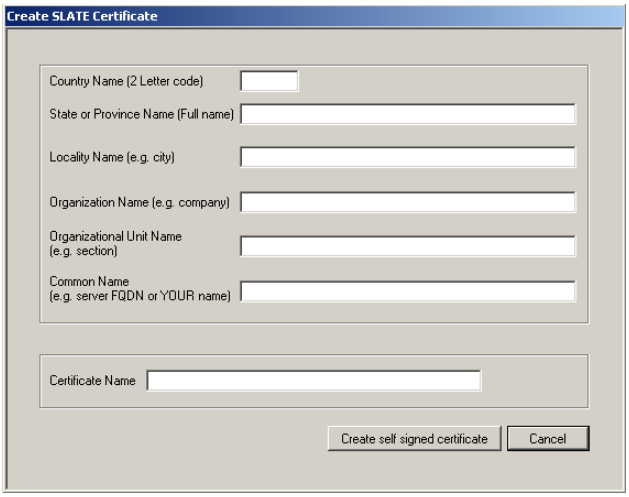


Click the “OK” button when you are finished.



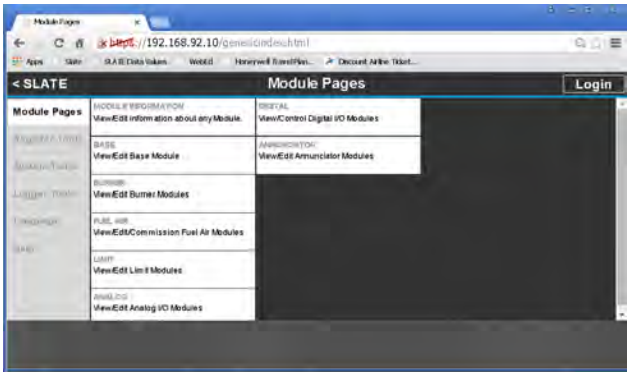
Now that you have a SLATE project identified and named you can highlight it and build a kit. Click on the “Open Kit Generator.”

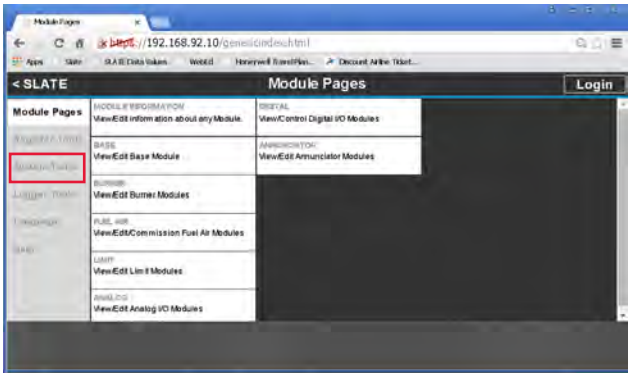




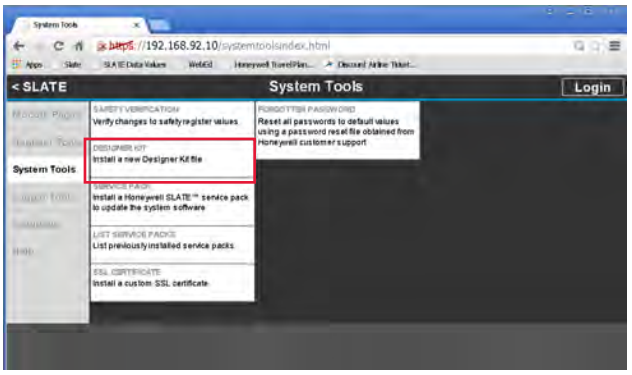
You will need to define what elements the kit will contain.

You are also given the option to lock kits down. Locking the kit insures that no one will have access to make any changes to the SLATE Base without the key certificate. Certificates are a way of protecting the kit. The screen shots below allows you to create access and locks the base down only allowing you to create kits for that specific base.

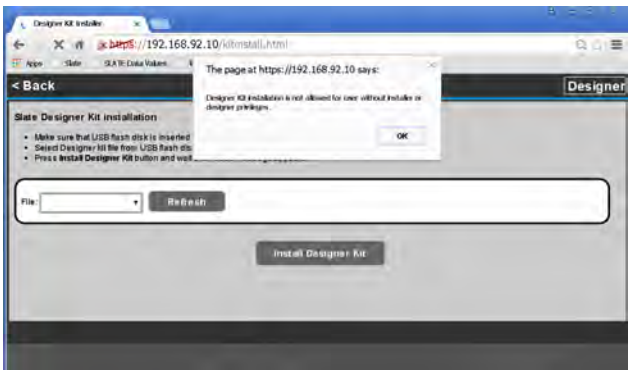




When you have selected the kit type, click the “Build SLATE Kit File” button and save the kit to your preferred location. The kit is installed into the SLATE base via a thumb drive.

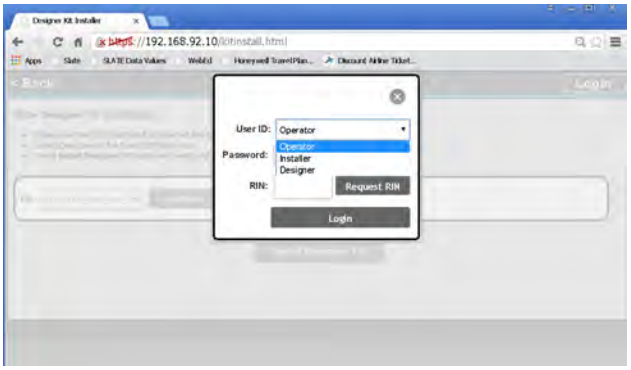


The next step to loading the kit once it is saved to a thumb drive is to open up your Chrome browser and accessing the SLATE Base via the PC on the network or to go to the generic menu on the 7” display on the network. Default URL: 192.168.92.10



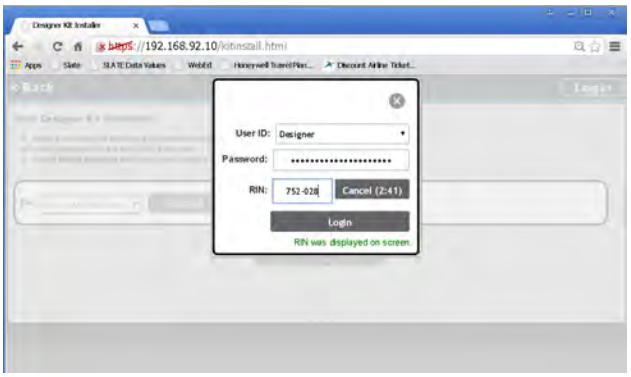
Click the System Tools

Click the “DESIGNER KIT” button

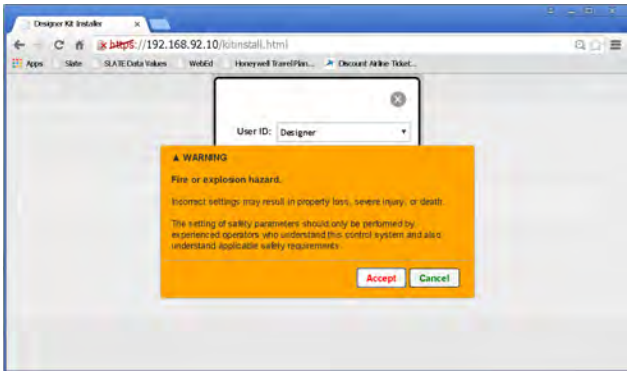


At this point, the user must have either Designer or Installer access in order to load a kit into the SLATE base. Logging in with the appropriate credentials is required.

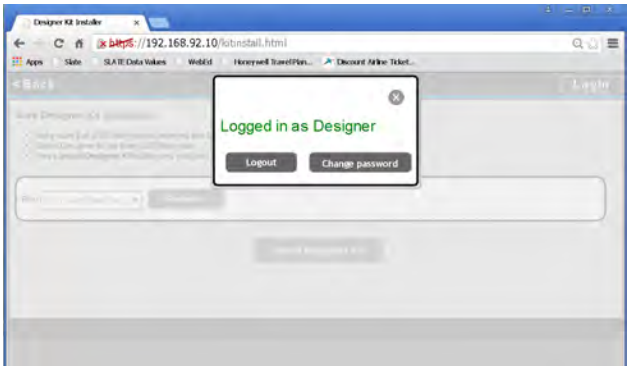
Click the “OK” button to proceed to the log-in window.



Select the credential level from the “User ID” drop down menu. Select “Designer” or “Installer”



The default Password for the Designer ID is “SlateDesignerPassword” or “SlateInstallerPassword”. Capitalize the password as written.



Once you have selected “Designer” for the User ID and typed in the password, click the “Request RIN” button and check the SLATE base display for a six digit number. Type in the number in the RIN field and include the dash! You have 3 minutes before the system times out.

If the system times out, you can re-initiate a log-in procedure from the top. The SLATE system forces a local presence at the SLATE base in order to log in (and load a kit or carry on any other function requiring log-in.

At this point you are given the option of changing the password. At this time do not change the password.

Click on the “X” to close the log-in window. You will be logged in as either Designer or Installer. But the screen shot above indicates Designer as an example. You are now returned to the Designer Kit page.

Find your project in the “File” field and click the “Install Designer Kit” button.

Allow the kit to load. This process may take a few minutes so be patient! At the end of a successful load you will see “Kit Loaded Successfully.”

SLATE™

UV Ampli-Check Flame Amplifier

R8001S1071

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application—offering virtually limitless development opportunities with far less complexity.

The R8001S1071 UV Ampli-Check module responds to an ultraviolet signal from an ultraviolet type flame detector to indicate the presence of flame. This flame amplifier is used with the C7027 and C7035 detector series.

Features

- Module display for flame signal strength
- 0.0 to 8.0 VDC flame signal strength reading range

Specifications

Electrical Ratings:
Base Voltage and Frequency
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85–264 VAC, 50/60 Hz

Environmental Ratings
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C).

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Dimensions: See Fig. 1.

Weight: 2 lb 1 oz (0.94 Kg)

Approvals
Underwriters Laboratories Inc. Listed, File: MP268
IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

Mounting
DIN Rail (See Fig. 3)

Required Components
R8001A1001 SLATE Base Controller
R8001S9001 SLATE Sub-Base Module

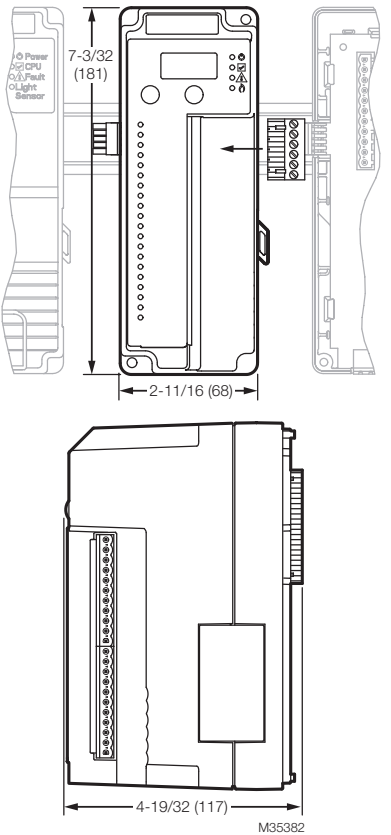

Fig. 1. Mounting dimensions of UV Ampli-Check Flame Amplifier in in. (mm).

LED Array

There are four LEDs on the front of the Ampli-Check Flame Amp module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	SLATE Burner Control Module has detected a fault
	No light	Running
Flame	Yellow	Weak flame is detected
	No light	No flame is detected

Table 1. LED Descriptions.

LED Display

The SLATE system modules have a seven-segment, three-position LED display used for indicating flame strength. It is also used to identify the module number of the SLATE system.

Color	Description
Terminal T2	
Green	Communicating with burner
Red	Communication fault
Terminal T8	
Green	Flame
Off	No flame

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Select button is used to scroll through the segment display information.

Selector Switch

The SLATE Burner Control Module is designed to operate with only one Flame Amplifier Module. The Flame Amplifier Module has a rotary switch on its back side which is factory set to 1. It must be set to 1 for the system to operate properly. See Fig. 2.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.
2. Verify the Selector Switch is set to 1. See Fig. 2.

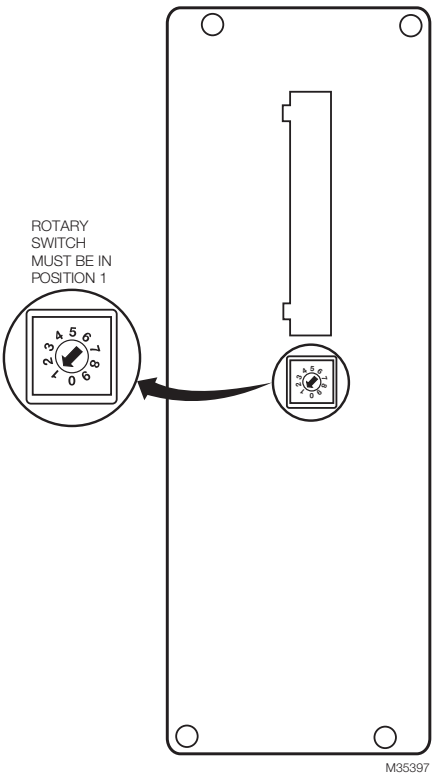

Fig. 2. Flame Amplifier Module Selector Switch.

3. Install the Flame Amplifier on the Sub-Base. See Fig. 3.

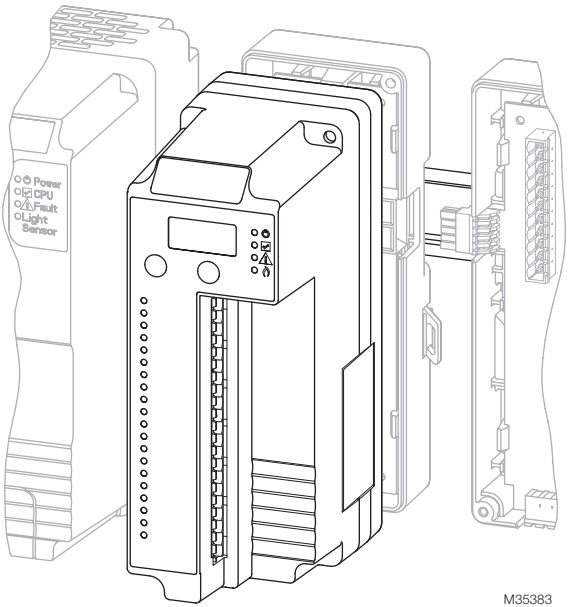

Fig. 3. Installing the UV Ampli-Check Flame Amplifier on the Sub-Base Module.

IMPORTANT

1. *Wiring must comply with all applicable codes, ordinances and regulations.*
2. *Wiring must comply with NEC Class 1 (Line Voltage) wiring.*
3. *The R8001S1071 should not interfere with the propersafety operation of the controls, limits and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS AND INTERLOCKS.*

The SLATE Flame Amplifier module must be mounted in an electrical enclosure with adequate clearance for servicing, installation, and removal of modules.

⚠ CAUTION

Equipment Damage Hazard.
Incorrect combination of relay module, amplifier and flame detector can cause equipment damage.

Installing the Flame Detector

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the Burner Control Module, then it must be externally wired to it via the remote bus connections.

Wiring

1. Refer to Fig. 4 for proper flame detector wiring.
2. Disconnect power supply before making wiring connections to prevent electrical shock and equipment damage.

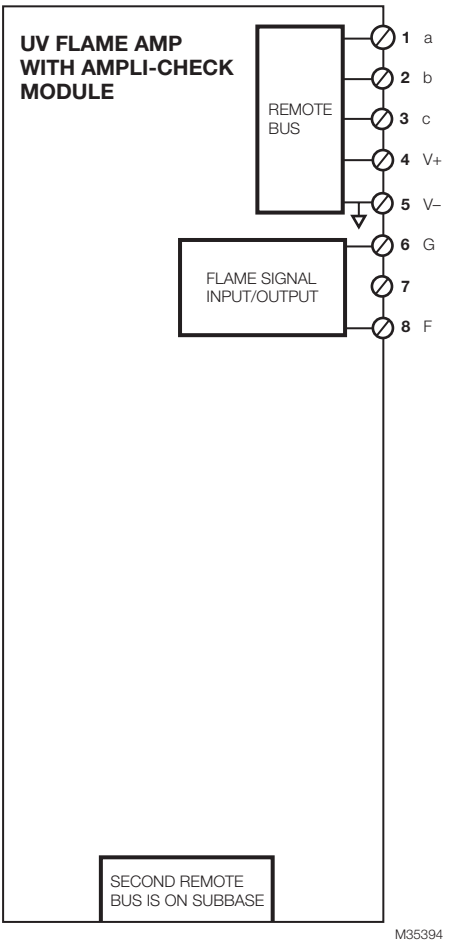

Fig. 4. R8001S1071 SLATE UV Ampli-Check Flame Amplifier wiring.

3. All wiring must comply with appropriate electrical codes, ordinances and regulations including NEC Class 1 (Line Voltage) wiring where required.

4. Use recommended wire size and type no. 18 copper conductors TTW (60C) or THW (75C) or THNN (90C).

5. Use recommended wire routing:
   - **a.** Keep the flame signal leadwire as short as possible from the detector to the SLATE module. The maximum permissible leadwire length depends on the type of leadwire, conduit type and leadwire diameter. The ultimate limiting factor for flame signal length is the flame signal voltage.
   - **b.** Do not run high voltage ignition transformer wires in the same conduit with the flame detection wiring.
   - **c.** If the flame detector leadwires are not long enough to reach the SLATE electrical connectors, make splices in a junction box.
     - **(1)** Enclose scanner wiring without armor cable in metal cable or conduit.
     - **(2)** Follow flame detector Instructions.

6. Check wiring, see Fig. 4.

Checkout

Preliminary Inspection

Make certain that:

1. Wiring connections are correct and all terminal screws and electrical connections are tight.
2. Proper flame failure response time is selected.
3. Amplifier is securely mounted on the DIN Rail and bus connector secured to SLATE Burner Control Module.
4. Detectors are properly positioned and cleaned according to Detector Instructions.
5. Correct combination of amplifier and flame detector is used.

The flame signal for the pilot alone, the main burner flame alone, and both together must be steady and a minimum of 0.8V. If the flame signal is unsteady, or less than the minimum acceptable voltage, check the flame detector installation and circuitry in the following procedure.

1. Check the supply voltages. Make sure the master switch is closed, connections are correct, and the power supply is of the correct voltage and frequency and is sinusoidal.
2. Check the detector wiring for defects including:
   - **a.** Incorrect connections.
   - **b.** Wrong type of wire.
   - **c.** Deteriorated wire.
   - **d.** Open circuits.
   - **e.** Short circuits.
   - **f.** Leakage paths caused by moisture, soot or accumulated dirt.
3. For all optical detectors, clean the detector viewing window, lens, and inside of the sight pipe as applicable.
4. With the burner running, check the temperature at the detector. If it exceeds the detector maximum rated temperature:
   - **a.** Add a heat block to stop conducted heat traveling up the sight pipe.
   - **b.** Add a shield or screen to reflect radiated heat.

   c. Add cooling (refer to sight pipe ventilation in the detector Instructions).

5. Make sure that the flame adjustment is not too lean.
6. Make sure the optical detector is properly sighting the flame.
7. If necessary, resight or reposition the detector.
8. If you cannot obtain proper operation, replace the plug-in amplifier.
9. If you cannot yet obtain proper operation, replace the flame detector.

IMPORTANT

If you make any changes to the flame detection system, repeat all required Checkout tests in Checkout section of the Instructions for the applicable SLATE module.

For more information and detailed instructions on the R8001S1071 and the entire SLATE system please refer to the SLATE User Guide located on our website at http://combustion.honeywell.com/SLATE

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.
2. Verify the Selector Switch is set to 1. See Fig. 2.

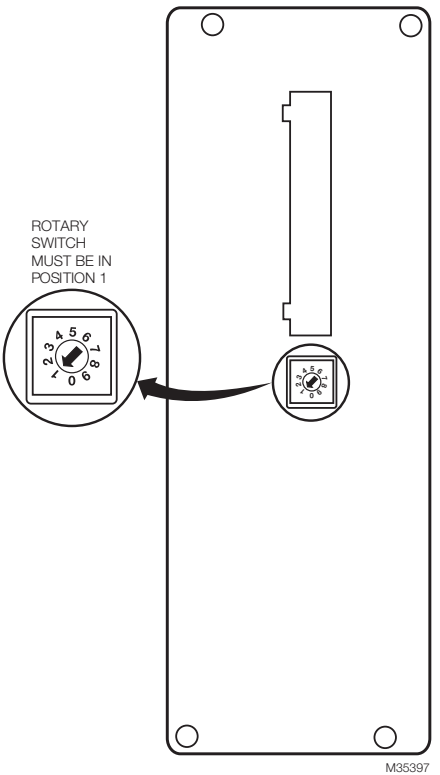

Fig. 2. Flame Amplifier Module Selector Switch.

3. Install the Flame Amplifier on the Sub-Base. See Fig. 3.

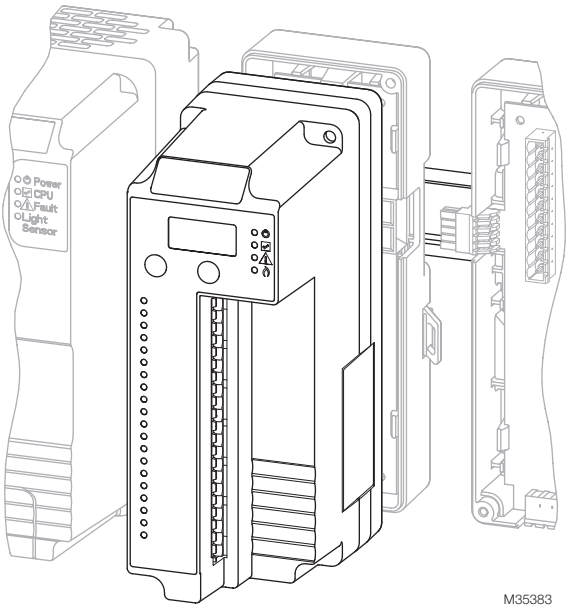

Fig. 3. Installing the UV Shutter-Check Flame Amplifier on the Sub-Base Module.

IMPORTANT

1. *Wiring must comply with all applicable codes, ordinances and regulations.*
2. *Wiring must comply with NEC Class 1 (Line Voltage) wiring.*
3. *The R8001S1051 should not interfere with the propersafety operation of the controls, limits and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS AND INTERLOCKS.*

⚠ CAUTION

Equipment Damage Hazard.
Incorrect combination of relay module, amplifier and flame detector can cause equipment damage.

Installing the Flame Detector

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the Burner Control Module, then it must be externally wired to it via the remote bus connections.

Wiring

1. Refer to Fig. 4 for proper flame detector wiring.
2. Disconnect power supply before making wiring connections to prevent electrical shock and equipment damage.

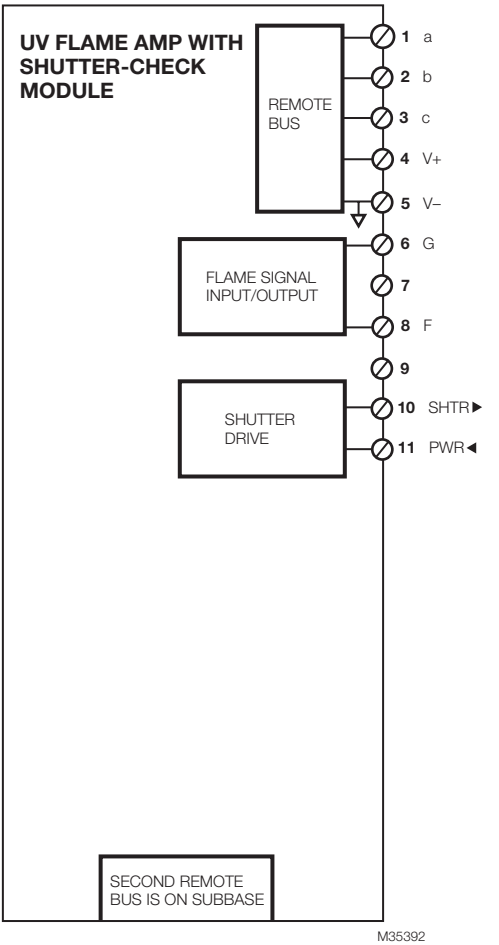

Fig. 4. R8001S1051 SLATE UV Shutter-Check Flame Amplifier wiring.

3. All wiring must comply with appropriate electrical codes, ordinances and regulations including NEC Class 1 (Line Voltage) wiring where required.

4. Use recommended wire size and type no. 18 copper conductors TTW (60C) or THW (75C) or THNN (90C).

5. Use recommended wire routing:
   - **a.** Keep the flame signal leadwire as short as possible from the detector to the SLATE module. The maximum permissible leadwire length depends on the type of leadwire, conduit type and leadwire diameter. The ultimate limiting factor for flame signal length is the flame signal voltage.
   - **b.** Do not run high voltage ignition transformer wires in the same conduit with the flame detection wiring.
   - **c.** If the flame detector leadwires are not long enough to reach the SLATE electrical connectors, make splices in a junction box.
     - **(1)** Enclose scanner wiring without armor cable in metal cable or conduit.
     - **(2)** Follow flame detector Instructions.

6. Check wiring, see Fig. 4.

Checkout

Preliminary Inspection

Make certain that:

1. Wiring connections are correct and all terminal screws and electrical connections are tight.
2. Proper flame failure response time is selected.
3. Amplifier is securely mounted on the DIN Rail and bus connector secured to SLATE Burner Control Module.
4. Detectors are properly positioned and cleaned according to Detector Instructions.
5. Correct combination of amplifier and flame detector is used.

NOTE: R7824C, Series 2 or greater, pulse shutter when signal of 1.5 Vdc is sensed. Display readings of 0.7 to 2.4 Vdc are common.

The flame signal for the pilot alone, the main burner flame alone, and both together must be steady and a minimum of 0.8V. If the flame signal is unsteady, or less than the minimum acceptable voltage, check the flame detector installation and circuitry in the following procedure.

1. Check the supply voltages. Make sure the master switch is closed, connections are correct, and the power supply is of the correct voltage and frequency and is sinusoidal.
2. Check the detector wiring for defects including:
   - **a.** Incorrect connections.
   - **b.** Wrong type of wire.
   - **c.** Deteriorated wire.
   - **d.** Open circuits.
   - **e.** Short circuits.
   - **f.** Leakage paths caused by moisture, soot or accumulated dirt.
3. For all optical detectors, clean the detector viewing window, lens, and inside of the sight pipe as applicable.
4. With the burner running, check the temperature at the detector. If it exceeds the detector maximum rated temperature:

   a. Add a heat block to stop conducted heat traveling up the sight pipe.
   b. Add a shield or screen to reflect radiated heat.
   c. Add cooling (refer to sight pipe ventilation in the detector Instructions).
5. Make sure that the flame adjustment is not too lean.
6. Make sure the optical detector is properly sighting the flame.
7. If necessary, resight or reposition the detector.
8. If you cannot obtain proper operation, replace the plug-in amplifier.
9. If you cannot yet obtain proper operation, replace the flame detector.

IMPORTANT

If you make any changes to the flame detection system, repeat all required Checkout tests in Checkout section of the Instructions for the applicable SLATE module.

SLATE™

IR Ampli-Check Flame Amplifier

R8001F1041

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application—offering virtually limitless development opportunities with far less complexity.

The R8001F1041 IR Ampli-Check Flame Amplifier module responds to an infrared signal from an infrared type flame detector to indicate the presence of flame. This flame amplifier is used with the C7915 detector series.

Features

- Module display for flame signal strength
- 0.0 to 10.0 VDC flame signal strength reading range

Specifications

Electrical Ratings:
Base Voltage and Frequency
24 VDC (± 15%),
24 VAC (± 15%), 50/60 Hz,
85–264 VAC, 50/60 Hz

Environmental Ratings
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C).

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

Dimensions: See Fig. 1.

Weight: 2 lb 1 oz (0.94 Kg)

Approvals
Underwriters Laboratories Inc. Listed, File: MP268
IRI Acceptable
Federal Communications Commission: Part 15, Class A
Must be mounted inside a grounded metal enclosure.

Mounting
DIN Rail (See Fig. 1)

Required Components
R8001A1001 SLATE Base Controller
R8001S9001 SLATE Sub-Base Module

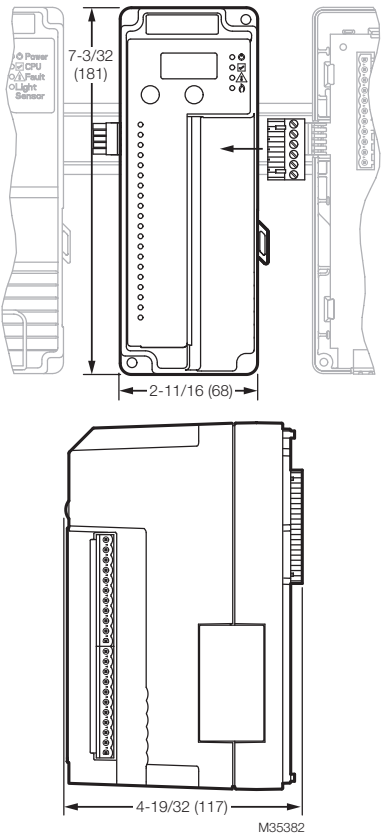

Fig. 1. Mounting dimensions of IR Ampli-Check Flame Amplifier in. (mm).

LED Array

There are four LEDs on the front of the IR Ampli-Check Flame Amplifier module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	SLATE Burner Control Module has detected a fault
	No light	Running
Flame	Yellow	Weak flame is detected
	No light	No flame is detected

Table 1. LED Descriptions.

LED Display

The SLATE system modules have a seven-segment, three-position LED display used for indicating flame strength. It is also used to identify the module number of the SLATE system.

Color	Description
Terminal T2	
Green	Communicating with burner
Red	Communication fault
Terminal T8	
Green	Flame
Off	No flame

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Selector Switch

The SLATE Burner Control Module is designed to operate with only one Flame Amplifier Module. The Flame Amplifier Module has a rotary switch on its back side which is factory set to 1. It must be set to 1 for the system to operate properly. See Fig. 2.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.
2. Verify the Selector Switch is set to 1. See Fig. 2.

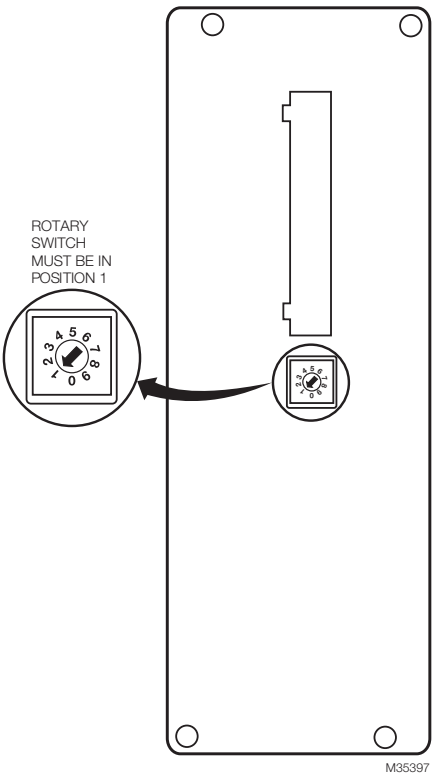

Fig. 2. Flame Amplifier Module Selector Switch.

3. Install the Flame Amplifier on the Sub-Base. See Fig. 3.

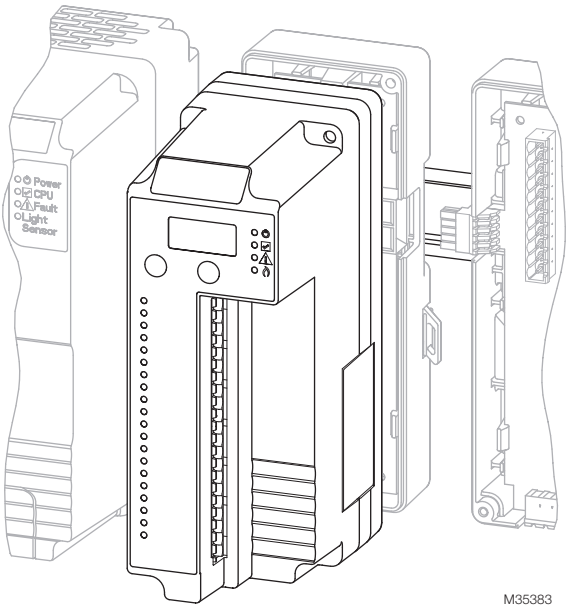

Fig. 3. Installing the IR Ampli-Check Flame Amplifier on the Sub-Base Module.

IMPORTANT

1. *Wiring must comply with all applicable codes, ordinances and regulations.*
2. *Wiring must comply with NEC Class 1 (Line Voltage) wiring.*
3. *The R8001F1041 should not interfere with the propersafety operation of the controls, limits and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS AND INTERLOCKS.*

⚠ CAUTION

Equipment Damage Hazard.
Incorrect combination of relay module, amplifier and flame detector can cause equipment damage.

Installing the Flame Detector

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the Burner Control Module, then it must be externally wired to it via the remote bus connections.

Wiring

1. Refer to Fig. 4 for proper flame detector wiring.

2. Disconnect power supply before making wiring connections to prevent electrical shock and equipment damage.

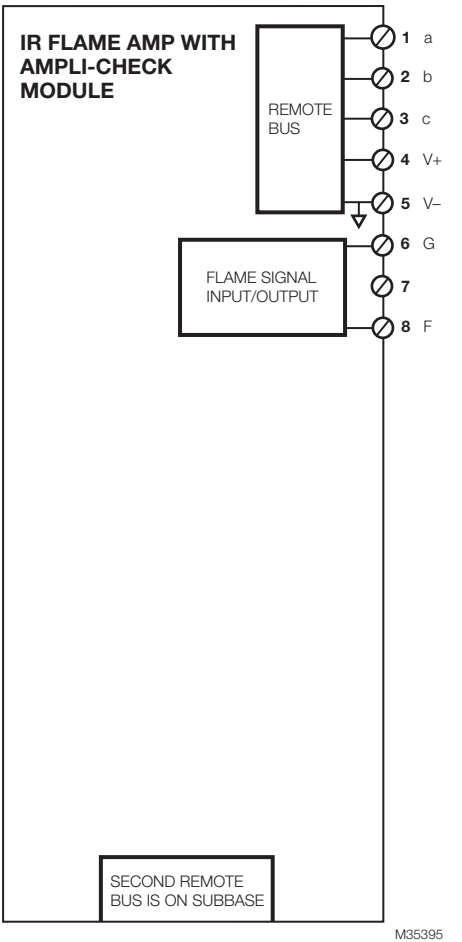

Fig. 4. R8001F1041 SLATE IR Ampli-Check Flame Amplifier wiring.

3. All wiring must comply with appropriate electrical codes, ordinances and regulations including NEC Class 1 (Line

Voltage) wiring where required.

4. Use recommended wire size and type no. 18 copper conductors TTW (60C) or THW (75C) or THNN (90C).
5. Use recommended wire routing:
   - **a.** Keep the flame signal leadwire as short as possible from the detector to the SLATE module. The maximum permissible leadwire length depends on the type of leadwire, conduit type and leadwire diameter. The ultimate limiting factor for flame signal length is the flame signal voltage.
   - **b.** Do not run high voltage ignition transformer wires in the same conduit with the flame detection wiring.
   - **c.** If the flame detector leadwires are not long enough to reach the SLATE electrical connectors, make splices in a junction box.
     - **(1)** Enclose scanner wiring without armor cable in metal cable or conduit.
     - **(2)** Follow flame detector Instructions.
6. Check wiring, see Fig. 4.

⚠ CAUTION

Equipment Damage Hazard.
Incorrect combination of relay module, amplifier and flame detector can cause equipment damage.

Installing the Flame Detector

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the Burner Control Module, then it must be externally wired to it via the remote bus connections.

Wiring

1. Refer to Fig. 4 for proper flame detector wiring.
2. Disconnect power supply before making wiring connections to prevent electrical shock and equipment damage.

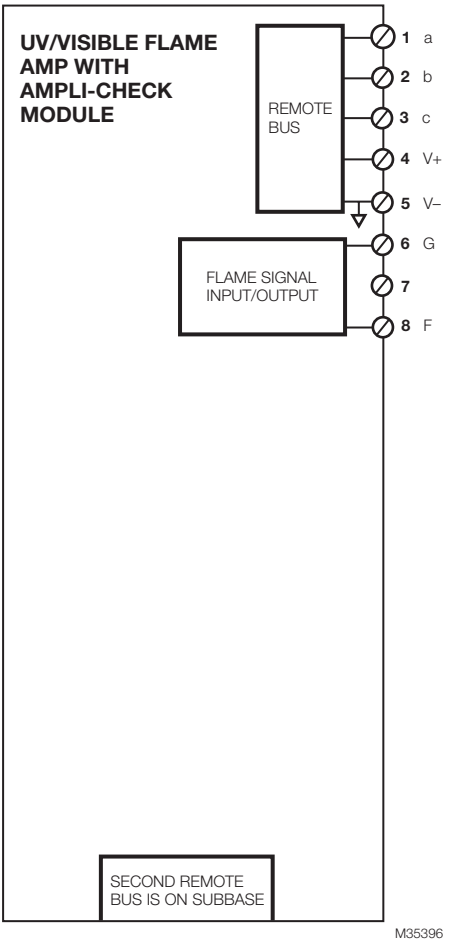

Fig. 4. R8001F1091 SLATE UV Visible Ampli-Check Flame Amplifier wiring.

3. All wiring must comply with appropriate electrical codes, ordinances and regulations including NEC Class 1 (Line Voltage) wiring where required.

4. Use recommended wire size and type no. 18 copper conductors TTW (60C) or THW (75C) or THNN (90C).

5. Use recommended wire routing:
   a. Keep the flame signal leadwire as short as possible from the detector to the SLATE module. The maximum permissible leadwire length depends on the type of leadwire, conduit type and leadwire diameter. The ultimate limiting factor for flame signal length is the flame signal voltage.
   b. Do not run high voltage ignition transformer wires in the same conduit with the flame detection wiring.
   c. If the flame detector leadwires are not long enough to reach the SLATE electrical connectors, make splices in a junction box.
      (1) Enclose scanner wiring without armor cable in metal cable or conduit.
      (2) Follow flame detector Instructions.

6. Check wiring, see Fig. 4.

Checkout

Preliminary Inspection

Make certain that:

1. Wiring connections are correct and all terminal screws and electrical connections are tight.
2. Proper flame failure response time is selected.
3. Amplifier is securely mounted on the DIN Rail and bus connector secured to SLATE Burner Control Module.
4. Detectors are properly positioned and cleaned according to Detector Instructions.
5. Correct combination of amplifier and flame detector is used.

NOTE: R7824C, Series 2 or greater, pulse shutter when signal of 1.5 Vdc is sensed. Display readings of 0.7 to 2.4 Vdc are common.

The flame signal for the pilot alone, the main burner flame alone, and both together must be steady and a minimum of 0.8V. If the flame signal is unsteady, or less than the minimum acceptable voltage, check the flame detector installation and circuitry in the following procedure.

1. Check the supply voltages. Make sure the master switch is closed, connections are correct, and the power supply is of the correct voltage and frequency and is sinusoidal.
2. Check the detector wiring for defects including:
   - **a.** Incorrect connections.
   - **b.** Wrong type of wire.
   - **c.** Deteriorated wire.
   - **d.** Open circuits.
   - **e.** Short circuits.
   - **f.** Leakage paths caused by moisture, soot or accumulated dirt.
3. For all optical detectors, clean the detector viewing window, lens, and inside of the sight pipe as applicable.
4. With the burner running, check the temperature at the detector. If it exceeds the detector maximum rated temperature:

   a. Add a heat block to stop conducted heat traveling up the sight pipe.
   b. Add a shield or screen to reflect radiated heat.
   c. Add cooling (refer to sight pipe ventilation in the detector Instructions).

5. Make sure that the flame adjustment is not too lean.

6. Make sure the optical detector is properly sighting the flame.

7. If necessary, resight or reposition the detector.

8. If you cannot obtain proper operation, replace the plug-in amplifier.

9. If you cannot yet obtain proper operation, replace the flame detector.

IMPORTANT

If you make any changes to the flame detection system, repeat all required Checkout tests in Checkout section of the Instructions for the applicable SLATE module.

Required Components

R8001A1001 Base Module
R8001S9001 Sub-base Assembly

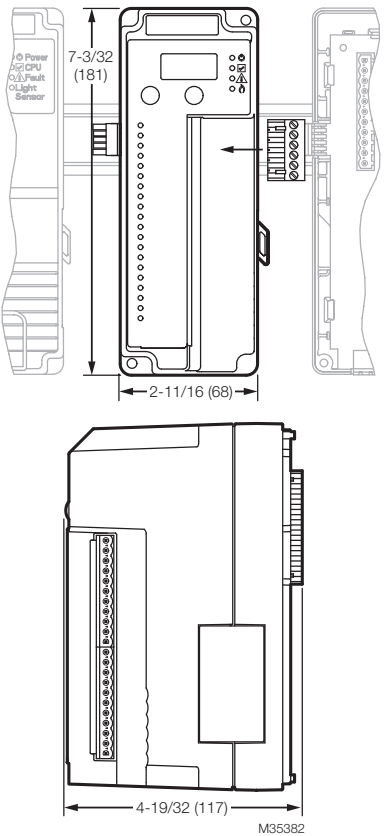

Fig. 1. Mounting dimensions of Rectification Ampli-Check Flame Amplifier in in. (mm).

Principal Technical Features

The R8001S1071 UV Ampli-Check module responds to a rectified signal from a rectification type flame detector to indicate the presence of flame. This flame amplifier is used with the C7027 and C7035 detector series.

LED Array

There are four LEDs on the front of the Ampli-Check Flame Amp module that provide quick identification of the system status and any problems that might occur. The status is broadcast to other modules on the platform bus in case they are affected by the inoperable modules. See Table 1 for descriptions.

LED	Color	Description
Power	No light	System does not have power
	Green	System has power
CPU	Red	No wire sheet or problem with the wire sheet
	Green	Running
Fault	Red	SLATE Burner Control Module has detected a fault
	No light	Running
Flame	Yellow	Weak flame is detected
	No light	No flame is detected

Table 1. LED Descriptions.

LED Display

The SLATE system modules have a seven-segment, three-position LED display used for indicating the module number of the SLATE system. The LED colors indicate the terminal state as shown in Table 2.

Color	Description
Terminal T2	
Green	Communicating with burner
Red	Communication fault
Terminal T8	
Green	Flame
Off	No flame

Table 2. Terminal LED Meanings.

Select and Reset Buttons

The SLATE system modules have Select and Reset buttons located on the front of the module and beneath the segment display. The Reset button is used to clear a lockout and reset the module. The Select button is used to scroll through the segment display information.

Selector Switch

The SLATE Burner Control Module is designed to operate with only one Flame Amplifier Module. The Flame Amplifier Module has a rotary switch on its back side which is factory set to 1. It must be set to 1 for the system to operate properly. See Fig. 2.

Installation

⚠ WARNING

Fire or Explosion Hazard
Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.
3. After installation is complete, check out the product operation as provided in these instructions.
4. The SLATE module must be mounted in an electrical enclosure with adequate clearance for servicing, installation and removal of modules.

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.
2. Verify the Selector Switch is set to 1. See Fig. 2.

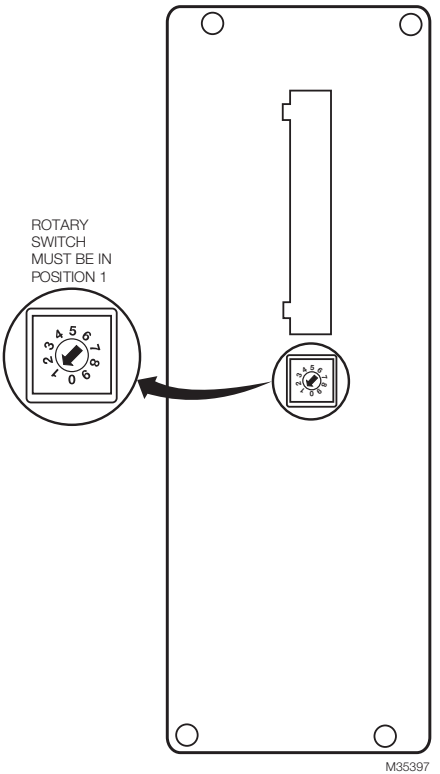

Fig. 2. Flame Amplifier Module Selector Switch.

3. Install the Flame Amplifier on the Sub-Base. See Fig. 3.

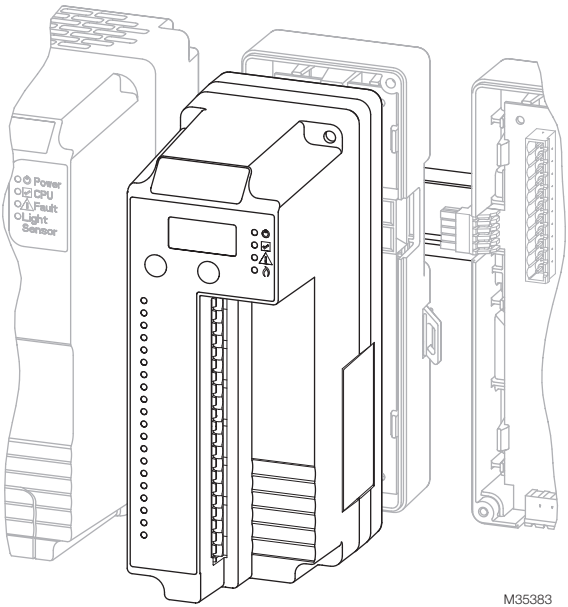

Fig. 3. Installing the Rectification Ampli-Check Flame Amplifier on the Sub-Base Module.

IMPORTANT

1. *Wiring must comply with all applicable codes, ordinances and regulations.*
2. *Wiring must comply with NEC Class 1 (Line Voltage) wiring.*
3. *The R8001V1031 should not interfere with the propersafety operation of the controls, limits and interlocks it is monitoring. After installation, check each control, limit and interlock to ensure that it is operating properly. DO NOT PLACE JUMPER WIRES ACROSS THE INSTALLATION CONTROLS, LIMITS AND INTERLOCKS.*
4. *G terminal on the flame amplifier must be connected to earth ground.*

⚠ CAUTION

Equipment Damage Hazard.
Incorrect combination of relay module, amplifier and flame detector can cause equipment damage.

Installing the Flame Detector

Proper flame detector installation is the basis of a safe and reliable flame safeguard installation. Refer to the instructions packed with the flame detector and the equipment manufacturer instructions.

Keep the flame signal leadwires as short as possible from the flame detector to the SLATE system. Capacitance increases with leadwire length, reducing the signal strength. The maximum permissible leadwire length depends on the type of flame detector, leadwire and conduit. However, the ultimate limiting factor for the flame detector leadwire is the flame signal.

If the flame amplifier is mounted on the DIN rail, it must be placed immediately to the right of the Burner Control Module that it is communicating with.

If the flame amplifier is not placed immediately to the right of the Burner Control Module, then it must be externally wired to it via the remote bus connections.

Wiring

1. Refer to Fig. 4 for proper flame detector wiring.
2. Disconnect power supply before making wiring connections to prevent electrical shock and equipment damage.

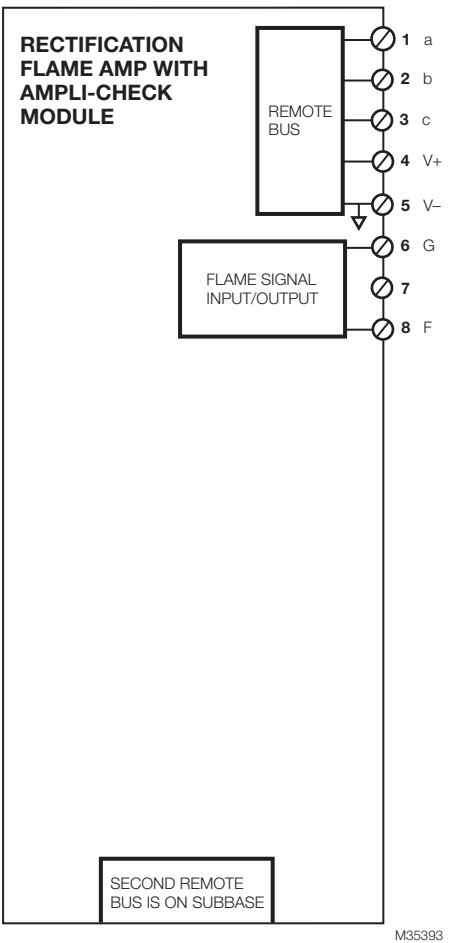

Fig. 4. R8001V1031 SLATE Rectification Ampli-Check Flame Amplifier wiring.

3. All wiring must comply with appropriate electrical codes, ordinances and regulations including NEC Class 1 (Line Voltage) wiring where required.

4. Use recommended wire size and type no. 18 copper conductors TTW (60C) or THW (75C) or THNN (90C).

5. Use recommended wire routing:
   - **a.** Keep the flame signal leadwire as short as possible from the detector to the SLATE module. The maximum permissible leadwire length depends on the type of leadwire, conduit type and leadwire diameter. The ultimate limiting factor for flame signal length is the flame signal voltage.
   - **b.** Do not run high voltage ignition transformer wires in the same conduit with the flame detection wiring.
   - **c.** If the flame detector leadwires are not long enough to reach the SLATE electrical connectors, make splices in a junction box.
     - **(1)** Enclose scanner wiring without armor cable in metal cable or conduit.
     - **(2)** Follow flame detector Instructions.

6. Check wiring, see Fig. 4.

Checkout

Preliminary Inspection

Make certain that:

1. Wiring connections are correct and all terminal screws and electrical connections are tight.
2. Proper flame failure response time is selected.
3. Amplifier is securely mounted on the DIN Rail and bus connector secured to SLATE Burner Control Module.
4. Detectors are properly positioned and cleaned according to Detector Instructions.
5. Correct combination of amplifier and flame detector is used.

NOTE: R7824C, Series 2 or greater, pulse shutter when signal of 1.5 Vdc is sensed. Display readings of 0.7 to 2.4 Vdc are common.

The flame signal for the pilot alone, the main burner flame alone, and both together must be steady and a minimum of 0.8V. If the flame signal is unsteady, or less than the minimum acceptable voltage, check the flame detector installation and circuitry in the following procedure.

1. Check the supply voltages. Make sure the master switch is closed, connections are correct, and the power supply is of the correct voltage and frequency and is sinusoidal.
2. Check the detector wiring for defects including:
   - **a.** Incorrect connections.
   - **b.** Wrong type of wire.
   - **c.** Deteriorated wire.
   - **d.** Open circuits.
   - **e.** Short circuits.
   - **f.** Leakage paths caused by moisture, soot or accumulated dirt.
3. For a flame rod, make sure:
   - **a.** There is enough ground area.
   - **b.** The flame rod is properly located in the flame.
   - **c.** Temperature at the flame rod insulator is no greater than 500°F (260°C).

4. With the burner running, check the temperature at the detector. If it exceeds the detector maximum rated temperature:
   a. Add a heat block to stop conducted heat traveling up the sight pipe.
   b. Add a shield or screen to reflect radiated heat.
   c. Add cooling (refer to sight pipe ventilation in the detector Instructions).
5. Make sure that the flame adjustment is not too lean.
6. Make sure the optical detector is properly sighting the flame.
7. If necessary, resight or reposition the detector.
8. If you cannot obtain proper operation, replace the plug-in amplifier.
9. If you cannot yet obtain proper operation, replace the flame detector.

IMPORTANT

If you make any changes to the flame detection system, repeat all required Checkout tests in Checkout section of the Instructions for the applicable SLATE module.

SLATE™

Sub-Base Module

R8001S9001

INSTALLATION INSTRUCTIONS

Scan for more information

Application

SLATE™ brings configurable safety and programmable logic together into one single platform. The platform can easily be customized for almost any requirement or application–offering virtually limitless development opportunities with far less complexity.

The R8001S9001 SLATE Sub-Base Module provides the ability for the SLATE system to be mounted via DIN Rail in a panel. All SLATE modules need this sub-base except for the SLATE Base Module.

Features

- Quick-mount to standard DIN-Rail
- Locking mechanism
- Provides bus connectivity to all modules
- Connections for remote mounted flame amplifiers (remote bus) and remote pushbutton reset

Specifications

Electrical Ratings:
Voltage and Frequency (from the Base): 18 VDC (± 1 VDC)
Maximum Total Connected Load: 2.5A
Terminal Ratings: See Table 1

Terminal	Description	Rating
1	18 V Power	2.5 A max including modules
2	18 V Ground	---
3	Remote Reset (Burner Control and Limit modules only)	Connect to Terminal 2 (18 V Ground) via external pushbutton

Terminal	Description	Rating
4	B (Remote Bus RS485)	Used for Remote mounted flame amplifiers
5	A (Remote Bus RS485)	Used for Remote mounted flame amplifiers

Table 1. Terminal Ratings.

Environmental Ratings
Ambient Temperature:
Operating: -20°F to +150°F (-29°C to +66°C).
Shipping: -40°F to +150°F (-40°C to +66°C)

Humidity: 95% continuous, noncondensing.
Vibration: 0.5G environment

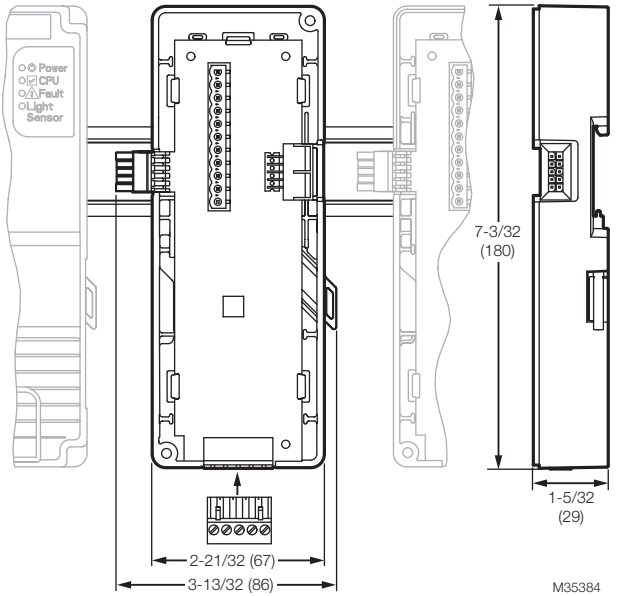
Dimensions: See Fig. 1.

Weight: 5 oz (136 g)

Approvals
Underwriters Laboratories Inc. Listed, File: MP286
IRI acceptable.
Federal Communications Commission: Part 15, Class A Emissions.

Mounting
DIN Rail (See Fig. 3)

Required Components
R8001A1001 SLATE Base Module
Any other SLATE modules
Optional 5-position terminal block for remote flame amplifier or remote reset button connections (Phoenix Contact p/n 1754504 or equivalent). See Fig. 2.



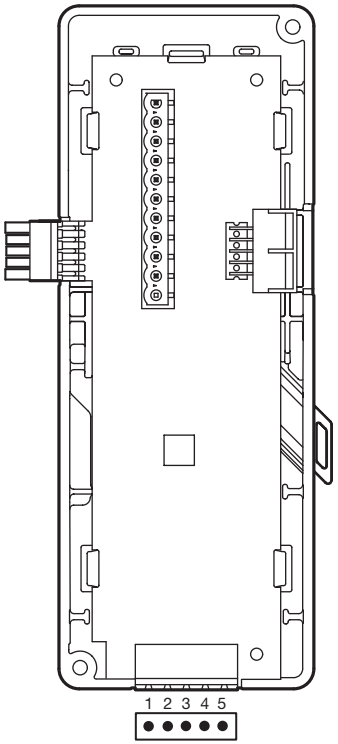


Fig. 1. Dimensions in in. (mm).

Installation

⚠ WARNING

Fire or Explosion Hazard Can cause severe injury, death, or property damage.

Verification of safety requirements must be performed each time a control is installed on a burner to prevent possible hazardous burner operation.

When Installing This Product

1. Read these instructions carefully. Failure to follow them could damage the product or cause a hazardous condition.
2. Check the ratings given in the instructions and on the product to make sure the product is suitable for your application.

Mounting

1. The sub-base module can be mounted on type C 20 DIN rail.
2. Mount the sub-base module first. The sub-base has locking mechanisms on both sides of the module. Pull to unlock position. See Fig. 3.

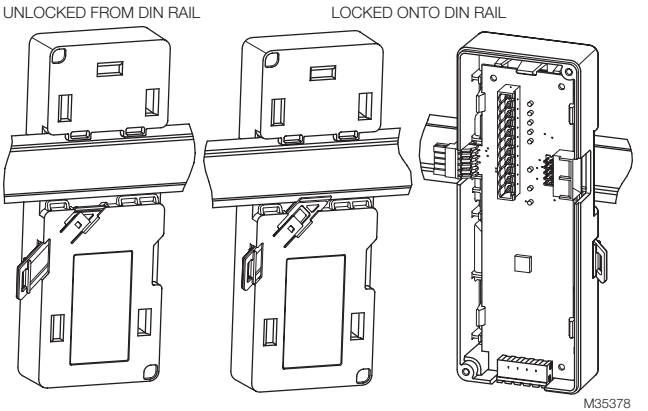

Fig. 3. Sub-base locking mechanisms.

3. Slide sub-base on the DIN rail and lock into place.

4. When securing subsequent sub-base modules make sure communication ports are aligned and locked into place. See Fig. 4.

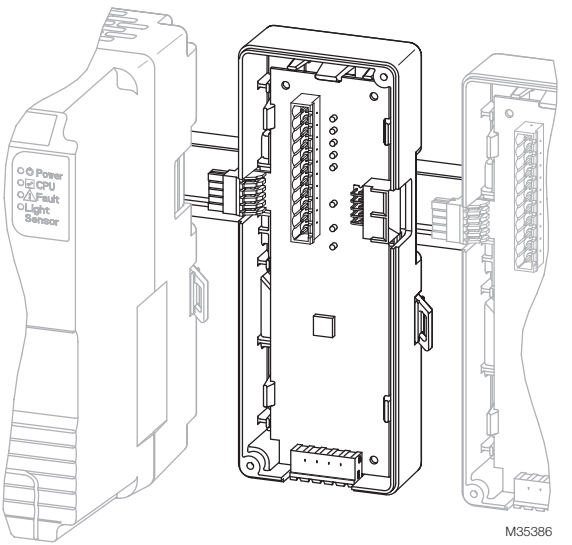

Fig. 4. Connecting additional sub-base modules.

5. After securing the sub-base module, snap the SLATE module into place and secure the module to the sub-base using screws (included with SLATE module).

Wiring

⚠ WARNING

Electrical Shock Hazard.

Can cause severe injury, death or equipment damage.

1. Disconnect the power supply before beginning installation to prevent electrical shock and equipment damage. More than one power supply disconnect can be involved.
2. Wiring must comply with all applicable codes, ordinances and regulations. See Fig. 2.
3. Wiring must comply with NEC Class 1 (Line Voltage) wiring.

Application	Recommended Wire Size	Recommended Part Numbers
Communication Lines	22 AWG two-wire twisted pair with ground, or five-wire.	Belden 8723 shielded cable or equivalent.
Other terminals	18 AWG wire insulated for voltages and temperatures for given application.	TTW60C, THW75C, THHN90C

Table 2. Recommended Wire Sizes and Part Numbers.

IMPORTANT

This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with these instructions, may cause interference for radio communications. It has been tested and found to comply with the limits of a Class A computing device of part 15 of FCC rules, which are designed to provide reasonable protection against such interference

when operated in a commercial environment. Operation of this equipment in a residential area may cause interference; in which case, the user, at their own expense, may be required to take whatever measures are required to correct this interference.

1. *This digital apparatus does not exceed the Class A limits for radio noise, set out in the Radio Interfeence Regulations of the Canadian Department of Communications.*
2. *Cable shield must be terminated to ground at both ends. If shielded cable is NOT used, use three-wire twisted cable.*

Recommended Grounding Practices

Use an Earth ground or a signal ground as described below.

Earth Ground (Base, Rectification Flame Amp Module, Other Modules Optional)

1. Use to provide a connection between the base and the control panel of the equipment. Earth ground must be capable of conducting enough current to blow the breaker in the event of an internal short circuit.
2. Use wide straps or brackets to provide minimum length, maximum surface area ground conductors. If a leadwire is required, use 14 AWG copper wire.
3. Verify that mechanically tightened joints along the ground path are free of nonconductive coatings and protected against corrosion on mating surfaces.

Signal ground

Note the 18 V system ground is not electrically connected to earth ground. Follow local codes and appliance recommendations to determine if this should be connected to earth ground.

Recommended Routing of Leadwires

- Do not run high voltage ignition transformer wires in the same conduit with the flame detector or data lines.
- Do not route flame detector or data lines in conduit with line voltage circuits.

- Enclose flame detector leadwires without armor cable in metal cable or conduit.
- Follow directions in flame detector instructions.

Be sure loads do not exceed the terminal ratings. Refer to the labels or terminal ratings in Table 1.

The SLATE system must be mounted in an electrical enclosure. When mounting in an electrical enclosure, provide adequate clearance for servicing, installation, and removal of SLATE modules.

Maximum Wire Length

- The maximum leadwire length is 300 feet to terminal inputs (Control, Running/Lockout Interlock)
- For remote reset leadwires, maximum length to remote pushbutton is 1000 feet.
- For remote bus data lines, maximum cable length depends on the number of modules connected, the noise conditions, and the cable used. The maximum of all interconnecting wires is 4000 feet.

G. SECTION 25 95 00 - Integrated Automation Control Sequences for HVAC

PART 2 PRODUCTS

2.1 MANUFACTURES

A. Manufacturers: Subject to compliance with requirements, provide products by one of the following:

1. MFR_1
2. MFR_2
3. MFR_3

Note to specifiers: Depending on the project configuration and requirements, and fuel options, a wide range of manufactures and models of packaged boilers can be specified. Cast-Iron boilers in commercial applications are employed. Firetube boilers in commercial, institutional, and industrial applications; both watertube and firetube units are employed.

2.2 CONSTRUCTION

A. Description: The boiler shall be factory-fabricated, factory-assembled and factory-tested, built on a steel base, including insulated jacket, flue-gas vent, combustion-air intake connections, water supply, return connections, and an integrated combustion management system. The combustion management system shall combine configurable safety and programmable logic ancillary control into a singular control platform in a modular format. Power burner shall have full modulation. Boiler efficiency shall increase with decreasing load (output), while maintaining setpoint. Unit to be ready for automatic operation except for connection of piping, fuel, electrical, chemical, and vent.

B. Pressure Vessel Design:

C. Heat Exchanger:

D. Modulating Fuel Valve:

E. Blower:

1. Motors:

a. Motor Sizes:

F. Ignition:

Note to specifiers: To specify Honeywell SLATE™ Integrated Combustion Management System with specified packaged boiler manufactures, "Copy and Paste" both Items 1.2 and 2.3 in project specification.

2.3 BOILER /BURNER CONTROLS

A. Description: The boiler /burner integrated combustion management system shall provide automatic boiler sequencing, circulation pump control, fan control, electronic ignition, flame supervision, system status indication, firing rate control, load control, central heating /domestic hot water control, limit control, system or self-diagnostics, and communications interface for a display, other network devices, Building Automation System, industrial control system, or to all simultaneously.

B. The control panel shall be factory pre-wired supplied with each boiler /burner unit. . The panel shall consist of an array of modules implementing a singular controller; **Honeywell SLATE™ Integrated Combustion Management System**, programmed at the OEM production facility. The control panel shall be mounted on the boiler, Base Module with light sensor backlit LCD screen local Operator Interface for monitoring and setpoint adjustments of the individual boiler.

C. The integrated combustion management system shall provide options and advanced system functions, configurable safety and programmable logic using NiagaraAX wire sheet editor Framework™, that allow standard and customizable control solutions.

D. Singular control platform modules:

1. Base module shall provide:
    a. Storage of data for device configuration and control program initialization.
    b. Backlit LCD screen with light sensor, local Operator Interface for monitoring and setpoint adjustments of the individual boiler.
    c. Power supply for all modules with multiple voltage options.
    d. Real time clock.
    e. Event log storage for lock-outs, fault history, and OEM requested events.
    f. Trend logging for OEM specified data.
    g. Network identification of the system as singular device.
    h. External communication 10BASE-T for Ethernet IP and /or RS485.
    i. Web services for direct browser access to the system, both Honeywell provided and designer customized pages, based on JavaScript, such as implemented Google Chrome™ and supports HTML5.

2. Burner Control module shall provide:
    a. Configurable safety.
    b. Flame safeguard control, 24 VDC or 24 to 240 VAC, primary or programmer, semi-automatic or fully automatic.
    c. Valve proving.
    d. Dual fuels capability.

3. Flame Amplifier modules shall provide:
    a. Signal from flame detector to indicate CE[e1] presents presence[MB(2] of flame, operated by Burner Control "parent" safety module.
    b. Display for flame signal strength.
    c. DIN rail or remote mounting.

4. Fuel Air Ratio Control module provides:

a. Relational control between fuel, airflow, and flue gas recirculation for the power burner.

b. Parallel-positioning control of up to four SLATE™ actuators and /or two variable frequency drives, up to (24) point curve with no slope constrains that would limit the steepness of the curve.

c. Control of RS-485 ModBus communications to communicate to the SLATE™ actuators and receive feedback (torque sizes: 50, 150, 300, 900 in/lb in-lb) with component anti-swap protection.

d. Curve verification and off curve checking algorithms.

e. Dual fuels capability.

f. O2 Trim control, or other flue gas constituents or temperatures.

5. Limit module shall provide:

a. The capability to directly receive any type of analog signal to create limits on either pressure or temperature or other, without requiring a UDC controller.

b. Four analog sensor cells, single input or two sets of redundant inputs.

c. Twelve limit blocks, with each block monitoring any sensor or pair of sensors.

d. Redundant relay output.

6. Analog I/O module shall provide:

a. Analog input and output capability for all combustion and ancillary control applications.

b. Multiple combination of analog functionality for each cell.

c. Four analog cells, with up to (12) signal inputs and outputs.

d. The capability to support voltage, resistance, current, PWM, Tachometer, Type J and K Thermocouples, RTD, Bridge and 3-wire NTC sensors.

e. The capability to configure inputs and outputs as 0-10 VDC and /or 4-20mA voltage, current, or PWM signals.

7. Digital I/O module shall provide:

a. Digital input and output capability for all combustion and ancillary control applications.

b. Universal I/O inputs configurable in multiple combination up to (14) optical inputs or (6) relay outputs.

c. Automatic adaptation to 24VDC or 24VAC to 240VAC.

8. Annunciator module shall provide:

a. Status monitoring of a series string of limit, control, and /or interlock contacts for diagnostic of a commercial or industrial burmer.

b. One relay output.

c. Automatic adaptation to 24VDC or 24VAC to 240VAC.

E. The platform shall be identified as a single network device, supporting communications protocols:

1.	BACnet /IP	-via 802.3i 10BASE-T.
2.	BACnet /MSTP	-via RS-485.
3.	Modbus RTU /TCP IP	-via 802.3i 10BASE-T.
4.	Modbus RTU /485	-via RS-485.
5.	Web Browser access (httpd)	-via 802.3i 10BASE-T

F. The platform shall provide a web-based user interface. The color touch screen display shall be Honeywell R8001K5001. ***(Where Shown on Drawings)*** provide a web-based user interface for viewing system status, and viewing, creating, or modifying configurations. ***(Where Shown on Drawings)*** The color touch screen display shall be:

1. Honeywell R8001K5001.
2. Third-party panel PC[e3][MB(4)].
3. Tablet or SmartPhone

G. Multiple Boiler Management: The OEM shall factory configure the Honeywell SLATE™ Integrated Combustion Management System for Lead /Lag Master Operation of a multiple boiler heating plant. The system shall be configured with all components of the system listed as products of a single manufacturer under the appropriate category by the Underwriter's Laboratories, Inc. and in accordance with the appropriate CSD-1 sections. System shall be commissioned by a factory authorized representative or supplier/installer with factory trained personnel.

H. Operational Sequence:

1. Shall comply with requirements specified in Section 23 09 93 Sequence of Operations for HVAC Controls.
2. Shall comply with requirements specified in Section 25 95 00 Integrated Automation Control Sequences for HVAC.

I. SLATE™ Building Automation System Integration: EachThe system shall function as a single network device respondingdevice responding to a single address, or be comprised of multiple SLATE™ systems may controllers, communicatecommunicating "peer to peer" via Modbus™ BACnet™/-MSTP and/or BACnet/t™ IP communication protocols.:

1. Shall comply with requirements specified in Section 23 09 23 Direct Digital Control System for HVAC.

2. Shall comply with requirements specified in Section 25 55 00 Integrated Automation Control of HVAC.

J. Building Automation System Interface: The system shall function as a single network device responding to a single address or be comprised of multiple SLATE™ controllers, communicating via Modbus/RS485 or BACnet/MSTPs™ and/or Modbus/TCP, BACnet/IP and/or HTTP™ communication protocols:

1. Shall comply with requirements specified in Section 23 09 23 Direct-Digital Control System for HVAC.
2. Shall comply with requirements specified in Section 25 55 00 Integrated Automation Control of HVAC.

CP35D1

Using natural gas, the CP35D1's high-efficiency generator provides 35 kW of electrical power. The engine heat is captured and heats water at a rated temperature of 176°F for immediate use or storage in your facility. Excess electricity production may be sold back onto the grid in certain states, creating a credit on your electric bill.

CHP Basic Flow

Standard Model			CP35D1-TNUG
Blackout Start Model			CP35D1Z-TNUG
Power	Output	Rated Output	35 kW
		Voltage	208V, 60Hz
		Phases/Wires	Three phase, 3 wire
Fuel	Gas type		Natural gas
	Pressure	Standard	9 in WC (2.25 kPa)
		Range	8 -10 in WC (2 - 2.5 kPa)
	Consumption (LHV)		367,487 BTU (107.7 kW)
			3.67 therms/hr
	Consumption (HHV) (*1)		407,114 BTU (119.3 kW)
			4.07 therms/hr
Heat output	Rated recovered heat		204,040 BTU/h (59.8 kW)
	Rated hot water temp.	Inlet	167°F (75°C)
		Outlet	176°F (80°C)
	Rated hot water flow rate		43 GPM (164 L/min)
	Maximum hot water temp. (Outlet)		190°F (88°C)
Input power	Voltage, Frequency		208V, 60Hz
	Starting current		46 A
	Power consumption	Radiator fan stop	0.72 kW (standard) 0.75 kW (blackout start)
		Radiator fan run	0.97 kW (standard) 1.00 kW (blackout start)
Gross Efficiency (LHV)	Overall efficiency		88%
	Electrical generation efficiency		32%
	Exhaust heat recovery ratio		55%
Sound level	Radiator fan stopped		62 dB (A)
	Radiator fan operating		64 dB (A)
Dimensions	Width		78.7 in (2,000 mm)
	Depth		31.5 in (800 mm)
	Height		76.9 in (1,995 mm)
	Net weight		3,153 lb (1,430 kg) (standard) 3,196 lb (1,450 kg) (blackout start)
Maintenance Interval			7,500 hrs
Standard Warranty			2 Years; Unlimited Hours
YES Product Protection	10 Years / 30,000 hrs		Optional
	10 Years / 60,000 hrs		Optional
Emissions & Certifications			EPA Certified UL2200 Certified CSAC22.2 No 14-13 Certified CSAC22.2 No 100-04 Certified UL1741/IEEE1547 Certified

*1: Natural gas calculations for fuel consumption are based on converting LHV to HHV: LHV= 983 BTU/scf, HHV = 1,089 BTU/scf

commercial economizers

A smart way to save on your commercial refrigeration costs.

ENERGY STAR PARTNER

IntelliCon®-RU

Commercial Refrigeration Unit Electrical Consumption Economizer

The IntelliCon®-RU will reduce electric consumption—typically 10% to 20%—when installed on commercial refrigeration/freezer (refrigeration) systems. IntelliCon-RU using intelligent Dynamic Cycle Management (DCM) Technology represents a major advancement in refrigeration system energy-saving technology, unsurpassed in today's commercial refrigeration marketplace. IntelliCon-RU is easily installed by a qualified installer, maintenance free and guaranteed to save energy.

Features

- Dynamic Cycle Management (DCM) Technology reduces air conditioning electric consumption—typically 10% to 20%
- UL listed, "Energy Management Equipment"
- Increased savings without replacing or upgrading costly system components
- "State-of-the-art" microprocessor-based control—LED indicators show operating modes
- Compatible with Intellidyne System 12
- Protects compressor against momentary power outages and short cycling
- Simple installation by a qualified HVAC/R installer
- No programming or follow-up visits required
- Maximum year-round efficiency
- Reduces maintenance and extends compressor life
- Fail-safe operation
- Guaranteed to save energy
- 15-year replacement warranty for breakdowns or defects

Intellidyne®

FEATURING DCM TECHNOLOGY

IntelliCon®-RU

Commercial Refrigeration Unit Electrical Consumption Economizer

Specifications

Mounting:
Any position via molded-on 1/2" Electrical Fitting

Size:
4"H x 4" W x 2 1/2"D

Operating Humidity:
5% - 95% Non-Condensing

Operating Temperature Range:
-10°F - +120°F

Power Input:
24/115/220 VAC @ 5W

Control Circuit:
24 VAC/DC, 115/220 VAC

Relay Contact:
10A @ 220VAC General Purpose

UL Listed,
"Energy Management Equipment"

Made in U.S.A.

The *IntelliCon®-RU* is a microprocessor-based, UL listed, electronic control that automatically adjusts the compressor cycles to achieve the greatest efficiency and reduced electrical usage. The sizing of refrigeration systems is based upon a number of factors. When any of the design considerations are not met, the refrigeration system can become oversized for the load and thus less efficient.

Intellidyne's intelligent Dynamic Cycle Management (DCM) Technology analyzes the demands and thermal characteristics of the entire refrigeration system, and dynamically modifies the compressor cycle pattern. These new patterns result in less frequent and more efficient compressor cycles. Just as computer control has increased the gas mileage of automobiles, *IntelliCon-RU* improves the electrical efficiency of refrigeration systems, by supplementing the antiquated on/off action of the thermostat or pressuretrol with the analysis and control capabilities of a computer.

The *IntelliCon* DCM Technology "intelligent modification of compressor cycling" will result in significant electrical energy savings. *IntelliCon's* innovative and intelligent algorithms have field proven electrical savings not only on properly sized and operating systems, but also on units that were undersized or those that had not been properly maintained.

The *IntelliCon-RU* works in conjunction with the existing temperature controls and will not void the compressor manufacturer's warranty. An additional feature of the *IntelliCon-RU* is the accepted industry practice of compressor anti-short-cycling control.

Installation by a qualified HVAC/R service technician is recommended. The *IntelliCon-RU* does not require any programming, adjustments or maintenance.

Verdiem®
by Aptean

The Leader In IT Energy Managment and Efficiency

TAKE CONTROL OF YOUR PC & PRINTER FLEETS

Verdiem uniquely monitors end user computing and print devices and provides IT with actionable data to increase efficiency and reduce costs, 30% or more. Verdiem also delivers a 90%+ success rate in waking up PCs for patches and other software updates.

GUARANTEED SOFTWARE UPDATE SUCCESS

- Enhanced Wake-on-LAN that requires no router or security changes
- Automatically elects proxies across all subnets
- Integrates with SCCM, automatically monitoring for advertisements
- Overcome Windows sleep disorders, ensuring PCs will properly wake-up, sleep, or shutdown
- Run system maintenance applications and reboot systems from a central console
- Automate custom processes when systems wake or before being put to sleep
- Report system health information

END USER PRINT OPTIMIZATION

- Inventory of printer makes and models
- Print volumes by department, location, users, and printer model
- Prescriptive guidance & cost savings on printers via elimination /shift to lower cost printers

"…if you're a Microsoft shop and you use Active Directory and Configuration Manager for deployments, Verdiem integrates both components seamlessly and we were extremely impressed with how we could leverage our existing implementations of both Active Directory and System Center Configuration Manager to deploy and then manage Verdiem."

"…because Verdiem allows us to remotely wake PCs with a simple website, we've actually solved a major help desk and support problem that we've had. People are actually able to turn their PCs on from home remotely and then able to do work off-line off-hours. So that was a very unforeseen benefit."

- Ryan Harvey,
Manager Design & IT,
University of Pittsburgh Medical Center

Verdiem is a registered trademark of Aptean Systems, LLC.

Aptean Verdiem Surveyor

Power Management for Microsoft and Mac

As a power management solution for PCs, Macs, and Windows tablets, Aptean Verdiem Surveyor provides a unified approach for IT device data collection, policy management, administration, and analytics. Surveyor offers the most accurate approach to energy management and measurement and can reduce your IT energy costs up to 60%.

Optimize Savings and Improve Energy Efficiency

Surveyor helps accurately measure computer and tablet energy consumption, allowing you to enforce policies for greater energy efficiency and optimize savings.

Surveyor delivers three IT efficiency solutions in a single integrated product:

- **PC Power Management** – Reducing PC energy usage starts with establishing a baseline of current energy usage data. Surveyor automatically detects and groups devices to capture accurate energy usage data and leverages the data to reduce power consumption.
- **Enterprise PC Wake** – Surveyor reliably wakes the PC fleet for security updates and patch management.
- **End User Print Analytics** – Uniquely monitor end user print activity and compile actionable data for devices and the people who use them.

Learn More

To learn more, contact your Account Manager or email us at **info@aptean.com**.

Benefits

- Improve security and compliance by achieving 95%+ wake success for patching
- Increase energy savings by an additional 30-60%
- Reduce IT labor and costs
- Streamline the administration of endpoint devices
- Enhance analytics capabilities with exhaustive reports that use the very detailed data collected on energy usage, savings opportunities and underutilized devices

DESTRATIFICATION FAN DESCRIPTION

The patented Air Pear Thermal Equalizer creates uniform air temperatures from floor to ceiling for maximum thermal comfort and energy savings up to 35% in the heating season and up to 25% in the cooling season.

CERTIFICATION: *Conforms to UL-507, CAN/CSA C22.2#60335-1, UL 94 5VA and is ETL listed in USA and Canada.*

HOUSING: *PC/ABS resin, 5VA flame resistance rating*

MOTOR: *Single phase, shaded pole, single speed (variable with optional speed control), axial motor. Motor is thermally protected. Operating temperature: -4˚ F (-20˚ C) to 158˚ F (70˚ C). No lubrication required. Bearings are sealed. 6' cord and plug provided for 120V, no plug for 230V.*

STATOR: *Patented multi-vane stator significantly increases air throw for maximizing performance. PC/ABS.*

SAFETY CABLE: *6' length steel cable (fastened to body)*

WARRANTY*: Warranty - 3-years parts and workmanship. Money back guarantee - 30 days. Refurbish program after 3-year warranty period.*

INTRODUCTION

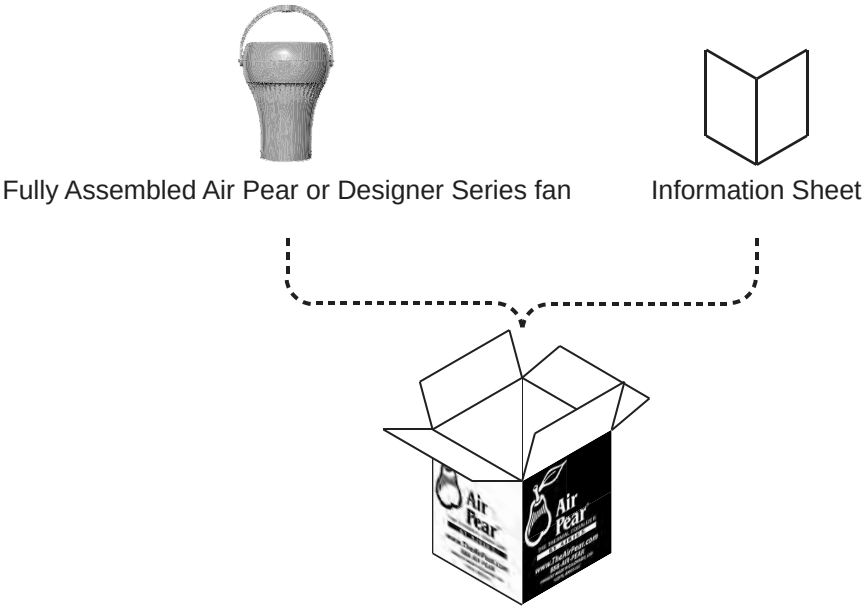
Thank You!

Congratulations on the purchase of Airius' Thermal Equalizer system (Air Pear). Our patented, American-made, air-mixing system will ensure better thermal comfort in both the summer and winter while driving down expensive energy bills. We are here to support you and if you have any questions or comments, we can be contacted through our website, www.airiusfans.com, or give us a call: 1-888-247-7327.



About Air Pear Models 10, 15, 25, 45, 60 & 100

The Air Pear unit is an energy-efficient air turbine, designed to continuously move a column of air to the floor for destratification and air circulation purposes. A typical system installation includes a series of units mounted just below the ceiling, evenly spaced throughout a facility, working in concert to improve comfort and reduce HVAC energy consumption up to 35% or more*. Airius fans are available in several sizes to accommodate a wide range of ceiling heights.

* THE PERFORMANCE AND RESULTS OF THE AIR PEAR SYSTEM ARE SUBJECT TO MANY VARIABLES SUCH AS, BUT NOT LIMITED TO, AIRFLOW OBSTRUCTIONS, THE INTERIOR ENVIRONMENT, EXTERIOR ENVIRONMENT, CONDITION OF BUILDING STRUCTURE, HVAC SYSTEM PERFORMANCE AND/OR ELECTRICAL SERVICE AND THUS, ACTUAL RESULTS MAY VARY.

What's in the Box

Each unit will arrive in its own box, fully assembled. NOTE: 120VAC versions come with a three-prong plug, and other voltages have no plug supplied. You will need to have a qualified electrician either wire the desired plug on to the power cord or hard wire directly to the power circuit. We recommend using a plug for easy removal during maintenance.

Models 10, 15, 25, 45, 60, &100: all voltages

120V Models:
Supplied with a polarized/grounded plug molded to a 6 ft. (1.8 m) cord. To reduce the risk of electrical shock, this plug is intended to fit in a polarized/grounded outlet only one way. If the plug does not fit fully in the outlet, contact a qualified electrician. Do not attempt to defeat this safety feature.

230V & 277V Models:
Supplied with a 6 ft (1.8 m) cord with a 3-wire pigtail for attachment to a single phase plug rated for the correct voltage; NEMA type: L6-20P or similar, wire color code: UL/CSA: black-live/white-neutral/green-yellow-earth.

Warning! To prevent electrical shock and/or injury, unplug/disconnect unit from power source before you move unit, service unit or remove any part of housing.

Warning! To reduce the risk of fire or electrical shock, do not use models 10, 15 and 25 equipped with shaded pole motors or models 45, 60 and 100 with permanent split capacitor (P.S.C.) motors with any unapproved solid-state speed control device. Models 45, 60, 100 and 125 with electrically commutated motors (labeled as EC or EL) are capable of variable speeds with the proper controls. Contact Airius for additional information regarding variable speed controls and options.

Do not carry the Air Pear/Designer Series unit by the cord. Do not use the cord as a handle. Do not use the cord to attach or hang the product. Be sure to grasp the plug, not the cord, when disconnecting this unit from an electrical outlet.

Do not use this product if it has a damaged cord, faulty plug or any broken housing or motor component. If the supply cord, plug, motor or housing is damaged, it must be serviced or replaced by Airius, its service agents or similarly qualified persons to avoid a hazard.

To prevent damage, which may result in fire or shock hazard, do not expose this product to rain or direct moisture. Do not immerse product into water or allow water to drip into the motor housing. Do not install outdoors or in an area open to the weather. Shut off power to a wet motor at source before servicing.

Spinning blades may inflict eye or other physical injury. Always replace a damaged blade. Disconnect unit from power source first. Contact Airius for replacement blades. Plastic blades are rated 5VA, the highest fire-resistant rating for plastics, and they will not maintain a flame.

Caution! Some Air Pear products have an unguarded impeller/fan blade. Do not use in locations readily accessible to people or animals. Blades may inflict injury when moving or stationary.

To reduce the risk of injury to persons, install product so that bottom of moving fan blade or the lowest moving part is at least 8.2 ft. (2.5 m) above the floor or grade level.

The motor is thermally protected; overheating will cause the motor to stop operating. The motor may restart once normal operating temperatures are achieved. If motor fails to restart, disconnect motor from electric source and contact Airius. Do not disable this safety device or override this safety feature; doing so will void the warranty.

Safety Precautions - Read & Save (cont.)

Do not use any PVC product (electrical tape) with the fans. If installing a fan in an environment with cutting oils in the air (production machine shop) contact the factory for assistance at 303-772-2633.

Do not position product near furnaces, fireplaces, stoves or other high temperature heat sources. Do not position Air Pear unit such that the downward air column created by the Air Pear will be directly bisected by another source of air flow, such as from another fan or from an open supply register. Do not position the unit close to other objects that will interfere with fan operation. Do not allow fan blades to come into contact with objects that can lock or inhibit the rotor operation.

Service and installation: No lubrication is required. Bearings are sealed. Bail adjustment can be made with a T-30 Torx driver/wrench, or a 5/32" Hex wrench may be used. Other tools for service: T-20 Torx (7/64" Hex) & T-25 Torx (1/8" Hex) and a #2 Phillips screwdriver.

The Air Pear unit is designed to be used with only the electrical voltage identified on the label located in the nozzle and on the bottom of the motor. Connecting to any other voltage could damage the motor and create an electrical hazard and will void warranty. If you have a question, please contact the factory.

Assembling Suspended Ceiling units: See additional instructions for kit included with this pamphlet or located in box containing kit.

Important: Install with hanging device or fastener rated for a minimum of 5x the weight of the unit. **Never use zip ties to hang the fan.** Use care when positioning the unit. To maximize performance, make sure the airflow is unobstructed into the top of the unit and the downward airflow is unobstructed and allowed to reach the floor.

Cleaning: Unplug unit from power source first to prevent electrical shock and to avoid injuries from spinning blades. Caution: Stationary blades can cause injury! You may clean the plastic housing with a warm cloth, using mild detergent only. Do not use petroleum products, thinners, solvents, ammonia, alcohols or other chemicals to clean any part of the Air Pear unit.

USA & Canada – ETL file #3164849 EU - CE

PRE-INSTALLATION

Preparing the Work Site - Electrical Installation

ELECTRICAL WORK MUST BE PERFORMED BY A QUALIFIED PERSON(S) IN ACCORDANCE WITH ALL NATIONAL AND LOCAL CODES/STANDARDS.

Airius recommends installing a dedicated circuit only to be used with the Air Pear units. DO NOT wire the units into the lighting circuit, as the system will cycle on and off with the lights, greatly reducing the system's effectiveness.

Outlets are available in many configurations, check with the local electrical contractor to determine the preferred type for the facility. Outlets should generally be mounted vertically unless a "twist/locking" type is being used.

Refer to page 13 for plug wiring directions.
Refer to page 12 for specific model amperage.

To confirm electrical continuity, if possible, plug the Air Pear system into an energized outlet at floor level, similar to the outlet installed in the ceiling, before permanently mounting the Air Pear in the ceiling. Only energize the fan after hands/fingers or loose clothing are removed from/around the fan intake.

CAUTION − Make sure the fan voltage matches the intended power supply before installing. Connecting the fan to the wrong voltage will void warranty.

Preparing the Work Site - Mechanical Installation

A ladder, scissor lift or other suitable means of reaching the installation point will be required.

The Air Pear system is designed to hang vertically 12-to-18 inches below the ceiling of the facility with the discharge pointing to the floor for maximum thermal equalization. NOTE: The bail may be angled, as it is ratcheted for special situations where a vertical air column is undesirable and an angled column would be more effective.

Make sure the air column will have an unimpeded path from the discharge to the floor. **If using the fans in a grocery aisle application, mount the fan a minimum of 3 ft. from the edge of any open reach in case to minimize the possibility of introducing air into the case.**

The free-hanging units are designed to hang vertically and freely from the ceiling on hardware capable of supporting a minimum of five times the weight of the unit. Example - 1/4" (7 mm) diameter steel bolt is rated at a 60 lb. (27 kg.) load.

Hardware that may be used to hang the unit includes, but is not restricted to: hooks, chains, cables, carabiners, bridle rings, beam clamps and bolts. Roof structure, building construction, electrical outlets/service and accessibility will define the appropriate hardware for each installation.

If installing within a suspended ceiling, make sure there are no objects (ducts, sprinklers, conduit, etc.), for clearance purposes, directly above the proposed location of installation and relocate if necessary.

Refer to installation directions on page 16 for further information.

Refer to Suspended Ceiling Kit Assembly and Installation on page 20.

Understanding Air Pear's Unique Air Flow

1. Low Velocity Intake - Low intake speed does not disturb air boundary layer under roof deck.
2. Columnar Laminar Flow - Removing the rotational component induced by the axial fan allows for the air to move in a straight, ductless column from the ceiling to the floor.
3. Entrainment - The column acts on the surrounding dead pool of air to induce entrainment and effectively multiply the air delivered to the floor.
4. Radial Spread - Once the column hits the floor, the air spreads radially until it loses velocity and migrates toward the ceiling.
5. Torus - The combination of these effects creates a torus-type air circulation and mixing pattern that effectively and efficiently achieves thermal equalization and general air movement.

Determine the number of fans, model and amperage to facilitate in the branch circuit design. Only qualified person(s) may determine the proper branch sizing and facilitate installation. If you have questions, contact your local electrical contractor.

INSTALLATION

Power Requirements

Model Amperage 120VAC, single phase, 50/60 Hz:

Air Pear 10-SP: 0.11 / 0.13 A
Air Pear 15-SP: 0.11 / 0.14 A
Air Pear 25-SP: 0.30 / 0.32 A
Air Pear 45-P4: 0.40 / 0.41 A
Air Pear 45-P2: 1.05 / 1.48 A
Air Pear 60-P4: 0.91 / 0.92 A

Model Amperage 100-130VAC, single phase, 50/60 Hz:

Air Pear 10-EC: 0.12 A
Air Pear 15-EC: 0.17 A
Air Pear 25-EC: 0.4 A
Air Pear 45-EC: 2.2 A
Air Pear 45-EL: 2.2 A
Air Pear 60-EC: 2.2 A
Air Pear 60-EL: 2.2 A
Air Pear 100-EC: 4.2 A

Model Amperage 230VAC, single phase, 50/60 Hz:

Air Pear 10-SP: 0.06 / 0.06 A
Air Pear 15-SP: 0.06 / 0.07 A
Air Pear 25-SP: 0.14 / 0.13 A
Air Pear 45-P4: 0.19 / 0.2 A
Air Pear 45-P2: 0.54 / 0.7 A
Air Pear 60-P4: 0.57 / 0.66 A

Model Amperage 200-250VAC, single phase, 50/60 Hz:

Air Pear 10-EC: 0.06 A
Air Pear 15-EC: 0.08 A
Air Pear 25-EC: 0.26 A

Model Amperage 277VAC, single phase, 60 Hz:

Air Pear 25-SP: 0.14 A
Air Pear 45-P4: 0.2 A
Air Pear 45-P2: 0.7 A
Air Pear 60-P4: 0.68 A

Model Amperage 200-277VAC, single phase, 50/60 Hz:

Air Pear 45-EC: 1.4 A
Air Pear 45-EL: 1.4 A
Air Pear 60-EC: 1.3 A
Air Pear 60-EL: 1.3 A
Air Pear 100-EC: 2.5 A
Air Pear 100-EL: 2.5 A

Branch Circuit Protection

The Air Pear fans do not include fuses for branch circuit protection. The branch circuit must have a dedicated circuit breaker or similar device. National and local safety standards and electrical codes may determine additional requirements for installation.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

Plug Wiring (230/277VAC Models)

120VAC cord is supplied with a molded three-prong polarized/grounded plug. DO NOT DEFEAT this SAFETY DEVICE or modify the plug in any way.

230/277VAC no plug supplied. When fitting a plug always ensure that all relevant local regulations/electrical codes are understood and followed with care - if in any doubt seek expert guidance.

The power cord is a three-wire 18 AWG (or 16 AWG) 300VAC rated electrical cord UL rated in North America (NA) as SJT or for CE/EU compliance rated as HO5VV.

The three wires in the power cord are color-coded to ensure proper wiring as follows:

BLACK or BROWN = HOT/ELECTRIFIED/LIVE
WHITE or BLUE = “N” NEUTRAL/RETURN PATH
GREEN or YELLOW-GREEN = GROUND/EARTH

The cord is attached to the fan motor via two power leads with insulated 1/4” quick connects.

The cord is secured in the housing by a strain relief and knotted inside the housing for additional security.

Procedure for wiring the plug in a single-phase electrical system:

Use CAUTION when wiring/attaching the plug (Male Connector) to the Air Pear/Designer Series system or when using any electrical device.

1. Plug should be rated for 230VAC or 277VAC and fit properly into outlet (female connector) being used for power.

2. To avoid electrical shock, DO NOT plug device into energized outlet until all exposed wires and connecting terminals are enclosed by plug housing. See plug manufacturer’s instructions.

3. Locate the three stripped wires on the 300VAC rated power cord attached to the unit where the outer cord insulation jacket has been removed. Wires are coded as follows: black or brown is HOT/Live (the energized conductor), white or blue is neutral “N” (the conductor used for a return current path) and green or yellow/green is ground/earth (the conductor to connect to the earth).

4. Using the plug manufacturer’s instructions, locate the proper positions to attach the color-coded wire to the color-coded or otherwise appropriately labeled terminals on the plug.

5. Tighten all connections. Reassemble plug in accordance with plug manufacturer’s instructions.

To confirm electrical continuity, if possible, plug the Air Pear system into an energized outlet on the ground, similar to the outlet installed in the ceiling, before permanently mounting.

NOTE: The Air Pear System can be wired directly to a junction box but only by a qualified electrician or similarly qualified person. Always ensure that all relevant local regulations/electrical codes are understood and followed with care - if in any doubt seek expert guidance. Check local electrical codes. The preferred system is designed with a plug for easy service and cleaning. An on-off switch must be installed in the circuit to be able to disable the power to prevent electrical hazard when servicing the appliance.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

Speed Control Wiring (Model 10-SP, 15-SP, 25-SP, 45-P2, 45-P4 & 60-P4)

SAFETY WARNING!

Unit should be installed by a qualified electrician in accordance with the National Electrical Code and other local codes that may apply. This control must be grounded when installed. Failure to follow these instructions may result in electrical shock or a fire hazard. This control is suitable for mounting in a metal or approved enclosure. These controls must not be used for loads exceeding those ratings clearly marked on the device.

CONNECTION DIAGRAM FOR 2-WIRE CONTROLS

APPLICATION

- Motor Type - Shaded Pole, PSC and Universal.
- Required Load - Fans and speed dependant loads.

WIRING

- Warning! - Power must be turned off before wiring. Connect control in series with motor and line voltage - never connect control across line.

MOUNTING

- Use 2” deep standard electrical box.
- Secure control with outer bracket tabs.

MINIMUM SPEED ADJUSTMENT

- Motor must be in actual operating conditions to achieve proper speed adjustment. (Motor will not slow down unless proper load is applied.)
- Turn main control knob clockwise to lowest speed position.
- Locate and adjust minimum speed setting on front plate with screw driver (rotate clockwise to decrease minimum speed; counter-clockwise to increase minimum speed.)
- Note: For all high-current models, 8 amps or greater, the opposite minimum speed rotation adjustment must be made so that motor runs with sufficient torque to prevent stalling.
- Motor will now operate from this preset minimum speed to full speed.

FINAL MOUNTING

- Install front dial plate - remove protective plastic.
- Turn main control until switch snaps off.
- Push on knob so that pointer is off position.

NOTE: For no switch models install front dial plate and push on knob.

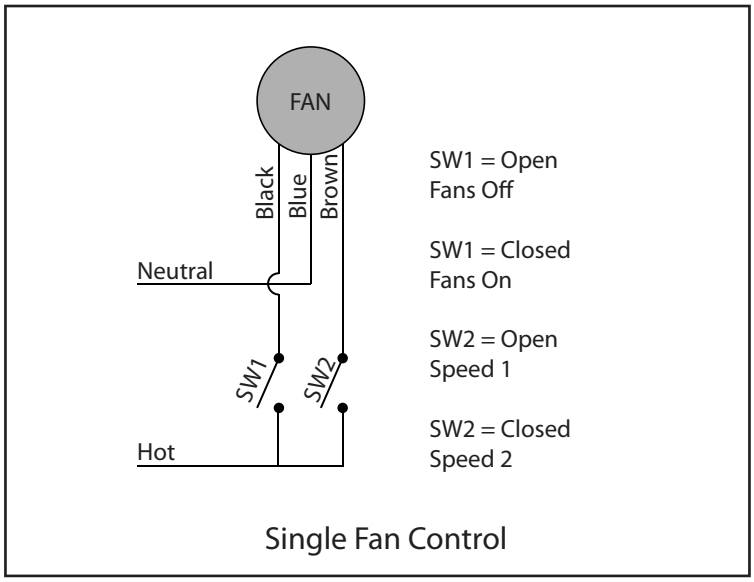
TRIAC SIZING CONSIDERATIONS

- ** Some models do not require grounding. Therefore, a ground wire is not provided.
- Make sure the total circuit amperage load does not exceed the TRIAC’s rated amperage.
- Make sure TRIAC’s voltage rating matches line voltage.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

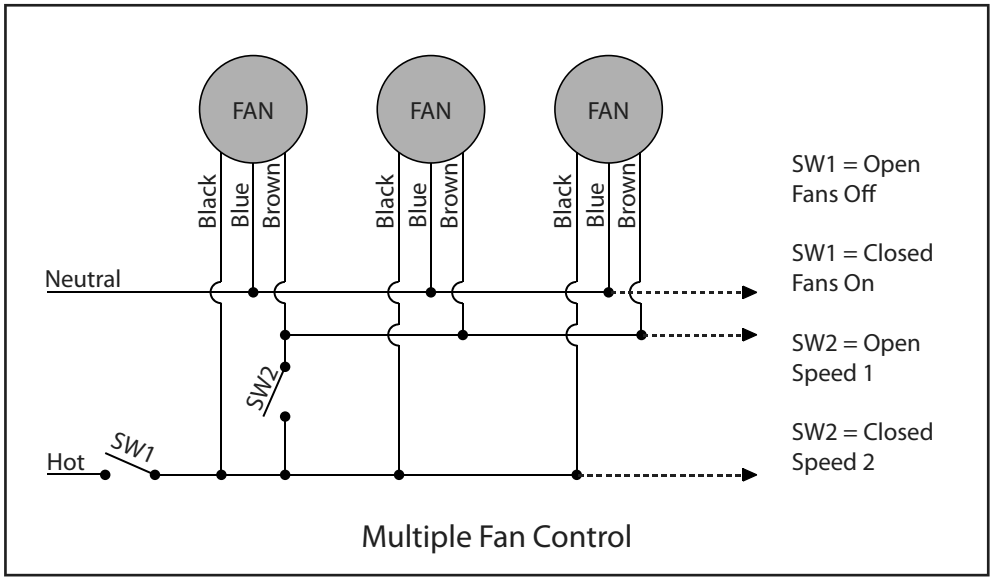
2-Speed Control Wiring (Model 10-EC, 15-EC and 25-EC only)

SAFETY WARNING!



Unit should be installed by a qualified electrician in accordance with the National Electrical Code and other local codes that may apply.

APPLICATION



• Motor Type - Electronically Commutated, 2-speed control. The 2 speeds are factory set. Do not use this wiring method if you have the optional 0-10VDC control module or a shaded pole motor.

WIRING

• Warning! - Power must be turned off before wiring.

Single Fan Control

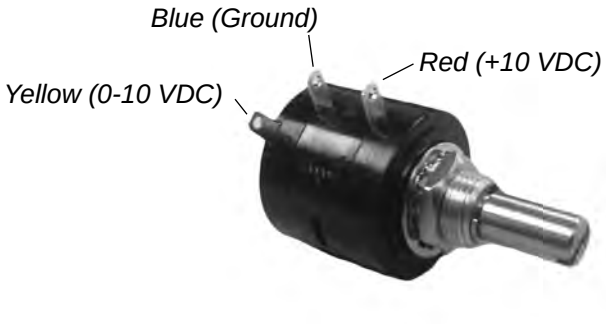
Multiple Fan Control

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

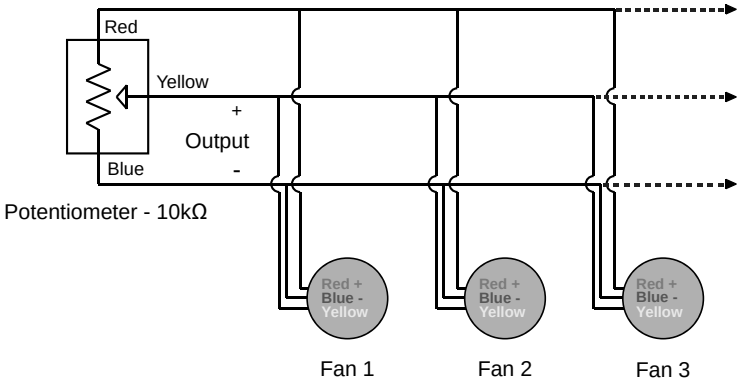
Speed Control Wiring (10-EC, 15-EC & 25-EC with optional 0-10VDC module. Model 45-EC, 60-EC & 100-EC)

POTENTIOMETER SPEED CONTROL DESCRIPTION

Multi-turn wirewound potentiometer used to vary the speed of electrically commutated (EC) motors. Speed controls for shaded pole or PSC motors: refer to page 14. Speed control for EL fans: refer to seperate FanCenter installation & operation guide.

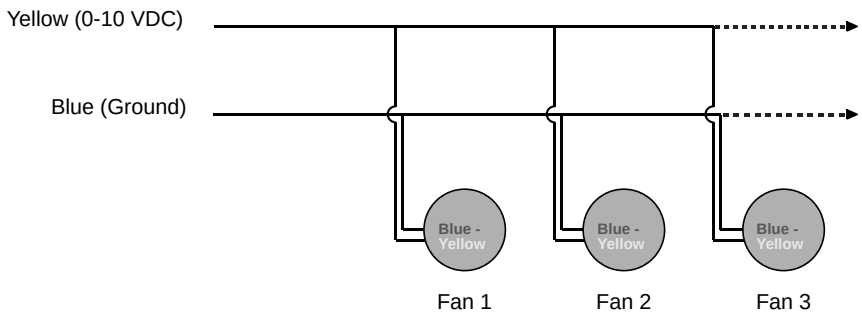


MODEL	VALUE (Ω)	LINEARITY	TOLERANCE
POT-1	10K	±0.25%	±5%



GENERAL NOTES

- The fan is supplied with current via the DC output and supplies a 0-10VDC signal that allows infinitely variable open loop speed control.
- If control wire exceeds 1300 ft. refer to Potentiometer wiring (external power source).
- A single controller can be used to control multiple fans with the same speed setting.
- Connecting the red and yellow leads will allow EC fans to operate at full speed.
- Wire runs up to 1000 feet (305 m) can be made using 20 - 24 AWG control wire. Wire runs longer than 1000 ft. will require the addition of a 10 - 12VDC power supply (not included).

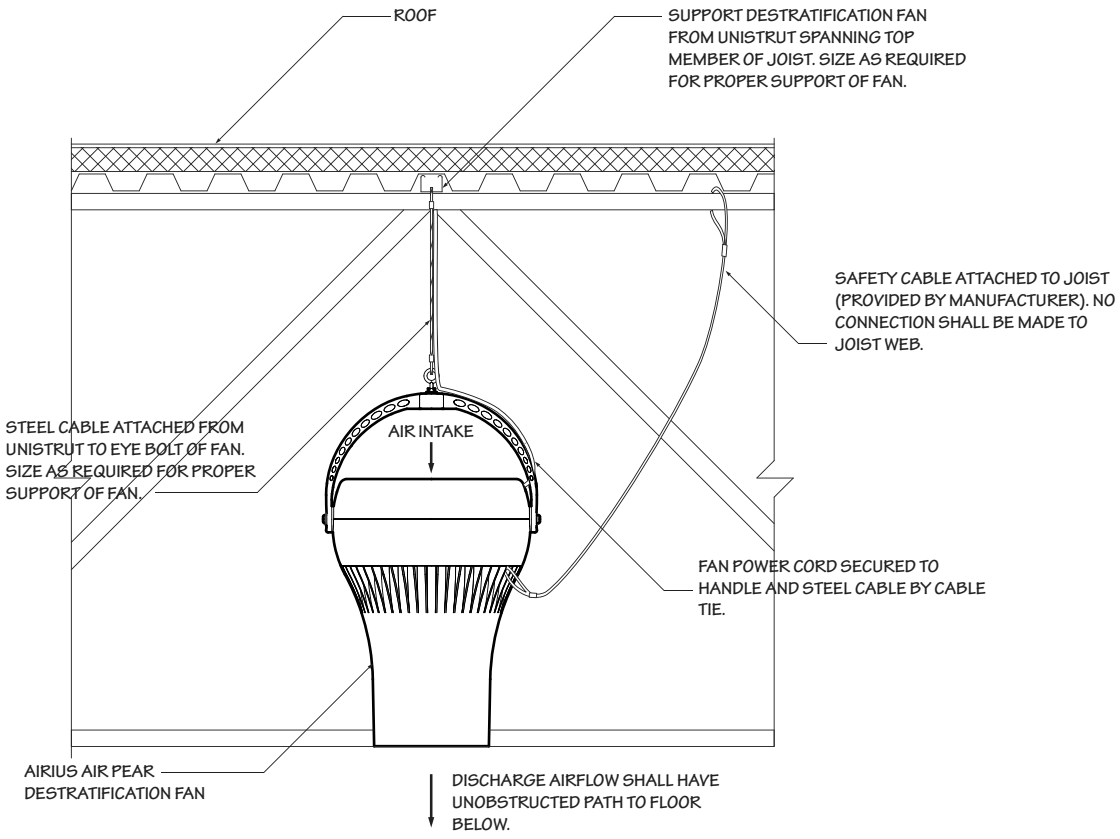


Potentiometer Control Wiring

BAS Control Wiring

The BAS should be capable of generating a 0-10VDC signal to modulate the fan speed. Use the following wiring diagram if this is the preffered connection type.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED



Free-Hanging Air Pear Suggested Installation Methods

Hardware that may be used to hang the unit includes, but is not restricted to: Hooks, chains, cables, carabiners, bridle rings, beam clamps and bolts. Roof structure, building construction and accessibility will define the appropriate hardware for each installation. Mount the fan as high in the ceiling as possible and do not restrict airflow into the intake.

After ensuring the Air Pear system is firmly attached and after REMOVING YOUR HANDS FROM THE UNIT, ONLY THEN is it safe to plug the unit into the power source using the approved plug to confirm function and electrical continuity.

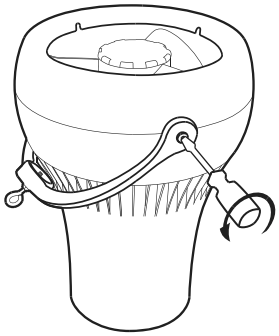
NOTE: Secure the power cord to the ceiling structure as added security. The cord will act as a safety leash and by securing it the possibility of the plug accidentally coming out of the outlet is greatly reduced. A 50 lb. (20 kg.) rated Zip Tie or several wraps of mechanics wire are examples of methods of securing the power cord.

The following graphic is an example of hanging the typical Air Pear unit:

DESTRATIFICATION FAN DETAIL

SCALE: NONE

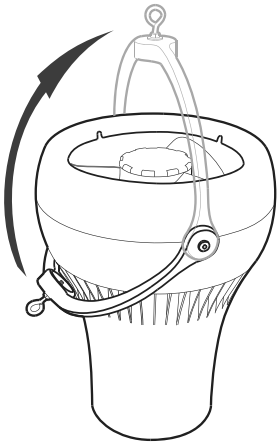
NOTES:



1. INSTALL FAN AS CLOSE AS POSSIBLE TO CEILING. (TYP 0'-6" TO 2'-0")
2. OPTIONAL HANGING METHODS INCLUDE: BEAM CLAMP/BRIDLE RING, CHAIN LINK/CARABINER, THREADED ROD/LOCK NUTS, ETC...
3. CONTRACTOR TO PROVIDE POWER FEED IN CONDUIT. THE ELECTRICAL CONNECTION CAN BE MADE IN A J-BOX (HARD WIRED) OR PLUG CONNECTION (J-BOX/RECEPTACLE).

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

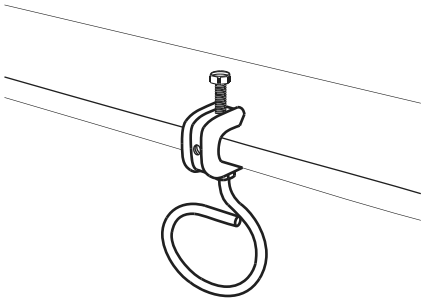
Suggested Installation Methods



1

Remove the Air Pear from its box, then remove the plastic protective bag. The bail (handle) is attached via two Torx screws. Using T-30 Torx driver, loosen these screws enough so the bail may swing.

2



Swing the bail to the vertical position and re-tighten the two Torx screws.

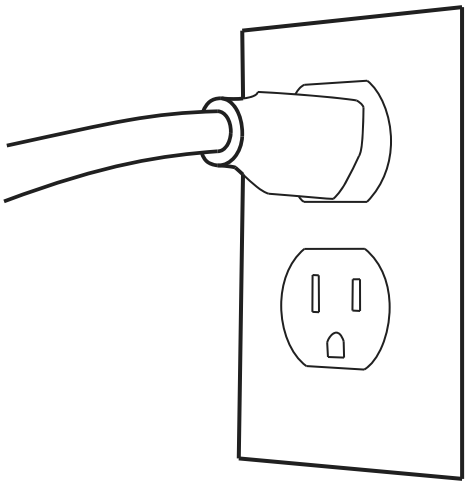
3

The Air Pear system is designed to hang vertically and freely 12-to-18 inches, or as close as possible, from the ceiling on professionally installed hardware, for models 10/15/25, capable of supporting a minimum of five times the weight of the Air Pear unit, 60 lb. (27 kg.). Example - 1/4” (7 mm) diameter steel bolt is rated at 60 lb. (27 kg.) load.

A feature of the Air Pear system is its flexibility. Hardware that may be used to hang the unit includes, but is not restricted to: Hooks, chains, cables, carabiners, bridle rings, beam clamps and bolts. Roof structure, building construction and accessibility will define the appropriate hardware for each installation.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

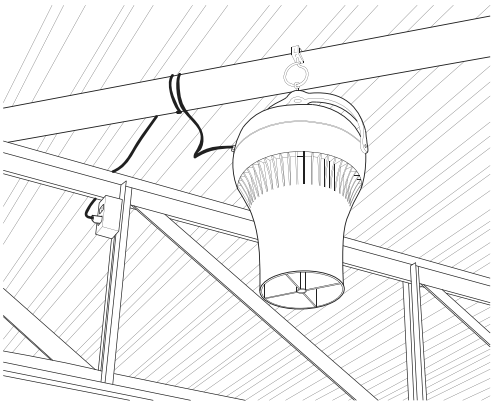
Suggested Installation Methods



4

After ensuring the Air Pear system is firmly attached, remove your hands from the unit.

5



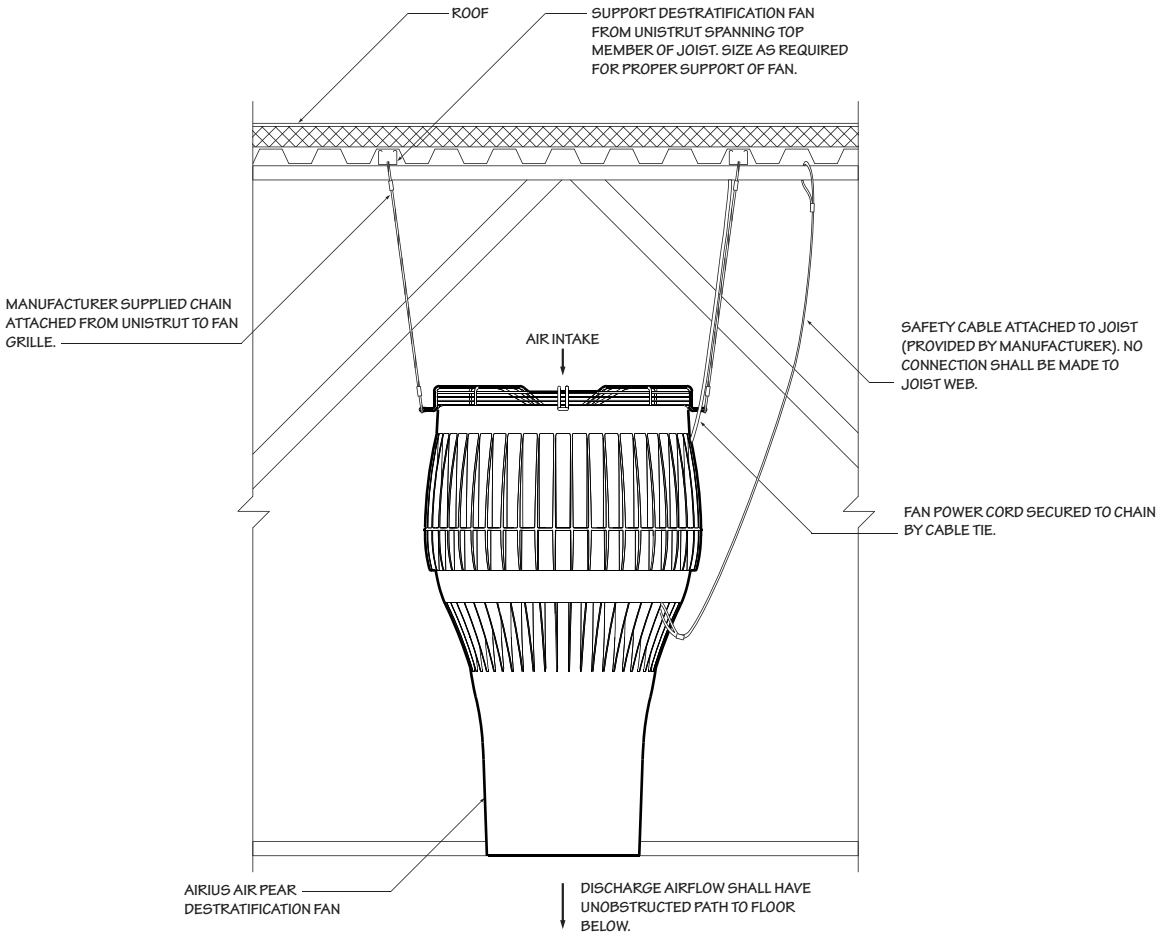
It is then safe to plug the unit into the power source using the approved plug to confirm function and electrical continuity.

6

NOTE: SECURE the power cord to the ceiling structure as added security. The cord will act as a safety leash and by securing it the possibility of the plug accidentally coming out of the outlet in the future is greatly reduced. A 50 lb. (20 kg.) rated Zip-Tie or mechanics wire are examples of methods of securing the power cord.

The graphic to the right is an example of hanging the Air Pear unit:

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED



Free-Hanging Air Pear 100 Suggested Installation Method

200 lbs rated chains are supplied with the Model 100 fans that attach to the unit and the structure above. Roof structure, building construction and accessibility will define the appropriate connection hardware for each installation. Do not fasten units to joist web members or joist bridging.

After ensuring the Air Pear system is firmly attached and after REMOVING YOUR HANDS FROM THE UNIT, ONLY THEN is it safe to plug the unit into the power source using the approved plug to confirm function and electrical continuity.

NOTE: Secure the power cord to the ceiling structure as added security. The cord will act as a safety leash and by securing it the possibility of the plug accidentally coming out of the outlet is greatly reduced. A 50 lb. (20 kg.) rated Zip Tie or several wraps of mechanics wire are examples of methods of securing the power cord.

The following graphic is an example of hanging the Air Pear Model 100:

DESTRATIFICATION FAN DETAIL

SCALE: NONE

NOTES:
1. INSTALL FAN CLOSE TO CEILING. (TYP 1'-6" TO 3'-0")
2. CONTRACTOR TO PROVIDE POWER FEED IN CONDUIT. THE ELECTRICAL CONNECTION CAN BE MADE IN A J-BOX (HARD WIRED) OR PLUG CONNECTION (J-BOX/RECEPTACLE).
3. THE THIRD MANUFACTURER SUPPLIED CHAIN CAN BE USED TO TILT THE FAN AT AN ANGLE.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

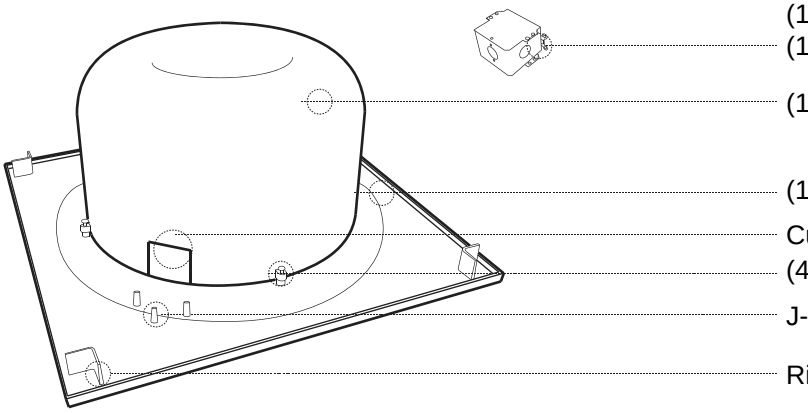
Suspended Ceiling Air Pear Suggested Installation Methods

After ensuring the Air Pear system is firmly attached and after REMOVING YOUR HANDS FROM THE UNIT, ONLY THEN is it safe to plug the unit into the power source using the approved plug to confirm function and electrical continuity.

NOTE: Drill each of the four right angle corner tabs and secure the faceplate to the structure above with mechanics wire.

The following graphic is an example of hanging the typical Suspended Ceiling Air Pear unit:

DESTRATIFICATION FAN DETAIL



SCALE: NONE

NOTES:

1. CONTRACTOR SHALL INSTALL METAL CLAD CABLE TO MANUFACTURER SUPPLIED JUNCTION BOX AND RECEPTACLE.

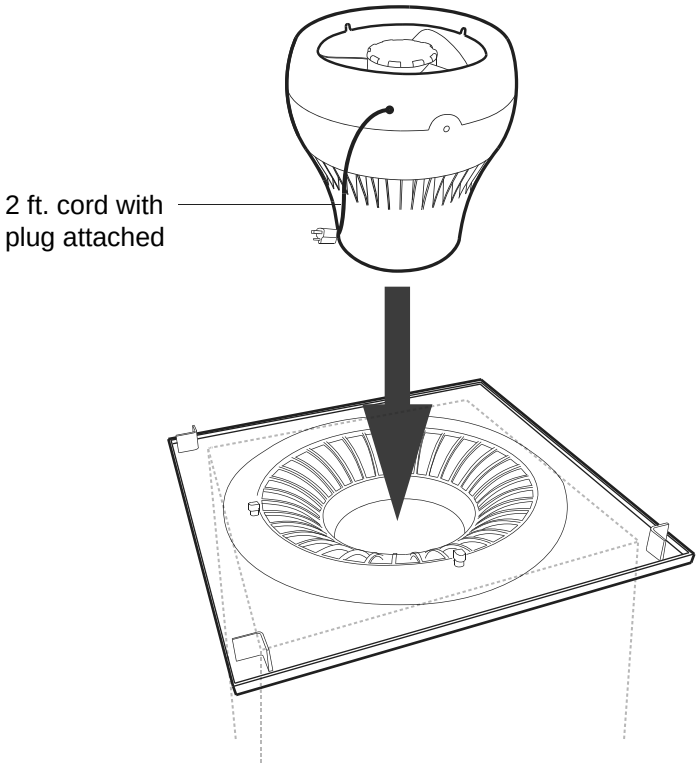
Suspended Ceiling Air Pear Assembly & Installation

*Included in hardware bag



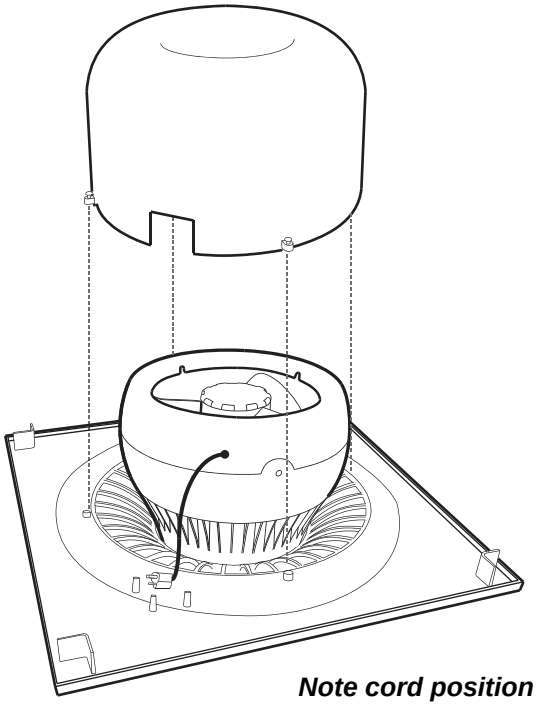
1

Remove the Air Pear from its box and plastic protective bag. The bail (handle) is attached via two Torx screws. Loosen these screws and remove the bail (discard at your discretion).

2

Remove all components from packing materials. Using the box that the suspended ceiling kit unit arrived in, open end up, place the 2’ x 2’ flat air intake grille over the open end of the box, face down. The right angle corner tabs should be facing up. Insert the Air Pear unit (with bail removed) into the center hole so that the nozzle extends below the air intake grille and the cord is hanging over the edge.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

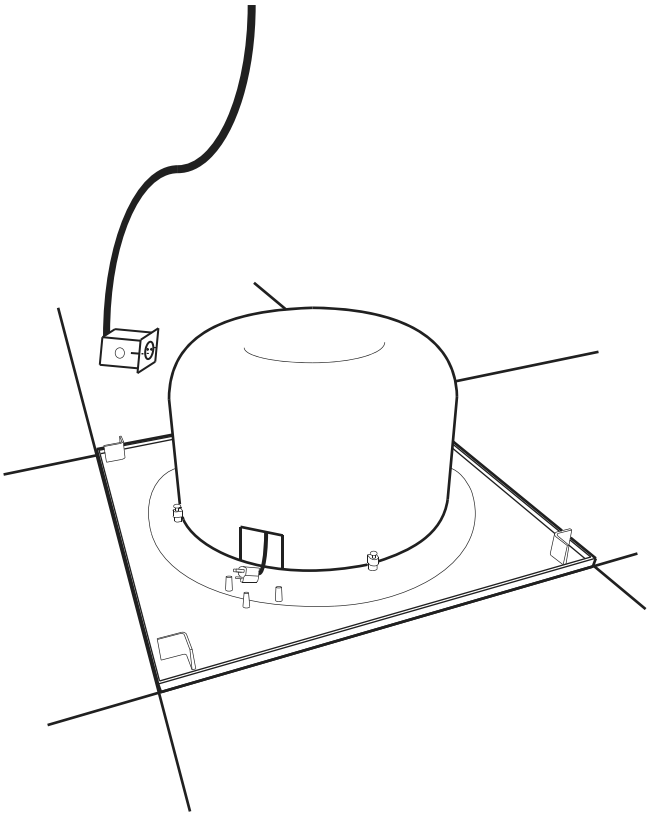


Suspended Ceiling Kit Assembly & Installation (cont.)

3

Place dome over Air Pear unit and align it with screw holes. Note that cutout should face the j-box mounting location. Dome should seat into the rim designed for it on the base, if necessary gently push the dome edge in until it seats inboard of the rim.

Insert the four Phillips screws (10-32 x 5/8” provided) through ears in dome and into threaded brass inserts. Screws will go in easily when aligned properly. Do not overtighten, as galling or stripping could occur.



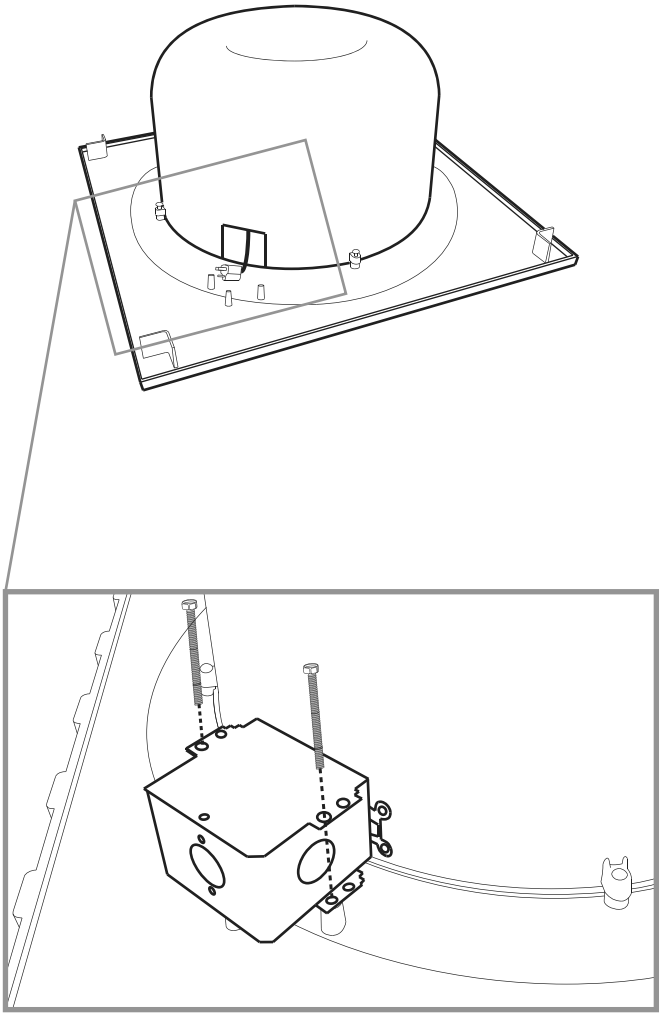
When dome is installed, the power cord needs to be fed through the cutout in the dome.

Note cord position

4

Have an electrician or similarly qualified person wire, with MC-type cable, the supplied receptacle into the j-box in close proximity to the intended installation location. Fasten the supplied metal faceplate to the j-box. Follow all local and national electric codes. MC cable should have enough length to ensure easy installation.

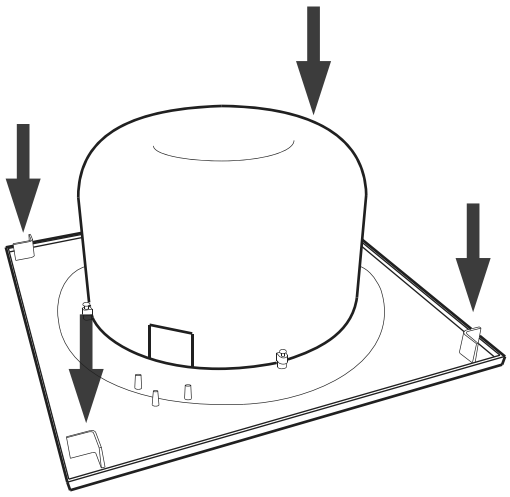
5



Place the assembled suspended ceiling kit into the T-bar grid. The air intake grille is designed to replace a 2’ x 2’ ceiling tile. If replacing a 2’ x 4’ tile, please use an additional piece of 2 ft. T-bar suspension material to finish the edge and provide additional strength and rigidity to the existing suspension system.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

Suspended Ceiling Air Pear Assembly & Installation (cont.)



6

Plug the Air Pear power cord into the receptacle. Using the supplied thumbscrews, fasten the j-box to the air intake grill through the indicated holes as shown (wiring to j-box omitted for clarity).

7

The base has four right angle tabs located at each corner that can be drilled for additional ceiling/support wires to be added if desired.

OPERATING THE FAN

Heating Season

Within an enclosed building space, with minimal air movement, hot lighter air rises to the ceiling while cold heavier air falls to the floor creating a temperature gradient. This condition will cause excess energy use as the HVAC system fights to maintain the thermostat set point typically at 5 ft. above floor level. This inefficient condition can also cause great thermal discomfort for the building occupants.

The Air Pear is an energy-efficient air turbine, designed to continuously move a column of air to the floor. A typical Air Pear installation includes a series of units mounted just below the ceiling, evenly spaced throughout a facility, working in concert to balance the air temperature ceiling to floor and wall to wall.

As air circulation improves and air temperatures balance, your HVAC system will require less and less energy to comfortably heat the work area, reducing the energy consumption of HVAC systems up to 35% or more. Once started, the entire process of “thermal equalization” will take, on average, less than 24 hours.

All Air Pear fans are designed to run continuously, year-round, to maintain thermal equalization and general air movement.

Cooling Season

We tend to think stratification occurs only in the heating season, but actually the condition exists year round. As you mechanically condition the air to combat rising outdoor temperatures, combined with minimal air movement, a large temperature gradient can exist.

The HVAC system will consume more energy as it fights the temperature gradient, hot and cold spots and short cycling compared to a properly mixed space. Using the Air Pear system will help alleviate the problem through thermal equalization. Keeping the thermostats satisfied longer and creating air movement that produces a cooling effect on the skin will result in the ability to raise the thermostat set points as much as 6° F, yielding up to an 18% energy savings during cooling seasons.

In non-air conditioned spaces, the Air Pear system can be used for spot cooling and general air circulation. If a large temperature differential exists between day and night, a strategy of drawing cool night air into the space and closing openings during the day can help maintain a cooler temperature internally as outdoor air temperatures rise.

A person’s head is most sensitive to comfort perception. Hot air trapped in the ceiling warms all the surrounding duct work, decking and other ceiling-mounted equipment to act as a radiant heat source and can cause the occupants to perceive discomfort. Reducing this radiant heat source through thermal equalization will help alleviate this condition.

All Air Pear fans are designed to run continuously, year-round, to maintain thermal equalization and general air movement. The fan speed can be maintained the same throughout the year or increased for the summer months to enhance the evaporative cooling effect if people in the space find this to be desirable.

MAINTENANCE

Preventive Maintenance

Follow these easy steps to prevent any excess dirt buildup and preserve the life of the product:

No lubrication is required as bearings are sealed.

Cleaning:

- **Unplug unit from power source** first to prevent possible electrical shock and prevent injuries from spinning blades.
- Caution: Stationary blades can cause injury!
- You may clean the plastic housing with a damp cloth, using mild household detergent only.
- DO NOT use petroleum products, thinners, solvents, ammonia, alcohols or other chemicals to clean any part of the Air Pear unit.

Note: If fan is not operating or any parts are broken, contact manufacturer for replacement information.

TROUBLESHOOTING

General Troubleshooting

The Air Pear/Designer Series units are tested before they leave the factory, resulting in an extremely low rate of returns. However, mechanical devices do fail, and we recommend that you identify the problem and try the simple suggestions below.

Fan will not start:

a) Check fuses and circuit breakers.
b) Check voltage at fan connection.
c) Adjust the trim set screw in fan wall speed control (if using optional speed control). If minimum setting is too low the fan may shut off with voltage fluctuations. Increase minimum. See page 14 for more information.
d) Contact manufacturer for additional help: 1-888-AIR-PEAR (888-247-7327).

Fan airflow is too fast/slow:

a) Adjust speed control dial to produce desired flow. Adjust the trim set screw in fan wall speed control (if using optional speed control). If minimum setting is too low the fan may shut off with voltage fluctuations. Increase minimum. See page 14 for more information.

Fan has excess vibration (noise or wobbles):

a) Make certain the hanging hardware is secured tightly.
b) Contact manufacturer for additional help: 1-888-AIR-PEAR (888-247-7327).

WARRANTY

Airius Warranty Policy

This warranty is limited to products purchased directly from Airius, LLC ("Airius") or one of its authorized resellers. To determine whether a reseller is authorized, please contact Airius at the contact information below.

Airius warrants products listed below will operate properly and be free of defects in materials and workmanship according to the following terms:

Products	Warranty Period
Air Pear Fans	3 Years (All Parts/Components)
Designer Series Fans	3 Years (All Parts/Components)
Retail Series Fans	3 Years (All Parts/Components)
Speed Controllers	1 Year (All Parts/Components)
Photohydroionization Cell	2 Years (All Parts/Components)

These include new units or units rebuilt under Airius' factory refurbish program. Airius will repair or replace such units, at Airius' sole discretion, if there is any defect in their materials or workmanship caused by Airius during the warranty period. With respect to replacement or repair rendered, Airius warrants that the parts replaced or repaired will operate properly and be free from defects in materials and workmanship for the remainder of the original warranty period.

Definitions:

1. The "warranty period" shall begin on the shipping date from the Airius factory to the customer (end user)
2. "Operate properly" applies to mechanical, electrical and structural functions only. No guarantee is made regarding the quantity of air movement or the appropriateness or the effectiveness or merchantability of any product for its intended purpose or for the customer's particular application.

Exclusions

Any of the following actions will constitute a breach of and will void all warranties:

1. Improper delivery, installation, or maintenance, including, but not limited to:
   a. Failure to follow the required installation procedures specified in the Airius "Installation Guide" and in all other documentation supplied with the fans and related equipment, including documentation provided by the manufacturers of the individual fan and control components;
   b. Failure to follow all applicable codes and ordinances, including, but not limited to the National Electric Code and state and local building codes;
   c. Failure to follow electrical engineering industry standards regarding the approved method of installing electrical equipment having the characteristics of the fans, the fan controls, and their related components, even if such standards are not explicitly referenced in any literature supplied by Airius or provided by the manufacturers of the fan and control components.
2. Any modification or alteration of, or adjustment to the fans, fan controls, and/or any disassembly of the components of the fans and fan controls for any purpose whatsoever, including any attempt to diagnose and/or repair any problem, without prior written authorization from Airius. Such disassembly includes, but is not limited to, separation of the motor from the housing assembly and/or removal of any electrical component from the fan controller unit.
3. Installation of fans into a detrimental environment with airborne oils / cutting fluids / solvents that may attack the base resin or motor, unless:
   a. Airius has provided written authorization prior to installation.
4. Misuse, abuse, accidents, unreasonable use or Acts of God.
5. Incorrect electric current, voltage or supply.
6. Failure to use fan controls supplied by Airius, unless:
   a. Airius has provided written authorization prior to installation; and
   b. The fan controls are built, operated and maintained according to specifications provided to and approved by Airius.

 ©2016 AIRIUS, LLC ALL RIGHTS RESERVED

Airius Warranty Policy (Continued)

7. Failure to perform periodic maintenance as detailed in the Airius-supplied "Installation Guide."
8. Consequential or incidental damages sustained by any person or entity as a result of any breach of these warranties are also excluded, except where such damages may not be excluded by law.

Acquiring Warranty Service

Do not return any item without first being assigned a Return Material Authorization (RMA) tag number. Customer must obtain a RMA# from Airius (888-AIR-PEAR or info@theairpear.com) before returning the faulty unit. RMA number must appear on the return-shipping label and be associated with any correspondence. Customer is responsible for all return shipping costs to:

Airius Warranty - RMA# ____
811 South Sherman Street
Longmont, Colorado 80501

Airius will return the unit(s) freight prepaid. Airius may elect to repair the same unit at customer site or offer replacement parts to facilitate repair and reduce customer down time and expense. Airius is not responsible for misuse of their product. Freight claims are the responsibility of the customer and all products are shipped FOB Longmont, Colorado, USA.

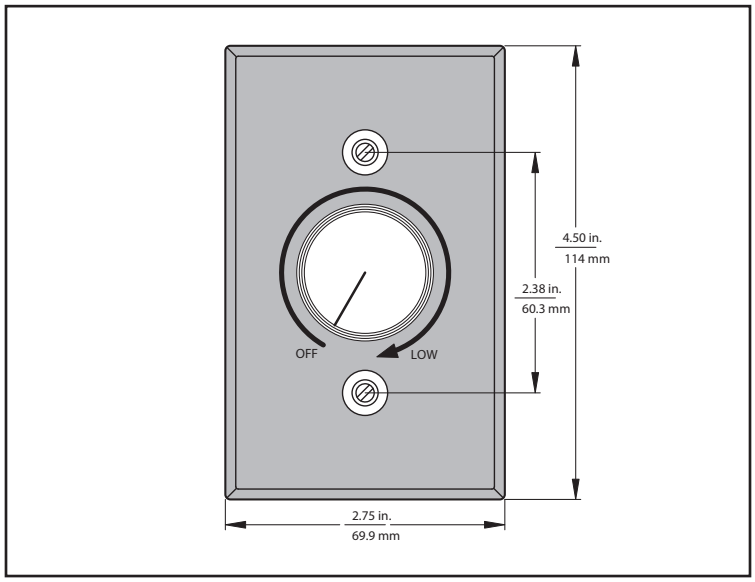
Remedy and Limit of Liability

The exclusive remedy of the purchaser, and the limit of liability for Airius, for any and all losses in connection with this product shall be repair or replacement of the warranted product or the affected components, as provided above.

Airius reserves the right to make the final determination, based on its own assessment, as to (1) whether the problem in question is the result of a defect in design, workmanship or materials, and not the result of error, misuse or abuse on the part of the customer, as set forth under the exclusions detailed above; (2) whether the problem or defect is material and requires action under this warranty; and (3) whether the remedy of repair or replacement is appropriate.

With regard to electrical and electronic components provided by Airius that comprise part of the products, including motors, Airius relies on the determination by the original manufacturer as to whether the failure of such component was the result of a defect. If the manufacturer of such component determines that there was no defect and therefore refuses to cover it under warranty, Airius likewise will not warranty such item.

THIS WARRANTY IS EXPRESSLY IN LIEU OF ALL OTHER WARRANTIES, EXPRESS OR IMPLIED, INCLUDING ANY WARRANTY, REPRESENTATION OR CONDITION OF MERCHANTABILITY OR THAT THE PRODUCTS ARE FIT FOR ANY PARTICULAR PURPOSE OR USE, AND SPECIFICALLY IN LIEU OF ALL SPECIAL, INDIRECT, INCIDENTAL, OR CONSEQUENTIAL DAMAGES. REPAIR OR REPLACEMENT SHALL BE THE SOLE REMEDY OF THE CUSTOMER AND THERE SHALL BE NO LIABILITY ON THE PART OF AIRIUS FOR ANY SPECIAL, INDIRECT, INCIDENTIAL, OR CONSEQUENTIAL DAMAGES, INCLUDING BUT NOT LIMITED, TO ANY LOSS OF BUSINESS OR PROFITS, WHETHER OR NOT FORESEEABLE.



Any and all disputes related to this warranty or any other matter related to Airius must be submitted to binding arbitration within 45 radial miles of Longmont, Colorado. The arbitrator will follow the Colorado Uniform Arbitration Act and the Rules of the American Arbitration Association. Under Colorado law, punitive damages are not recoverable by any party subject to arbitration. Moreover, jury trials are not available in arbitration. The arbitration decision or award is legally binding and enforceable. To the extent that a court rules that this paragraph is not enforceable, the parties agree to resolve any and all disputes in the Boulder District Court in Boulder, Colorado.

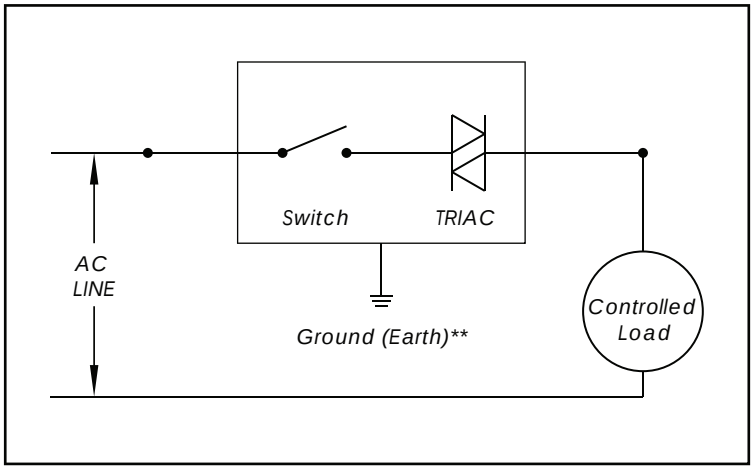
TRIAC SPEED CONTROL DESCRIPTION

Airius speed controls are used to vary the speed of shaded pole (SP) or permanent split capacitor (PSC) motors. Speed controls for EC motors: refer to the potentiometer submittal. Speed control for EL fans: refer to the FanCenter submittal.

ATTRIBUTES AND CHARACTERISTICS



- Built-in On/Off AC line switch
- RFI filter (provides RFI and EMI suppression)
- All models mount in a standard 2" x 4" electrical wall box
- Faceplate (4.5" x 2.75"), knob, screws and wire nuts included
- Simple installation by a qualified electrician
- Off - Max - Hi - Med - Low speeds (4 step)
- Can control a single fan

CODE APPROVAL

- UL listing/recognition
- CSA certified

WARRANTY

- Warranty - 1 - years parts and workmanship

Commercial Gas Water Heaters

CYCLONE® Mxi MODULATING

MODULATING BURNER ADVANCES THE CYCLONE TO HIGHER LEVELS OF EFFICIENCY

The full line of A. O. Smith Cyclone Mxi condensing water heaters has been designed to provide years of dependable service and feature industry leading technology. Models are available from 120,000 to 500,000 Btu/h and all deliver thermal efficiencies of 95% and higher. The unique helical coil heat exchanger limits weld joints for optimal service life while maximizing heat transfer.

Cyclone is the industry leader in high efficiency commercial water heating. The current Mxi modulating models adjust firing rate to the specific demand further increasing efficiency and money savings.

INTELLIGENT CONTROL SYSTEM WITH LCD DISPLAY AND iCOMM CONNECTIVITY

- Exclusive A. O. Smith designed touch display control system
- Provides detailed water heater status information
- Precise temperature control adjustable from 90 to 180 degrees
- Built-in diagnostics
- Run history information
- Cyclone® Mxi Modulating water heaters are compatible with the iCOMM™ remote monitoring system. Call 1.888.928.3702 for information.

COMING SPRING 2017

- Remote monitoring capability utilizing the iCOMM app. Wi-Fi connectivity kit requited for models 120-250, standard on models 300-500.

SUBMERGED COMBUSTION CHAMBER, WITH HELICAL HEAT EXCHANGER COIL

- Positioned in center of tank, surrounded by water to virtually eliminate radiant heat loss from chamber
- Direct spark ignition
- Spiral heat exchanger keeps hot burner gases swirling, uses centrifugal force to maximize efficiency of heat transfer to water in tank
- Spiral heat exchanger reduces lime scale from forming on water-side surfaces, which maintains energy efficiency over time

POWERED ANODES STANDARD ON ALL MODELS

- Provides long-lasting tank protection in varying water conditions
- Powered anodes are non-sacrificial
- Automatically adjusts output needed to properly protect the tank

PERMAGLAS® ULTRA COAT™ GLASS LINING

- Glass coating is applied using a liquid slush coating technique to ensure uniform coating
- Heat exchanger coil is glassed both externally and internally for optimum protection

MECHANICAL VENTING VERSATILITY

- Conventional power venting or direct venting
- Vents vertically or through a sidewall
- Front located exhaust and condensate connections allow for easy install and access
- Vents with low cost PVC Schedule 40 intake and exhaust pipe. Approved for optional CPVC Schedule 40, Polypropylene and AL29-4C stainless steel vent materials
- Direct-vent intake and exhaust pipe can terminate separately outside building or through single opening, using concentric vent assembly
- Canadian installations require ULC S636 PVC/ CPVC, ULC S636 Polypropylene and AL29-4C stainless steel pipe for intake and exhaust

HIGH EFFICIENCY MODULATING PRE-MIX POWERED BURNER

- Down-fired pre-mix burner provides optimum efficiency and quiet operation
- Top-mounted burner position prevents condensation from affecting burner operation

3-YEAR LIMITED TANK / 1-YEAR LIMITED PARTS WARRANTY

- For complete warranty information, consult written warranty or go to hotwater.com.

BTH-120(A) THROUGH BTH-500(A)

OTHER FEATURES:

SPACE-SAVING DESIGN FOR INSTALLATION FLEXIBILITY

- Easy-to-remove top cover for convenient access to serviceable parts
- 0″ installation clearances on sides and rear, 1-1/2″ installation clearance on top
- Handhole cleanout allows easy access to tank interior for cleaning
- 0″ clearance to combustibles, approved for installation on combustible floors

CODES AND STANDARDS

- CSA certified and ASME rated T&P relief valve
- Maximum hydrostatic working pressure: 160 psi
- All models are design certified by Underwriters Laboratories (UL), Inc., to ANSI Z21.10.3 - CSA 4.3 Standards
- Meets the thermal efficiency and standby loss requirements of the U.S. Department of Energy and current edition ASHRAE/IES 90.1
- Design Certified by Underwriters Laboratories to NSF standard 5 for 180°F (62°C) water
- Complies with SCAQMD Rule 1146.2 and other Air Quality Management Districts with similar requirements for ultra low-NOx emissions
- ASME tank construction optional on 120-500 model sizes

COMMON VENTING KITS FOR UP TO 3 WATER HEATERS (ONE KIT PER WATER HEATER REQUIRED)

Kit	Description
100227396	PVC Common Vent Kit, 120 – 250 Models
100223775	PVC Common Vent Kit, 300 – 500 Models
100227395	Polypropylene Common Vent Kit, 120 -250 Models
100223774	Polypropylene Common Vent Kit, 300 - 500 Models

Installations must comply with all national, state and local codes.
See kit instructions and corresponding water heater manual for detailed installation instructions and additional information.
50 Feet maximum equivalent length of straight pipe common vent and elbows
NOTE: Order 1 kit for each water heater.
See the Common Vent Kit manual or spec sheet for detailed information.

SPECIFICATION

(Natural or Propane) gas water heater(s) shall be A. O. Smith Cyclone Mxi model # _____ or equal, minimum 95% thermal efficiency, a storage capacity of _____ gallons, an input rating of _____ BTUs per hour, a recovery rating of _____ gallons per hour (gph) at 100°F rise and a maximum hydrostatic working pressure of 160 psi. Water heater(s) shall: 1. Modulating gas burner that automatically adjusts the input based on demand. 2. Powered anodes that are non sacrificial and maintenance free. 3. Have seamless glass-lined steel tank construction, with glass lining applied to all water-side surfaces after the tank has been assembled and welded; 4. Meets the thermal efficiency and/or standby loss requirements of the U. S. Department of Energy and current edition of ASHRAE/IES 90.1; 5. Have foam insulation and a CSA Certified and ASME rated T&P relief valve; 6. Have a down-fired power burner designed for precise mixing of air and gas for optimum efficiency, requiring no special calibration on start-up; 7. Be approved for 0˝ clearance to combustibles.

The control shall be an integrated solid-state temperature and ignition control device with integral diagnostics, graphic user interface, fault history display, and shall have digital temperature readout. 1. All models are design certified by Underwriters Laboratories (UL), Inc., according to ANSI Z21.10.3 - CSA 4.3 standards governing storage type water heaters; 2. Meet the thermal efficiency and standby loss requirements of the U. S. Department of Energy and current edition ASHRAE/IES 90.1. Complies with SCAQMD Rule 1146.2 and other air quality management districts with similar requirements for low NOx emissions.

120K-250K BTU Input: For Standard Power Venting: Water heater(s) shall be suitable for power venting using a (3˝ or 4˝) _____ diameter PVC pipe for a total distance of (50 ft or 120 ft.) _____ equivalent feet of vent piping. For Power Direct Venting: Water heater(s) shall be suitable for power direct venting using a (3˝ or 4˝) _____ diameter PVC pipe for a total distance of (50 ft or 120 ft.) _____ equivalent feet of vent piping and (50 ft. or 120 ft.)_____ equivalent feet of intake air piping.

300K - 500K BTU Input: For Standard Power Venting: Water heater(s) shall be suitable for standard power venting using a (4˝ or 6˝)_____ diameter PVC pipe for a total distance of (70 ft. or 120 ft.)_____ equivalent feet of vent piping. For Power Direct Venting: Water heater(s) shall be suitable for power direct venting using a (4˝ or 6˝) _____ diameter PVC pipe for a total distance of (70 ft or 120 ft.) _____ equivalent feet of vent piping and (70 ft. or 120 ft.)_____ equivalent feet of intake air piping.

Operation of the water heater(s) in a closed system where thermal expansion has not been compensated for (with a properly sized thermal expansion tank) will void the warranty.

Water heater should incorporate the iCOMM™ system for remote monitoring, leak detection and fault alert.

RTU Solution

Dynamic Energy Management System for Roof Top Units

I-CON 3300

Forced-Air System Fuel Economizer

I-CON 2400

Commercial Air Conditioning Electricity Consumption Economizer

Features

- Dynamic Cycle Management (DCM) technology is guaranteed to reduce fuel and electricity consumption - typically 10% - 20% or more.
- Saves energy without replacing or upgrading costly system components and without violating manufacturers' warranties.
- Illuminated LCD display shows consumption savings, operating modes, system diagnostics and operating temperatures.
- Compatible on systems with undersized ducting.
- Compatible with packaged or split systems.
- Energy saving system is field tested and validated.
- Works with any thermostat including setback and multi-zone.
- Reduces maintenance and extends service.
- Simple installation by a qualified installer.
- Saves energy without sacrificing comfort.
- Maximum efficiency year round.
- 15 year limited manufacturer's warranty for breakdown or defects.

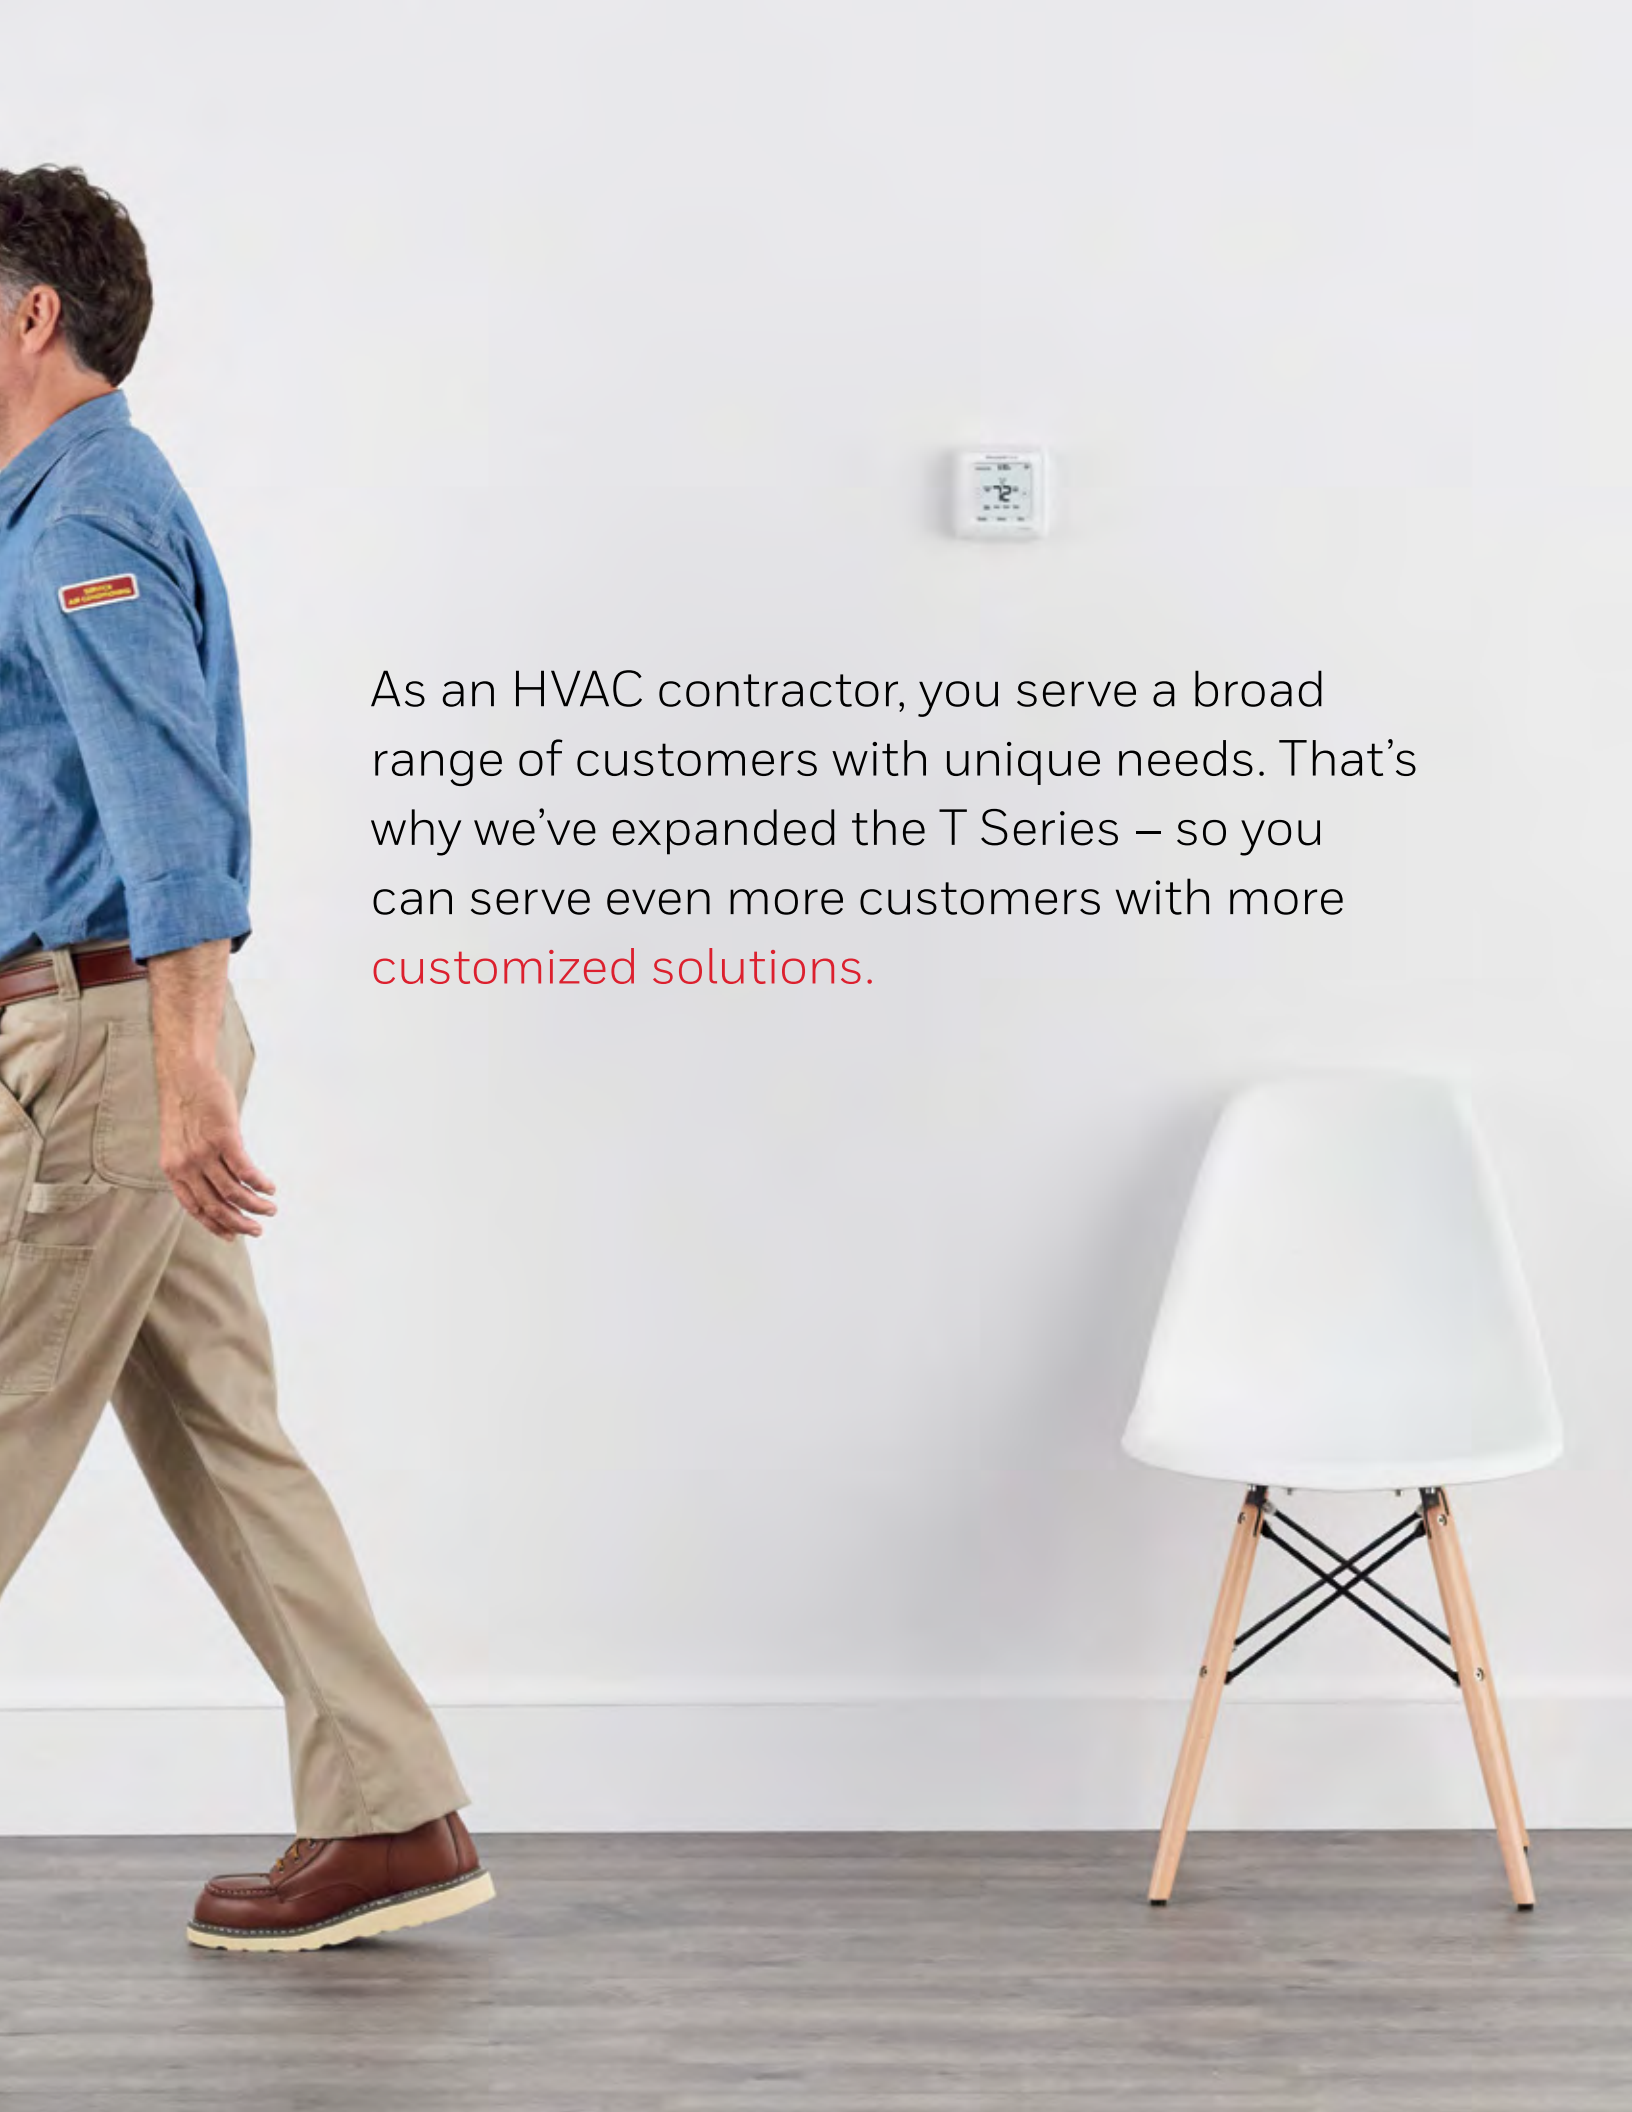
Honeywell Home

Thoughtfully designed. Expertly engineered.

THE HONEYWELL HOME T SERIES

Fits your business to a T.

BRILLIANT



Meet the next generation of everyday comfort solutions.

T10 Pro Smart Thermostat with RedLINK™ Room Sensor

Get to know Honeywell Home T Series.

The T Series is a portfolio of non-connected and Wi-Fi connected thermostats that streamlines everything from product selection and installation to customer service and support. With a standard mount and simple interface, the T Series will enhance the entire thermostat experience for you and your customers alike.

As an HVAC contractor, you serve a broad range of customers with unique needs. That's why we've expanded the T Series – so you can serve even more customers with more customized solutions.

UWP mounting system

A thermostat series designed with

CONTRACTORS IN MIND

Intuitive setup

Fits your technicians to a T

Every T Series thermostat features on-screen menus with familiar installer setup (ISU) steps, helping to eliminate the learning curve that can come with a new product. Your techs will be T Series experts in no time.

Faster installs

Fits your install process to a T

With the UWP mounting system, you can standardize your training program, install process, and truck stock – helping your techs get in and out and on their way more quickly and efficiently.

Easy upsell

Fits your revenue model to a T

The T Series has a snap-together design that enables you to easily move customers from a non-connected to a connected thermostat without having to rip and replace the connector and cover plate.*

DELIVER CONNECTIVITY

without the complexity

Consumers want a connected experience that streamlines and simplifies home comfort. The T10 Pro Smart Thermostat with RedLINK™ Room Sensor and T6 Pro Smart Thermostat will fit their needs to a T. They're easy to use, easy to love, and best of all, easy for your techs to install and set up.

T10 Pro Smart Thermostat with RedLINK™ Room Sensor

T6 Pro Smart Thermostat

Smart Features

Flexible comfort control

The T10 Pro Smart with RedLINK™ Room Sensor allows homeowners to prioritize comfort in the rooms that matter most, using time-based scheduling, motion detection or geofencing. The T6 Pro Smart allows homeowners to customize comfort using geofencing or scheduling.

Seamless smart home integration

The T10 Pro Smart and T6 Pro Smart seamlessly integrate with smart home partners like Google Assistant and Amazon Alexa for customers who want to control all their smart home devices with voice commands or a single app.

Simple Functionality

Familiar installer setup

Technicians can configure the T10 Pro Smart and T6 Pro Smart and connect to Wi-Fi right on the device – making installation quick and easy.

Intuitive operation

Homeowners can choose to do scheduling on the thermostat, or they can use the highly rated Honeywell Home app.

Optional IAQ control

With the T10 Pro Smart, you can control one humidification, dehumidification or ventilation solution, and with the T6 Pro Smart, you can choose optional ventilation control and dual fuel.

AM CONSERVATION GROUP, INC.

DUAL SPRAY SWIVEL AERATOR

Product Highlights

Our Dual Spray Swivel Aerator allows for directing the water flow where it's needed most providing greater efficiencies. It offers two stream options: a full force multiple stream and a splash-free bubble stream and a contains a 360° swivel helping to reduce water use and boosts water pressure.

Product Details

- Dual threaded
- Fits most male and female threaded faucets
- Available in bulk, individually packaged or in contractor ten packs

Item Code	Flow Rate	Finish	Dual Stream		Dual Thread		Case Qty	Certifications	
			Compact	Extended	Male	Female		ASME A112.18.1/CSA B125.1	Low Lead
FA035-C-1.5	1.5 gpm	Chrome	Aerated	Multi-spray	15/16" -27	55/64" -27	250	Yes	Yes
FA035-C-2.0	2.0 gpm	Chrome	Aerated	Multi-spray	15/16" -27	55/64" -27	250	Yes	Yes

Certification and Performance Requirements

- Low lead compliant (AB-1953)
- ANSI specification A112.18.1, CSA, CEC, DOE
- Meets Performance Requirements for:
  California Energy Commission
  Department of Environmental Conservation
  Canadian Standards Association,
  Federal, State and Local plumbing standards

water efficiency

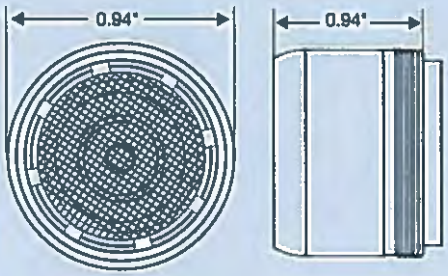
Pressure Compensating Bubble Spray Faucet Aerator

Our Niagara Conservation branded Pressure Compensated Bubble Spray Aerators are an innovative water-saving solution designed to accommodate both male and female applications. These faucet aerators save water and energy by producing forceful streams at a reduced flow rate that minimizes the amount of energy needed to heat hot water.

Features

- All brass chrome plated dual threaded body
- Fits most male and female threaded faucets, Male: 15/16-27, Female: 55/64-27
- Pressure compensating technology guarantees a consistent flow rate across a wide range of pressure
- Bubble Spray
- 10 year warranty**



Certification and Performance Requirements

- ASME A112.18.1 / CSA B125.1; ANSI/NSF 61

Certified by CSA Group

Model #	Spray	Finish	Flow Rate	Watersense	Case Qty
N3210B-PC	Aerated Bubble	Chrome	1.0 GPM	Yes	500
N3104-PC	Aerated Bubble	Chrome	1.5 GPM	Yes	500

Dimensions

*Dimensions are subject to change

Potential Annual Savings[1]

	Flow Rate	Water	Electric Heating	Gas Heating
Dollar Savings	1.0 GPM	$104	$67	$37
Utility Savings	1.0 GPM	10,512 Gallons	594 kWh	33 Therms
Dollar Savings	1.5 GPM	$51	$39	$21
Utility Savings	1.5 GPM	6,132 Gallons	347 kWh	19 Therms

Factors in calculating savings potential

- 3 person households each person using a faucet 8 minutes per day 365 days per year (AWWARF Residential Study)
- Comparing water use with these aerator vs. a standard 2.2 GPM unit
- US city average water and sewer cost of $8.3 per 1,000 gallons (study done by AUS Consulting Group 2011)
- Average cost of electricity 0.113c per kWh (Energy Star Nov 2013 Lightbulb Calculator — http://www.energystar.gov/ia/products/prod_lists/lamps_savings)
- Average cost of gas $1.137 per therm (Bureau of Labor Statistics April 2014)
- Calculations done by http://www.fishnick.com/savewater/tools/watercalculator

**WARRANTY DETAILS

AM Conservation Group, Inc. guarantees to the original purchaser or recipient of an aerator that it is free from defects in material and workmanship for a period of 10 years. AM Conservation Group, Inc. will at our choice replace any part of the aerator which is in our opinion defective provided that the product has not been abused, misused, altered, or damaged after its purchase. This includes damage due to the use of tools or harsh chemicals. In the event a product has been discontinued, AM Conservation Group, Inc. will replace it with what we determine to be the closest product. AM Conservation Group, Inc. is not responsible for labor charges, installation, or other consequential cost. AM Conservation Group, Inc.'s responsibility shall not exceed the original cost of the product.

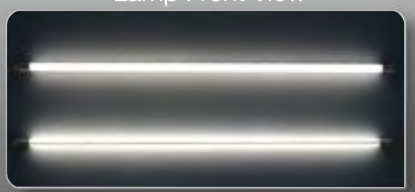
TUBE FEATURES

Ultra-high Efficacy



At 162 LPW, GREEN CREATIVE's ultra-high efficacy T8 BYP tube is 24% more efficient than the Tier 1 LED T8 industry average . This energy-saving, high-performance T8 is a smart retrofit choice that provides a faster ROI than traditional T8 LED tubes.

Extra Wide Beam Design - Frosted Glass Body

This lamp uses an innovative coated glass design that diffuses heat and light more evenly than plastic. As a result of its compact light engine, this lamp produces a light emitting area of 310°. This wider beam angle improves a fixture's total light distribution and creates a more complete lighting effect.

Lamp Back View

T8 10.5W 4FT. BYP TITANIUM LED SERIES

GREENCREATIVE

BYPASS INSTALLATION

- Bypass ballast by cutting all wires as in Fig. A
- Directly wire Live + Neutral on a single end as in Fig. B for single tube or as in Fig. C for multiple tubes
- Replace shunted lamp holder with non-shunted one if applicable (Instant Start)
- Existing fixture maintains original UL compliance thanks to UL1598C tube

Specification Sheet: G5 SEP Plastic T8 LED Tube Lamp

Retrofitting Is Easy with Our Energy Efficient Led Tubes

Revolution Lighting's high-performance G5 SEP T8 LED Tube Lamp can reduce your lighting energy use by as much as 65% compared to conventional fluorescent tubes while providing superior light output.

These high-efficacy, UL Type-B single-end-powered tube lamps install easily and are backed with our 55,000-hour rated lamp life and 10-year warranty.

See order logic table below for our TAA and BAA compliant products. Contact your Revolution Lighting representative for pricing and more information.

APPLICATIONS

- Offices & Commercial Buildings
- Big-Box Retail Outlets
- Hotels
- Schools
- Hospitals
- Warehouses
- Assisted Living Facilities
- Recreation Centers
- Military & Government Facilities

ILLUMINATION ANGLE

Revolution Lighting Light Distribution

CAN DECREASE ENERGY USAGE BY

vs. Similar Fluorescent Lamps

WARRANTY

Our Industry-Leading 10-Year Limited Warranty Guarantees Unsurpassed Quality

PRODUCT BENEFITS

OPERATIONAL

- 3X greater lamp life than fluorescent, supported by industry-leading 10-year warranty
- 55,000 hour lamp life and eliminated ballast reduce long-term maintenance costs
- Instant on, no warm-up time
- No buzzing

SAFETY

- Single-end-power installation
- Glass-free lightweight, seamless plastic tube
- Complies with UL 1598C and UL 1993
- Suitable for use in dry and damp locations

SUSTAINABILITY

- Lack of UV minimizes concerns with fading or discoloration
- Mercury-free, allowing for non-hazardous disposal
- 100% recyclable

Specification Sheet: T8 SEPLV LED External-Driver Tubes

Retrofitting Is Easy with Our Energy Efficient LED Tubes

Our T8 SEPLV External-Driver Tube Lamps offer a simple, dimmable, energy-efficient solution for outdated fluorescent lighting. Each LED lamp kit comes with a matched driver customized for 1-, 2-, or 3-tube luminaires. Just swap out your fluorescent ballast and tubes with our LED driver and tubes, and start saving energy and money. These lightweight, shatterproof LED tube lamps can decrease your energy usage by as much as 60% and feature advanced "Nano" polycarbonate lenses for uniform light distribution.

The low-voltage, single-end-power (SEPLV) lamp design allows for easy installation, and the 0-10V dimmable external driver operates from 120VAC to 277VAC. With an industry-leading rated lifetime of 50,000 hours, our T8 SEPLV External-Driver Tube Lamps are also backed by a 10-year warranty.

APPLICATIONS

- Offices & Commercial Buildings
- Retail Settings
- Hotels
- Schools
- Hospitals
- Warehouses
- Assisted Living Facilities
- Parking Garages
- Recreation Centers
- Food Processing Centers

WARRANTY

10 YEAR WARRANTY

Our Industry-Leading 10-Year Limited Warranty Guarantees Unsurpassed Quality

PRODUCT BENEFITS

OPERATIONAL

- Very high efficacies up to 140 lm/W
- 0-10V dimming
- 3X greater lamp life than fluorescent, supported by industry-leading 10-year warranty
- 50,000 hour lamp life and eliminated ballast reduce long-term maintenance costs
- Instant on, no warm-up time

SAFETY

- No glass
- Negligible light depreciation over time
- Superior light output
- Includes External Driver to power LED tube
- These UL Type C tube lamps are tested to comply with UL 1598C

SUSTAINABILITY

- Lack of UV or IR minimizes concerns with fading or discoloration
- Mercury-free, allowing for non-hazardous disposal
- 100% recyclable

Specification Sheet: SEP Plastic T5 LED Tube Lamp

The Energy Efficient LED Solution

Revolution Lighting's high-performance SEP Plastic T5 LED Tube Lamps can reduce your lighting energy use by as much as 55% compared to conventional fluorescent tubes while providing superior light output.

These high-efficacy UL Type-B SEP tube lamps install easily and are backed with our 70,000-hour rated lamp life and 7-year warranty.

APPLICATIONS

- Offices & Commercial Buildings
- Hotels
- Schools
- Hospitals
- Warehouses
- Assisted Living Facilities
- Recreation Centers

BEAM ANGLE

120°

Revolution Lighting Light Distribution

CAN DECREASE ENERGY USAGE BY

55%

vs. Similar Fluorescent Lamps

WARRANTY

7 YEAR WARRANTY

Our Industry-Leading 7-Year Limited Warranty Guarantees Unsurpassed Quality

PRODUCT BENEFITS

OPERATIONAL

- 3X greater lamp life than fluorescent
- 70,000-hour lamp life reduces long-term maintenance costs
- Instant on, no warm-up time
- Lightweight, seamless plastic tube

SAFETY

- No glass
- Negligible light depreciation over time
- Superior light output
- Complies with UL 1598C
- Suitable for use in IC- and non-IC-rated fixtures
- Suitable for use in dry and damp locations
- NSF-Listed for Splash and Non-Food Zones

SUSTAINABILITY

- Lack of UV minimizes concerns with fading or discoloration
- Mercury-free, allowing for non-hazardous disposal
- 100% recyclable

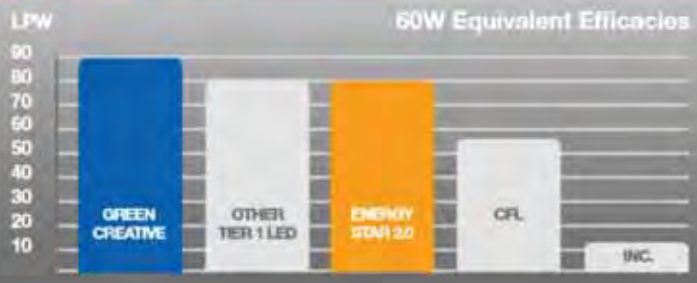
A19 PRODUCT FEATURES



Suitable for Enclosed Fixtures

This A19 is suitable for use in totally enclosed fixtures and capable of operating in a broad range of applications. Whether it is installed in fully enclosed flushmounts or sconces, this lamp's advanced thermal design ensures optimal performance over the course of its lifetime.

ENCLOSED

Exceptional Efficacy

At 89 LPW, this lamp's efficacy is higher than the Tier 1 LED A19 60W replacement industry average and exceeds new ENERGY STAR 2.0 requirements. This energy-saving performance makes this lamp a smart retrofit choice for incandescent and CFL bulbs.

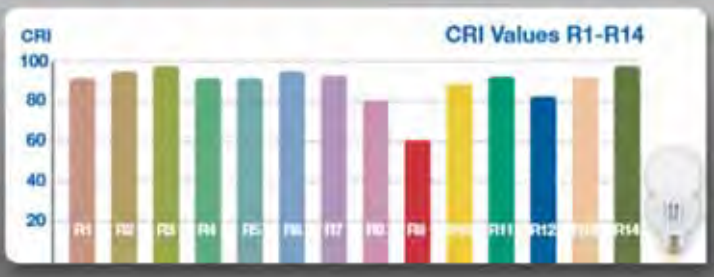
A21 PRODUCT FEATURES



Omnidirectional Lighting

This A21 meets the new ENERGY STAR® V1.1 requirements for omnidirectional bulbs by providing 330° of evenly distributed light intensity. In the 135° to 180° zone, this lamp emits 65% more lumens than what is required by ENERGY STAR, providing a fuller light than other LED A-lamps.

CRI & CA Quality Specification

The CRI^{SP} SERIES A21 18.5W lamp features a typical CRI 90, R9 60 and R13 90, providing crisp and vibrant colors across the whole spectrum. Its exceptional R9-R14 values (R9 & R13) provide redder reds, natural looking skin tones and whiter whites.

This lamp meets the California Quality Specification which requires a CRI of 90+ and demands color temperatures fall within a 4-step Macadam ellipse to ensure minimal color deviation across lamps.

R20 7.5W DIM.

FEATURES

- ENERGY STAR certified
- 45W incandescent replacement
- Energy efficient
- Environmentally friendly
- Providing a comfortable diffused level of light
- Smooth dimming with existing installations
- Suitable for use in totally enclosed fixtures
- Suitable for use in damp locations
- Operating temperature: -4°F / -20°C to +95°F / +35°C
- Rated Lifetime (L70): 25,000hrs
- 3 years limited warranty
- Shatterproof

Dimensions

Features

- OMNIDIRECTIONAL - HID lamp replacement from 70W up to 150W
- UNIVERSAL voltage and compact design allows for installation across many applications.
- INSTALLATION ORIENTATION - Lamps can be installed base up, down, or horizontal
- DAMP RATED - Suitable for use outdoors
- BALLAST BYPASS- Reduces maintenance costs
- ENCLOSED FIXTURE RATED - May be used in enclosed and open fixtures

Specification Sheet: Eco Linear High Bays

Increase Visibility with Brighter, More Efficient Lighting

Better lighting can reduce eye-fatigue, improve visibility, and transform the appeal of a space, from warehouses to big-box stores. Our new Eco Linear High Bay fixtures provide bright, tailored illumination featuring three lens options for your specific needs: DLA, for lighting along narrow warehouse aisles; DLM, for wider aisle-illumination needs; and GPL, for broad, symmetrical illumination and low glare. Other options include: 347VAC/480VAC operation, battery backup, occupancy/daylight sensor, protective wire guards, and a surface-mounting junction box.

Designed for easy mounting (V-hook, cable, or surface mount), these strong, lightweight, fully-assembled fixtures replace existing fluorescent or MH high-bays and provide superior uniformity for high visibility. The efficiency of Eco Linear High Bays reduces energy consumption by 50% over existing fluorescent fixtures, increasing the return on your lighting investment. Moreover, these LED high bays are DLC-Premium listed, qualifying them for premium rebates. And with 0-10V dimming, our Linear High Bays can reduce energy costs even further. With a 50,000-hour rated life and 7-year warranty, our Eco Linear High Bays significantly reduce your long-term operational and maintenance costs.

APPLICATIONS

- Warehouses
- Recreation Centers
- Gymnasiums
- Big-Box Stores
- Indoor Stadiums

WARRANTY

7 YEAR WARRANTY

Our Industry-Leading 7-Year Limited Warranty Guarantees Unsurpassed Quality

64W Eco Linear High Bay

128W Eco Linear High Bay

258W Eco Linear High Bay

100W with Battery Backup

PRODUCT BENEFITS

OPERATIONAL

- 3X greater lamp life than fluorescent
- 50,000-hour lamp life reduces long-term maintenance costs
- Instant on, no warm-up time
- 0-10V dimming
- Available with three lens options, battery backup and high-voltage models

SAFETY

- No glass
- Negligible light depreciation over time
- Superior light output
- Carries a UL rating of Suitable for Damp Locations

SUSTAINABILITY

- Lack of UV or IR minimizes concerns with fading or discoloration
- Mercury-free, allowing for non-hazardous disposal
- 100% recyclable

Product is DLC-listed, Premium.

† *All listed specs are for the DLM (Discrete Lens Medium) lens option. Specs will vary slightly, depending on which lens option is ordered. For battery-backup specs (Fulham FireHorse Hotspot FHSBATT8-D4), contact your Revolution Lighting representative.*

* *Note 1: The Catalog No., SKU No., and Beam Angles all depend on which lens option is ordered: Discrete Lens Aisle, General Prismatic Lens, or Discrete Lens Medium. Use the following chart to determine what values to use in the above table when ordering:*

Spec	Discrete Lens Aisle	General Prismatic Lens	Discrete Lens Medium
Catalog No.	XXX = DLA	XXX = GPL	XXX = DLM
SKU No.	X = 0	X = 1	X = 2
Beam Angles	XX° x XX° = 90° x 30°	XX° x XX° = 95° x 95°	XX° x XX° = 90° x 85°

* *Note 2: When ordering with battery backup, please add '-BB' after the Order No. and the SKU. (See Order Logic examples above.)*

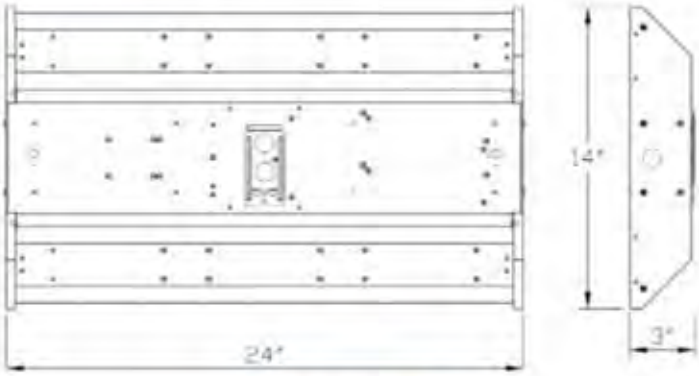
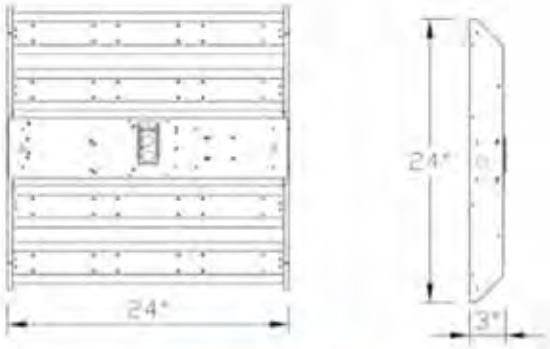
OPTIONAL ACCESSORIES

Wire Guard Kits
(SKUs 128010-W01, 1' x 2'; 128010-W02, 2'x 2'; 128010-W03, 2' x 4')

IP65-Rated Microwave Motion/Daylight Sensor
(SKU 121000-C01)*



Surface-Mounting Junction Box
(SKU 128010-J00)



** Caution: Motion/Daylight Sensor operates only with standard 120-277VAC models. Do not use this sensor accessory with high-voltage high bays.*

Note: Order these accessories separately with the SKUs provided. Three wire guard kits are available, one for each of the three fixture sizes; the Motion/Daylight Sensor is designed to mount directly to a conduit knockout; and the Surface-Mounting Junction Box permits surface mounting of the fixture.

THE POWER TO OUTPERFORM

Specification Sheet: SpunBay High Bay

Increase Productivity with Better Quality and More Efficient Lighting

Better lighting can reduce eye-fatigue, improve working conditions, and transform the appeal of a space, from industrial facilities to warehouses to parking garages. Our SpunBay fixtures bring increased energy efficiency to the workspace, increasing the return on your lighting investment.

Specifically designed with a light diffusing prismatic acrylic drop lens to provide superior uniformity and low glare illumination for high visibility, our SpunBay is 65% more efficient than traditional lighting sources, combined with a 100,000 hour rated life and 10-year warranty to significantly reduce your long-term operational and maintenance costs.

APPLICATIONS

- Factory Floors
- Food Processing Facilities
- Warehouses
- Mechanical Facilities
- Industrial Facilities
- Workshops
- Supermarkets
- Gymnasiums
- Recreation Centers

BEAM ANGLE

180°

Revolution Lighting Light Distribution

CAN DECREASE ENERGY USAGE BY

WARRANTY

10 YEAR WARRANTY

Our Industry-Leading 10-Year Limited Warranty Guarantees Unsurpassed Quality

PRODUCT BENEFITS

OPERATIONAL

- 3X greater lamp life than fluorescent, supported by industry-leading 10-year warranty
- 100,000 hour lamp life reduces long-term maintenance costs
- Instant on, no warm-up time
- Standard 0-10V Dimming Driver
- Low LED Junction Temperatures - Longer LED Life
- Light Diffusing Prismatic Acrylic Drop Lens

SAFETY

- No glass
- Negligible light depreciation over time
- Superior light output

SUSTAINABILITY

- Lack of UV or IR minimizes concerns with fading or discoloration
- Mercury-free, allowing for non-hazardous disposal
- 100% recyclable

LED BARKITJ RETROFIT FOR LINEAR FLUORESCENT LUMINAIRES

PRO
BASE

the ultimate LED retrofit kit

RemPhos' LEDBARKIT universal retrofit kit for linear fluorescent luminaires is the perfect retrofit solution. Delivers better long-term reliability, longer life (10yr warranty), controllability (standard 0-10V dimmable driver) and faster paybacks (since Utility incentives are typically higher), when compared to LED tubes. Designed to easily fit into existing T5/T8/T12 linear fluorescent fixtures. Fast, "one-man" installation.

SIMPLE INSTALLATION

Retrofits existing fluorescent fixtures quickly with unique magnetic design and quick connector technology. Designed from an installer's point of view, convert existing fixtures fast with magnets on the back of the light bars that allow hands-free placement (self-tapping screws are provided for for secure install). Electrical quick connects for simple, error-free power connections. For videos showing the simple installation go to www.remphos.com/videos

FITS BETWEEN THE SOCKETS

No need to remove existing T5/T8/T12 sockets. The LEDBAR is sized to fit in between the existing sockets, further reducing install time.

PERFORMANCE-OPTIMIZED TECHNOLOGY

Provides high-efficacy light up to 130 lumens per watt along with a remarkable 10-year system warranty.

MAXIMUM VERSATILITY

Offered in 2ft, 3ft and 4ft lengths along with multiple lamp/driver combinations (1L,2L,3L,4L) providing a fit for any application.

MANY LIGHT OUTPUT CHOICES

Systems available in 10W (1300LM) all the way to 80W (10,400LM). See ordering guide for available systems.

STANDARD 10V DIMMABLE DRIVER

CODE-COMPLIANT APPLICABILITY

Meets typical foot candle requirements for office and commercial space.

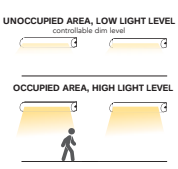
HIGH QUALITY CONSTRUCTION & MATERIALS

Top tier LED diodes. Heatsink made from extruded 6063 T5 aluminum with substantial surface area for maximum cooling.

SUITABLE FOR DRY & DAMP LOCATIONS

UL 1598C CLASSIFIED RETROFIT KIT LISTED & DLC QPL LISTED

10 YEAR WARRANTY, L70 >100,000HRS



OPTIONAL "BAA" BUY AMERICA ACT

Compliant models available, assembled in our state-of-the-art Middleton, MA assembly center. (BAA SECTION 1605 COMPLIANT)

CUSTOM BRACKET DESIGNS AVAILABLE

Contact our engineering team to help design a low-cost bracket for easy mounting in direct/indirect fixture. Helps to provide up and down light with 1, 2, 3, 4 or more LED bars.

OPTIONAL HIGH/LOW MOTION SENSOR

Contact our engineering team to help choose the best low-cost integrated motion sensor which will easily install into the existing fixture, behind the lens. Our motion sensor technology can read through glass and plastic lenses. Also compatible with ZigBee wireless networks.

LED BARKITJ RETROFIT FOR LINEAR FLUORESCENT LUMINAIRES

PRO
BASE

HOW TO EASILY ADD OCCUPANCY SENSING AND DAYLIGHT CONTROL TO YOUR FIXTURE

Choose one of the control options below which best fits your needs. Any of these options can be easily installed under the existing glass or plastic fixture lens. These controls will allow the LED Barkit to adjust it's light level depending on cccupancy or daylight levels, acheiving greater energy savings.

	PART #	DETAILS
	**HC419V**	Integrated antenna. Can be mounted behind glass or plastic lens. Adjusts for occupancy and daylight. DIP switch to adjust settings.
	**HC403VRC-KD SAM5**	Remote mounted antenna can be screwed to outside of ballast cover. Can be mounted behind glass or plastic lens. Adjusts for occupancy and daylight. Optional remote control to adjust settings.
	**LG SENSOR CONNECT**	LG's intelligent wireless lighting control system. ZigBee technology. Allows for occupancy sensing, daylight harvesting, grouping, scheduling, high-end trim and more. Adjust settings via Android app.

More details and videos are available at www.remphos.com/controls.

ORDERING DIRECTIONS (SEE ORDERING GUIDE ON NEXT PAGE)

A) Choose your desired total system wattage and lumen output.
B) Choose your desired LEDBAR length (2, 3 or 4FT) and QTY of LEDBAR(s) per driver from column C.
D) Order system part # (a system will include 1pc LED driver + LEDBAR(s). Substitute "XX" in the 8XX for your desired CCT. 35 (3500K), 40 (4000K) and 50 (5000K) are standard color temps. 27 (2700K), 30 (3000K), 65 (6500K) are custom colors and are special order.
E) The wattage of each LEDBAR in the system.
F) The lumen output of each LEDBAR in the system.
G) DLC QLP listed system Part #.
H) DLC QPL Product Code.

If the system you want is not currently a DLC listed part #, please contact us for a letter to send to your Utility for custom incentive approval.

CAUTION! MAX WATTAGES PER LEDBAR
2FT: 12W 3FT: 12W 4FT: 22W

If you require BAA SECTION 1605 COMPLIANT add -BAA at end of part number.

STANDARD COLOR TEMPS AVAILABLE

3500K, 4000K, 5000K

SPECIAL ORDER COLOR TEMPS AVAILABLE

2700K, 3000K, 6500K, RED, GREEN, BLUE, AMBER

ORDERING EXAMPLE

A 20W/2600LM system is desired utilizing 2pcs of 2FT LEDBAR in 4000K running off 1pc of driver. For this system you would order:

SYSTEM: **RPT-P-LEDBARKITJ-20W-2FT-2L-840-A** (All kits include driver)
TOTAL SYSTEM WATTAGE: **20W**
TOTAL SYSTEM LUMEN OUTPUT: **2600LM**
LENGTH OF LED BAR: **2FT** (actual 21.65in)
OF LED BARS: **2pcs**
WATTAGE PER LED BAR: **10W**
LUMENS PER LED BAR: **1300LM**
DLC LISTED KIT PART #: **RPT-LEDBARKIT-24IN-840-2L**
DLC QPL PRODUCT CODE: **PG2CRZ1T**

LITHONIA LIGHTING®

Catalog Number	
Notes	
Type	

FEATURES & SPECIFICATIONS

INTENDED USE — The CLX is a linear lighting solution that is available in multiple lengths, lumen packages and distributions. Designed for versatility, the CLX can address virtually any indoor lighting need. The CLX is also offered in standard and high efficacy configurations and capable of being continuous row mounted or installed as a stand-alone fixture. Ideal for uplight and downlight in commercial, retail, manufacturing, warehouse, and display applications. **Certain airborne contaminants can diminish the integrity of acrylic and/or polycarbonate.** Click here for Acrylic-Polycarbonate Compatibility table for suitable uses.

CONSTRUCTION — Channel and cover are formed from code-gauge cold-rolled steel. Housing and lens endcaps are injection molded plastic to provide a more architectural look and feel. The endcaps come standard with a 7/8" knock out for continuous mounting but can be ordered without.

Finish: Paint options include high-gloss, baked white polyester (WH), galvanized (GALV), matte black (MB) and smoke gray (SKGY). Five-stage iron phosphate pre-treatment ensures superior paint adhesion and rust resistance.

OPTICS — Offered with acrylic lens and less lens configurations. Provides a choice of optical distributions including, wide, narrow, and aisle.

ELECTRICAL — Utilizes high-output LEDs integrated on a two-layer circuit board, ensuring cool-running operation. Optional internal pluggable wiring harness for reduced labor cost in row mounting applications. (See PLR_ ordering information on page 15.) Electronic LED driver is multi-volt input and 0-10V dimming standard (see Operational Data on page 12 for actual wattage consumption). This fixture is designed to withstand a maximum line surge of 2.5kV at 0.75kA combination wave for indoor locations, for applications requiring higher level of protection additional surge protection must be provided.

L70>100,000 hours at 25˚C.

LEDs provide nominal 80 CRI or 90CRI at 3000 K, 3500 K,4000 K, or 5000 K.

Lumen output up to 2,500 lumens per foot.

INSTALLATION — Fixture may be ceiling or wall mounted (with or without THCLX hanger or angle mounted with CLXANGBRT), pendant or stem mounted with appropriate mounting options.

WARNING — Removing the lens and opening the fixture during installation exposes the LEDs, putting them at risk for damage.

If you plan to surface mount the fixture, we recommend using the THCLX. This eliminates the need to open the fixture.

If you plan to continuous row mount, we recommend using the PLR wiring harness option. This eliminates the need to open the fixture.

Damage to the LEDs caused during installation will not be covered under the warranty.

LISTINGS — CSA certified to US and Canadian safety standards. For use in damp locations between -4°F (-20°C) and 104°F (40°C). Optional High Ambient (HA) ranging to 122°F(50°C) available on certain lumen packages (See ambient temperature chart for additional information).
DesignLights Consortium® (DLC) Premium qualified product and DLC qualified product. Not all versions of this product may be DLC Premium qualified or DLC qualified. Please check the DLC Qualified Products List at www.designlights.org/QPL to confirm which versions are qualified.

WARRANTY — 5-year limited warranty. Complete warranty terms located at:
www.acuitybrands.com/resources/terms-and-conditions

Note: Actual performance may differ as a result of end-user environment and application.
All values are design or typical values, measured under laboratory conditions at 25 °C.
Specifications subject to change without notice.

Stock configurations are offered for shorter lead times:

A+ Capable Luminaire

This item is an A+ capable luminaire, which has been designed and tested to provide consistent color appearance and out-of-the-box control compatibility with simple commissioning.

- All configurations of this luminaire meet the Acuity Brands' specification for chromatic consistency
- This luminaire is part of an A+ Certified solution for nLight® or XPoint™ Wireless control networks marked by a shaded background*

To learn more about A+, visit www.acuitybrands.com/aplus.

Options

PS1050	Emergency battery pack, 10W, CA Title 20 Noncompliant [2,11,13,16,17]
E10WLCP	Emergency battery pack, 10W Linear Constant Power, Certified in CA Title 20 MAEDBS [2,11,13,16,17]
BGTD	Generator transfer device, not avaialble with PS1050[13,16,18]
OCS	5', 18/3 Reloc selectable One Pass cable[16]
HA	High ambient, for use in ambient temperatures up to 50°C[11]
EPNKO	Decorative endplate, no knock out[19]
OUTCTR	Wiring leads pulled through back center of fixture[20]
OUTEND	Wiring leads pulled through end of fixture[21]
Cord Sets:	
CS1W	Staight blade plug, 120V[10,16]
CS3W	NEMA twist-lock plug, 120V[10,16]
CS7W	Staight blade plug, 277V[10,16]
CS11W	NEMA twist-lock plug, 277V[10,16]
CS25W	NEMA twist-lock plug, 347V[10,16]
CS97W	NEMA twist-lock plug, 480V[10,16]
CS93W	600V SEOOW white cord, no plug (no voltage required)
CS6WG16ST0WD5D	6' white cord, 16/5, no plug, includes low voltage dimming wires (no voltage required)[15]
PLR__	Plug-in wiring, see page 16 for ordering information
PLR1LVG	Plug-in wiring,low voltage dimming[22]
RRL__	RELOC®-ready luminaire. See page 15 for ordering information
SPD	Surge protection device, provides up to 6kV protection[16,20]
USPOM	Assembled in the United States
nLight® Wireless: [23,24]	
NLTAIR2 RES7	nLight® Generation 2 enabled PIR integral occupancy sensor with automatic dimming photocell
NLTAIR2 RES7PDT	nLight AIR Generation 2 enabled dual technology integral occupancy sensor with automatic dimming photocell
NLTAIR2 RIO	No sensor control
nLight® Wired: [23,25]	
N100	nLight® without lumen management
NES7	nLight® nES 7 PIR integral occupancy sensor[26]
NESPDT7	nLight® nES PDT 7 dual technology integral occupancy control[26]
NES7ADCX	nLight® nES 7 ADCX PIR integral occupancy sensor with automatic dimming photocell[26]
NESPDT7ADCX	nLight® nES PDT 7 dual technology integral occupancy sensor with automatic dimming photocell[26]
Individual controls: [23,25]	
MSD7	PIR integral occupancy sensor
MSDPDT7	PDT 7 dual technology integral occupancy control
MSD7ADC	PIR integral occupancy sensor with automatic dimming control photocell
MSDPDT7ADC	PDT integral occupancy sensor with automatic dimming control photocell

Finish

WH	White
GALVW	Galvanized with white lens end caps
GALVB	Galvanized with black lens end caps
MB	Matte black
SKGYW	Smoke gray with white lens end caps
SKGYB	Smoke gray with black lens end caps

Accessories: *Order as separate catalog number.*

Mounting:

ZACVH	Aircraft cable 120" (one pair)
ZAC120	One adjustable aircraft cable with canopy 120" [27]
ZACFP120	One adjustable aircraft cable with feed (3 conductor) and canopy, 120" [27]
ZACFPD120	One adjustable aircraft cable with feed (5 conductor) and canopy 120" [27]
ZAC240	One adjustable aircraft cable with canopy 240" [27]
ZACFP240	One adjustable aircraft cable with feed (3 conductor) and canopy, 240" [27]
ZACFPD240	One adjustable aircraft cable with feed (5 conductor) and canopy 240" [27]
SQ__	Stem kit, 2" increments up to 48" [27]

THCLX __	Tong hanger (Must specify color) (one pair) [28]
CLXANGBKT ____	Angle bracket, (Must specify color) (one pair) [28]
HC36	Hanger chain, 36" (one pair)

Sensors & Controls:

LSXR	Sensor Switch ® LSXR occupancy sensor [29]
NPP16D	nLight® switching/dimming module
NPP16DER	nLight® switching/dimming module with emergency relay
rPP20D	nLight® air dimming/switching module
XPA CMRB0	XPoint™ Wireless 0-10V relay, external, 55°C max ambient

Reflectors:

CLXRW24___	Wide decorative 24" reflector, (Must specify color) [30]
CLXRW36___	Wide decorative 36" reflector, (Must specify color) [30]
CLXRW48___	Wide decorative 48" reflector, (Must specify color) [30]
CLXRW96___	Two wide decorative 48" reflectors, (Must specify color) [30]
CLXRWU24___	Wide decorative 24" reflector with uplight, (Must specify color) [30]
CLXRWU36___	Wide decorative 36" reflector with uplight, (Must specify color) [30]
CLXRWU48___	Wide decorative 48" reflector with uplight, (Must specify color) [30]
CLXRWU96___	Two wide decorative 48" reflectors with uplight, (Must specify color) [30]
CLXRN24	Narrow 24" reflector, (Must specify color) [31]
CLXRN36	Narrow 36" reflector, (Must specify color) [31]
CLXRN48	Narrow 48" reflector, (Must specify color) [31]
CLXRN96___	Two narrow 48" reflectors, (Must specify color) [31]

Wireguards:

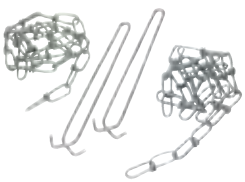
WGCLX24___	24" wireguard, (Must specify color) [32]
WGCLX36___	36" wireguard, (Must specify color) [32]
WGCLX48___	48" wireguard, XX, (Must specify color) 96" fixture requires two [32]

Notes

1 Not available with OUTCTR option.
2 Not available with HA option.
3 Not available with SEF when ordered in combination with EZ1.
4 Not available with NLTAIR2 RES7, NLTAIR2 RES7PDT, or NLTAIR2 RIO.
5 Not available with EZ1 when ordered with L24 with 5000LM or L36 with 7500LM.
6 When ordered with L24 only available with 1500LM or 2000LM in combination with GZ10 driver. Not for use with THCLX, CLXANGBKT, CLX reflectors or WGCLX accessories. Not available with RDL lens options.
7 Only available with general distribution.
8 Not available with CLXRN accessories.
9 Available L/LENS only.
10 Not available with PS1050, E10WLCP, or BGTD.
11 Not available with BGTD option.
12 Voltage selected utilizes a step-down transformer. Not available with L24 when ordered with N100.Not available with PS1050, E10WLCP or BGTD option.
13 Requires SPD option.
14 When continuous row mounting, fixtures must all have the same driver selection.
15 Not available with Individual controls, nLight wired networking, nLight wireless networking, nLight wireless zone control options.
16 Must specify voltage.
17 Not available with L24 or L36. Not available with L48 in combination with N100.
18 Available with L48 or L96 only. 20 Not available with PS1050 or E10WLCP options. Not available with 208 or 240V. Not available Individual controls, NLight Wired, or NLight Wireless options.
19 Not available OUTEND.
20 Required with PS1050, E10WLCP, BGTD, XAD, or XAD924.
21 Not available with PLR options.
22 Not available with XPoint, Individual controls, NLight Wired, or NLight Wireless options.
23 Sensor housing will be the same color as lens end caps.
24 Not available with L24 in combination with 5000LM, not available with L36 in combination with 7500LM, not available with L48 in combination with 10000LM, and not available with L96 in combination with 14000LM, 18000LM, or 20000LM. Not available with PLRs containing low voltage dimming wires.
25 Not available with any other control option. Requires EZ1.
26 Requires N100 option.
27 Ships standard as white.
28 Not available with louver, wireguards, wide reflectors.
29 More configurations on LSXR Specification Sheet.
30 L24 reflector is 22.65", L36 reflector is 34.01", L48 reflector is 46.80", L96 comes with two L48 reflectors.
31 For use with L/LENS fixtures only. L24 reflector is 22.75", L36 reflector is 34.20", L48 reflector is 46.85", L96 comes with two L48 reflectors.
32 Not for use with CLX wide reflector accessories.

OPTIONS AND ACCESSORIES

Narrow reflector
Ships separtely from fixture.
Order as:
CLXRN24___
CLXRN36___
CLXRN48___
CLXRN96___



Wide decorative reflector
Ships separtely from fixture.
Order as:
CLXRW24___
CLXRW36___
CLXRW48___
CLXRW96___

Wireguard
Ships separately from fixture:
96" fixture requires two WGCLX48.
Order as:
WGCLX24___
WGCLX36___
WGCLX48___

Aircraft Cable with Canopy
Available in 120" or 240"
Order as:
ZAC120
ZAC240

HANGER CHAIN
36" chain with Y hanger. ships as a pair
Order as:
HC36

ZACVH HANGER
10' Aircraft cable with Y hanger.
Order as:
ZACVH

Tong hanger
Ships as a pair
Order As:
THCLX___

RRL - RELOC®-Ready Luminaire

- RRL connectors can be used with Quick-Flex®, System 820 and OnePass® systems.
- Load side of connector factory installed to luminaire.
- 4-pole mating connector with push-in terminations allows for simple installation.
- Touch-safe design on both halves meets UL/CSA requirement.
- Wiping contact design allows safe disconnect under load.

ORDERING INFORMATION Lead times will vary depending on options selected. Consult with your sales representative. **Example**: RRLA

Series		Wiring instructions	
RRL	RELOC®-ready luminaire	A	Hot conductor wired to position #1 (phase A)
		B	Hot conductor wired to position #2 (phase B)
		C	Hot conductor wired to position #3 (phase C) [1]

Compatible RELOC® Cables for Industrial Luminaires (ordered and shipped separately)

OCS

OCU

OD

DC

PT

Notes

1 C, ABE, and C12S options are not used with Quick-Flex QFC, QSFC, QPT, and QD.

PRODUCT INFORMATION

Advanced plug-in system with two-circuit capability. Available on industrial and strip products and a variety of architectural products mounted in continuous rows. 1, 2, 3 and 4-lamp fixtures. PLR22 (2-circuit) and crossover harness switches hot circuit serving next fixture in row. Reduces fixture types on job for alternating circuit applications (see example below.)

Easy one-step installation, saves up to 35% on labor costs. Expanded switching flexibility helps save energy.

Rows can be 50% longer with two-circuit systems. Polarized, lock-together nylon connectors prevent miswiring in the field. #12 THHN conductor, rated 600V, 90°C. White neutral wire included. Grounding accomplished by fixture in-row connectors.

CSA certified systems available with up to 2 circuits. G ground required.

Note: Specifications subject to change without notice.

Wiring

PLR

Advanced 1 or 2-Circuit Plug-In

ORDERING INFORMATION Lead times will vary depending on options selected. Consult with your sales representative.

Series	Number of hot wires		Branch circuits				Dimming		Ground	
			Circuits to which ballast is connected		Emergency circuit connected					
PLR	(blank)	Not required for 22	(blank)	Not required for 22	(blank)	No emergency circuit	LV	Low-voltage dimming	G	Ground
PLR22	1	Black	A	Black wire	ELA	Emergency circuit wired to black wire				
	2	Black and red	B	Red wire	ELB	Emergency circuit wired to red wire				

Typical Applications

- Multiple-circuit and single-circuit for longer continuous rows
- Multiple-circuit with alternating fixtures on separate circuits and 2-circuit (PLR 22)
- Multiple circuit with night-lights located along row as desired

SB LED Square Basket Wraparound

Linear Flush Mount

Square-basket LED wraparound designed to deliver ambient lighting for surface-mount ceiling applications. Ideal for schools, offices, hospitals and many other applications.

FEATURES:

- Designed to replace existing 2-lamp T8 and T12 fluorescent
- Standard MVOLT (120-277) dimming driver
- Available in two CCTs: 3500K and 4000K

Catalog Number	UPC	Description	Lumens	Input Watts	CCT	CRI	Voltage	Pallet qty.
SBL4 LP835 (CI-254RKP)	00190887819410	4' LED Wraparound	3,933	32W	3500K	80	120-277V	70
SBL4 LP840 (CI-254RKU	00190887819434	4' LED Wraparound	3,994	32W	4000K	80	120-277V	70

More configurations are available. Click here or visit www.acuitybrands.com and search for SBL LED Square Basket Wraparound.

Specifications

INTENDED USE:
SBL LED wraparound provides a digital lighting platform to deliver general ambient lighting for surface-mount applications. The SBL provides a similar look to that of an existing fluorescent wrap with all of the excellent benefits of LED: energy savings, long life, and maintenance savings. Ideal for closets, storage rooms, and offices. Certain airborne contaminants can diminish integrity of acrylic. Click here for Acrylic Environmental Compatibility table for suitable uses. **Certain airborne contaminants can diminish integrity of acrylic. Click here for Acrylic Environmental Compatibility table for suitable uses.**

CONSTRUCTION:
Linear side prisms control brightness, pyramidal bottom prisms minimize lamp image. Continuous side flanges on fixture body provide light trap and continuous diffuser support to prevent accidental opening and simplify maintenance. Full depth, white enamel end plates.

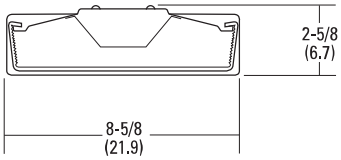
Die-formed from code gauge cold-rolled steel. Channel cover snaps into place without the use of tools. Full end cap factory installed to reduce job site labor.

OPTICS:
The translucent white diffuser reduces glare and pixilation without impacting performance.

ELECTRICAL:
Long-life LEDs, coupled with high-efficiency drivers, provide extended service life. 90% LED lumen maintenance at 50,000 hours (L90/50,000).

INSTALLATION:
Suitable for suspension by cable, surface-mounting bracket, hook monopoint or single (pendant) monopoint. Surface mounting not recommended without optional surface mounting bracket. To maintain ambient listing, fixture should be mounted at a minimum plenum height of 18".

LISTINGS:
CSA certified to U.S. and Canadian standards. Damp listed.



WARRANTY:
5-year limited warranty. Complete warranty terms located at:
www.acuitybrands.com/support/customer-support/terms-and-conditions

Note: Actual performance may differ as a result of end-user environment and application. All values are design or typical values, measured under laboratory conditions at 25 °C. Specifications subject to change without notice.

FEATURES & SPECIFICATIONS

INTENDED USE — The BLWP LED Wrap/ Wall bracket expands the BLT family with the features and aesthetics of the popular BLT and BLTR center basket design with a clean, versatile style and volumetric distribution. High efficacy LED light engines deliver energy savings and low maintenance compared to traditional sources. An extensive selection of configurations and options make the BLWP the perfect choice for many lighting applications including schools, offices, stairwells and other commercial spaces. With multiple mounting options, easy installation, and controls configurations, the BLWP is an excellent choice for renovation and new construction.

CONSTRUCTION — BLWP enclosure components are die-formed for dimensional consistency. For 2' and 4' product, hinged door frame allows easy access to electrical components and mounting locations without having to remove additional parts. For 8' product, suspension aircraft cables allow easy access to electrical components and mounting locations without having to remove additional parts. Available in three paint finishes: white (pre-paint), painted after fabrication white, and natural aluminum. Diffusers are extruded from impact modified acrylic for increased durability. Optional polycarbonate lens available for additional impact resistance, as well as Tamper Proof screws.

OPTICS — Volumetric illumination is achieved by creating an optimal mix of light to walls, partitions and vertical and horizontal work surfaces – rendering the interior space, objects and occupants in a more balanced, complimentary luminous environment. High performance extruded acrylic diffusers conceal LEDs and efficiently deliver light in a volumetric distribution. Five diffuser choices available - curved and square designs with linear prisms, a smooth frosted finish, and a smooth polycarbonate finish.

ELECTRICAL — Long-life LEDs, coupled with high-efficiency drivers, provide superior quantity and qualityof illumination for extended service life. 80% LED lumen maintenance at 60,000 hours (L80/60,000). Replaces 2 lamp fluorescent.

Configurable BLWP: Available in High Efficiency (HE) versions for applications where a lower wattage (over the standard product) is required. The High Efficiency versions deliver >130 LPW and can be specified via the Lumen Package designations in the Ordering Information on page 2.

eldoLED driver options deliver choice of dimming range, and choices for control, while assuring flicker-free, low-current inrush, 89% efficiency and low EMI.

Optional integrated nLight®controls make each luminaire addressable - allowing it to digitally communicate with other nLight enabled controls such as dimmers, switches, occupancy sensors and photocontrols. Connection to nLight is simple. It can be accomplished with integrated nLight AIR wireless or through standard Cat-5 cabling. nLight offers unique plug-and-play convenience as devices and luminaires automatically discover each other and self-commission, while nLight AIR is commissioned easily through an intuitive mobile app.

Lumen Management: Unique lumen management system (option N80) provides on board intelligence that actively manages the LED light source so that constant lumen output is maintained over the system life, preventing the energy waste created by the traditional practice of over-lighting.

Driver disconnect provided where required to comply with US and Canadian codes.

CONTROLS — **Integrated sensor (individual control):** Sensor Switch MSD7ADCX (Passive infrared (PIR)) or MSDPDT7ADCX (PIR/Microphonics Dual Tech (PDT)) integrated occupancy sensor/automatic dimming photocell allows the luminaire to power off when the space is unoccupied or enough ambient light is entering the space.

Integrated Sensor (nLight Wired Networking): This sensor is nLight-enabled, meaning it has the ability to communicate over an nLight network. When wired, using CAT-5 cabling, with other nLight-enabled sensors, power packs, or WallPods, an nLight control zone is created. Once linked to a Gateway, directly or via a Bridge, the zone becomes capable of remote status monitoring and control via SensorView software. See page 5 for the nLight sensor options.

Integrated Smart Sensor (nLight AIR Wireless Platform): The rES7 sensor is nLight AIR enabled, meaning it has the ability to communicate over the wireless nLight control platform. It is available with an automatic dimming photocell, and either a digital PIR or dual technology occupancy sensor. It pairs to other luminairs and wall switches through our mobile app, CL***AIR***ITY PRO, which allows for simple sensor adjustment. See page 5 for more details on the Integrated Smart Sensor.

INSTALLATION — Intended for surface or suspend mounting. For row mounting and quick mounting to junction boxes see accessories section. Suitable for damp location.

LISTINGS — CSA Certified to meet U.S. and Canadian standards.

DesignLights Consortium® (DLC) Premium qualified product. Not all versions of this product may be DLC Premium qualified. Please check the DLC Qualified Products List at www.designlights.org/QPL to confirm which versions are qualified.

WARRANTY — 5-year limited warranty. Complete warranty terms located at: www.acuitybrands.com/support/customer-support/terms-and-conditions

Note: Actual performance may differ as a result of end-user environment and application.
All values are design or typical values, measured under laboratory conditions at 25 °C.

A+ Capable Luminaire

This item is an A+ capable luminaire, which has been designed and tested to provide consistent color appearance and out-of-the-box control compatibility with simple commissioning.

- All configurations of this luminaire meet the Acuity Brands' specification for chromatic consistency
- This luminaire is part of an A+ Certified solution for nLight® or control networks marked by a shaded background*
- This luminaire is part of an A+ Certified solution for nLight control networks, providing advanced control functionality at the luminaire level, when selection includes driver and control options marked by a shaded background*

To learn more about A+, visit www.acuitybrands.com/aplus.

*See ordering tree for details

BLWP Low Profile LED Wraparound

A+ Capable options indicated by this color background.

ORDERING INFORMATION Lead times will vary depending on options selected. Consult with your sales representative.

Example: BLWP4 40L ADP GZ10 LP840

Notes

1 Approximate lumen output. All versions may not achieve 130+ LPW including 90CRI and versions with integral sensor trim. Refer to photometry on www.acuitybrands.com. See QPL for latest DLC listings.
2 Not available with HE (high efficiency) performance package on BLWP2 and BLWP4 only. If ordered on BLWP2 with TD, must select 33L or 40L. If ordered on BLWP4 with TD, must select 30L, 40L, 48L, 85L, or 100L.
3 Not available with TD, E10WLCP, EL7L, EL14L, BGTD or BLWP4 > 85L/ 85LHE.
4 Not available with nLight Interface or Controls.
5 On BLWP2, not available with 8L, 20L, 48L, 8LHE, or 20LHE. On BLWP4, not available with 15L, 20L, 60L, 72L, 15LHE, 20LHE, 60LHE, or 72LHE.
6 Not available with TD.
7 Requires a connection to existing nLight network. Power is provided from a separate NLIGHT enabled fixture or external power pack.
8 Must select nLight wireless control
9 Must select Lens/Diffuser type with Trim Rings.
10 Requires EZ1 and nLight interface wired option to be specified.
11 Not available with nLight interface.
12 0-10V wires are not accessible via access plate.
13 Requires EZ1 and NLTAIR2 to be specified. Only available with 60L or lower lumen packages on the BLWP4. Only available with 100LHE/80L lumen packages or lower on the BLWP8.
14 Requires occupancy control. Must be ordered with nLight Wired or Individual Control sensor option. Not available with NLTAIR2 sensor option.
15 Can only be ordered in conjunction with EZ1, NLTAIR2, RES7/RES7PDT. Occupancy sensor disabled at factory but can be re-enabled upon commissioning.
16 Only available with EZ1 driver option.
17 Only available on BLWP8, 8ft length version of this fixture, in lumen packages 140L or less. Not available with TD.
18 Not available with TD or emergency battery options. Must specify voltage. Requires BSE labeling, voltage specific. Consult factory for options. Example: BGTD BSE10.
19 Only available with BLWP4 (4') fixture.
20 Accessory BLWP TRS T15 BIT available to be ordered with this option. See Accessories section page 3. Order as separate item.
21 Must specify voltage. 120 or 277, with GLR and GMF fusing.
22 Must specify EZ1 driver. Not available with lumen packages > 6000LM. FAO restricts use of external dimmingcontrols. See chart on page 3 for additional details.
23 Not available with BLWP2 or TD.
24 Not available with Controls options or nLight interface.
25 For ADP lens only, for additional lens options refer to photometry on www.acuitybrands.com.
26 Cannot be used with PLR1LVG.
27 Cannot be used to continuous row mount 4' fixtures with 8' fixtures.

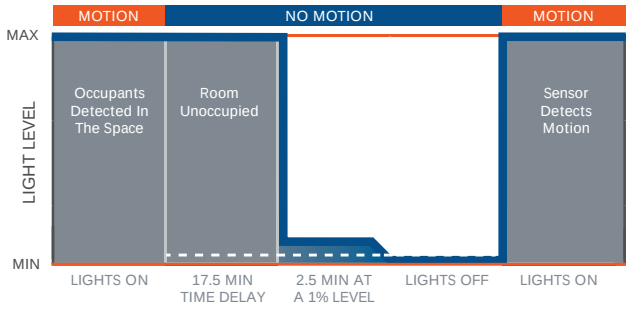
Basic nLight Zone

Integrated Sensor with Individual Control

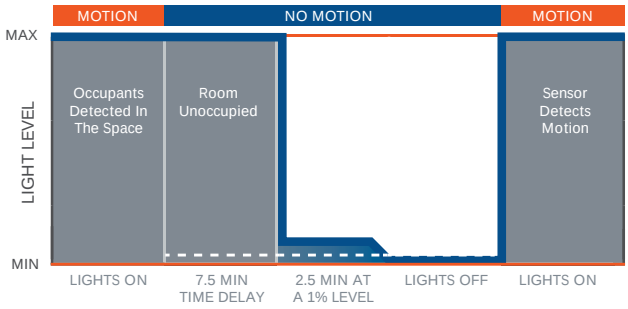
The MSD7ADCX PIR occupancy sensor/automatic dimming photocell is ideal for areas without obstructions and where daylight harvesting may be desired. Suggested applications include, but not limited to, hallways, corridors, storage rooms, and breakrooms or other areas where people are typically moving.



The MSDPDT7ADCX PIR/Microphonics Dual Tech occupancy sensor/automatic dimming photocell is ideal for areas with obstructions and where daylight harvesting is desired. Suggested applications include, but not limited to, open offices, private offices, classrooms, public restrooms, and conference rooms.

nLight Wired Networking

The nES 7 is ideal for small rooms without obstructions or areas with primarily walking motion. Ideal areas include hallways, corridors, storage rooms, and breakrooms. Additionally, the NES7ADCX includes an integrated photocell, which enables daylight harvesting controls.



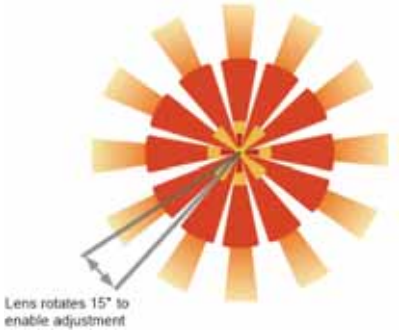
For areas like restrooms, private offices, open offices, conference rooms or any space with obstructions, the nES PDT 7 dual technology sensor is recommended. The nES PDT 7 utilizes both PIR (passive infrared) and Microphonics technologies to detect occupancy. Additionally, the NESPDT7ADCX includes an integrated photocell, which enables daylight harvesting controls which is ideal for areas where windows are present.

Sequence of Operation

*The presetting on the automatic dimming photocell is 5fc.

Sequence of Operation

*The presetting on the automatic dimming photocell is 5fc.



Sensor Coverage Pattern
Mini 360° Lens

- Recommended for walking motion detection from mounting heights between 8 ft (2.44 m) and 20 ft (6.10 m)
- Initial detection of walking motion along sensor axes at distances of 2x the mounting height up to 15 ft (4.57 m) and
- 1.75x up to 20 ft (6.10 m).
- Provides 12 ft (3.66 m) radial detection of small motion when mounted at 9 ft (2.74 m)
- Initial detection will occur earlier when walking across sensor's field of view than when walking directly at sensor

nLight AIR Wireless

nLight AIR is the ideal solution for retrofit or new construction spaces where adding additional wiring can be labor intensive and costly. nLight AIR is available with or without an integral sensor. The integrated rES 7 or rES7 PDT smart sensor is part of each luminaire in the nLight AIR network, which can be grouped to control multiple luminaires. The granularity of control with the digital PIR occupancy detection and daylight sensing makes a great solution for any application.

MOUNTING INFORMATION

For unit or row installation; surface or suspend mounting.

Suspension Methods:

Aircraft Cable Suspension

Order one BLWPCG_, BLWPCGF_, or BLWPCGE_ required for each suspension point.

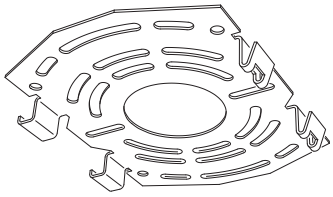
F1 for use with most T-bar and screw slot grid ceiling applications. Designed for on-grid and off-grid installations.

F2 for use with recessed or surface-mount horizontal J-box applications..

See Accessories page on page 3 for part numbers configurations.

Stem Suspension

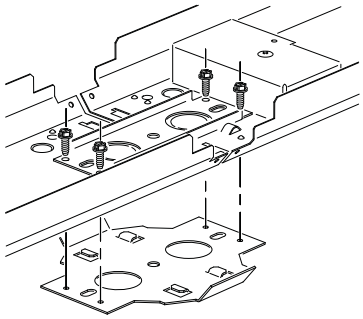
Individual installation — Two single-stem hangers required.



Note: 2' configurations with emergency option cannot be stem mounted.

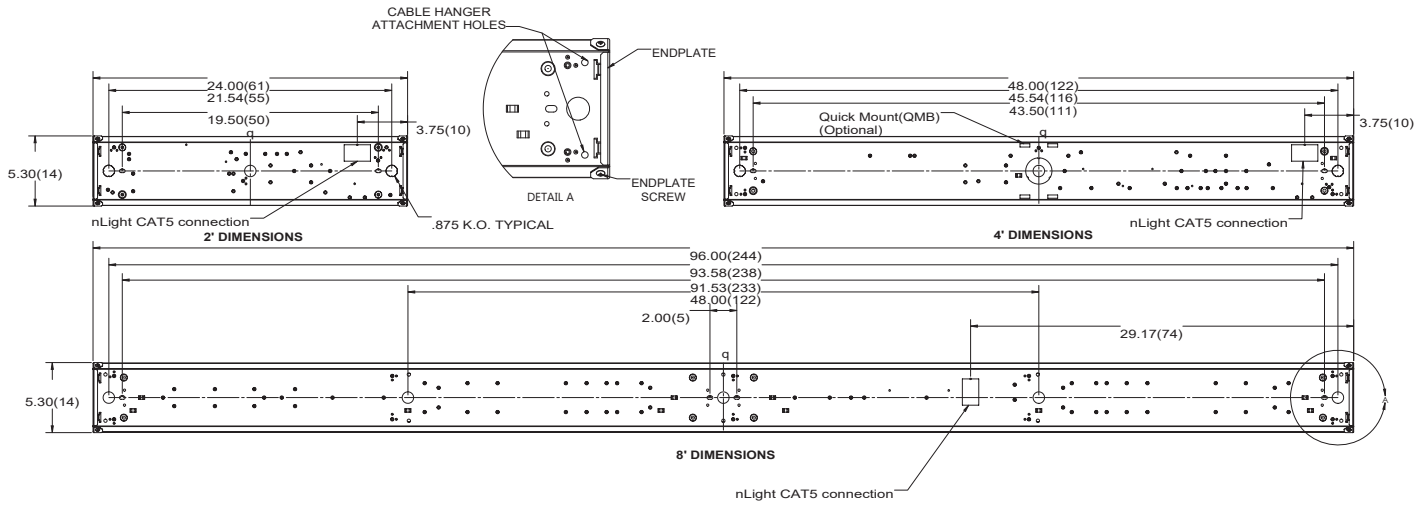
Accessory Images

(QMB) Quick Mount Bracket



Quick Mount Bracket allows easy installation to junction boxes without having to remove any parts in the fixture.

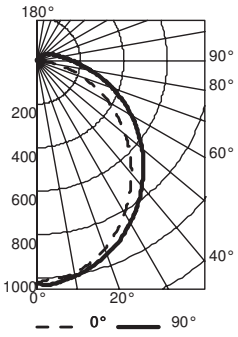
Note: 2' and 8' configurations not available with QMB accessory.



BLWPCR - continuous row mount bracket

Order one (1) BLWPCR bracket per fixture for continuous row applications. Order one hanger(Aircraft Cable Suspension Kit or Stem Suspension Kit) per fixture plus one per joiner required.

DIMENSIONS



All dimensions are inches (centimeters) unless otherwise noted.

PRODUCT INFORMATION

Advanced plug-in system with three-circuit capability. Available on industrial and strip products and a variety of architectural products mounted in continuous rows. 1, 2, 3 and 4-lamp fixtures. PLR22 (2-circuit) and PLR33 (3-circuit) crossover harness switches hot circuit serving next fixture in row. Reduces fixture types on job for alternating circuit applications (see example below.)

Easy one-step installation, saves up to 35% on labor costs. Expanded switching flexibility helps save energy.

Rows can be 50% longer with two-circuit systems. Polarized, lock-together nylon connectors prevent miswiring in the field. #12 THHN conductor, rated 600V, 90°C. White neutral wire included. Grounding accomplished by fixture in-row connectors.

CSA certified systems available with up to 2 circuits. G ground required.

Note: Specifications subject to change without notice.

Wiring

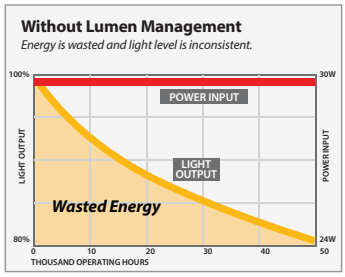
PLR

Advanced 3-Circuit Plug-In

ORDERING INFORMATION Lead times will vary depending on options selected. Consult with your sales representative.

Series	Number of hot wires		Branch circuits				Dimming		Ground	
			Circuits to which ballast is connected		Emergency circuit connected					
PLR	(blank)	Not required for 22 or 33	(blank)	Not required for 22 or 33	(blank)	No emergency circuit	LV	Low-voltage dimming	(blank)	No ground in PLR
PLR22	1	Black	A	Black wire	ELA	Emergency circuit wired to black wire			G	Ground. Maximum 2 circuits
PLR33	2	Black and red	B	Red wire	ELB	Emergency circuit wired to red wire				
	3	Black, red and blue	C	Blue wire	ELC	Emergency circuit wired to blue wire				

Typical Applications



- Multiple-circuit and single-circuit for longer continuous rows
- Multiple-circuit with alternating fixtures on separate circuits, 2-circuit (PLR 22) and 3-circuit (PLR 33)
- Multiple circuit with night-lights located along row as desired

Constant Lumen Management

Enabled by the embedded nLight control, the BLT actively tracks its run-time and manages its light source such that constant lumen output is maintained over the system life. Referred to as lumen management, this feature eliminates the energy waste created by the traditional practice of over-lighting.

How to Estimate Lumens in Emergency Mode
Use the formula below to estimate the delivered lumens in emergency mode
Estimated Lumens = 1.25 x P x LPW
P = Ouput power of emergency driver. P = 10W for E10WLCP option.
LPW = Lumen per watt rating of the luminaire. LPW information available in Performance Data section.

XVML

LED Vapor Tight

These fully-gasketed, wet-location, and code-compliant vapor-tights are DLC® listed and IP65 and IP66 rated. They can be surface mounted on the ceiling or wall and are designed for continuous row mounting. The XVML vapor-tights are ideal for outdoor venues, canopies and locker rooms.

FEATURES:

- The fully gasketed, polycarbonate housing with ten polycarbonate captive latches provides a water-tight seal and stands up to dust and dirt with its IP65 and IP66 ratings
- Provides the performance you need with the UV-stabilized, high-impact, frosted polycarbonate lens for uniform light output and high impact-resistance
- Quick and simple to install with the snap-lock tool-less access

Accessories: *Order as separate catalog number.*

XVML LATCH STSL	Stainless steel latch kit (Set of 10) [1]
XVMLJSB	Junction box mount [2]
XVMLANGBKT45	Angle mount bracket (Set of 2) [3]

NOTES

1. To deter tampering, stainless steel latches can accommodate #8-32x1/2" tamper resistant fasteners (not provided). Kit includes 10 latches.
2. IP65 rated. Not compatible with angle mount bracket. Required to be used in center of fixture with supplied brackets for additional mounting support.
3. For use with applications where ceiling meets wall at a 90° angle. See drawing on page 3 for more information.

Specifications

INTENDED USE:

Ideal for damp/wet locations such as outdoor venues, canopies and locker rooms. **Certain airborne contaminants may adversely affect the functioning of LEDs and other electronic components, depending on various factors such as concentrations of the contaminants, ventilation, and temperature at the end-user location. Click here for a list of substances that may not be suitable for interaction with LEDs and other electronic components.**

CONSTRUCTION:

Light gray, fully gasketed, polycarbonate housing with ten polycarbonate captive latches provides a watertight seal. The high-impact resistant housing and extruded silicone rubber gasket protects the internal components from the environment, including moisture and dirt. 3/8"" wet location fitting provided on the 3500LM fixture and 1/2"" wet location fitting provided on the 5000LM fixture on one end for use with liquid tight conduit. The housing dimensions vary based on the lumen package selected. Polycarbonate latches (included) deter tampering, by accommodating #6-32x3/8"" tamper resistant fasteners (not provided). Grade 301 stainless steel latches (available separately) deter tampering, by accommodating #8-32x1/2"" tamper resistant fasteners (not provided).

ELECTRICAL:

High-efficiency LEDs. 0-10V dimming standard for a dimming range of 100% to 10%. Luminaire Surge Protection Level: Designed to withstand up to 2.5kV/0.75kA per ANSI C82.77-5-2015.

INSTALLATION:

Mounting hardware for surface mounting to ceiling or wall (horizontally or vertically) included. Mounting hardware kit also includes hooks for suspended mount (chain not included).

Optional 45° corner angle bracket mount and junction mount kit also available. Maximum of 15 units or 6A for through wiring connection or daisy chain type installation. Tool-less access for installation.

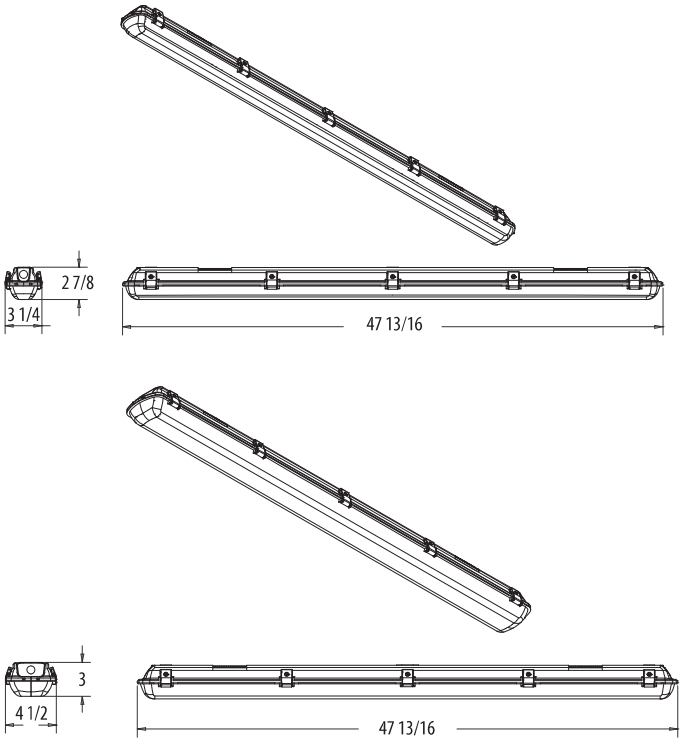
LISTINGS:

UL/C-UL listed to US and Canadian Safety Standards. For use in wet locations under covered ceilings. For use in ambient temperatures from -4°F (-20°C) to 104°F (40°C). IP65 and IP66 rated when ceiling, suspended, wall or corner mounted. Junction Box mount rated IP65. This unit meets FCC Non- Consumer Class A (277v) and Consumer Class B (120V) limits.

DesignLights Consortium® (DLC) qualified product. Not all versions of this product may be DLC qualified. Please check the DLC Qualified Products List at www.designlights.org/QPL to confirm which versions are qualified.

WARRANTY:

5-year limited warranty. Complete warranty terms located at:
www.acuitybrands.com/resources/terms-and-conditions



Note: Actual performance may differ as a result of end-user environment and application. All values are design or typical values, measured under laboratory conditions at 25 °C. Specifications subject to change without notice.

STANDARD SPECIFICATIONS

PROJECT:
MODEL #:
FIXTURE TYPE:

HOUSING
Cold rolled 20 GA steel, formed with die punch tooling with no exposed hardware. The pan has three steel brackets which mate with the diffuser.

DIFFUSER
Translucent, UV stabilized, white acrylic. Diffusor is vacuum formed and features a secure "twist lock" tool free installation method.

MOUNTING
Directly to j-box (by others). Mounting hardware included.

FINISH (HOUSING & CANOPY)
The standard finish is a sturdy electroplated brushed nickel. Options include all Brownlee paint finishes. Plated finishes such as Brushed Nickel are suitable for indoor applications only. Installation outdoors voids the Brownlee Limited Warranty.

WARRANTY
5 year limited warranty on this LED product. Consult factory for details.

SUSPENSION SYSTEM
Three stainless steel aircraft cables and a power cord allow mounting at multiple heights from 10" to 25". Both the power cord and aircraft cables are field trimmed for mounting, with additional options for up to 10' and 20' drops.

LED PERFORMANCE - 3500K STANDARD

SKEET® XL Specifications

UL Listing: Suitable for damp locations

LEDs: Long-life, high-efficiency surface mount LEDs

Lifespan: 50,000-hour LED lifespan based on IES LM-80 results and TM-21 calculations

Drivers:
10W: 120VAC TRIAC, Constant current, Class 2, 60 Hz, 0.09A

12W: 120VAC TRIAC, Constant current, Class 2, 60 Hz, 0.11A

20W: 120VAC TRIAC, Constant current, Class 2, 60 Hz, 0.17A

25W: 120VAC TRIAC, Constant current, Class 2, 60 Hz, 0.21A

Ambient Temperature: Suitable for use in 40°C ambient temperatures

Housing: Steel sheet metal

Lens: Diffused acrylic

Reflector: White painted, reflective, steel sheet metal

Mounting: Ceiling or wall mount to junction box

IESNA LM-79 & LM-80 Testing: RAB LED luminaires have been tested in accordance with IESNA LM-79 and LM-80, and have received the Department of Energy "Lighting Facts" label.

Lumens	8,941
Efficacy	117.8 LPW

Technical Specifications

Listings

UL Listing:

Suitable for wet locations as a downlight

DLC Listed:

This product is on the Design Lights Consortium (DLC) Qualified Products List and is eligible for rebates from DLC Member Utilities. DLC Product Code: P000017AL

IESNA LM-79 & IESNA LM-80 Testing:

RAB LED luminaires and LED components have been tested by an independent laboratory in accordance with IESNA LM-79 and LM-80.

LED Characteristics

Lifespan:

100,000-hour LED lifespan based on IES LM-80 results and TM-21 calculations

LEDs:

Six (6) multi-chip, 13W, high-output, long-life LEDs

Color Consistency:

3-step MacAdam Ellipse binning to achieve consistent fixture-to-fixture color

Color Stability:

LED color temperature is warrantied to shift no more than 200K in CCT over a 5-year period

Color Temperature (Nominal CCT):

4100K

Color Uniformity:

RAB's range of CCT (Correlated Color Temperature) follows the guidelines of the American National Standard for Specifications for the Chromaticity of Solid State Lighting (SSL) Products, ANSI C78.377-2017.

Construction

IP Rating:

Ingress Protection rating of IP66 for dust and water

Ambient Temperature:

Suitable For use in 40°C (104°F)

Cold Weather Starting:

Minimum starting temperature is -40°C (-40°F)

Housing:

Die cast aluminum housing, lens frame and mounting arm

Reflector:

Specular vacuum-metallized polycarbonate

Gaskets:

High-temperature silicone gaskets

Finish:

Formulated for high durability and long-lasting color

Green Technology:

Mercury and UV free. RoHS-compliant components.

Optical

Specification Grade Optics:

The Type III distribution is ideal for roadway, general parking, and other area lighting applications where a larger pool of lighting is required. It is intended to be located near the side of the area, allowing the light to project outward and fill the area.

BUG Rating:

B1 U0 G2

Copyright © 2019 RAB Lighting All Rights Reserved Note: Specifications are subject to change at any time without notice

Technical Specifications (continued)

Electrical

Driver:

Constant Current, Class 2, 2000mA, 100-277V, 50-60Hz, 1.1A, Power Factor 99%

THD:

5.2% at 120V, 13.6% at 277V

Surge Protection:

6kV

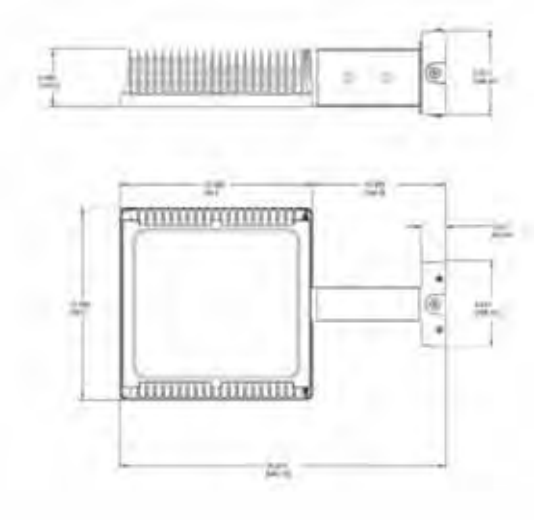
Other

Warranty:

RAB warrants that our LED products will be free from defects in materials and workmanship for a period of five (5) years from the date of delivery to the end user, including coverage of light output, color stability, driver performance and fixture finish. RAB's warranty is subject to all terms and conditions found at rablighting.com/warranty.

Patents:

The WPLED design is protected by patents pending in the U.S., Canada, China, Taiwan and Mexico.



Replacement:

Replaces 400W Metal Halide

Buy American Act Compliance:

RAB values USA manufacturing! Upon request, RAB may be able to manufacture this product to be compliant with the Buy American Act (BAA). Please contact customer service to request a quote for the product to be made BAA compliant.

Dimensions

Features

- High performance LED light engine
- Maintains 70% of initial lumens at 100,000-hours
- Weatherproof high temperature silicone gaskets
- Superior heat sinking with die cast aluminum housing and external fins
- Replaces 400W MH
- 100 up to 277 Volts
- 5-Year, No-Compromise Warranty

An LED powerhouse

Leave no corner unlit with over 15,000 lumens.

NEW

WP3LED 110W

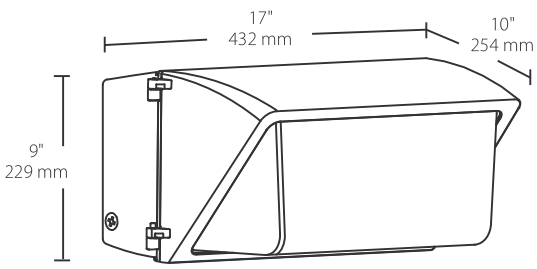
DLC QPL LISTED

RAB | Outdoor

WP3LED 110W

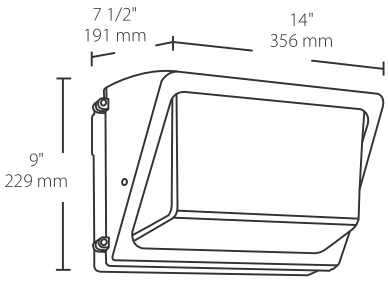
- Delivers over 15,000 lumens; replaces 400W MH
- High efficiency with up to 144 lm/W
- Same look as traditional HID wallpacks, and covers most large footprints
- Photocell and motion sensor options available
- 100,000-Hour LED lifespan

Traditional HID wallkpack look, simple installation



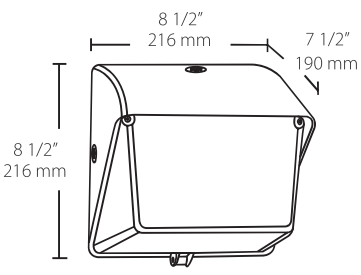
Optional photocell *(button or swivel)* and motion sensor available

480V



480V models available

Dimensions and weights



WP3LED
Weight: 23.4 lbs (110W) Weight: 16.8 lbs (82, 65, 55W)

WP2LED
Weight: 9.6 lbs

WP1LED
Weight: 4.4 lbs

Specifications

WP3LED 110W - Replaces up to 400W MH

Color Temperature	5000K	4000K	3000K
Input Watts	107	108	107
Output Lumens	15113	15531	14516
Lumens Per Watt	141	144	136
Color Accuracy (CRI)	79	73	73

WP3LED 82W - Replaces up to 400W MH

Color Temperature	5000K	4000K	3000K
Input Watts	81	79	83
Output Lumens	9280	9347	8496
Lumens Per Watt	114	118	103
Color Accuracy (CRI)	82	83	82

WP3LED 65W - Replaces up to 400W MH

Color Temperature	5000K	4000K	3000K
Input Watts	62	65	63
Output Lumens	7559	7591	7023
Lumens Per Watt	123	126	112
Color Accuracy (CRI)	82	83	82

WP3LED 55W - Replaces up to 400W MH

Color Temperature	5000K	4000K	3000K
Input Watts	57	55	58
Output Lumens	7026	7017	6401
Lumens Per Watt	123	127	110
Color Accuracy (CRI)	82	83	82

WP2LED 37W - Replaces up to 175W MH

Color Temperature	5000K	4000K	3000K
Input Watts	37	37	39
Output Lumens	4387	4365	4207
Lumens Per Watt	118	118	109
Color Accuracy (CRI)	83	84	83

WP2LED 24W - Replaces up to 70W MH

Color Temperature	5000K	4000K	3000K
Input Watts	25	25	25
Output Lumens	2998	2983	2874
Lumens Per Watt	122	122	115
Color Accuracy (CRI)	83	85	83

WP1LED 30W - Replaces up to 100W MH

Color Temperature	5000K	4000K	3000K
Input Watts	31	30	31
Output Lumens	3332	3392	2810
Lumens Per Watt	107	115	91
Color Accuracy (CRI)	86	84	83

UL:
Suitable for wet locations. Wall mount only.

LEDs:
High-output, long-life LEDs

Lifespan:
All have 100,000-hour LED lifespan based on IES LM-80 results & TM-21 calculations except for 65W and 82W WP3LED models which have a 60,000-hour LED lifespan.

Drivers:
Constant Current, Class 2, 50/60 Hz. 100 - 277V in either 480V, 4kV surge protection

Housing:
Precision die-cast aluminum housing

Mounting:
WP1LED: Housing has three (3) conduit entry points and knockout pattern for junction box or direct wall mounting. Hinged door for easy re-assembly;
WP2LED and WP3LED: Die-cast backbox with four (4) conduit entry points and knockout pattern for junction box or direct wall mounting. Hinged door for easy re-assembly.

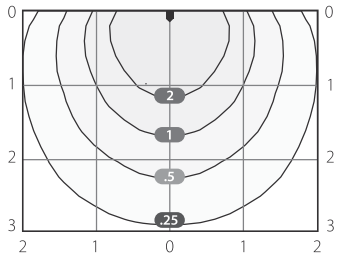
Lens:
WP1LED: High-impact, prismatic, UV-stabilized polycarbonate refractor lens;
WP2LED and WP3LED: Prismatic, heat-resistant borosilicate glass

Gaskets:
High-temperature silicone

Finish:
Our environmentally friendly polyester powder coatings are formulated for high-durability and long-lasting color, and contain no VOC or toxic heavy metals.

Color Stability:
LED color temperature warrantied not to shift more than 200K in CCT in 5 years

Color Uniformity:
RAB's range of CCT (Correlated Color Temperature) follows the guidelines of the American National Standard for Specifications for the Chromaticity of Solid State Lighting (SSL) Products, ANSI C78.377-2017.



Green Technology:
Mercury and UV free

IESNA LM-79 & LM-80 Testing:
RAB LED luminaires have been tested by an independent laboratory in accordance with IESNA LM-79 and LM-80, and have received the Department of Energy "Lighting Facts" label.

FFLED®

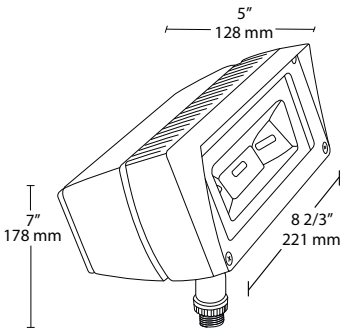
RAB's warranty is subject to all terms and conditions found at rablighting.com/warranty

- Replace 35W to 250W metal halide floods
- Available in 18W, 26W, 39W, 52W and 80W
- NEMA Type 7x6 beam spread (4x4 or 5x5 distributions also available*)
- Ultra efficient: up to 112 lumens per Watt
- Swivel arm, trunnion mount and slipfitter mount options*
- 100,000-Hour LED lifespan

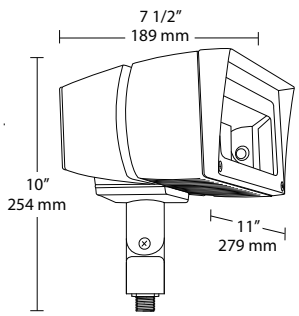
Three mounting options: standard swivel arm, trunnion or slipfitter.*

Three NEMA Types: 7x6, 5x5 and 4x4 for various beam spreads.*

Patent-pending Air-Flow fins keep FFLEDs running cool.



The FFLED family is ultra efficient, performing at up to 112 lm/W.



**Not available for 18W models.*

Dimming: 18, 26, 39, 52 and 80W: Available as On/Off or with 0-10V dimming.

Cold Weather Starting: The minimum starting temperature is -40°C.

Thermal Management: Superior heat sinking with external Air-Flow fins

Housing: Die-cast aluminum housing, lens frame and mounting arm

Reflector: 18W: Semi-specular anodized aluminum, **26, 39, 52 and 80W:** specular polycarbonate.

NEMA Type: Standard 7H x 6V. 5H x 5V and 4H x 4V available for 26, 39, 52 and 80W models.

Mounting: Heavy-duty mounting arm with "O" ring seal & stainless steel screws. Trunnion and slipfitter mounts also available for 26, 39, 52 and 80W models.

Gaskets: High-temperature silicone gaskets

Finish: Our environmentally friendly polyester powder coatings are formulated for high-durability and long-lasting color, and contain no VOC or toxic heavy metals.

Color Stability: LED color temperature warrantied not to shift more than 200K in CCT in 5 years

Color Uniformity: RAB's range of CCT (Correlated Color Temperature) follows the guidelines of the American National Standard for Specifications for the Chromaticity of Solid State Lighting (SSL) Products, ANSI C78.377-2015.

Green Technology: Mercury and UV free, and RoHS compliant. Polyester powder coat finish formulated without the use of VOC or toxic heavy metals.

IESNA LM-79 & LM-80 Testing: RAB LED luminaires have been tested in accordance with IESNA LM-79 and LM-80, and have received the Department of Energy "Lighting Facts" label.

California Title 24: FFLED18 and FFLED26 equipped with a photocell comply with 2013 California Title 24 building and electrical codes as commercial outdoor non-pole-mounted fixtures <30 Watts. FFLED39, FFLED52 and FFLED80 equipped with a 0-10V driver comply with 2013 California Title 24 building and electrical codes as commercial outdoor non-pole-mounted fixtures >30 Watts mounted up to 24 feet when used with the RAB Stealth Dimmer. Use catalog code STLDIM10 to order a Stealth Dimmer module.

** Values shown for 7H x 6V NEMA Type only. Visit rabweb.com for 5H x 5V and 4H x 4V performance.*

Introduction

The The OFL Size 2 Floodlight delivers up to 16,900 lumens, with a robust design and several mounting options making it perfect for light commercial applications. It's the ideal long-life replacement for 250-400W metal halide floods, with typical energy savings up to 62% and expected service life of over 50,000 hours.

Accessories

Ordered and shipped separately.

OFL2WG	Wire Guard Accessory
DSXF1/2TS DDBXD U	Slipfitter for 1-1/4" to 2-3/8" OD tenons; mates with 1/2" threaded knuckle (specify finish)
FTS CG6 DDBXD U	Slipfitter for 2-3/8" to 2-7/8" OD tenons; mates with yoke mount (specify finish)

NOTES

1 MVOLT driver operates on any line voltage from 120-277V (50/60Hz).

FEATURES & SPECIFICATIONS

INTENDED USE
The traditional and robust design of the OFL2 LED floodlight with energy efficient LEDs, is suitable for replacing up to 400W Metal Halide. It is ideal for landscape, signage, and accent lighting in heavy commercial and residential applications.

CONSTRUCTION
Die-cast aluminum housing has integral heat sink fins to optimize thermal management through conductive and convective cooling. The LED driver is mounted in direct contact with the casting to promote low operating temperature and long life. Housing is completely sealed against moisture and environmental contaminants (IP65). Low EPA (0.7 ft²) for optimized wind loading.

FINISH
Exterior parts are protected by a zinc-infused Super Durable TGIC thermoset powder coat finish that provides superior resistance to corrosion and weathering.

ELECTRICAL
Light engine(s) consist of chip-on-board (COB) LEDs directly coupled to the housing to maximize heat dissipation and promote long life (50,000 hrs).

INSTALLATION
Integral slipfitter or yoke facilitates quick and easy installation to a variety of mounting accessories.

LISTINGS
UL certified to U.S. and Canadian standards. Luminaire is IP65 rated. Rated for -40°C minimum ambient.
DesignLights Consortium® (DLC) qualified product. Not all versions of this product may be DLC qualified. Please check the DLC Qualified Products List at www.designlights.org/QPL to confirm which versions are qualified.

WARRANTY
5-year limited warranty. Complete warranty terms located at: www.acuitybrands.com/CustomerResources/Terms_and_conditions.aspx.

Note: Actual performance may differ as a result of end-user environment and application. All values are design or typical values, measured under laboratory conditions at 25 °C. Specifications subject to change without notice.

Performance Data

Lumen Output

Lumen values are from photometric tests performed in accordance with IESNA LM-79-08. Data is considered to be representative of the configurations shown, within the tolerances allowed by Lighting Facts. Contact factory for performance data on any configurations not shown here.

Performance Package	System Watts	Dist. Type	Field Angle		Beam Angle		40K		50K	
			°H	°V	°H	°V	Lumens	LPW	Lumens	LPW
P2	114W	WFL	106	106	71	72	12,281	108	12,154	107
P3	151W	WFL	106	106	71	72	16,902	112	16,261	107

Lumen Ambient Temperature (LAT) Multipliers

Use these factors to determine relative lumen output for average ambient temperatures from 0-40°C (32-104°F).

Ambient		Lumen Multiplier
0°C	32°F	1.06
10°C	50°F	1.03
20°C	68°F	1.01
25°C	**77°F**	**1.00**
30°C	86°F	0.99
40°C	104°F	0.97

Projected LED Lumen Maintenance

Data references the extrapolated performance projections for the **OFL Flood Size 2** platform based on 9000 hours of LED testing (tested per IESNA LM-80-08 and projected per IESNA TM-21-11).

To calculate LLF, use the lumen maintenance factor that corresponds to the desired number of operating hours below. For other lumen maintenance values, contact factory.

Operating Hours	0	25,000	50,000
Lumen Maintenance Factor	1	0.96	0.94

Electrical Load

Light Engines	System Watts	Current (A)				
		120V	208V	240V	277V	347V
1	114W	0.97	0.56	0.49	0.42	0.34
2	151W	1.29	0.75	0.65	0.57	0.45

Replace old canopy fixtures with low-profile, energy-saving LED.

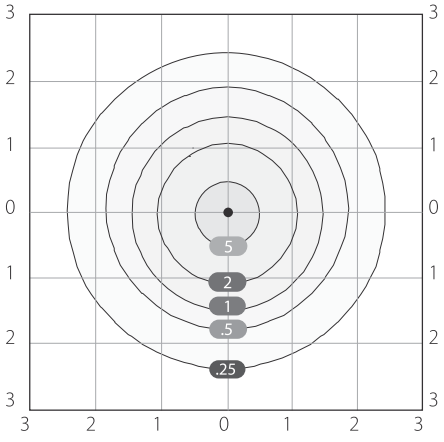
VANLED®

RAB | Outdoor

RABLIGHTING.COM • 888-722-1000

Vandal-resistant canopy light

- 6 power packages with a replacement range of 50W to 200W
- Low-profile design covers traditional canopy footprints
- Ultra-high efficiency up to 150 lm/W
- Available with flat lens or drop lens
- Replace surface or recess-mounted fixtures
- Durable polycarbonate lens is vandal and UV resistant
- IP66 rated against dust and water ingress
- 100,000-Hour LED lifespan



Visit rablighting.com to see which models are DLC listed.

RAB's warranty is subject to all terms and conditions found at rablighting.com/warranty

Dimming: On/off driver or 0-10V dimming available for 20, 40 and 52W models

Cold Weather Starting: The minimum starting temperature is -40°C.

Housing: Die-cast aluminum housing and lens frame with (4) 1/2" NPS side conduit entries and weatherproof rear wire plug and access plate

Reflector: Semi-specular, vacuum-metalized polycarbonate

Lens: Vandal-resistant polycarbonate textured opaque for low glare; frosted models available.

Mounting: Ceiling mount to recessed junction with knockout template or directly to ceiling surface, utilizing side conduit entry points.

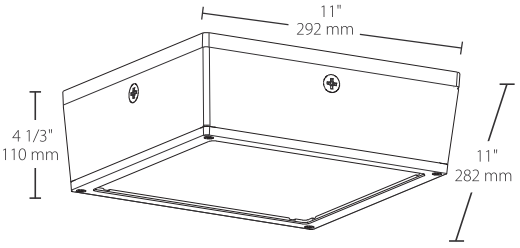
Gaskets: High-temperature silicone gaskets

Finish: Our environmentally friendly polyester powder coatings are formulated for high-durability and long-lasting color, and contain no VOC or toxic heavy metals.

Color Stability: LED color temperature warrantied not to shift more than 200K in CCT in 5 years

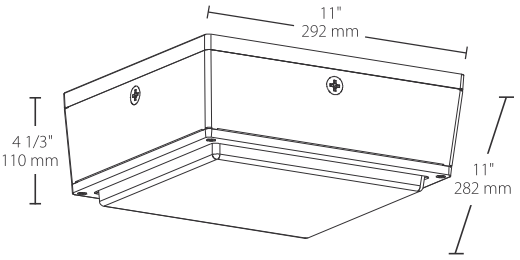
Color Uniformity: RAB's range of CCT (Correlated Color Temperature) follows the guidelines of the American National Standard for Specifications for the Chromaticity of Solid State Lighting (SSL) Products, ANSI C78.377-2017.

Green Technology: Mercury and UV free. RoHS-compliant components.



IESNA LM-79 & LM-80 Testing: RAB LED luminaires have been tested by an independent laboratory in accordance with IESNA LM-79 and LM-80, and have received the Department of Energy "Lighting Facts" label.

California Title 24: 10 and 20 Watt VANLED models equipped with a swivel photocell or mini-sensor comply with 2013 California Title 24 building and electrical codes as a commercial outdoor non-pole-mounted fixture <30 Watts.



** Values shown for 5000K temperature only, with a clear drop lens. Visit rablighting.com for 4000K and 3000K performance, as well as other lenses.*

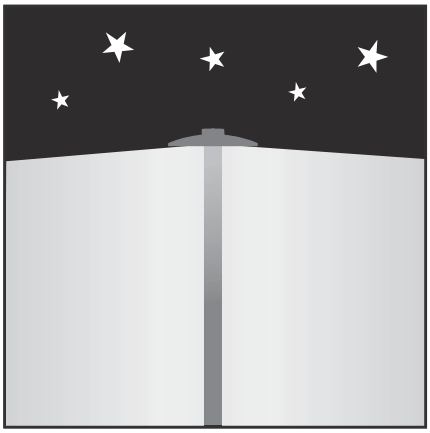
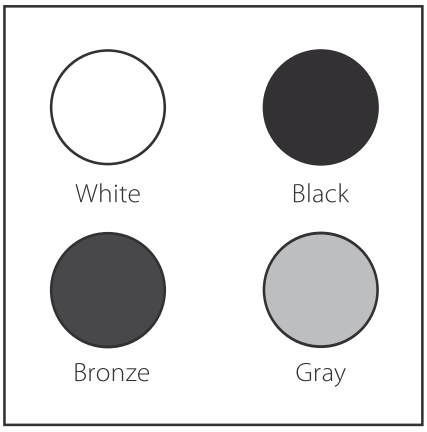
VANLED Canopy Light



Low profile, low glare.
Edge-lit technology unlike any other.
IVELOT™
RAB® | Outdoor

IVELOT™

- Available in 4,500lm (38W), 7,500lm (67W), 10,000lm (94W) and 13,000lm (117W) models
- Offered with 3 mounting options: universal pole adapter, wall or slipfitter
- Type II, III, IV, VS and Forward Throw distributions
- 0-10V Dimming, standard
- Motion sensor, photocell and Lightcloud® Controller options available
- 100,000-Hour LED lifespan



RAB's warranty is subject to all terms and conditions found at rablighting.com/warranty.

The IVELOT is a complete cutoff, fully shielded area light that minimizes glare, while reducing light trespass.

IVELOT offers several mounting options to support a variety of applications. *(Universal Pole Adapter shown)*

Available in four color finishes: bronze, black, white and gray. *(gray has no texture)*

Available with Lightcloud Controller.

Lightweight, low-profile design, and a low EPA help reduce the load on a pole.

Available with an optional, integrated motion sensor or photocell.

Specifications

UL:
Suitable for wet locations

LEDs:
Long-life, high-efficiency, micro-power, surface-mount LEDs

Drivers(s):
Class 2, 50/60Hz. 120 - 277V, 347-480V, 4kV standard, 10kV optional surge protection

Dimming Driver:
Driver includes dimming control wiring for 0-10V dimming systems. Requires separate 0-10V DC dimming circuit. Dims as low as 10%.

Lifespan:
100,000-hour LED lifespan based on IES LM-80 results & TM-21 calculations at 25°C

IP Rating:
Ingress Protection rating of IP66 for dust and water

Color Weather Starting:
Minimum starting temperature is -40°C (-40°F)

Maximum Ambient Temperature:
Suitable for use in 40°C (104°F) temperatures

Housing:
Die-cast aluminum housing

Mounting:
Universal pole adapter, slipfitter or wall mount options available

Lens:
Diffused Polymethyl Methacrylate (PMMA)

Vibration Rating:
3G vibration tested per ANSI C136.31

Effective Projected Area:
EPA = 0.61

Color Stability:
LED color temperature is warrantied to shift no more than 200K in CCT over a 5-year period

Color Uniformity:
RAB's range of CCT (Correlated Color Temperature) follows the guidelines of the American National Standard for Specifications for the Chromaticity of Solid State Lighting (SSL) Products, ANSI C78.377-2017.

Title 24 Compliant:
An IVELOT edge-lit area light can be used with a motion sensor or photocell control option to comply with 2016 Title 24 Part 6 Section 130.2 (a,b,c).

Finish:
Formulated for high durability and long-lasting color

Green Technology:
Mercury and UV free. RoHS-compliant components

IESNA LM-79 Testing:
RAB LED luminaires have been tested by an independent laboratory in accordance with IESNA LM-79

FEATURES & SPECIFICATIONS

INTENDED USE — Suitable for applications requiring both exit sign and unit equipment. Attractive, 8" tall, streamlined design is great for above-the-door applications and other tight fits. Optional high-output version with remote lamps are ideal for emergency egress lighting. **Certain airborne contaminants can diminish integrity of acrylic and/or polycarbonate.** **Click here for Acrylic- Polycarbonate Compatibility table for suitable uses.**

CONSTRUCTION — Engineering-grade thermoplastic housing is impact-resistant, scratch-resistant and corrosion-proof. UL94V-0 flame rating. UV-stable resin resists discoloration from natural and man-made light sources.

Rugged unibody housing snaps together with no additional fasteners. Faceplate and back cover are interchangeable on housing. Positive snap-fit tabs hold faceplate securely, yet are easily removable for lamp compartment access. Universal, directional chevron inserts are easily removed and reinserted.

Uniform graphics illumination without shadows or hot spots. Letters are 6" high with 3/4" stroke, with 100 ft. viewing distance rating based upon UL924 standard.

LEDs mounted on primary circuit boards for sign illumination. Low-energy LED lamp in sign operates in normal (AC input) and emergency (DC input) modes.

Low-profile, integrated test switch/pilot light. Easily viewed bright red status indicator.

Unique track-and-swivel arrangement permits full range of direction of lamp head adjustment. Universal J-box mounting pattern. Tool-less access for maintenance. Conduit entry position on top of unit.

U.S. Patent No. 6,848,798; 6,499,866; 6,142,648; 5,797,673; D379,373; 5,526,251; D484,272; D473,672; 5,611,163; 5,646,502.

OPTICS — Twin LED lamp heads operate in emergency (DC input) mode with 12 series-parallel white LEDs in each head. Provides redundant light sources to ensure emergency lighting performance. The typical life of the exit LED lamp is 10 years.

ELECTRICAL — Dual-voltage input capability (120/277V). Edge connector on printed circuit board ensures long-term durability.

Current-limiting charger maximizes battery life and minimizes energy consumption. Provides low operating costs.

Short-circuit protection — current-limiting charger circuitry protects printed circuit board from shorts.

Thermal compensation adjusts charger output to provide optimum charge voltage relative to ambient temperature.

Regulated charge voltage maintains constant-charge voltage over a wide range of line voltages. Prevents over/undercharging that shortens battery life and reduces capacity.

Filtered charger input minimizes charge voltage ripple and extends battery life.

AC/LVD reset allows battery connection before AC power is applied and prevents battery damage from deep discharge.

Single multi-color LED indicator to display two-state charging, test activation and three-state diagnostic test. Test switch provides manual activation of 30-second diagnostic testing for on-demand visual inspection. Self-diagnostic testing for 30 seconds every 30 days, 30 minutes at 180-day interval, and 90 minutes annually. Diagnostic evaluation of LED light source, AC-to-DC transfer, charging and battery condition.

Battery: Sealed, maintenance-free nickel-cadmium battery delivers 90-minute capacity to emergency lamps. Two-state contstant-current charge maximizes battery life and automatically recharges after battery discharge. Low-voltage disconnect prevents excessively deep discharge that can permanently damage the battery. Optional high-output battery to power both local and optional LED remote lamp heads simultaneously.

INSTALLATION — Top, end or back mounting. Housing snaps to canopy with positive-locking tabs. Cam locking pin secures housing to canopy.

Easily removed mounting knockouts. Conduit entry knockout for 1/2" flexible conduit. J-box pattern on back panel.

LISTINGS — UL damp location listed standard 50°-104°F (10°-40°C). Meets UL 924, NFPA 101 (current Life Safety Code), NEC and OSHA illumination standards.

WARRANTY — 5-year limited warranty. (Battery is prorated). Complete warranty terms located at www.AcuityBrands.com/CustomerResources/Terms_and_Conditions.aspx.

Note: Actual performance may differ as a result of end-user environment and application.

All values are design or typical values, measured under laboratory conditions at 25 °C.

Specifications subject to change without notice.

ORDERING INFORMATION

Specification Sheet: G2 Line-Voltage LED Battery Backup Kit

The LED Battery-Backup Solution

When your power goes out, Revolution Lighting's G2 Line-Voltage LED Battery Backup Kit is the ideal accessory to have. The kit is UL-listed as field-installable, rated for damp locations, and complies with UL-924 emergency-lighting standards. Designed with single-end-power LED tube lights in mind, the battery backup also can power any 120VAC line-voltage LED lighting system up to 25W at full power for 90 minutes or more during an outage. * And when the power is on, the battery draws only 8W max from any 120-277VAC supply circuit while charging. **

This lithium-ion-powered battery backup is surface-mounted, completely enclosed, and includes mounting hardware, 18 in. of ½-in. flexible conduit, wire nuts, and a manual test switch.

* Caution: Do not power any lighting system over 25W or the battery could overheat and be damaged. Not for use with higher-wattage LED high bays, wall packs, etc.

** Note: Not for use with fixtures controlled by Triac dimmers.

GENERAL SPECIFICATIONS

- 120-277VAC input charging voltage
- 170VDC output voltage (compatible with 120VAC LED driver inputs
- 25W power output
- At least 90 minutes of backup time at rated wattages
- 8W max power draw when charging

PRODUCT BENEFITS

- UL Listed for field installation
- Universal line input voltage (120-277VAC)
- Perfect battery backup for UL Type-B line-voltage LEDs up to 25W max
- Provides full-power backup up to 25W for 90 minutes or more
- Works with any Revolution Lighting product requiring 120VAC line voltage (25W max)
- Long-life Li-ion battery in surface-mounted housing with flexible metal conduit
- Damp-location-rated

WARRANTY

5 YEAR WARRANTY

Our Industry-Leading 5-Year Limited Warranty Guarantees Unsurpassed Quality

Specification Sheet: G2 Line-Voltage LED Battery Backup Kit

WIRING DIAGRAM

WIRING NOTES:

(1.) Do not mate connector until physical installation is complete.

(2.) Do not apply AC power until connector is mated.

(3.) Test accessory leads, observe proper wiring polarity.

(4.) Wall switch controls on and off of the AC driver when the supplied voltage is normal.

(5.) Caution: Do not install this backup kit on any fixture that draws more than 25W.

(6.) Not for use with Triac-dimmed fixtures.

Model #:

K4500

Shorting Cap, Locking-Type Mounting

The K4500 Shorting Cap features 3-prong locking-type plug connector. It is used with luminaries with a photocontrol receptacle to complete circuit when a photocontrol is not required.

Features

- Designed to meet environmental protection requirements in ANSI C136.10.
- Complete circuit to provide direct connection to luminarie when no photocontrol is connected.

K4500

Ratings

Size:	3" (7.6 cm) High, 3" (7.6 cm) Diameter
Color:	Milky White with Black Imprints
Material:	UV Stabilized Polypropelyne Cap Black Polypropelyne Base Neoprene Blend Gasket Solid Brass Contacts
Electrical Rating:	15 A, 120-488 V
Environmental:	Meets ANSI C136-10 Environmental Requirements
Regulatory Listings:	UL/CSA Listed ANSI C136-10 Compliant
Warranty:	Limited 2-year Manufacturer's Warranty

K4500

Specification

The locking type, shorting plug shall install on a ANSI C136-10 NEMA style 3-pin receptacle to connect load pins to bypass local photocell control. Shorting plug shall have a rating of 15A at 105-488 VAC. The shorting plug shall be constructed with UV stabilized polypropelyne cap, black polypropelyne base and neoprene blended gasket. The shorting plug shall be agency certified and tested accordingly. The shorting plug shall meet all environmental and electrical requirements of ANSI C136.10. The shorting plug shall have a manufactures limited warranty of 2 years minimum. The shorting plug shall be Intermatic model K4500.

Locking-Type Mounting, Thermal Type — K4500 Series

Easy to install; just plug in and twist. This series is equipped with standard 3-prong NEMA locking-type plug connections. Incorporates K4000 style thermal switch for reliable long life performance. Complies with ANSI C136.10.

Size – 3-3/4" (9.5 cm) High, 3" (7.6 cm) Diameter.

Insulation Type:

A. Type A: Knauf 1000° Pipe Insulation, ASTM C547, Class 1, k value of 0.23 at 75 degrees F, with All Service Jacketing (ASJ) or equal.

Fittings:

All fittings with Type A Pipe Insulation will be Proto Fitting Covers manufactured from 20-mil thick high-impact, ultra-violet-resistant PVC, or equal.

Jacket:

All type A Pipe insulation includes a Foil and Paper Jacket: Laminated glass-fiber-reinforced, flame retardant kraft paper and aluminum foil – white exterior, Kraft reinforce foil vapor barrier with self-sealing adhesive joints.

Accessories:

All Type A Pipe Insulation terminations will be neatly finished with Childers Vi-Cryl CP-11 Mastic, or equal.

B. Type B: Removable insulation jackets

Insulation:

- High-temperature needled insulation blanket with no binder
- Insulation Moisture Sorption < 3% by weight per ASTM C1104.
- Maximum Use Temperature 1100°F (593°C) per ASTM C411
- Needled Fiber Glass mat, 1" @ 5.0 LB/CF.
- K value .21 @ 75F mean, .42 @ 500F mean.
- Compliance:
  1) ASTM C665 – corrosion resistance
  2) ASTM C553 Type V
  3) ASTM C795
  4) NRC 1.36

Construction:

1. Double sewn lock stitch with a minimum 4 to 6 stitches per inch. Jackets shall be sewn with two (2) parallel rows of stitching using Teflon Coated Fiberglass Thread. The thread must be able to withstand the skin temperatures without degradation.

2. No raw cut jacket edges shall be exposed.

3. Jackets shall be fastened using hook and loop (Velcro) straps and 1” Slide Buckles.

4. All stitching will be done with Teflon Coated Fiberglass Thread.

5. Provide a permanently attached Aluminum or stainless-steel nameplate on each jacket to identify its location, size and tag number.

6. The insulation shall be designed to minimize the convection current in the space between the hot metal surface and the inner layer of insulation. To this end, during jacket fabrication, the layers of insulating mat shall be placed in an overlapping pattern.

7. All jacket pieces which match mating seams must include an extended 2" flap constructed from the exterior fabric and shall be secured using hook & loop closure (i.e. Velcro ^{TM}) parallel to the seam.

8. Insulation must be sewn as integral part of the jacket to prevent shifting of the insulation. Insulation pins are not an allowable method of preventing the insulation from shifting and will not be used.

EQUIPMENT INSULATION

Equipment	Insulation Type	Insulation Thickness
Interior Exposed Above Ambient Temperature Heat Exchangers, Equipment, Tanks, Condensate Receivers	Fiberglass/ w ASJ Jacketing	2”

Insulation Type:

A. Type A: Knauf Fiberglass, Kwikflex Pipe & Tank Insulation, ASTM C 1393, Types I, II, IIIA, IIIB Category 2, ASTM, flame spread rating is <25 and smoke developed rating is <50 as tested by ASTM E84, k value of 0.24 at 75 degrees F, with All Service Jacketing, or equal.

1000° Pipe Insulation

Submittal Date _____

Description

Knauf 1000° Pipe Insulation is a molded, heavy-density, one-piece insulation made from inorganic glass fibers bonded with a thermosetting resin. It is produced in 3' lengths with or without a factory-applied jacket. The jacket is a white-kraft paper bonded to aluminum foil and reinforced with glass fibers, and the longitudinal lap of the jacket is available with or without a self-sealing adhesive. A butt strip is furnished for each section.

Application

Knauf 1000° Pipe Insulation is used in power, process and industrial applications and in commercial and institutional buildings where maximum fire safety, resistance to physical abuse and a finished appearance are desired. Additional weather protection is needed outdoors.

Features & Benefits

Energy Conservation

- Offers excellent resistance to heat loss or gain, which saves energy and lowers operating costs.
- A low thermal conductivity of .23 at 75°F (24°C).

Low-Cost Installation

- Available with a self-sealing lap, which eliminates need for staples, additional material and tools.
- Fast, easy installation reduces labor costs.

Condensation Control

- Installed properly, the foil vapor retarder and pressure-sensitive lap assure a positive vapor seal.

UL Classified

- All Knauf 1000° Pipe Insulation, plain or jacketed, meets the fire and smoke safety requirements of most federal, state and local building codes.

Easy Size Identification

- Pipe size, wall thickness and Proto 25/50 Rated PVC fitting cover size are printed in a repeat pattern along the longitudinal lap.
- Easy identification at job site.
- Simplifies restocking.
- After application, print is covered by the lap for a neat appearance.

Specification Compliance

In U.S.:

- ASTM C 547; Type I
- ASTM C 585
- ASTM C 795
- ASTM C 1136 (jackets); Type I, II, III, IV
- HH-B-100B (jackets); Type I and II
- HH-I-558C; Form D, Type III, Class 12; Class 13 (to 1000°F, 538°C)
- GREENGUARD Certification
- GREENGUARD For Children & Schools™ Certification
- MEA 325-83-M (City of New York Dept. of Buildings)
- MIL-I-22344D
- MIL-I-24244C (ships)
- NFPA 90A and 90B
- NRC Reg. Guide 1.36
- USCG 164.109/4/0 (plain, unjacketed only)

In Canada:

- CAN/ULC S102-M88
- CCG F1-304 (plain only)
- CGSB 51-GP-9M
- CGSB 51-GP-52M (jacket)

Technical Data

Surface Burning Characteristics

- UL Classified.
- Does not exceed 25 Flame Spread, 50 Smoke Developed when tested in accordance with ASTM E 84, CAN/ULC S102-M88, NFPA 255 and UL 723.

Temperature Range

- Pipe operating temperatures from 0°F to 1000°F (-18°C to 538°C).

Water Vapor Transmission (ASTM E 96, Procedure A)

- Jacket has a water vapor permeance of .02 perms or less.

Corrosiveness (ASTM C 665)

- No greater than sterile cotton.

Stress Corrosion

- Complies with ASTM C 795, MIL-I-24244C and NRC 1.36.

Puncture Resistance (TAPPI Test T803) (Beach Units)

- Jacket minimum rating of 50 units.

Alkalinity (ASTM C 871)

- Less than 0.6% as Na_2O.
- pH between 7.5 and 10.0.

Microbial Growth (ASTM C 1338)

- Does not promote microbial growth.

Water Vapor Sorption (ASTM C 1104)

- Less than 0.2% by volume.

Linear Shrinkage (ASTM C 356)

- Negligible.

Product Forms and Sizes

Produced in 3' (914 mm) sections:

- For iron pipe from ½" to 24" nominal pipe size (15 mm to 610 mm).
- For copper tube from ⅝" to 6⅛" (16 mm to 156 mm).
- Wall thicknesses from ½" to 6" (13 mm to 152 mm) in single layer (for most sizes).
- All insulation inner and outer diameters comply with ASTM C 585.

Packaging

- Four convenient carton sizes for easy ordering, inventory tracking and storage.
- Reinforced carton handles for strength and easy lifting.
- Bar-coded cartons for accurate shipments and tracking.
- Full product range stocked at distributors for fast availability.

Precautions

Hot Pipe

- May be installed while the system is in operation, at all temperatures up to 1000°F (538°C).
- Knauf recommends, for insulation thickness greater than 6" (152 mm), the temperature must be increased from 500°F (260°C) to maximum temperature at a rate not exceeding 100°F (56°C) per hour.
- During initial heat-up to operating temperatures above 350°F (177°C), a slight odor and some smoke may be given off as a portion of the bonding material used in the insulation begins to undergo a controlled decomposition.
- If natural convection is not adequate in confined areas, forced ventilation should be provided in order to protect against any harmful fumes and vapors that might be generated.
- Care must also be taken when using sealants, solvents or flammable adhesive during installation.
- A maximum of 6" (152 mm) wall thickness is recommended.

Cold Pipe

- Use a continuous vapor retarder on piping operating below ambient temperatures.
- Seal all joints, surfaces, seams and fittings to prevent condensation.
- On below freezing applications and, in high abuse areas, the ASJ jacket shall be protected with a PVC vapor retarding outer jacket. In addition, exposed ends of insulation shall be sealed with vapor barrier mastic installed per the mastic manufacturer's instructions. Vapor seals at the butt joint shall be applied at every fourth pipe section joint and at each fitting to isolate any water incursion.
- On chilled water systems operating in high humidity conditions, it is recommended that the same guide lines be followed as listed above for below freezing applications.
- Exterior hanger supports are r ecommended.

Outside Application

- Do not expose pipe insulation to weather. It must be covered with appropriate jacketing, mastic or vapor retardant adhesives.
- All exposed surfaces must be protected. Proto® Indoor/Outdoor PVC Jacketing is recommended. See Knauf Guide Specifications for recommended PVC jacketing application guidelines.
- Apply jacketing, mastics or vapor retardant adhesives per manufacturer's instructions. For metallic jackets, factory-applied condensate barriers are recommended.

ASJ-SSL

- Keep adhesive and contact surfaces free from dirt and water, and seal immediately once adhesive is exposed.
- Apply when ambient and insulation temperatures are between 0°F and 130°F (-18°C and 54°C).
- If stored below 0°F or above 130°F, allow insulation cartons to stand within recommended temperature range for 24 hours prior to application.
- Do not store product below -20°F (-29°C) or above 150°F (66°C).
- When using Knauf's SSL closure system, make sure the longitudinal and circumferential joints are properly sealed by rubbing the closure firmly with a squeegee. Use of staples is not recommended.
- When using Knauf SSL Pipe Insulation, the surface temperature of the insulation should be between -20°F and 150°F (-29°C and 66°C) during the life of the insulation.

Fittings and Hangers

- Use Proto 25/50 Rated (ASTM E 84) PVC Fitting Covers, applying PVC fittings per Proto's Data Sheet.
- Fittings should be insulated to same thickness as the adjoining insulation.
- Apply fittings per manufacturer's instructions.
- When required by specification, a hard insert of sufficient length should be used to avoid compression of the insulation.

1000° Pipe Insulation

Submittal Date _____

Additional Precautions

- Fiber glass may cause temporary skin irritation. Wear long-sleeved, loose-fitting clothing, head covering, gloves and eye protection when handling and applying material.
- Wash with soap and warm water after handling.
- Wash work clothes separately and rinse washer.
- Use a disposable mask/respirator designed for nuisance-type dusts where sensitivity to dust and airborne particles may cause irritation to the nose or throat.

Application Guidelines

Storage

- Protect insulation from water damage or other abuse, welding sparks and open flame.
- Cartons are not designed for outside storage.

Preparation

- Apply only on clean, dry surfaces.
- Pipe or vessel should be tested and released before insulation is applied.

General Guidelines

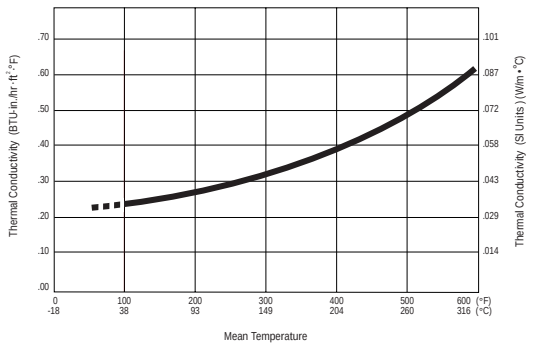
- All sections should be firmly butted.
- Seal circumferential joint with a minimum 3" (76 mm) wide butt strip.
- Jackets, coating and adhesives should have a comparable F.H.C. rating.
- Factory-applied jacket can be painted with latex or water-based paint. Solvent-based paints should not be used.
- Do not expose factory-applied jacket to chemicals or liquid water.
- All piping should have continuous insulation.
- Position longitudinal lap downward to avoid dirt and moisture infiltration.
- Do not expose pipe insulation to excessive vibration or physical abuse.
- Faced insulation should not have a facing temperature above 150°F (66°C).

Recommended Thicknesses

ASHRAE 90.1-1989

The minimum thicknesses are based on ASHRAE 90.1-1989 standards and do not necessarily represent the Economic Thickness of Insulation or the thickness required for proper condensation control. Rather, they serve as minimum recommendations for commercial applications. For recommended Economic Thickness, install according to Knauf or NAIMA 3E Plus programs or as specified.

Fiber Glass and Mold



Fiber glass insulation will not sustain mold growth. However, mold can grow on almost any material when it becomes wet and contaminated with organic materials. Carefully inspect any insulation that has been exposed to water. If it shows any sign of mold it must be discarded. If the material is wet but shows no evidence of mold, it should be dried rapidly and thoroughly. If it shows signs of facing degradation from wetting, it should be replaced.

Notes

The chemical and physical properties of Knauf 1000° Pipe Insulation represent typical average values determined in accordance with accepted test methods. The data is subject to normal manufacturing variations. The data is supplied as a technical service and is subject to change without notice. References to numerical flame spread ratings are not intended to reflect hazards presented by these or any other materials under actual fire conditions.

KNAUF INSULATION
it's time to save energy

Knauf Data Sheet | PE-DS-15e 12-09

KwikFlex™ Pipe & Tank Insulation

with ECOSE® Technology

with ECOSE® TECHNOLOGY

- Knauf KwikFlex offers a unique combination of flexibility and compressive strength in a roll form.

- Tough and durable, yet easy to handle and fabricate.

- Can be used for any curved or irregular surfaces that require the finished characteristics of rigid fiber glass insulation.

- KwikFlex has excellent thermal properties, with temperature rating to 850°F (454°C).

- Wraps tightly around curved and spiral surfaces, making installation quick.

Facts at a glance

- Covers any curved or irregular surface
- No need to stock multiple sizes
- Excellent compressive strength
- Great flexibility provides easier installation
- Low thermal conductivity
- Easy to handle and fabricate

KwikFlex™ Pipe & Tank Insulation *with ECOSE® Technology*

Description

Knauf KwikFlex Pipe and Tank Insulation with ECOSE Technology is a 48" wide semi-rigid fiber glass blanket, 2.5 pcf density, in roll form. It is available plain or faced with a factory-applied ASJ, FSK or PSK vapor retarder jacket. The fiber orientation provides excellent compressive strength while maintaining flexibility for ease of installation.

ECOSE Technology

ECOSE Technology is a revolutionary new binder based on rapidly renewable bio-based materials rather than non-renewable petroleum-based chemicals such as phenol, formaldehyde or acrylics. ECOSE Technology reduces Knauf binder embodied energy and contains no phenol, formaldehyde, acrylics or artificial colors found in traditional fiber glass insulation.

Application

Knauf KwikFlex Pipe and Tank Insulation with ECOSE Technology is typically used on tanks, vessels and large-diameter (greater than 10") pipes. It can be used for any curved or irregular surfaces that require finished characteristics of rigid fiber glass insulation.

Features and Benefits

Excellent Thermal Properties

- Temperature rating to 850°F (454°C).

Low-Cost Installation

- Flexible.
- Easy to handle and fabricate.

Inventory Savings

- No need to stock multiple sizes.
- Various thicknesses available to meet all your pipe and tank insulation needs.

Resists Damage

- Tough and durable.
- Resists damage in shipment and during and after installation.

Resists Microbial Growth

- Does not promote the growth of fungi or bacteria.
- Will not rot.
- Will not sustain vermin.

Corrosiveness (ASTM C 665)

- Does not accelerate corrosion on steel, copper or aluminum.

Corrosion (ASTM C 1617)

- The corrosion rate in mils/yr will not exceed that of the 1 ppm chloride solution.

Specification Compliance

- UL/ULC Classified (FSK, ASJ)
- ASTM C 1393
  Types I, II, IIIA, IIIB Category 2

Technical Data

Temperature Range (ASTM C 411)

- Operating temperature to 850°F (454°C).

Compressive Strength (ASTM C 165)

- Not less than 25 PSF (1.2 kPa) at 10% deformation.

Water Vapor Transmission (ASTM E 96, Procedure A)

- FSK, ASJ and PSK vapor retarders have a maximum rate of .02 perms.

Puncture Resistance (TAPPI Test T803) (Beach Units)

- FSK and PSK facings: 25
- ASJ facing: 50

Surface Burning Characteristics

- UL/ULC Classified (FSK, ASJ)
- Does not exceed 25 Flame Spread, 50 Smoke Developed when tested according to ASTM E 84 and UL 723.

Linear Shrinkage (ASTM C 356)

- Negligible.

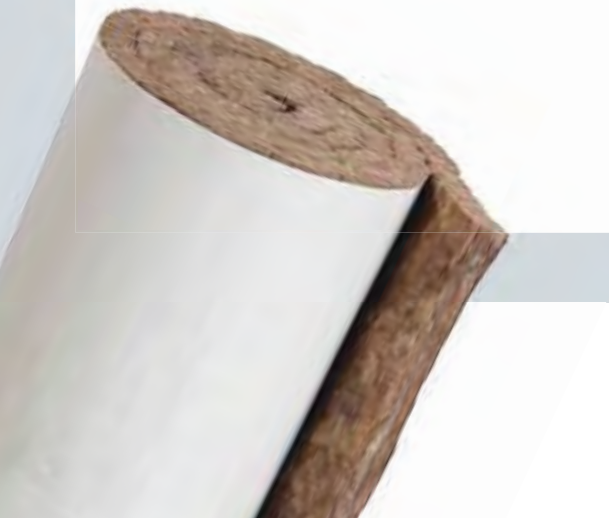
Application & Specification Guidelines

Precautions

- ASJ, FSK and PSK jackets should not be used if outer-surface temperature exceeds 150°F (66°C).
- During initial heat-up to operating temperatures above 350°F (177°C), a slight odor and some smoke may be given off as a portion of the bonding material used in the insulation begins to undergo a controlled decomposition.
- If natural convection is not adequate in confined areas, forced ventilation should be provided in order to protect against any harmful fumes and vapors that might be generated.
- Care must also be taken when using sealants, solvents or flammable adhesive during installation.

Storage

- Protect stored insulation from water damage or other abuse.
- Protect from welding sparks and open flame.
- Packages are not designed for outside storage.



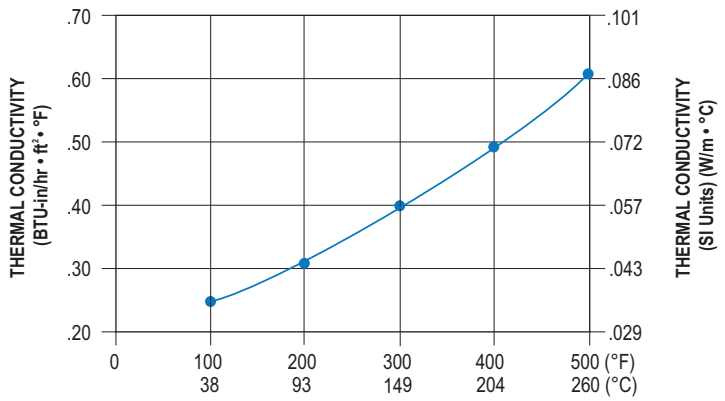
Preparation

- Apply Knauf KwikFlex Pipe and Tank Insulation on clean, dry surfaces.

Application

For easy installation of Knauf KwikFlex Pipe and Tank Insulation simply follow these guidelines.

- Refer to the Stretchout Chart to find the appropriate length to cut for the specific pipe size. Be sure to add an additional 2" (51 mm) to 4" (102 mm) for your staple flap.
- Cut your stretchout length and wrap the material around the iron pipe to ensure the proper fit.
- Staple the lap on 3" (76 mm) centers with outward clinching staples.
- Butt edges shall be firmly secured, and butt strips matching the jacket shall be applied at each joint.



Stretch-Outs*

Nominal Iron Pipe Size		Iron Pipe Outside Diameter		Thickness

400°F (204°C)	0.49	.070
500°F (260°C)	0.61	.088

Forms Available

Thickness	Width†	Length
1" (25 mm)	48" (1219 mm)	52' (15.85 m)
1½" (38 mm)		30' (9.14 m)
2" (51 mm)		26' (7.92 m)
2½" (64 mm)		21' (6.40 m)
3" (76 mm)		18' (5.48 m)

† Cut-to-length sizes also available.

Caution

Fiber glass may cause temporary skin irritation. Wear long-sleeved, loose-fitting clothing, head covering, gloves and eye protection when handling and applying material. Wash with soap and warm water after handling. Wash work clothes separately and rinse washer. A disposable mask designed for nuisance type dusts should be used where sensitivity to dust and airborne particles may cause irritation to the nose or throat.

Fiber Glass and Mold

Fiber glass insulation is not a food source for mold growth. However, mold can grow on almost any material when it becomes wet and contaminated. Carefully inspect any insulation that has been exposed to water. If it shows any sign of mold growth it must be discarded. If the material is wet but shows no evidence of mold, it should be dried rapidly and thoroughly. If it shows signs of facing degradation from wetting, it should be replaced.

PVC FITTING COVERS, PRE-MOLDED, INSULATED
WHITE GLOSS FINISH — INDOOR OUTDOOR GRADE

SUBMITTAL SHEET DOES NOT SUPERCEDE WRITTEN SPECIFICATIONS OR OWNER AGREEMENT.

DESCRIPTION

The Proto Fitting Cover System consists of one piece and two piece pre-molded high impact LoSMOKE® PVC fitting covers with fiberglass inserts and accessories, which include elbows, tee/valves, end caps, mechanical line couplings, specialty fittings, white and indoor color jacketing, Protop® Tank End Panels, tack fasteners, tapes and specialty items.

APPLICATIONS

The Proto Fitting Cover System is used to insulate mechanical piping systems at fitting locations and provide a PVC jacketing for straight run piping. Both give a quality appearance and have excellent durability.

FEATURES AND BENEFITS

25/50 Rated. All Proto PVC Fittings are made of LoSMOKE® grade PVC. Roll Jacketing is available in either 25/50 rated or regular PVC Grade (not 25/50 rated). The 25/50 products meet fire and smoke safety requirements of federal, state and local building codes.

Excellent Appearance. Bright high-gloss white coloring adds a distinct quality appearance to the system. The standard line of Proto Fitting Covers are made in LoSMOKE® PVC designed for indoor and outdoor use. Virtually all sizes pass 25/50 when made of LoSMOKE® PVC. Colored PVC is manufactured from a LoSMOKE® formula that is suitable for indoor use only.

Easy To Clean. Due to the smooth, high gloss finish on Proto PVC Fittings, the product cleans easily with soap and water. This makes the system ideal for food and drug facilities.

Low Cost Installation. Significant cost savings vs. conventional cement, molded sections, and mitered sections.

Fast and Easy. At fitting locations, wrap the fiberglass insert around the pipe fitting, apply the Proto PVC Fitting over the insert and tack or tape in place. Do not use tacks where a vapor retarder is applied.

Wide Temperature Range. May be used for mechanical piping systems operating from -20°F to +140°F surface temperature of insulation. Variety: LoSMOKE®, Indoor/Outdoor, Exod®, Exotuff®. Proto products are also available in LoSMOKE® Indoor colors. Exod® is CPVC, GOOD TO 225° F.

Long Lasting. Can be used more than once on retrofit projects, general maintenance.

Excellent Thermal Value. K value of .26 at 75°F (.037 W/m °C at 24°C) of fiberglass insert, mean temperature assures better thermal efficiency than conventional cement fittings.

Resistance To Fungi and Bacteria. (ASTM G 21, ASTM G 22) Does not promote growth of fungi or bacteria.

U.V. Resistant. Can be used on indoor or outdoor applications, for both (White) LoSMOKE® PVC and Regular PVC. Extra thick fitting covers should be used outdoors. (All Std. Proto Fitting covers are made of LoSMOKE® PVC.)

APPLICATION AND SPECIFICATION GUIDELINES

A. STORAGE

Protect cartons from water damage or other abuse. Proto Fitting Cover cartons are not designed for outside storage.

B. PREPARATION

Proto Fitting Covers should be applied on clean, dry surfaces.

C. APPLICATION

1. **General:** The matching fiberglass insert shall be wrapped completely around the metal fitting leaving no voids. Loose wrappings of twine is helpful in shaping difficult surfaces. The Proto Fitting Cover shall then be applied over the fitting and insert, and the throat secured by either tack fastening or taping.

2. **Cold Pipe:** Fitting systems below ambient temperature must have a continuous vapor retarder or vapor retardant mastic as specified by the engineer. When using Proto PVC Tape, a 2" (51mm) minimum downward overlap is recommended for optimum performance. Care should be taken not to stretch the last 2" (51mm) of Proto PVC Tape, to avoid stretching or creeping.

3. **Hot Pipe:** Insulate as per General Instructions given above. Due to PVC softening point at approximately 159°F (70.6°C), care should be taken to ensure sufficient insulation thicknesses are applied.

For hot piping which requires Pipe Insulation over 1 1/2" (38 mm) wall thickness, an extra fiberglass insert shall be applied for each additional inch of pipe insulation wall thickness. Proto recommends the surface temperature of the Pipe Insulation and PVC to be no higher than 125°F (52°C). To complete application of Proto PVC Fittings on hot piping, the throat seam shall be tack fastened or taped. Seal all laps outdoors and in wash down areas.

CAUTION: During initial heat-up to operating temperatures above 350°F, (177°C) an acrid odor and some smoke may be given off as a portion of the bonding material used in the insulation begins to undergo a controlled decomposition. If natural convection is not adequate in confined areas, forced ventilation should be provided in order to protect against any harmful fumes and vapors that might be generated.

4. **Outdoor Pipe:** Insulate as per above instructions.

Minimum Proto PVC Jacketing thickness for outdoor applications should be .030" (.7 mm). Over 15" O.D., .040 is recommended. Under 3 1/8" O.D., .020 is permitted. The PVC Jacketing shall be overlapped a minimum of 2" (51 mm) on the down side so as to shed water. All long and round joints shall be completely weather sealed with caulk adhesive.

On all piping, insulation shall be of sufficient thickness to keep the surface temperature below 125°F (52°C). Additionally, a slip type expansion joint of 8" (202 mm) minimum width shall be applied at least every 25 lineal feet (6.1 lineal meters) and between fittings.

Painting: Painting must be done only after priming the PVC surface with a suitable primer, such as X-1-M 400W Primer, or a similar, approved product.

Outdoor Painting: Only over White Exotuff® 195°F deflection temp. (modified PVC) or EXOD™ 225°F deflection temp. CPVC after X-1-M primer, or a similar, approved product. Use PVC compatible paints without strong solvents. Test paint a section before proceeding.

5. **CAUTION:** Fiberglass may cause temporary skin irritation. Wear long-sleeved, loose-fitting clothing, head covering, gloves and eye protection when handling and applying material. Wash with soap and warm water after handling. Wash work clothes separately and rinse washer. A disposable mask designed for nuisance type dusts should be used where sensitivity to dust and airborne particles may cause irritation to the nose or throat.

D. HEAVY INDUSTRIAL APPLICATIONS OUTDOORS

Use .030" or higher PVC Jacketing. Use "heavy duty" two piece fitting covers made from minimum .030" thick to .050" thick PVC sheet depending on size of fitting cover. Jacketing to be cut and oven precurled

E. FIRE TEST RESULTS: PROTO LoSMOKE® — PVC

USA: E-84 25/50 Rated up to .035" thick (The Best Rated PVC)

CANADA: Conforms to CAN 4-S102.2

LoSMOKE® fitting covers conform to virtually all city, state and federal codes, for use in hotel, commercial and industrial buildings.

LoSMOKE® fitting covers will be labeled on the box "Passes ASTM E-84." Flame spread 25; smoke developed 50".

All E-84 ratings shown here were tested on flat sheets from which fitting covers are made.

Virtually all Proto LoSMOKE® fitting covers will pass E-84 25/50 flame spread and smoke development rating requirements.

SUGGESTIONS

Slide Joints: Do not apply PVC Jacketing too tightly. Slide joints plus PVC thickness must work together to prevent cracks and puckering.

Caulk/Adhesives:
Use: Celulon® (Red Devil Inc.) water base "Ultra Clear".
Service temp. -25°F to +175°F

PVC Cement: Avoid use if possible. Heavy application can cause puckering and cracks. Learn how to use it sparingly.

Vapor Retarder: A vapor retarder is required under all fitting covers for systems operating below ambient temperatures, such as chilled water lines, and is recommended for all outdoor applications. The fitting vapor retarder should provide a continuous seal with the adjacent pipe vapor retarder.

Outdoor Fitting Covers: Use extra thick, plastic heavy duty covers.

Outdoor and Indoor Washdown Areas: Use EXOD™ (CPVC) by Proto, for its higher deflection temperature (225°F). It is light grey.

PVC Outdoor Thickness (Reg. PVC Jacketing): Use .030" thick cut and oven precurled jacketing. Use "heavy duty" plastic fitting covers formed from minimum .030" to .050" thick PVC sheet depending on size of fitting cover. On pipe insulation larger than 15" O.D. use .040" thick PVC.

PVC Indoor Thickness: Use white or indoor color LoSMOKE® on piping. Use .020" thick with standard one piece fitting cover, .030" jacketing can also be used.

Vessels and Tank Tops: Use .050" or .060" thick tank panels for outdoor applications and .030" or .040" for indoor tanks. Use .050" thick Protop® segments for tank heads. (Only Proto Corp. has them.) Made of LoSMOKE® PVC.

Pipe Insulation End Caps: Use on all outdoor, indoor washdown areas, and all vapor sealed systems. End caps will be PVC, metal, or gasket materials appropriate for the metal pipe temperatures. Silicone rubber (500°F) can be applied (min. 1/16" thick) as an end cap outdoors.

Indoor hot piping need not be sealed to the end cap. Cap will be sealed or taped to the jacket.

Two-Ply Waterproofing System: Use .010" thick PVC with self-sealing long lap tape, as the first waterproof layer. Overlap ends 3" and PVC tape over. Caulk all openings with Celulon® or similar, approved product. The finished jacketing material should employ staggered joints with at least a .010 mil thick first layer. Recaulk again over last layer. Install slide joints every 25', caulk shut all other seams, openings, or end overlaps with PVC tape or caulk. Use vapor seal jacketing (instead of .010" thick PVC first layer) where a vapor seal system is required.

CPVC-High Chemical Resistance and High Deflection Temperature: Use "Exod®" CPVC jacketing and fitting covers for 225°F deflection temperature and maximum chemical resistance. Offered only by Proto Corp. as a substitute for stainless steel.

Regular PVC Jacketing Outdoors: Use regular PVC jacketing outdoors. It is less expensive, does the same job as LoSMOKE® PVC. Regular PVC has very good fire (self-extinguishing) properties — not as good as the LoSMOKE® PVC used in confined people areas (buildings), however much better than common plastics used outdoors.

Vessels with ends 24" O.D. or larger: Use .040" thick jacketing up to 48" O.D. On sides of vessels larger than 48" O.D. See Protop® brochure for instructions requiring a suspended band system, to hang panels from, (Gerrard & Company or equal). Use thick PVC panels on Outdoor Tanks not PVC Roll Jacketing. See Tank Tops above for end segments.

PROTO PVC CORP™

The physical and chemical properties of Proto Corp. PVC represent typical average values obtained in accordance with accepted test methods and are subject to normal manufacturing variations. They are supplied as a technical service and are subject to change without notice. Numerical flame spread rating is not intended to reflect hazards presented by this or any other materials under actual fire conditions. Check with Proto Corp. office to assure current information. Purchaser will be responsible to determine suitability of this product for purchaser's use. Proto Corp. liability will be limited to the purchase price of the material. No person is authorized to alter this without a Proto Corp. officer's written approval.

Childers®
Mastics, Coatings, Adhesives, Sealants

VI-CRYL®
CP-10 (Trowel Grade)
CP-11 (Spray/Brush)
Weather Barrier Coatings

DURABLE WATER BASED VINYL-ACRYLIC MASTIC COATING FOR THERMAL INSULATIONS

DESCRIPTION
VI-CRYL® CP-10/11 weather barrier coating is a tough, durable, and fire-resistive water based mastic for most types of thermal insulation and finishing and insulating cements. It is very thixotropic - it looks heavy but spreads easily. It is available in a variety of standard and special fade-resistant colors. It is outdoor rated and U.V. resistant.

USES
VI-CRYL CP-10/11 weather barrier coating is unsurpassed for the mechanical protection and weatherproofing of thermal insulations both outdoors and indoors, in hot, cold, and dual-temperature service. However, since it is a 'breathing' coating (vapors under pressure will pass through it) it should only be used over insulations in low-temperature, or dual-temperature service when the insulations themselves are vapor barriers. VI-CRYL CP-10/11 has also found use throughout the thermal insulation industry as a coating used over closed cell polyethylene and polyurethane foam insulations. Industry experience has demonstrated that all weather barrier coatings may blister when applied over polystyrene board. This effect may be limited by the use of white colored coatings. VI-CRYL CP-10/11 weather barrier coating in its Metallic Gray color is the ideal companion product to Aluminum and Stainless Steel Jacketing.

APPLICATION
VI-CRYL CP-10/11 weather barrier coating is easy to apply by Trowel, Brush or Heavy-Duty Airless Spray. Its thixotropic consistency yields a smooth, attractive finish even over rough substrates; it readily fills gaps and imperfections. VI-CRYL CP-10/11 coating should be applied with glass fiber reinforcing mesh.

ADVANTAGES
- In the wet state, VI-CRYL CP-10/11 weather barrier coatings is non-flammable. It contains no solvents that will attack insulations or facings.
- The cured film is tough, flexible, and resists most common chemicals and many solvents.
- It is fire-resistive: its flame spread index being within the range of acceptance of government and industrial agencies.

CERTIFIED
- Meets NFPA Standard 90-A and 90-B 25/50 requirements.
- This product has been tested according to ASTM E-84 (Surface Burning Characteristics of Building Materials).
- Meets requirements for LEED® IEQ 4.2 Low-Emitting Materials, Paints and Coatings. CP-10 VOC: 45 g/l, less water and exempt solvents, CP-11 VOC: 20 g/l, less water and exempt solvents.

CP-10/11 contains no asbestos, lead, mercury, or mercury compounds.
See other side for specification and application information.

MASTIC FINISH over insulation shall be VI-CRYL CP-10/11 weather barrier coating. It shall be applied in two coats. A tack coat is to be applied at a rate of two gallons per 100 sq. ft. (.81 l/sq. m.). While the tack coat is still wet, a layer of CHIL-GLAS #10 open weave glass fiber reinforcing mesh shall be embedded with all fabric seams overlapped a minimum of 2" (5.08cm). A finish coat at a coverage of four gallons per 100 sq. ft. (1.6 l/sq. m) shall be applied, fully covering the glass fiber reinforcing mesh, so that the minimum dry film thickness is 1/16" (.063") (.16 cm). There shall be no voids or holidays and the mastic shall be trowelled, sprayed or wet-brushed to a smooth even finish.

All adjoining insulated or un-insulated surfaces must be completely waterproofed and flashed. To effectively seal those locations where the VI-CRYL CP-10/11 coating meets adjoining insulated or uninsulated surfaces, or dissimilar weather proofing materials, CP-76 sealant shall be applied as the sealing/flashing material. CP-76 shall be trowelled at 1/8" thickness a minimum of 1" in both directions back onto and over the complete joint interface of the VI-CRYL CP-10/11 coating and the adjoining surface. CHIL-GLAS #10 glass fiber reinforcing mesh is recommended to provide thickness control and strength at the joint interface.

NOTES TO SPECIFYING ENGINEER

1. Synthetic fabrics may be substituted for #10 open weave glass cloth without affecting the application.

2. If Chicken Wire, Hardware Cloth, or other metal reinforcements are to be used in lieu of fabric membranes, contact your representative for suggested procedures.

3. The above specification is for weather proofing and protection of insulation in HOT SERVICE: or for COLD or DUAL TEMPERATURE SERVICE where the insulation and/or the insulation system forms an adequate vapor barrier prior to the application of the VI-CRYL CP-10/11 coating.

Application Guide and Suggested Procedures

1. USE OF MATERIAL

VI-CRYL CP-10/11 weather barrier coating looks much heavier than it is. It is thixotropic. DO NOT THIN. Protect from freezing until dry. Keep stored over long periods of time in a heated area. For spray application VI-CRYL CP-10/11 coating must be kept at a minimum of 50ºF (10ºC) just prior to spraying to achieve optimum results.

2. THE CONDITION OF THE INSULATION TO BE COATED

VI-CRYL CP-10/11 is a "breathing coating", which means that it will allow reasonable amounts of water (in the form of vapor - a gas) to pass through it in a reasonable period of time. However, excessively wet insulation on equipment operating at elevated temperatures will cause excessive water vapor pressure, and therefore blistering of the finish. Make certain the insulation is dry prior to the application of any coating.
To obtain proper bonding, dusty surfaces shall first be primed with Chil-Seal CP-50A MV1 diluted 50% with water.
When applying VI-CRYL CP-10/11 coating over hygroscopic alkaline cements, first prime the surface of the cement with Chil-Seal CP-50A MV1 diluted 50% with water and allow to dry completely before applying the finish coat.
The presence of moisture in systems operating in Cold Service can completely destroy the effectiveness of not only the finish, but the entire insulation system. They MUST BE DRY.
All exterior horizontal surfaces must be sloped at least 1/2 inch per foot (4cm/m) to prevent ponding water.

3. HAND APPLICATION

Large flat areas are best covered by application with trowel or stiff brush. Smaller, irregular surfaces such as fittings are more readily covered by brushing. Airless spray may also be used.

4. SPRAY APPLICATION

VI-CRYL CP-11 coating may be sprayed with many types of equipment, including airless spray. It may also be sprayed with conventional Mastic spray equipment using an external atomizing spray gun. Many manufacturers of spray equipment can make detailed recommendations for any number of types of equipment. The spray equipment and techniques would be similar to those used for applying block fillers. For best results, we suggest the following airless spray equipment.

PUMP	Graco Bulldog Hydramastic, 40:1 ratio (model 204-925) air regulator with inductor plate (207-039).
COMPRESSOR	Capable of 75 CFM and maintaining 100 PSIG.
FLUID HOSE	High pressure capable of 4,000 PSI One inch up to 150 feet. 3/4 inch after the first 150 feet. Use 8' (2.4 m) 1/2" I.D. hose for coupling to the gun.
GUN	Graco Hydra-Mastic #207-300 with Reverse-A-Clean 205-614.
TIP SIZES	635 to 655.

5. DRYING AND RECOATING

A finish coat of VI-CRYL CP-10/11 weather barrier coating should be applied immediately after the tack coat and membrane application for maximum bond.

CUSTOMER SERVICE: 800-832-9002

IMPORTANT: H.B. Fuller Construction Products Inc. warrants that each of its products will be manufactured in accordance with the specifications in effect on the date of manufacture. WE MAKE NO OTHER WARRANTIES AND EXPRESSLY DISCLAIM ANY WARRANTIES OF MERCHANTIBILITY OR FITNESS FOR A PARTICULAR PURPOSE. If a product fails to meet this limited warranty, purchaser's sole and exclusive remedy is replacement of the product or, at our option, refund of the purchase price. OUR ACCEPTANCE OF ANY ORDERS FOR THE PRODUCT IS EXPRESSLY CONDITIONAL UPON PURCHASER'S ASSENT TO THE TERMS ON THE APPLICABLE INVOICE.

ADEQUATE TESTS: The information contained herein we believe is correct to the best of our knowledge and tests. The recommendations and suggestions herein are made without guarantee or representation as to results. We recommend that adequate tests be performed by you to determine if this product meets all of your requirements. The warranted shelf life of our products is six months from date of shipment to the original purchaser.

For professional use only. Keep out of reach of children.
Consult Material Safety Data Sheet and container label for further information.

Product Data Sheet

Description

Owens Corning® UtiliCore® Insulation products are flexible white blankets designed for high temperature commercial and industrial applications. The pliable, lightweight insulation offers outstanding thermal performance, making it an excellent choice as core insulation for removable and reusable industrial pipe covers, and other industrial pads and blankets.

Thermal Conductivity[1]

	UtiliCore® Insulation					
	L1	L1.3	L1.8	L2.5	L3.7	HP5 Mat
Thickness[2] (inches)	1.0	1.0	1.0	1.0	1.0	1.0

L3.7	1.0	0.10	0.57	1.09	1.17	1.12	1.17	1.00	0.99
HP5 Mat	1.0	0.13	0.43	0.84	1.05	1.02	0.94	0.85	0.83

3. Nominal samples were measured in accordance with ASTM C 423. These measured absorption coefficients were adjusted to values representative of the product with mean specification properties. While these values are an accurate representation of our product, they are for design approximations only. Production, testing, and application variabilities will alter results. Specific designs should be evaluated in end-use configurations.

Key Features

- L series products are low-binder blankets, while HP5 Mat is a needled blanket with no binder
- User friendly fibers result in less itch and irritation for installers
- HP5 Mat can be used in applications up to 1100°F, L Series, up to 1000°F
- Flexible, lightweight material that makes it easier to install and wrap around curved surfaces
- Easier and cleaner to work with than most competitive mats on the market
- Stitches can be sewn directly through material
- Low water absorption
- Lightweight insulation provides for easy cutting both in shop and in the field

Product Applications

Owens Corning® UtiliCore® insulation products offer outstanding dimensional stability allowing ease of handling in fabrication, assembly and installation of removable and reusable industrial pipe covers.

- Core Insulation Used in:
  - o Industrial Piping System Insulation Covers
  - o Valve Insulation Covers
  - o Flange Insulation Covers
  - o Exchanger Insulation Covers
  - o Filter Insulation Covers
  - o Flow Meter Insulation Covers
  - o Strainer Insulation Covers

Availability

- UtiliCore® L Series Insulation 1" and 2" thicknesses
- UtiliCore® HP5 Mat Insulation 1" thickness
- Other thicknesses may be available upon request. Contact your Area Sales Rep for availability

Standards, Codes Compliance

- ASTM C553, Mineral Fiber Blanket Thermal Insulation, Type V - All UtiliCore®
- ASTM C1139 Fibrous Glass Thermal Insulation and Sound Absorbing Blanket and Board for Military Applications
- ASTM C795, Thermal Insulation for Use in Contact with Austenitic Stainless Steel[4]
- Nuclear Regulatory Commission Guide 1.36, Non-Metallic Thermal Insulation[4]
- MIL-I-22023D Insulation Felt, Thermal and Sound Absorbing Felt, Fibrous Glass, Flexible. See MIL-I-22023D Compliance and Variances
- MIL-DTL-I-24244D (Ships) Insulation Material with Special Corrosion, Chloride, and Fluoride Requirements[4]; Type XVI
- U.S. Coast Guard Approval No. 164.109, Noncombustible Materials

  NOTE: All UtiliCore® products comply to the Noncombustible requirements of IMO FTP Code
- ASTM E136, Behavior of Materials in a Vertical Tube Furnace at 750°C (Noncombustible rating)
- Doesn't contain the fire retardant decabrominated diphenyl ether (decaBDE)

Certifications and Sustainable Features of Owens Corning® UtiliCore® Insulation Products[5]

- Certified by SCS Global Services to contain a minimum of 53% recycled glass content, 31% pre-consumer and 22% post-consumer.
- Certified to meet indoor air quality standards under the stringent GREENGUARD Certification Program, and the GREENGUARD Gold Certification.

Environmental and Sustainability

Owens Corning is a worldwide leader in building material systems, insulation and composite solutions, delivering a broad range of high-quality products and services. Owens Corning is committed to driving sustainability by delivering solutions, transforming markets and enhancing lives. More information can be found at http://sustainability.owenscorning.com.

Physical Property Data

Property	Test Method	Value
Operating Temperature Range	ASTM C411	L Series: up to 1000°F (538°C) HP5 Mat: up to 1100°F (593°C)
Corrosion Resistance	ASTM C665	Meets requirement
Fungi Resistance	ASTM C1338	Meets requirements
Odor	ASTM C1304	No objectionable odor
Moisture Sorption	ASTM C1104	< 3% by weight
Composite Surface Burning Characteristics[6]	ASTM E84, UL 723, and CAN/ULC-S102	
Flame Spread		< 25
Smoke Developed		< 50

6. The surface burning characteristics of these products have been determined in accordance with ASTM E84, UL 723, and CAN/ULC-S102. These standards should be used to measure and describe the properties of materials, products, or assemblies in response to heat and flame under controlled laboratory conditions and should not be used to describe or appraise the fire hazard or fire risk of materials, products or assemblies under actual fire conditions. However, results of this test may be used as elements of a fire risk assessment, which takes into account all of the factors, which are pertinent to an assessment of the fire hazard of a particular end use. Values are reported to the nearest 5 rating.

MIL-I-22023D Compliance and Variances

Density Variance

UtiliCore® complies to MIL-I-22023D, with the exception of Section 1.2 Classification; Table 1 Nominal Density; Type I and Type II, for Class 4 and Class 6, which are slightly below the -10% allowance, but complies to all properties required for these Classes. Table 1 below aligns the UtiliCore® product for Type i and Type II Classes.

Table 1:	Density Required pcf (lb/ft³)	UtiliCore® Product	Product Density pcf (lb/ft³)	Density Compliance
Class 3	1.0	L1	1.0	Yes
Class 4	1.5	L1.3	1.3	0.05 pcf below tolerance
Class 5	2.0	L1.8	1.8	Yes
Class 6	3.0	L2.5	2.5	0.2 pcf below tolerance

3. UtiliCore® offers no Class 2 product.

4. Preproduction qualification testing complete and on file. Chemical analysis of each production lot required for total conformance.
5. Results representative of core insulation only.

SILICONE IMPREGNATED FIBERGLASS CLOTH
STYLE 750

Style 750 is designed for preparing high temperature removable pads, flange and valve covers. Style 750 is a fiberglass fabric impregnated with a high temperature, flame retardant, silicone rubber which provides greater life and improved resistance to abrasion, flexing, tear and puncture. The base fabric meets MIL-C-20079.

Controlling Energy Costs With Best Energy Reduction Tools (BERT)

Executive Summary:

As companies, consumers and the country look for ways to save energy and reduce pollution, increased attention will be focused on new ways of controlling the energy use of the legion of smaller electrical loads which now represent the major source of growth in total energy use. While energy managers have been quick to identify and automate large sources of energy use (like HVAC), controlling many smaller devices spread throughout a building is difficult to do. The promotion of 'good habits' like turning off lights and computers may have short term impacts, but sustaining these types of activities over time has proven to be difficult. This paper describes a new approach to facility energy management that leverages a building's existing WiFi network to control end uses throughout a building. By connecting 'smart plugs' to a web-based software interface, energy managers can program schedules by end-use that control energy consumption during times when facilities are not being used. Case studies of university, office, restaurant and residential applications illustrate a range of ways in which the technology can be used. The end uses described in these cases average a 6 month payback. If widely adopted, the control of 'small use' devices could save approximately 461 million kWh and 632 million pounds of carbon annually.

Section 1: Introduction

As energy prices increase and companies and organizations place increased focus on the environment, facility energy managers are challenged to find ways of controlling the energy use of an ever-widening variety of electronic devices. While most managers have made significant strides increasing the efficiency and control of major end uses like HVAC, a large portion of each facility's bill is spent on 'the little stuff'—computers, lights, and other relatively new electronic devices. This paper describes and documents a new patented technology that utilizes the existing WiFi infrastructure to control devices throughout a facility. Section 2 describes the explosion of electronic devices, which represents both a significant growth area for energy demand as well as a new, untapped opportunity for savings. Section

3 provides an overview of past attempts to control diffuse devices over networks, and provides a glimpse into the future of 'smart' appliances. Section 4 describes a new technology called "BERT", for Best Energy Reduction Technologies. Particular focus is placed on how the software interface allows for the individual control of virtually any device. Section 5 describes how the technology can operate within a university, office, restaurants and in residential applications. Section 6 concludes by documenting the savings potential of the technology in several key sectors, and illustrates the potential for this type of technology to transform how energy use is managed in homes and businesses.

Section 2: The Electronics Explosion: Growth and Savings Opportunity

Despite the increased efficiency of a wide variety of many electronic devices, efficiency gains for many facilities have been countered by a proliferation of new devices. Spending on PCs continues to be strong, growing 22.7% in 2010 according to iSuppli, a company that tracks technology sales. According to the Department of Energy's Building Data Book, total energy use for computers rose 43% between 2006 and 2010. Even more startling is the growth in uncategorized uses, which jumped 663% during the period[1]. The increasing number of peripheral devices, from iPhones, to video conferencing equipment and large format LED and plasma displays all add up. Energy use at work is clearly on the rise, despite the increased efficiency of new equipment. Similar growth is taking place residentially. According to the Nielsen Television Audience Report[2], the number of TV's per household is now 2.86, jumping 43% since 1990. In addition, 88% of homes have a DVD, over 80% of homes have a computer, and of those homes 92% had internet access[3].

A byproduct of the proliferation of devices is phantom load. Phantom load refers to energy that is used when a device is off. This includes energy used by TV's when they're in standby mode (i.e. when they can be turned on with a remote), and energy used by chargers or a laptop's AC adapter. Studies estimate that phantom load now accounts for 6% of all energy use.

This increase in energy consumption has been made worse by increases in price. Recent data from the Department of Energy shows that average electricity prices have increased in all three sectors (commercial, residential, industrial) between 2009-2010[4]. The lifting of rate caps in many states has already lead to dramatic price increases. Electricity rates have already increased 39% in Maryland, 21% in Illinois, and are projected to increase 40-70% in Pennsylvania.

With the increasing number of devices, many facilities managers must rely on people to remember to turn out the lights, or unplug their printers when not in use. However this is easier said than done. A

study conducted by the Alliance for Efficiency found that the impact of behaviorally-based conservation programs wanes within a year, even when education campaigns are ongoing[5].

Section 3: The Device Control Industry: Past, Present and Future

Home automation and control technologies have been around for years, and have the potential to reduce the energy used by a wide variety of devices. Pioneers such as X10 created a communications protocol that used in-home electric wiring to transmit commands to compatible devices. These technologies have advanced over the years to utilize wireless transmission (for example, X10 now uses 310 MHz radio frequency to transmit commands to specially equipped devices within the home.) While significant effort has been put behind these technologies a host of problems have hindered widespread adoption, including unreliability due to wiring impedance, slow response time, and interference with/from other household appliances and devices. Despite the apparent allure of ubiquitous electrical wiring, X10 lacked the ease, reliability and security needed for the product segment to grow.

Individual manufacturers, such as Lutron, have created proprietary high-end home control products intended to provide high levels of control, allowing the programming of lighting 'schemes', and the integrated control of equipment throughout the home. These high cost end-to-end solutions provide an interesting niche product for high end or specialty customers, but do not appeal to the mass market. At the other end of the market, products like Belkin's Conserve[6] Surge With Timer builds a timer into standard surge strip allowing an individual user to set the strip to turn off during select hours.

More recently, the Zigbee suite of proprietary communications protocols has made an appearance in the home control market. Under the Smart Energy 2.0 initiative, Zigbee proponents have created a data standard that they hope will be adopted by a potentially large AMI and Smart Metering industry. While the potential of this utility-driven segment is large, its success will rely on the installations of millions of Zigbee enabled electric meters and related devices.

Section 4: What Makes BERT different?

BERT provides a deceptively simple solution to the device control dilemma. First, BERT was built on a large, reliable, existing networking technology- WIFI. Building the control platform on the existing network has several key benefits:

1. Ubiquity: Virtually all homes and businesses are wifi-enabled. This means that any building that has wi-fi can easily utilize a "Plug and Play" BERT device.

[5] http://www.allianceforwaterefficiency.org/public_education.aspx
[6] http://www.belkin.com/energy/conserve/default.aspx

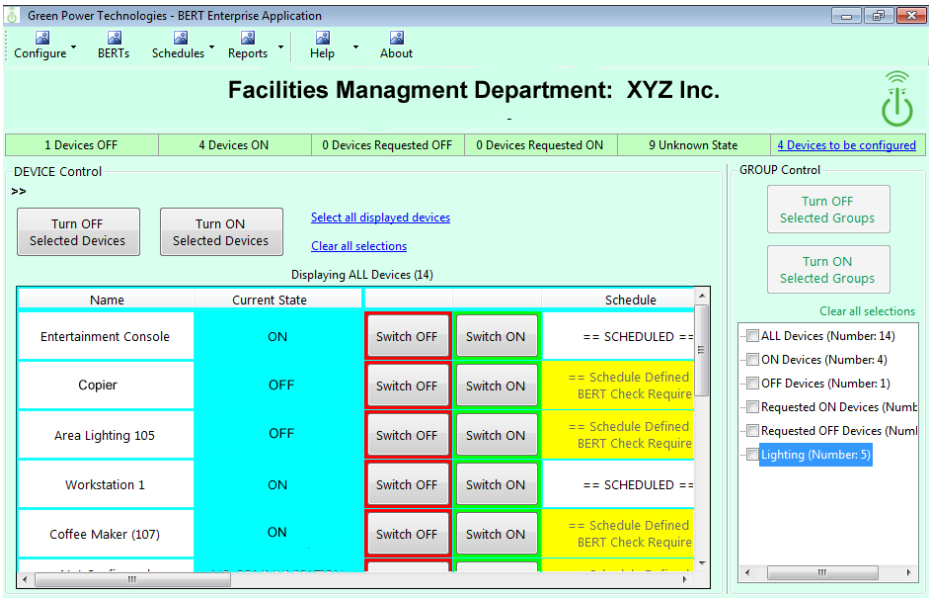
2. Reliability: WiFi networks have achieved an amazingly high degree of reliability and security. This reliability meaning that the problems of cross-device interference and the lack of security are no longer issues.

3. Cost: Because the wifi network already exists, no special equipment needs to be purchased as would be with proprietary or other standards such as ZigBee. This allows for the lowest total cost solution in the marketplace.

4. Ease of installation and use: The computer-based control software allows devices to be easily programmed or controlled through any computer-enabled device. BERT does not rely on proprietary physical control panels, or specially-wired consoles. Instead BERT takes commands through common MAC, PC or Smart Phone devices consumers and businesses already use.

Figure 4-1 shows how the BERT device works. The Enterprise Application Program (EAP) is installed on one computer on the network, and is used to set schedules, group devices, and monitor activity. On/Off requests are sent through the existing network router using WiFi. Each BERT plug contains a microchip and antenna that communicates with the EAP on a periodic basis. The BERT EAP uses SNMP (Simple Network Management Protocol) to monitor the activity of connected devices (plugs). When a BERT plug receives an "off" command, the module turns off all power supplied to the plug.

Figure 4-1: BERT System Schematic



The BERT EAP provides a set of tools to configure, schedule and monitor connected BERT devices. The windows based program is installed on a computer within the network (e.g. a facilities manager's workstation). BERT plug contains a microchip and obtains an IP address from your network. Each BERT device appears on the interface, and individual schedules can be set with multiple on/off periods over a seven day schedule. For example, hallway TV monitors can be programmed to go off at midnight, and

on again at 6 am. Multiple TV's can be grouped together to make control and reporting easier. The EAP tracks and reports the status of all devices on the system.

The energy use of each device can also be programmed into the EAP. For example, if the LCD hallway monitor consumes 225 watts of power, then BERT can use this information to track cumulative energy and dollar savings. The BERT reporting interface allows reports for individual devices, groups, or the entire portfolio of devices.

When deviations from standard building schedules occur, devices can be activated in several ways. Most simply, users approaching a BERT device that is it's off state can press a button on the side of the BERT plug and power will be restored to the device. This change of state will be recognized and recorded by the EAP. The device will remain on until the next programmed schedule change. If there are temporary schedule changes for multiple devices, for example if a building is open late for a special event, the facilities manager can turn on/off individual or groups of units remotely. The manager simply selects the designated groups, like Hallway LCD Monitors, and clicks on "Turn On Selected Groups".

Figure 4-2: The BERT EAP Interface

The microprocessors embedded in each BERT plug provide unique protection in the event of a WiFi outage, the shutdown of the management computer, or other interruption. Each BERT unit contains the programmed weekly schedule within the microchip, so if the plug loses contact with the EAP control software it will simply continue to execute its standard schedule.

Section 5: Sample Applications

BERT units can work in a wide variety of applications. This section describes how BERT can operate in university, office, restaurant and residential applications.

University Building:

Temple University's Speakman Hall is an academic building in the middle of campus, and contains a mix of classrooms, public spaces, study areas, and administrative services. The building includes a wide variety of devices that are on 24x7, including hallway announcement TVs, cooled water fountains, office equipment, vending machines, and computer monitors. The building is WiFi enabled. While the University prides itself on having a wide variety of amenities available for students, it also recognizes that many of these amenities use energy round the clock, even when the building is closed during nighttime hours.

Table 5-1: Sample BERT Installation in a University Building

Item Description	Watt Savings	Hours off per day	Number of devices	*Potential energy savings (kWh per year)*
Computer Monitors	65	8	30	5,694
Vending Machine	400	8	2	2,336
Water fountain (cooled)	60	8	24	4,205
Copier	5.26	10	2	38
LCD TV	225	10	12	9,855

Table 5-1 shows modeled energy savings for 70 BERT plugs installed in a single academic building over a 1 year period of time. This application saves 22,128 kWh and $3,983 per year.

Office

An office has 30 workstations (each with a computer, monitor, printer and cell phone charger), a water cooler, copier, and a TV screen in the company lobby. The office manager installs a BERT plug at each workstation, and various other devices. The manager schedules the BERT devices to go off for 12 hours each night, when the office is closed.

Table 5-2: Sample BERT Savings In A Small Office

Item Description	Watt Savings	Hours off per day	Number of devices	*Potential energy savings (kWh)*
Workstation	48.51	12	30	6,374

Water cooler	60	12	1	263
Copier	9.63	10	1	35
LCD TV	225	10	1	821

Table 5-2 shows modeled energy savings for 33 BERT plugs installed in a single office over a 1 year period of time. This application saves 7.493 kWh and $1,349 per year.

Restaurant:

A sports bar features a large number of flat screen TVs so that patrons can view their favorite sporting events from virtually any seat. The restaurant owner configures BERT so that the closing manager can turn off all BERT devices as part of the nightly shut down procedure. BERTS return to service when the opening manager returns in the morning.

Table 5-3: Sample BERT Applications In A Restaurant

Item Description	Watt Savings	Hours off per day	Number of devices	*Potential energy savings (kWh)*
Register Stations	48.51	14	3	744
Bar lighting	65	14	5	1,661
Vending Machines	400	14	4	8,176
LCD TV	225	14	20	22,995

Table 5-3 shows modeled energy savings for 33 BERT plugs installed in a single restaurant over a 1 year period of time. This application saves 33,882 kWh and $6,099 per year in energy.

Residential:

A homeowner buys four BERTS to control a computer workstation, entertainment center, area lighting, and kitchen appliances. The homeowner programs BERTS to be on during the times when family members are typically using the equipment; the coffee maker goes on in the morning, while the computer station is active in both morning and evening hours.

Table 5-4: Sample BERT Residential Application

Item Description	Watt Savings	Hours off per day	Number of devices	*Potential energy savings (kWh)*
Light	60	14	1	307
Entertainment Center	75	16	1	438
Workstation	48	14	1	245
Kitchen	8	20	1	58

Table 5-4 shows modeled energy savings for 4 BERT plugs installed in a single home over a 1 year period of time. This application saves 1,084 kWh and $189 per year in energy.

Section 6: Global Impacts:

The global impacts of the adoption of BERT plugs is significant. For example, one million plugs deployed in applications similar to the ones described above saves 461 million kilowatt hours and over 632 million pounds of carbon per year.

Table 6-1: Potential Energy and Environmental Savings

Number of plugs	1,000,000
Average KWH Savings	461.34
Total KWH Savings	461,335,714
Total Dollar savings	$ 83,040,428
Annual Carbon Savings:	632,029,928 pounds per year

In contrast to existing and emerging technologies described in Section 3, WiFi based devices like BERT provide an immediate opportunity to leverage an enormous existing technology infrastructure to save money, energy and the environment by turning off devices on a controlled, scheduled basis while they are not in use.

SeamlesSEAL ULTRA
SILICONE COATING ROOFING SYSTEMS

SeamlesSEAL™ ULTRA HS

Silicone Coating

Overview

SeamlesSEAL ULTRA HS is a single-component, moisture-cured, high-solids, fluid-applied silicone coating. Once cured, the silicone coating membrane offers excellent resistance to water intrusion, UV exposure, and natural weathering. This product is designed to provide protection for a wide range of building surfaces. It is excellent for waterproofing and restoring existing roof systems, as well as for weather protection of SPF roofing systems.

Features and Benefits

- Superior leak protection
- Easy to apply and wide application window
- Weatherability
- Long-lasting
- Resistance to ponding water

Coverage Rate

SeamlesSEAL ULTRA HS Silicone Coating is 96% solids by volume so that a typical application rate of 1.0-1.5 gallons per 100 square feet should yield a dry film thickness of approximately 15 mils in one coat. Waste, wind loss, and other variables will affect the actual dry film thickness.

Installation

1. All surfaces to be coated must be clean, dry, and paintable. It may be necessary to power wash and/or prime to enhance adhesion.
2. No thinning or reducing is recommended. Mix well before using. For drums: use a ¾ hp air-powered mixer with a 6" blade and shaft that will create a good vortex. For pails: use at least a 3" blade or a suitable hand mix paddle. Mixed materials should be used immediately to avoid curing in the container with small amounts of atmospheric moisture.
3. It is not recommended that this product be applied at temperatures below 40°F (4°C) or if inclement weather is expected within 1 hour of application.
4. This product is suitable for application through airless spray equipment or with a roller, squeegee, or brush. Utilize a pump with a minimum output of 3 gallons per minute and 3,500 psi fluid pressure capability, fed with a 5:1 transfer pump and ½" and ¾" ID hose. Always use components rated for the pump maximum pressure. Use a 30-mesh screen or larger. Use a spray tip with a minimum orifice of .30" and 50 degree fan angle. Medium to heavy nap roller pads are recommended. Use hoses dedicated for silicone coatings.
5. This coating can be installed in one or multiple coats.
6. SPF should be coated within 24 hours of application. Subsequent coats should be applied within 24 hours of prior applications to ensure full and uniform adhesion. Coating must be evenly applied and pinhole free. The coating will cure in 2 to 8 hours, dependent on weather conditions such as temperature and humidity. Do not install additional coats until coating is fully cured.
7. Approved roofing granules may be installed in the topcoat to improve aesthetics, traffic resistance, and impact resistance.
8. See listing at www.nsf.org for application and cure instructions for rainwater catchment use.
9. Cleanup of spray equipment containing uncured material may be accomplished by flushing with VM&P Naphtha or Rule 66 mineral spirits. SeamlesSEAL ULTRA HS cures by reacting with moisture and should not be left in spray guns, pump equipment, or hoses for prolonged periods unless equipment contains moisture lock hoses, fittings, and seals. Equipment without these components will transmit sufficient moisture vapor to gradually form cured material on hose walls and at unsealed connections.

Review Carlisle Roof Foam and Coatings' specifications and details for complete installation information. Please contact CRFC for more information.

Precautions

- Not recommended for continuous immersion service, for use in cold storage applications without a vapor retarder, or directly over asphaltic surfaces without a sealer.
- Silicone coatings are slippery when wet. Exercise caution when walking on a roof under these conditions.
- Avoid breathing silicone vapors or spray mists. Use an appropriate MESA/NIOSH approved respirator when exposure can exceed recommended PEL. This product is not recommended for interior use. Additional care must be taken to prevent rooftop HVAC equipment from introducing silicone vapors into interior areas during application. Building occupants should be warned of spray operations in process.
- Keep cleaning solvents away from all sources of heat, sparks, flame, lighted smoking materials, or any other ignition source. Pumping equipment should be grounded to avoid accidental ignition due to static sparks.
- It is not recommended to store this product at temperatures exceeding 100°F (38°C). For maximum shelf life, store between 40°F and 70°F (4°C and 21°C). Higher temperatures will reduce shelf life.
- Remove any skin prior to mixing the material. Once container is opened, all product should be used. Container cannot be resealed without product skinning or curing inside container. Always keep covered and protected from the elements. When transporting this product, ensure lid is tight and container secured.
- See Safety Data Sheet (SDS) for complete safety information.

Ratings and Approvals

Underwriters Laboratories	File R26705
Evaluation Report	UL EX R26705
Factory Mutual Global	Approved
NSF Protocol	P151 (white only)

ZH/ZJ/ZR SERIES
3 - 12.5 TON
60 Hertz

ZH/ZJ/ZR 3 THROUGH 10 TON

ZH/ZJ/ZR 12.5 TON

Description

ASHRAE 90.1 COMPLIANT

YORK® Predator® units are convertible single packages with a common footprint cabinet and common roof curb for all 3 through 12.5 ton models. All 6.5 through 12.5 ton units have two compressors with independent refrigeration circuits to provide 2 stages of cooling. The units were designed for light commercial applications and can be easily installed on a roof curb, slab, or frame.

All Predator® units are self-contained and assembled on rigid full perimeter base rails allowing for 3-way forklift access and overhead rigging. Every unit is completely charged, wired, piped, and tested at the factory to provide a quick and easy field installation.

Predator® units in all tonnage sizes are convertible between side airflow and down airflow, with corresponding economizer if economizer option is desired.

Predator® units are available in the following configurations: cooling only, cooling with electric heat, cooling with gas heat, reheat only, reheat with electric heat and reheat with gas heat. Electric heaters are available as factory-installed options or field-installed accessories.

All units provide constant supply air volume. A variable air volume (VAV) option, which features a variable frequency drive (VFD), is available on 6.5 through 12.5 ton ZH/ZJ models only.

1 = First Generation

Prior Nomenclature

3-12.5 Ton York® Model Number Nomenclature
For Units Produced Before 2-01-2016

Features and Benefits

Standard Features

- **Service Friendly** - The Predator® incorporates a number of key features for ease of serviceability.

  The motor and blower slide out of the unit as a common assembly. This facilitates greater access to all the indoor airflow components, thus simplifying maintenance and adjustment.

  Service time is reduced through the use of hinged, toolless panels. Such panels provide access to frequently inspected components and areas, including the control box, compressors, filters, indoor motor & blower, and the heating section. The panels are screwed in place at the factory to prevent access by children or other unauthorized persons. It is recommended that the panels be secured with screws once service is complete.

  Service windows have been placed in both condenser section walls. Rotation of the cover allows easy access to the condenser coils for cleaning or inspection.

  The Smart Equipment™ control board provides alarm messages to help quickly identify any faults.

  All units use four filters of the same standard size. This standardization simplifies selections for filter replacement.

  The non-corrosive drain pan slides out of the unit to permit easy cleaning. The drain pan is accessed by removing the drain pan cover plate on the rear of the unit. Once the plate is removed, the drain pan slides out through the rear of the unit.

  All Predator® units have a second model nameplate located inside the control access door. This is to prevent deterioration of the nameplate through weathering.
- **Coil Technology** – All ZH/ZJ condensers utilize Micro-Channel “all-aluminum” condensers which provide improved heat transfer capabilities and reduced charge volumes. All evaporators utilize a conventional copper tube/aluminum fin design for proven reliability and performance. ZR037 thru 061 models utilize Micro-Channel condenser coils, ZR078 thru 150 models utilize copper tube/aluminum fin or Micro-Channel condenser coils. For specific unit model information see Physical Data Tables.
- **Environmentally Aware** - For improved Indoor Air Quality, a combination of aluminum foil faced and elastometric rubber insulations are used exclusively throughout the units.
- **Balanced Heating** - The Predator® two stage gas heating offers "Ultimate Heating Comfort" with a balance between 1st and 2nd stage gas heating to provide a well maintained desired temperature.

Unit Tonnage	1st. Stage	2nd. Stage
3-5 Ton	70 to 75% of Heating Capacity	100% of Heating Capacity
6.5 - 12.5 Ton	60% of Heating Capacity	100% of Heating Capacity

- **Convertible Airflow Design** – The side duct openings are covered when they leave the factory. If a side supply/return is desired, the installer simply removes the two side duct covers from the outside of the unit and installs them over the down shot openings. No panel cutting is required. Convertible airflow design allows maximum field flexibility and minimum inventory.
- **System Protection** - Suction line freezestats are supplied on all units to protect against loss of charge and coil frosting when the economizer operates at low outdoor air temperatures while the compressors are running. Every unit has solid-core liquid line filter-driers and high and low-pressure switches. Internal compressor protection is standard on all compressors. Phase Monitors are standard on units with Scroll compressors. This accessory monitors the incoming power to the unit and protects the unit from phase loss and reversed phase rotation.
- **Advanced Controls** - Smart Equipment™ control boards have standardized a number of features previously available only as options or by utilizing additional controls.

⚠ CAUTION

The Smart Equipment™ control board used in this product will effectively operate the cooling system down to 0°F when this product is applied in a comfort cooling application for people. An economizer is typically included in this type of application. When applying this product for process cooling applications (computer rooms, switchgear, etc.), please call the applications department for Unitary Products @ 1-877-UPG-SERV for guidance. Additional accessories may be needed for stable operation at temperatures below 30°F.

- **Units will come with the new state of the art Smart Equipment™ control system.** The new unit control incorporates the best of the already proven unitary controls and creates a more robust, intelligent control. The goal of this control is to utilize cutting edge technology making the equipment easier to install, operate, and service. All units are Factory commissioned, configured, and run tested.
- **Versatile -** The Smart Equipment™ control can be configured to use with a standard thermostat (easy to connect screw terminals), A zone sensor, or can be setup to communicate with multiple BAS communication protocols to integrate with building automation systems.
- **Reduce field installed complexity -** Each unit will comes equipped with factory installed supply air, return air, and outdoor air temperature sensors providing key temperature readings thus reduce field installed complexity.
- **On-board USB Port -** The new control comes with a long list of features including data logging, current and previous system faults and software update capabilities using the on board USB port and common flash drive. Energy use monitoring capabilities allow custom tailoring to allow a system to work more efficiently at all times and occupancy levels. Self test and start-up reports also available from the board VIA the USB port.
- **Embedded LCD Display -** The board has a easy to read, built-in LCD display and easy to use navigation joystick and buttons allowing the user to quickly navigate the menus displaying unit status, options, current function, supply, return and outdoor temperatures, fault codes and other information.
- **Safety Monitoring -** The control monitors the outdoor, supply, and return air temperatures and the high and low pressure switch status on the independent refrigerant circuits. On units with heating the gas valve and high temperature limit switches are monitored on gas and electric heating units. The control also monitors the voltage supplied to the unit and will protect the unit if low voltage due to a brown out, or other electrical issue occurs.
- **Low Ambient -** An integrated low-ambient control allows units to operate in the cooling mode down to 0°F outdoor ambient without additional components or intervention. Optionally, the control board can be programmed to lockout the compressors when the outdoor air temperature is low or when free cooling is available.
- **Anti-Short Cycle Protection -** To aid compressor life, an anti- short cycle delay is incorporated into the standard control. Compressor reliability is further ensured by programmable minimum run times. For testing, the anti-short cycle delay can be temporarily overridden with the push of a button.
- **Fan Delays -** Fan on and fan off delays are fully programmable. Furthermore, the heating and cooling fan delay times are independent of one another. All units are programmed with default values based upon their configuration of cooling and/or heating capacity.
- **Nuisance Trip Protection and Three Strikes -** To prevent nuisance calls, the control board uses a three times, you're out philosophy. The high, low-pressure switch, anti-freeze protection, low voltage or heating high limit must trip three times within two hours before the unit control board will lock out the associated compressor.An alarm message will be displayed on the LCD screen.
- **Lead-Lag** - An integrated Lead-Lag option allows equal run time hours on all compressors, thereby extending the life of all compressors. This option is selectable on the unit control board.
- **Low Limit Control (LLC)** - To prevent the supply air from dropping below a specified set point, when there is a demand for cooling during cold outside conditions. (Programmable Set point)
- **Reliable** - From the beginning - All units undergo computer automated testing before they leave the factory. Units are tested for refrigerant charge and pressure, unit amperage, and 100% functionality. For the long term - All units are painted with a long lasting, powder paint that stands up over the life of the unit. The paint used has been proven by a 1000 hour salt spray test.
- **Full Perimeter Base Rails** - The permanently attached base rails provide a solid foundation for the entire unit and protect the unit during shipment. The rails offer rigging holes so that an overhead crane can be used to place the units on a roof.
- **Easy Installation** - Gas and electric utility knockouts are supplied in the unit underside as well as the side of the unit. Utility connections can be made quickly and with a minimum amount of field labor. All units are shipped with 2" throw-away filters installed.
- **Wide Range of Indoor Airflows** - All supply air blowers are equipped with a belt drive that can be adjusted to meet the exact requirements of the job. A high static drive option is available for applications with a higher CFM and/or static pressure requirement.
- **Warranty** - All models include a 1-year limited warranty on the complete unit. Compressors and electric heater

elements each carry a 5-year warranty. Aluminized steel (10 yr.) and stainless steel tubular heat exchangers carry a 15- year warranty.

Factory Installed Options

YORK® offers several equipment options factory installed, for the Predator® line.

- **Optional Factory Installed Economizers** - Predator units offer a variety of optional factory installed economizers with low leak dampers. The outdoor air dry bulb sensor enables economizer operation if the outdoor air temperature is less than the set point of the economizer logic module. See economizer options section to determine the correct economizer for your application.
  - **Down flow / End Return Economizers (with barometric relief and fresh air hood)** - All units offer a variety of optional factory installed down flow economizers that are shipped, installed and wired with low leak dampers designed to meet ASHRAE 90.1-2010, AMCA 511 Class 1A damper, and the International Energy Conservation Code (IECC) certification requirements by achieving leakage rates of 3 cfm/sq. ft. at 1" of static pressure. Each economizer goes through a rigorous 60,000 cycle test. Dry bulb, single enthalpy, and dual enthalpy (with field installed kit) can be selected. The economizer has spring return, fully modulating damper actuators and is capable of introducing up to 100% outdoor air. As the outdoor air intake dampers open, the return air dampers close. The changeover from mechanical refrigeration to economizer operation is regulated by the outdoor air dry bulb temperature or the outdoor air enthalpy input. The optional (field installed) single or dual enthalpy kits provide additional inputs to monitor outdoor air/ or return air humidity and temperature for true enthalpy control. The installer needs only to assemble the outdoor air hood, attach the enthalpy control the hood and mount the hood to the unit (Hood and control are provided).
- **Power Exhaust** - This factory option allows down flow or horizontal end return economizer operation. **The power exhaust must be removed from the unit and mounted in the horizontal end return duct work when applying the product in the horizontal, end return configuration.**
- **Motorized Outdoor Air Damper** - The motorized outdoor air damper includes a slide-in/plug-in damper assembly with an outdoor air hood and filters. The outdoor air dampers open to the preset position when the indoor fan motor is energized. The damper has a range of 0% to 100% outdoor air entry.
- **Alternate Indoor Blower Motor** - For applications with high static restrictions, units are offered with optional indoor motors that provide higher static output and/or higher airflow, depending upon the installer's needs.
- **Variable Air Volume (VAV; 6.5 through 12.5 ton, only)** - A factory-installed variable frequency drive (VFD), mounted in the Blower Access compartment, is used to control the speed of the indoor blower motor in order to maintain a constant static pressure in the supply duct. A duct pressure transducer is provided with the unit. The drive comes completely wired and pre-programmed from the factory.

  An optional, factory-installed manual bypass switch available with factory-installed VFD can be found in the Blower Motor Access compartment. The switch can be used to either route power to the VFD for modulating control of the blower motor, to bypass the drive and operate the motor at full speed, or to power the drive (and not the motor) for diagnostic purposes.

  VAV is not available with the factory-installed 3rd. party BAS controllers. VAV is only factory installed with the Smart Equipment™ Controller.

  A 'VFD-ready' option provides the provisions for a customer-installed drive. The unit comes with a mounting bracket installed in the Blower Access compartment which may accommodate other vendor's drives depending on their size. In order to utilize the unit's mounting bracket, the maximum recommended drive dimensions are limited to approximately 9" H x 5" W x 7.5" D.

  If the drive will not fit in the allotted space, then it will have to be mounted elsewhere; either within the building on a perpendicular wall which is not subjected to excessive temperature, vibration, humidity, dust, corrosive gas, explosive gas, etc., or within an appropriate enclosure rated for outside installation to safeguard against moisture, dust and excessive heat. A terminal block located in the control box is provided for field connection of the VFD controls.
- ***IntelliSpeed*™ Supply Fan Control Option (ASHRAE 90.1 compliant) -** Units configured with the ***IntelliSpeed*™** Supply Fan Option will contain a VFD for multi-speed supply fan operation. This option allows the supply fan RPM to vary based on the number of compressors or heating stages energized. The economizer's minimum position will also be configurable to vary based on the supply fan VFD frequency output.
- **Aluminized Steel Gas Heat Exchanger** - For applications in non-corrosive environments.
- **Stainless Steel Gas Heat Exchanger** - For applications in corrosive environments, this option provides a full stainless steel heat exchanger assembly.
- **Low NOx Option** - For units with gas furnaces in locations where codes require that the Oxides of Nitrogen emissions from the furnace be below 40 Nano grams per joule.
- **Stainless Steel Drain Pan -** An optional rust-proof stainless steel drain pan is available to provide years of trouble-free operation in corrosive environments.
- **Electric Heaters** - The electric heaters range from 3kW to 54kW and are available in all the voltage options of the base units. All heaters are intended for single point power supply.
- **Disconnect Switch** - For gas heat units and cooling units with electric heat, a HACR breaker sized to the unit is provided. For cooling only units, a switch sized to the largest electric heat available for the particular unit is provided. Factory installed option only.

- **Convenience Outlet - (Non-Powered/Powered)** - This option locates a 120V single-phase GFCI outlet with cover, on the corner of the unit housing adjacent to the compressors. The “Non-powered” option requires the installer to provide the 120V single-phase power source and wiring. The “Powered” option is powered by a stepdown transformer in the unit. Factory installed option only.
- **Smoke Detectors** - The smoke detectors stop operation of the unit and provide a fault message to the control board. Smoke detectors are available for both the supply and/or return air configurations.
- **Filters -** 2” Pleated MERV 8 or 4” Pleated MERV 13 are available to meet LEED requirements. A 2” Throwaway is shipped as standard.

⚠WARNING

Factory-installed smoke detectors may be subjected to extreme temperatures during "off" times due to outside air infiltration. These smoke detectors have an operational limit of -4°F to 158°F. Smoke detectors installed in areas that could be outside this range will have to be relocated to prevent false alarms.

- **Phase Monitors** - Designed to prevent unit damage. The phase monitor will shut the unit down in an out-of phase condition. **(Standard on units with Scroll Compressors.)**
- **Coil Guard** - Customers can purchase a coil guard kit to protect the condenser coil from damage. Additionally, this kit stops animals and foreign objects from entering the space between the inner condenser coil and the main cabinet. This is not a hail guard kit.
- **Dirty Filter Switch** - This kit includes a differential pressure switch that energizes the fault light on the unit thermostat, indicating that there is an abnormally high pressure drop across the filters. Factory installed option or field installed accessory.
- **E-Coat Condenser Coils** - The condenser coils are coated with an epoxy polymer coating to protect against corrosion.
- **E-Coat Evaporator Coils** - The evaporator coils are coated with an epoxy polymer coating to protect against corrosion.
- **Hot Gas Bypass -** Allows operation during low load conditions while avoiding coil frosting and damage to compressor. When suction pressure falls below valve setpoint, the valve modulates hot gas to the inlet of the evaporator. HGBP is standard on all units with VAV and optional with constant-volume units.

Control Options

- **Smart Equipment™ with Communication Option Control** - The York® Smart Equipment™ with Communication Option Control is factory installed. It includes all the features of the Smart Equipment™ control with an additional gateway to BACnet MS/TP (programmable to Modbus or N2 protocols).
- **FDD (Fault Detection and Diagnostics) - Refrigerant side** A factory installed control system option on the commercial equipment that constantly monitors refrigerant circuit pressures, refrigerant circuit temperatures, as well as the environmental temperatures and humidity via multiple sensor inputs.
  - Provides a building owner, technician or contractor with the operational characteristics of the RTUs entire refrigerant circuit to ensure the unit is functioning at its specified performance level.
  - Provides alarms if the unit is not functioning optimally.
  - Remotely accessible via the Mobile Access Portal (MAP) gateway as well as scrolled on the UCB LCD screen.
- **Novar® BAS Control -** The Novar® building automation system controller is factory installed. Includes supply air sensor, return air sensor, dirty filter indicator switch, and air proving switch.
- **CPC BAS Control -** The Computer Process Controls Model 810-3060 ARTC Advanced Rooftop building automation system controller is factory installed. Includes supply air sensor, return air sensor, with optional dirty filter indicator switch and air proving switch.
- **Honeywell BAS Control -** The Honeywell W7750C building automation system controller is factory installed. Includes air supply sensor, return air sensor, with optional dirty filter indicator switch, and air proving switch.
- **Verasys** - Verasys provides a simple user experience with configurable self-recognizing controllers without the need for any additional tools. Verasys creates enhanced integration of HVACR equipment, zoning, and controls. Contractors are able to offer a complete bundled solution of equipment and controls to serve the light commercial market.

Field Installed Accessories

YORK® offers several equipment accessories for field installation, for the Predator® line.

- **Down flow and End Return Economizers (with fresh air hood and barometric relief) -** All units offer a variety of optional factory installed down flow economizers that are shipped, installed and wired with low leak dampers designed to meet ASHRAE 90.1-2010, AMCA 511 Class 1A damper, and the International Energy Conservation Code (IECC) certification requirements by achieving leakage rates of 3 cfm/sq. ft. at 1" of static pressure. Each economizer goes through a rigorous 60,000 cycle test. Dry bulb, single enthalpy, and dual enthalpy (with field installed kit) can be selected. The economizer has spring return, fully modulating damper actuators and is capable of introducing up to 100% outdoor air. As the outdoor air intake dampers open, the return air dampers close. The changeover from mechanical refrigeration to economizer operation is regulated by the outdoor air dry bulb temperature or the outdoor air enthalpy input. The dual enthalpy kit provides a second input used to monitor the return air (field installed). The installer needs only to assemble the outdoor air hood, attach the enthalpy control

the hood and mount the hood to the unit (Hood and control are provided).

- **Single or Dual Enthalpy Control, Accessories** - These kits contain the required components to convert a dry bulb economizer to a single enthalpy and/or dual enthalpy economizer.
- **Barometric Relief Damper** - Zero to 100% capacity barometric relief dampers for use with horizontal flow, or field installed economizers.
- **Power Exhaust** - This accessory installs in the unit with a down flow or horizontal end return economizer. Power exhaust plugs into the connector in the unit bulkhead. **User must purchase the 1EH0408 barometric relief and hood kit when applying the product in a horizontal flow application. The power exhaust must be mounted in the horizontal end return ductwork.**
- **Manual Outdoor Air Damper** - Like the motorized outdoor air damper, each manual outdoor air damper includes a slide-in damper assembly with an outdoor air hood and filters. Customers have a choice of dampers with ranges of 0% to 100% or 0% to 35% outdoor air entry.
- **Motorized Outdoor Air Damper** - The motorized outdoor air damper includes a slide-in/plug-in damper assembly with an outdoor air hood and filters. The outdoor air dampers open to the preset position when the indoor fan motor is energized. The damper has a range of 0% to 100% outdoor air entry. Factory installed option or field installed accessory.
- **Smoke Detectors** - The smoke detectors stop operation of the unit by interrupting power to the control board if smoke is detected within the air compartment.
- **CO_2 Sensor** - Senses CO_2 levels and automatically overrides the economizer when levels rise above the preset limits.
- **Dirty Filter Switch** - This kit includes a differential pressure switch that energizes the fault light on the unit thermostat, indicating that there is an abnormally high pressure drop across the filters.
- **Coil Guard -** Field installed decorative wire coil guard.
- **Hail Guard** - This kit includes a sloped hood which installs over the outside condenser coil and prevents damage to the coil fins from hail strikes. Field installed accessory only.
- **Flue Exhaust Extension Kit** - In locations with wind or weather conditions which may interfere with proper exhausting of furnace combustion products, this kit can be installed to prevent the flue exhaust from entering nearby fresh air intakes.
- **Gas Heat High Altitude Kit** - This kit converts a gas heat unit to operate at high altitudes, 2,000 to 6,000 feet. Conversion kits are available for natural gas and propane.
- **Low NOx Kit** - For units with gas furnaces in locations where codes require that the Oxides of Nitrogen emissions from the furnace be below 40 Nano grams per joule.
- **Gas Heat Propane Conversion Kit** - This kit converts a gas-fired heater from natural gas to propane. It contains the main burner orifices and gas valve replacement springs.
- **Gas Piping Kit** - Contains pipe nipples, fittings and gas cock required for gas supply connection with external shut off.
- **Electric Heaters** - The electric heaters range from 3kW to 54kW and are available in all the voltage options of the base units. The 54kW/208-240 volt, field-installed heater kit is not available with VAV units due to a lack of space to accommodate the heater's fuse block accessory.

  All heaters are dual staged. Cooling units include an adapter panel for easy installation of the electric heaters. Necessary hardware and connectors are included with the heaters. All heaters are intended for single point power supply.
- **Metal Frame Filter Kit -** Metal frame with polyester filter medium.
- **Permanent Filters** - Permanent filters are available.
- **Roof Curbs** - The roof curbs have insulated decks and are shipped disassembled The roof curbs are available in 8" and 14" heights. For applications with security concerns, burglar bars are available for the duct openings of the roof curbs.
- **Roof Curb Transition -** Single Piece Adapter (10" High) - Roof curbs for transitioning from Sunline™ units to Predator® units. Fits 7.5 to 12.5 Sunline™ roof curbs only.
- **Burglar Bars** - Mount in the supply and return openings to prevent entry into the duct work.
